Annex C
(normative)
Implementation method specific requirements

The implementation method defines what types of exchange behaviour are required with respect to this part of ISO 10303. Conformance to this part of ISO 10303 shall be realized in an exchange structure. The file format shall be encoded according to the syntax and EXPRESS language mapping defined in ISO 10303-21 and in the AIM defined in annex A of this part of ISO 10303. The header of the exchange structure shall identify use of this part of ISO 10303 by the schema name 'electronic_assembly_interconnect_and_packaging_design'.

Exchange between implementations shall be limited to implementations which have implemented the same (or none) 2D shape representation conformance classes unless 2D to 3D conversion is employed. Exchange between implementations shall be limited to implementations which have implemented the same (or none) 3D shape representation conformance classes unless 2D to 3D conversion is employed.

Annex D (normative)

Protocol Implementation Conformance Statement (PICS) proforma

The Protocol Implementation Conformance Statement (PICS) proforma is supplied for completion by the person or organization (the client) requesting conformance testing. Its purpose is to ascertain the scope of claimed conformance to a particular application protocol by an implementation under test (IUT) using a defined implementation method. Through the completion of this form, the PICS Proforma becomes a PICS.

The information contained in the PICS is used to configure an appropriate executable test suite for use by the client.

Conformance classes and the appropriate relationships between conformance classes for this part of ISO 10303 are detailed in clause 6.

Questions:

1. Please provide an identifier for the product or system for which conformance is claimed:

Product name and current version number: _____

2. Please indicate the implementation method chosen:

☐ ISO 10303-21 Exchange Structure – preprocessor

Preprocessor name and current version number: _____

☐ ISO 10303-21 Exchange Structure – postprocessor

Postprocessor name and current version number: _____

☐ ISO 10303-22 Exchange Interface – processor

Interface Processor name and current version number: _____

3. Please indicate the classes for which conformance is claimed:

☐ Class 1 - Device Functional and Physical Characteristics

☐ Class 2 - Interconnect Technology Constraints

☐ Class 3 - Assembly Technology Constraints

☐ Class 4 - Assembly Functional Requirements

- _ Class 5 - Assembly Physical Requirements
- _ Class 6 - Interconnect Functional Requirements
- _ Class 7 - Interconnect Physical Requirements
- _ Class 8 - Assembly Physical Design
- _ Class 9 - Interconnect Design
- _ Class 10 - Interconnect Design (Microwave)
- _ Class 11 - Geometric Dimensioning and Tolerancing
- _ Class 12 - Product Rule
- _ Class 13 - Functional Decomposition
- _ Class 14 - Package Functional and Physical Characterization
- _ Class 15 - Geometrically Bounded Surface Model
- _ Class 16 - Wireframe Model with Topology
- _ Class 17 - Advanced Boundary Representation
- _ Class 18 - Constructive Solid Geometry
- _ Class 19 - Extruded solid
- _ Class 20 - Geometrically Bounded 2d Wireframe Model
- _ Class 21 - Wireframe 2d Model with Topology
- _ Class 22 - Curve 2d
- _ Class 23 - Basic Curve 2d
- _ Class 24 - Laminate Assembly Design
- _ Class 25 - Connection Zone Based Model Extraction
- _ Class 26 - Functional Specification
- _ Class 27 - Physical Unit Physical Characterization

- _ Class 28 - Packaged Part White Box Model
- _ Class 29 - Printed Part Functional and Physical Characterization
- _ Class 30 - Open Shell Model
- _ Class 31 - Assembly Functional Interface Requirements
- _ Class 32 - Assembly Physical Interface Requirements
- _ Class 33 - Assembly Requirements Allocation
- _ Class 34 - Interconnect Requirement Allocation
- _ Class 35 - Functional Requirement Allocation
- _ Class 36 - Product Requirement Allocation
- _ Class 37 - Datum Difference Based Model Definition
- _ Class 38 - Datum Difference Based Characteristic
- _ Class 39 - Design Management

4. Please indicate whether Date only or Date and Time to the second is supported:

Date only _____

Date and Time to the Second _____

User selects between the above two choices _____

Annex E (normative) Information object registration

E.1 Document identification

To provide for unambiguous identification of an information object in an open system, the object identifier

{ iso standard 10303 part(210) version(1) }

is assigned to this part of ISO 10303. The meaning of this value is defined in ISO/IEC 8824-1, and is described in ISO 10303-1.

E.2 Schema identification

To provide for unambiguous identification of the schema specifications given in this application protocol `electronic_assembly_interconnect_and_packaging_design` in an open information system, object identifiers are assigned as follows:

{ iso standard 10303 part(210) version(1) object(1)
`electronic-assembly-interconnect-and-packaging-design(1)` }

is assigned to the `electronic_assembly_interconnect_and_packaging_design` expanded schema (see annex A).

{ iso standard 10303 part(210) version(1) object(1)
`electronic-assembly-interconnect-and-packaging-design(2)` }

is assigned to the `electronic_assembly_interconnect_and_packaging_design` short form schema (see 5.2).

The meaning of these values is defined in ISO/IEC 8824-1, and is described in ISO 10303-1.

Annex F (normative) Application interpreted constructs

An application interpreted construct (AIC) provides a logical grouping of interpreted constructs that supports a specific functionality for the usage of product data across multiple application contexts. An interpreted construct is a common interpretation of the integrated resources that supports shared information requirements among application protocols.

NOTE SC4 resolution 286 (Kobe June 1996) states that

- an AIC shall be published as a separate part (500-series document)
- APs shall reference AICs only as a normative reference
- AICs shall be at the same or advanced voting status as an AP in which it is being used at the the time of the AP's DIS or FDIS ballot.

As a result of this resolution, ISO 10303-210's annex sequence shall differ from the annex sequence defined by the ISO TC184/SC4/N537 *Supplementary directives for the drafting and presentation of ISO 10303*. Annex F of this part of ISO 10303 contains text copied verbatim from the AIC ISO 10303-507 (CD) and the AIC ISO 10303-509 (CD).

F.1 Geometrically bounded surface

F.1.1 Scope

This application interpreted construct specifies the interpretation of the integrated resources to satisfy requirements for the description of geometric shapes by means of geometrically bounded surface models.

The following are within the scope of this AIC:

- 3D points;
- points defined in the parameter space of curves or surfaces;
- 3D curves;
- curves defined in the parameter space of surfaces;

NOTE Such curves are also known as pcurves or cons, which are acronyms for parametrised curve and curve on surface.

- the elementary curves, i.e., line, circle, ellipse, parabola, and hyperbola;
- intersection curves;
- polylines that consist of at least three points;

- surfaces;
- the elementary surfaces, i.e., plane, cylinder, cone, torus, and sphere;
- swept surfaces created by rotation or linear extrusion of a curve;
- sculptured curves and surfaces;
- trimming of curves and surfaces;
- composition of curves and surfaces;
- replication of curves, surfaces, and surface models;
- 3D offsets of curves and surfaces.

The following are outside the scope of this AIC:

- unbounded geometry;
- self-intersecting geometry;
- geometry in a 2D cartesian coordinate space;
- replication of points;
- topological entities.

F.1.2 EXPRESS short listing

This application interpreted construct provides a consistent set of geometric entities for the definition of surface models that consist of points, elementary or sculptured curves, and elementary or sculptured surfaces. Geometry shall be bounded; no topological entities are used for bounding.

product_property_representation_schema	ISO 10303-41
representation_schema	ISO 10303-43

F.1.2.1 Fundamental concepts and assumptions

The following entities are intended to be independently instantiated in the application protocol schemas that use this AIC:

— `geometrically_bounded_surface_shape_representation`.

F.1.2.2 `aic_geometrically_bounded_surface` schema entity definitions

F.1.2.2.1 `geometrically_bounded_surface_shape_representation`

A **`geometrically_bounded_surface_shape_representation`** describes the shape or portions of the shape of a **product** using a surface model without topology.

NOTE 1 Entity **product** is not part of this AIC.

The highest level entity of this AIC is **`geometrically_bounded_surface_shape_representation`**. It is a **shape_representation** (see ISO 10303-41) consisting of **geometric_sets**. **Points**, **curves**, and **surfaces** may be contained in a **geometric_set** provided they are of the same dimensionality (see ISO 10303-42, rule **compatible_dimension**). A **`geometrically_bounded_surface_shape_representation`** shall include at least one **surface**. The geometric entities that are exclusively used to support the

definition of other geometric entities shall not themselves exist in the sets of **elements** of a **geometric_set**. All geometric entities shall be of dimensionality three except for two-dimensional geometry that is used for the purpose of defining **pcurves**. The use of one-dimensional **cartesian_points** is excluded.

All unbounded curves and surfaces shall be explicitly trimmed. The boundaries of curves shall be defined either by points on curves and explicit associations between these points and curves, or by parameter values. The boundaries of surfaces shall be defined either by curves on surfaces and explicit associations between these curves and surfaces, or by parameter values.

The **items** of a **geometrically_bounded_surface_shape_representation** may also be of type **mapped_item** (see ISO 10303-43) or **axis2_placement_3d**. These are used to assemble one or several **geometrically_bounded_surface_shape_representations** into one other **geometrically_bounded_surface_shape_representation**.

The WHERE-rules of this entity restrict the use of the entity data types that are imported from ISO 10303-42 and ISO 10303-43 according to the statements above. Most of these type checks and validations of constraints are specified in the following three functions:

- **gbsf_check_point;**
- **gbsf_check_curve;**
- **gbsf_check_surface.**

The three functions shall be applied to all **elements** of all **geometric_sets** in a **geometrically_bounded_surface_shape_representation**. The functions automatically assess all **points**, **curves**, and **surfaces** that are referenced by these **elements**. The functions, therefore, apply recursion.

EXAMPLE 1 A **pcurve** references both a **curve** and a **surface**. Function **gbsf_check_curve** validates not only the **pcurve**, but also its underlying geometry. It will, therefore, not only call itself, but also **gbsf_check_surface**.

NOTE 2 An application protocol that uses this part of ISO 10303 should explicitly require that the **shape_representation** entity may be instantiated as a **geometrically_bounded_surface_shape_representation**.

Formal propositions:

WR1: The **items** in a **geometrically_bounded_surface_shape_representation** shall be **geometric_sets**, **mapped_items**, or **axis2_placement_3ds**.

NOTE 3 **Axis2_placement_3d** is a valid **mapped_item.mapping_target**. To include another **representation** into the list of **items** of a **geometrically_bounded_surface_shape_representation** (see WR3 for valid **mapped_items**), the **mapped_item.mapping_source.mapping_origin** may be any entity that is geometrically founded in the **geometric_representation_context** of the **mapped_representation**. If this entity is an **axis2_placement_3d**, the operator that maps the **mapped_representation** into the **geometrically_bounded_surface_shape_representation** corresponds to a transformation matrix with only translation and rotation enabled. If a **cartesian_transformation_operator_3d** is used as **mapping_origin**, scaling and mirroring are possible.

WR2: At least one of the **items** in a **geometrically_bounded_surface_shape_representation** shall be either a **geometric_set** or a **mapped_item**.

WR3: If there is a **mapped_item** in a **geometrically_bounded_surface_shape_representation**, the **mapped_representation** of its **mapping_source** shall be a **geometrically_bounded_surface_shape_representation**.

WR4: Each **point** that is among the **elements** of a **geometric_set** that is one of the **items** of a **geometrically_bounded_surface_shape_representation** shall be a valid **point**.

WR5: Each **curve** that is among the **elements** of a **geometric_set** that is one of the **items** of a **geometrically_bounded_surface_shape_representation** shall be a valid **curve**.

WR6: Each **surface** that is among the **elements** of a **geometric_set** that is one of the **items** of a **geometrically_bounded_surface_shape_representation** shall be a valid **surface**.

WR7: At least one of the **elements** of at least one **geometric_set** that is among the **items** of a **geometrically_bounded_surface_shape_representation** shall be a **surface**.

Informal propositions:

IP1: A **b_spline_curve** shall not self-intersect.

IP2: A **composite_curve** shall not self-intersect.

IP3: An **offset_curve_3d** shall not self-intersect.

IP4: A **b_spline_surface** shall not self-intersect.

IP5: An **offset_surface** shall not self-intersect.

IP6: The geometric entities that are exclusively used to support the definition of other geometric entities shall not themselves exist in the sets of **elements** of a **geometric_set**.

F.1.2.3 aic_geometrically_bounded_surface function definitions

This section describes functions required to formulate constraints for the **aic_geometrically_bounded_surface** schema. These functions are used in the specification of the entity **geometrically_bounded_surface_shape_representation**.

F.1.2.3.1 gbsf_check_point

The **gbsf_check_point** function performs type checking for **points**. An instance is checked against all types of **points** that are valid in the context of a **geometrically_bounded_surface_shape_representation**. All related geometry, that is **curves** and **surfaces**, are also checked in the same way. When **curves** or **surfaces** are referenced, the functions **gbsf_check_curve** respectively **gbsf_check_surface** are called. The recursion within these functions terminates at entity types that do not reference any **points**, **curves**, or **surfaces**.

The following point types and their subtypes are within the scope of the **geometrically_bounded_surface_shape_representation** and are valid input to this function:

- **cartesian_point**;
- **degenerate_pcurve**;
- **point_on_curve**;
- **point_on_surface**.

The three latter ones in the list reference either **curves** or **surfaces** or both.

The **basis_surface** of a **degenerate_pcurve** may be any of the valid **surfaces** in a **geometrically_bounded_surface_shape_representation**. The **reference_to_curve** of a **degenerate_pcurve** shall be of one of the following types:

- **b_spline_curve**;
- **composite_curve** (recursive);
- **conic**;
- **curve_replica** (recursive);
- **line**;
- **polyline**;
- **trimmed_curve** (recursive).

The **basis_curve** of a **point_on_curve** may be any of the valid **curves** in a **geometrically_bounded_surface_shape_representation**.

The **basis_surface** of a **point_on_surface** may be any of the valid **surfaces** in a **geometrically_bounded_surface_shape_representation**.

This function returns TRUE, if the types of all referenced geometries are within the scope of the **geometrically_bounded_surface_shape_representation**, otherwise the function returns FALSE.

NOTE 1 This function does not check the correctness of references with respect to ISO 10303-42. Only additional requirements due to the scope of the **geometrically_bounded_surface_shape_representation** are checked.

NOTE 2 The function uses recursion to trace entity references.

Argument definitions:

pnt: (input) the **point** that is being checked for being a valid **point** in a **geometrically_bounded_-surface_shape_representation**.

BOOLEAN: (return) is TRUE if the **point** is a valid **point**; else FALSE.

F.1.2.3.2 gbsf_check_curve

The **gbsf_check_curve** function performs type and constraint checking for **curves**. An instance is checked against all types of **curves** that are valid in the context of a **geometrically_bounded_surface_shape_representation**. All related geometry, that is **curves** and **surfaces**, are also checked in the same way.

EXAMPLE 1 One of the constraints that is validated by this function is whether the self-intersection flag of a **b_spline_curve** instance is set to TRUE or FALSE; only FALSE is valid.

Where appropriate an instance is investigated recursively. This means if a **curve** references another **curve** as a basis curve or parent curve, the **gbsf_check_curve** function is called again. If a **surface** is referenced, the **gbsf_check_surface** function is called. The recursion terminates at entity types that do not reference any **curves** or **surfaces**.

The following curve types and their subtypes are within the scope of the **geometrically_bounded_surface_shape_representation** and are valid input to this function:

- **b_spline_curve**;
- **composite_curve**;
- **conic**;
- **curve_replica**;
- **line**;
- **offset_curve_3d**;
- **pcurve**;
- **polyline**;
- **surface_curve**;
- **trimmed_curve**.

The **parent_curve** of a **curve_replica**, the **basis_curve** of an **offset_curve_3d**, and the **basis_curve** of a **trimmed_curve** shall all be of one of the following types:

- **b_spline_curve**;
- **composite_curve** (recursive);
- **conic**;

- **curve_replica** (recursive);
- **line**;
- **offset_curve_3d** (recursive);
- **pcurve** (recursive);
- **polyline**;
- **surface_curve** (recursive);
- **trimmed_curve** (recursive).

The one instance in the set of **items** of a **definitional_representation** that is referenced as **reference_to_curve** by a **pcurve** shall be of one of the following types:

- **b_spline_curve**;
- **composite_curve** (recursive);
- **conic**;
- **curve_replica** (recursive);
- **line**;
- **polyline**;
- **trimmed_curve** (recursive).

The **curve_3d** of a **surface_curve** shall be of one of the following types:

- **b_spline_curve**;
- **composite_curve** (recursive);
- **conic**;
- **curve_replica** (recursive);
- **line**;
- **offset_curve_3d** (recursive);
- **polyline**;

- **surface_curve** (recursive);
- **trimmed_curve** (recursive).

This function returns TRUE, if the types of all referenced geometries are within the scope of the **geometrically_bounded_surface_shape_representation** and if all constraints are satisfied, otherwise the function returns FALSE.

NOTE 1 This function does not check the correctness of references with respect to ISO 10303-42. ISO 10303-42 requires, for example, that the **segments** of a **composite_curve** shall be of type **composite_curve_segment** and that the **parent_curve** of a **composite_curve_segment** shall be a **bounded_curve**. This constraint is not verified by this function. Only additional requirements due to the scope of the **geometrically_bounded_surface_shape_representation** are checked.

NOTE 2 This function uses recursion to trace entity references.

Argument definitions:

cv: (input) the **curve** that is being checked for a valid **curve** in a **geometrically_bounded_surface_shape_representation**.

BOOLEAN: (return) is TRUE if the **curve** is a valid **curve**; else FALSE.

F.1.2.3.3 gbsf_check_surface

The **gbsf_check_surface** function performs type and constraint checking for **surfaces**. An instance is checked against all types of **surfaces** that are valid in the context of a **geometrically_bounded_surface_shape_representation**. All related geometry, that is **curves** and **surfaces**, are also checked in the same way.

EXAMPLE 1 Whether the instance of a **b_spline_surface** self-intersects, is an example of a constraint that is validated by this function.

Where appropriate an instance is investigated recursively. This means if a **surface** references another **surface** as a basis surface or parent surface, the **gbsf_check_surface** function is called again. If a **curve** is referenced, the **gbsf_check_curve** function is called. The recursion terminates at entity types that do not reference any **curves** or **surfaces**.

The following surface types and their subtypes are within the scope of the **geometrically_bounded_surface_shape_representation** and are valid input to this function:

- **b_spline_surface;**
- **curve_bounded_surface;**
- **elementary_surface;**
- **offset_surface;**
- **rectangular_composite_surface;**
- **rectangular_trimmed_surface;**
- **surface_replica;**

– **swept_surface**.

Both the **basis_surface** of a **curve_bounded_surface**, the **basis_surface** of an **offset_surface**, the **basis_surface** of a **rectangular_trimmed_surface**, and the **parent_surface** of a **surface_replica** shall all be one of the **surface** types listed above.

Swept_surfaces reference **curves**. Function **gbsf_check_curve** is called for type checking. The **geometrically_bounded_surface_shape_representation** requires the same constraints on valid sweeping curves as specified in ISO 10303-42. All **curves** that are in the scope of a **geometrically_bounded_surface_shape_representation** are valid **swept_curves**.

This function returns TRUE, if the types of all referenced geometries are within the scope of the **geometrically_bounded_surface_shape_representation** and if all constraints are satisfied, otherwise the function returns FALSE.

NOTE 1 This function does not check the correctness of references with respect to ISO 10303-42. ISO 10303-42 requires, for example, that the **segments** of a **rectangular_composite_surface** shall be **surface_patches** and that these shall have **bounded_surfaces** as their parent surfaces. This constraint is not verified by this function. Only additional requirements due to the scope of the **geometrically_bounded_surface_shape_representation** are checked.

NOTE 2 The function uses recursion to trace entity references.

F.2 Manifold surface

F.2.1 Scope

This application interpreted construct specifies the interpretation of the integrated resources to satisfy requirements for the description of geometric shapes by means of manifold surface models.

The following are within the scope of this AIC:

— 3D points;

- points defined in the parameter space of curves or surfaces;
- 3D curves;
- curves defined in the parameter space of surfaces;

NOTE Such curves are also known as pcurves or cons , which are acronyms for parametrised curve and curve on surface .

- the elementary curves, i.e., line, circle, ellipse, parabola, and hyperbola;
- intersection curves;
- polylines that consist of at least three points;
- the elementary surfaces, i.e., plane, cylinder, cone, torus, and sphere;
- swept surfaces created by rotation or linear extrusion of a curve;
- sculptured curves and surfaces;
- trimming of curves and surfaces using topological entities;
- composition of curves and surfaces using topological entities;
- replication of curves, surfaces, and surface models;
- 3D offsets of curves and surfaces;
- 2-manifolds.

The following are outside the scope of this AIC:

- unbounded geometry;
- self-intersecting geometry;
- geometry in a 2D cartesian coordinate space;
- replication of points;
- topology without an association to a corresponding geometric domain;
- non-manifolds.

F.2.2 EXPRESS short listing

This application interpreted construct provides a consistent set of geometric and topological entities for the definition of manifold surface representations that consist of elementary or sculptured curves and surfaces. The highest level entity of this AIC is **manifold_surface_shape_representation**. A **manifold_surface_shape_representation** is bounded. The bounding of the geometry is achieved by topological entities, such as **vertex**, **edge**, and **face**.

Topological entities shall not exist without an association to a corresponding geometric domain.

NOTE 1 This AIC uses all the entities and types from ISO 10303-511, **aic_topologically_bounded_surface**.

F.2.2.1 aic_manifold_surface entity definition: manifold_surface_shape_representation

A **manifold_surface_representation** describes the shape or portions of the shape of a **product** using 2-manifolds with boundaries.

NOTE 1 2-manifolds are topologically constrained in a way that makes them suitable for inclusion into solid representations. Within a 2-manifold, for example, only a maximum of two **faces** may share the same **edge**.

NOTE 2 Entity **product** is not part of this AIC.

A **manifold_surface_shape_representation** is a **shape_representation** (see ISO 10303-41) that consists of one or many **shell_based_surface_models**. Each **shell_based_surface_model** is built up of **open_shells** and **closed_shells** which are sets of **faces**. **Connected_face_set**, which is the supertype of **open_shell** and **closed_shell**, shall not be instantiated. **Faces** use **edges** and **vertices**; all of these shall reference geometric entities such as **points**, **curves**, and **surfaces**. The link between topology and geometry may be established by either using **face_surface** or **advanced_face** (see ISO 10303-511). The two options differ both in the selection of valid **point**, **curve**, and **surface** subtypes and in constraints on references to underlying geometry.

NOTE 3 The representation of **face_surfaces** as **advanced_faces** is recommended for manifold surface models that are intended to be used together with boundary representation solid models; the integration of such a manifold surface model into for example an advanced boundary representation model (see ISO 10303-514) will be easier.

All geometric entities shall be of dimensionality three except for two-dimensional geometry that is used for the purpose of defining **pcurves**. The use of one-dimensional **cartesian_points** is excluded.

All unbounded geometry shall be trimmed by using topological constructs.

The **items** of a **manifold_surface_shape_representation** may also be of type **mapped_item** (see ISO 10303-43) or **axis2_placement_3d**. These are used to assemble one or several **manifold_surface_shape_representations** into one other **manifold_surface_shape_representation**.

The WHERE-rules of this entity restrict the use of the entity data types that are imported from ISO 10303-42 and ISO 10303-43 according to the statements above. Some of these type checks and validations of constraints are specified in the following two functions:

- **msf_curve_check**;
- **msf_surface_check**.

In WR6 and WR11 below, these functions validate the **curves** and **surfaces** of all **edges** and **faces** that are in the scope of a **manifold_surface_shape_representation** except for those that are in the reference tree of an **advanced_face**; the geometry of an **advanced_face** is validated by a different set of rules. The functions automatically assess all underlying geometry; this is done by recursive calls.

EXAMPLE 1 A **pcurve** may reference both a **curve** and a **surface**. Function **msf_curve_check** validates not only the **pcurve**, but also this underlying geometry. It will, therefore, not only call itself, but also **msf_surface_check**.

NOTE 4 This part of ISO 10303 does not include a function for the validation of **points** and their underlying **curves** and **surfaces**. This is because all **curves** and **surfaces** of a **manifold_surface_shape_representation** are referenced from **edges** and **faces** and are, thus, covered by the two existing functions already.

NOTE 5 An application protocol that uses this AIC should explicitly require that the **shape_representation** entity may be instantiated as a **manifold_surface_shape_representation**.

Formal propositions:

WR1: The **items** in a **manifold_surface_shape_representation** shall be **shell_based_surface_models**, **mapped_items**, or **axis2_placement_3ds**.

NOTE 6 **Axis2_placement_3d** is a valid **mapped_item.mapping_target**. To include another **representation** into the list of **items** of a **manifold_surface_shape_representation** (see WR3 for valid **mapped_items**), the **mapped_item.mapping_source.mapping_origin** may be any entity that is geometrically founded in the **geometric_representation_context** of the **mapped_representation**. If this entity is an **axis2_placement_3d**, the operator that maps the **mapped_representation** into the **manifold_surface_shape_representation** corresponds to a transformation matrix with only translation and rotation enabled. If a **cartesian_transformation_operator_3d** is used as **mapping_origin**, scaling and mirroring are possible.

WR2: At least one of the **items** in a **manifold_surface_shape_representation** shall be either a **shell_based_surface_model** or a **mapped_item**.

WR3: If there is a **mapped_item** in a **manifold_surface_shape_representation**, the **mapped_representation** of its **mapping_source** shall also be a **manifold_surface_shape_representation**.

WR4: The boundary of a **shell_based_surface_model**, that is its attribute **sbsm_boundary**, shall be defined by using only **open_shells**, **closed_shells**, or **oriented_closed_shells**; **oriented_open_shells** are not valid.

WR5: A **face** shall be instantiated as either a **face_surface**, its subtype **advanced_face**, or an **oriented_face**.

WR6: The **face_geometry** of a **face_surface** shall be either a **b_spline_surface**, an **elementary_surface**, an **offset_surface**, a **surface_replica**, a **swept_surface**, or a **surface** within the reference tree of an **advanced_face**.

WR7: All basis geometry that is referenced by **surfaces** shall be either within the reference tree of an **advanced_face** or shall be valid **curves** and **surfaces**.

The **basis_surface** of an **offset_surface** shall be either an **elementary_surface**, **b_spline_surface**, **offset_surface**, **swept_surface**, or **surface_replica**.

The **parent_surface** of a **surface_replica** shall be either an **elementary_surface**, **b_spline_surface**, **offset_surface**, **swept_surface**, or **surface_replica**.

The **swept_curve** of a **swept_surface** shall be either a **line**, **conic**, **pcurve**, **surface_curve**, **offset_curve_3d**, **b_spline_curve**, **polyline**, or **curve_replica**.

The attribute **self_intersect** shall be set to FALSE for **b_spline_surfaces** and **offset_surfaces**.

WR8: The **bound** of a **face_bound**, which is referenced from a **face**, shall be either within the reference tree of an **advanced_face** or shall be an **edge_loop** or a **vertex_loop**.

WR9: The geometry of a bounding **edge**, that is the **edge_element** of an **oriented_edge**, shall be either within the reference tree of an **advanced_face** or shall be an **edge_curve**.

WR10: The **curve** used to define the geometry of an **edge**, that is the **edge_geometry** of an **edge_curve** of an **edge**, shall be either a **b_spline_curve**, a **conic**, a **curve_replica**, a **line**, an **offset_curve_3d**, a **pcurve**, a **polyline**, a **surface_curve**, or a **curve** in the reference tree of an **advanced_face**.

WR11: All basis geometry that is referenced by **curves** shall be either within the reference tree of an **advanced_face** or shall be valid **curves** and **surfaces**.

The **parent_curve** of a **curve_replica** shall be either a **line**, **conic**, **pcurve**, **surface_curve**, **offset_curve_3d**, **b_spline_curve**, **polyline**, or **curve_replica**.

The **basis_curve** of an **offset_curve_3d** shall be either a **line**, **conic**, **pcurve**, **surface_curve**, **offset_curve_3d**, **b_spline_curve**, **polyline**, or **curve_replica**.

The **curve_3d** of a **surface_curve** shall be either a **line**, **conic**, **offset_curve_3d**, **b_spline_curve**, **polyline**, or **curve_replica**.

The **basis_surface** of a **surface_curve** shall be either a **b_spline_surface**, **elementary_surface**, **offset_surface**, **surface_replica**, or **swept_surface**.

Polylines shall contain at least three **cartesian_points**.

The attribute **self_intersect** shall be set to FALSE for **b_spline_curves** and **offset_curve_3ds**.

WR12: The **edge_start** and **edge_end** of an **edge** shall be either within the reference tree of an **advanced_face** or shall be **vertex_points**.

WR13: The **vertex_geometry** of a **vertex** that is part of an **edge_loop** shall be either within the reference tree of an **advanced_face** or shall be a **cartesian_point**, **point_on_curve**, **point_on_surface**, or **degenerate_pcurve**.

WR14: The **loop_vertex** of a **vertex_loop** shall be either within the reference tree of an **advanced_face** or shall be a **vertex_point**.

WR15: The **vertex_geometry** of a **vertex** that is part of a **vertex_loop** shall be either within the reference tree of an **advanced_face** or shall be a **cartesian_point**, **point_on_curve**, **point_on_surface**, or **degenerate_pcurve**.

Informal propositions:

IP1: A **b_spline_curve** shall not self-intersect.

IP2: A **b_spline_surface** shall not self-intersect.

IP3: An **offset_curve_3d** shall not self-intersect.

IP4: An **offset_surface** shall not self-intersect.

IP5: If a **face** has only one connected outer bound, the corresponding **loop** shall be represented as **face_outer_bound**. If the outer bound is not connected, **face_outer_bound** shall not be used.

F.2.2.2 **aic_manifold_surface** function definitions

This section describes functions required to formulate constraints for the **aic_manifold_surface** schema. These functions are used in the specification of the entity **manifold_surface_shape_representation**.

F.2.2.2.1 **msf_curve_check**

The **msf_curve_check** function performs type checking for **curves**. An instance is checked against all types of **curves** that are valid in the context of a **manifold_surface_shape_representation**. All related geometry, that is **curves** and **surfaces**, are also checked in the same way.

Where appropriate an instance is investigated recursively. This means if a **curve** references another **curve** as a basis curve or parent curve, the **msf_curve_check** function is called again. If a **surface** is referenced, the **msf_surface_check** function is called. The recursion terminates at entity types that do not reference any **curves** or **surfaces**.

The following curve types and their subtypes are within the scope of the **manifold_surface_shape_representation** and are, thus, valid input to this function:

- **b_spline_curve**;
- **conic**;
- **curve_replica**;
- **line**;
- **offset_curve_3d**;
- **pcurve**;
- **polyline**;
- **surface_curve**.

Four of these **curve** types reference basis or parent **curves**. The lists below indicate the valid references.

The **parent_curve** of a **curve_replica** and the **basis_curve** of an **offset_curve_3d** shall be of one of the following types:

- **b_spline_curve**;
- **conic**;

- **curve_replica** (recursive);
- **line**;
- **offset_curve_3d** (recursive);
- **pcurve** (recursive);
- **polyline**;
- **surface_curve** (recursive).

The one instance in the set of **items** of a **definitional_representation** that is referenced as **reference_to_curve** by a **pcurve** shall be of one of the following types:

- **b_spline_curve**;
- **conic**;
- **curve_replica** (recursive);
- **line**;
- **polyline**.

The **curve_3d** of a **surface_curve** shall be of one of the following types:

- **b_spline_curve**;
- **conic**;
- **curve_replica** (recursive);
- **line**;
- **offset_curve_3d** (recursive);
- **polyline**;
- **surface_curve** (recursive).

Pcurve and **surface_curve** also reference **surfaces**. Function **msf_surface_check** is called for type checking. The **manifold_surface_shape_representation** requires the same constraints on valid **surface** references for **pcurves** and **surface_curves** as specified in ISO 10303-42.

A valid **polyline** shall consist of at least three **cartesian_points**. The attribute **self_intersect** shall for B-spline and offset geometry be set to FALSE.

This function returns TRUE, if the types of all referenced geometries are within the scope of the **manifold_surface_shape_representation** and if all constraints are fulfilled, otherwise the function returns FALSE.

NOTE 1 This function does not check the correctness of references with respect to ISO 10303-42. Only additional requirements due to the scope of the **manifold_surface_shape_representation** are checked.

NOTE 2 This function uses recursion to trace entity references.

                            (cv\surface_curve.associated_geometry[i]) THEN
                            IF NOT msf_curve_check
                                (cv\surface_curve.associated_geometry[i]) THEN
                                RETURN(FALSE);
                            END_IF;
                        END_IF;
                    END_IF;
                END_REPEAT;
                RETURN(TRUE);
            END_IF;
        ELSE

```

[illegible]

Argument definitions:

cv: (input) the **curve** that is being checked for a valid **curve** in a **manifold_surface_shape_representation**.

BOOLEAN: (output) is TRUE if the **curve** is a valid **curve**; else FALSE.

F.2.2.2.2 msf_surface_check

The **msf_surface_check** function performs type checking for **surfaces**. An instance is checked against all types of **surfaces** that are valid in the context of a **manifold_surface_shape_representation**. All related geometry, that is **curves** and **surfaces**, are also checked in the same way.

Where appropriate an instance is investigated recursively. This means if a **surface** references another **surface** as a basis surface or parent surface the **msf_surface_check** function is called again. If a **curve** is referenced, the **msf_curve_check** function is called. The recursion terminates at entity types that do not reference any **curves** or **surfaces**.

The following surface types and their subtypes are within the scope of the **manifold_surface_shape-representation** and are, thus, valid input to this function:

- `b_spline_surface`;
- `elementary_surface`;
- `offset_surface`;
- `surface_replica`;
- `swept_surface`.

Two of these **surface** types reference basis or parent **surfaces**. The **parent_surface** of a **surface_replica** and the **basis_surface** of an **offset_surface** shall both be of one of the following types:

- **b_spline_surface**;
- **elementary_surface**;
- **offset_surface** (recursive);
- **surface_replica** (recursive);
- **swept_surface**.

Swept_surfaces reference **curves**. Function **msf_curve_check** is called for type checking. The **manifold_surface_shape_representation** requires the same constraints on valid sweeping curves as specified in ISO 10303-42. All **curves** that are in the scope of a **manifold_surface_shape_representation** are valid as **swept_surface.swept_curves**.

The attribute **self_intersect** shall for B-spline and offset geometry be set to FALSE.

This function returns TRUE, if the types of all referenced geometries are within the scope of the **manifold_surface_shape_representation** and if all constraints are fulfilled, otherwise the function returns FALSE.

NOTE 1 This function does not check the correctness of references with respect to requirements specified by ISO 10303-42. Only additional requirements due to the scope of the **manifold_surface_shape_representation** are checked.

NOTE 2 The function uses recursion to trace entity references.

EXPRESS specification:

```

*)
FUNCTION msf_surface_check (surf : surface) : BOOLEAN;

(* This function verifies the validity of a surface in the
   context of a manifold surface model.
*)

(* let those types pass that do not have any further
   references respectively rules to be applied
   *)
IF 'GEOMETRY_SCHEMA.ELEMENTARY_SURFACE' IN TYPEOF(surf) THEN
  RETURN(TRUE);
ELSE

```

```

(* a swept_surface shall have a valid sweeping curve
*)
IF 'GEOMETRY_SCHEMA.SWEPT_SURFACE' IN TYPEOF (surf) THEN
    RETURN (msf_curve_check(surf\swept_surface.swept_curve));
ELSE

    (* an offset_surface shall not self-intersect and shall
       reference a valid surface
    *)
    IF (('GEOMETRY_SCHEMA.OFFSET_SURFACE' IN TYPEOF (surf)) AND
        (surf\offset_surface.self_intersect = FALSE)) THEN
        RETURN (msf_surface_check(surf\offset_surface.basis_surface));
    ELSE

        (* a surface_replica shall have a valid parent surface
        *)
        IF 'GEOMETRY_SCHEMA.SURFACE_REPLICA' IN TYPEOF(surf) THEN

Annex G (informative) **Application activity model**

The application activity model (AAM) is provided to aid in understanding the scope and information requirements defined in this application protocol. The model is presented as a set of figures that contain the activity diagrams and a set of definitions of the activities and their data. The application activity model is given in figures G.1 through G.21. The viewpoint of the application activity model is that of design participants in creating an electrical or electronic product.

G.1 Application activity model definitions

The following terms are used in the application activity model. Terms marked with an asterisk are outside the scope of this application protocol. The definitions given in this annex do not supersede the definitions given in the main body of the text.

G.1.1

advanced parts list

a preliminary list of all parts that go into the manufacture of a fully populated printed circuit board (see preliminary parts list.)

G.1.2

analyse board architecture manufacturability

an activity that reviews the architecture and ascertains the relative manufacturability of the product. Issues recorded are presented during meetings of the product development team.

G.1.3

analyse board architecture performance*

an activity that includes sub-activities that focus on the expected performance of the electrical or electronic product. Questions of acceptable performance are presented to the customer for final acceptance.

G.1.4

analyse board function*

an activity that includes sub-activities associated with verifying that the electrical or electronic product functionally meets the requirements of the customer. Results of these analyses are reported and discussed during project development team meetings.

G.1.5

analyse board manufacturability*

an activity that includes those sub-activities that address the ease with which the electrical or electronic product is manufacturable.

G.1.6**analyse board performance***

an activity that includes those sub-activities that relate directly to performance issues required by the customer. Results of analysis from these activities may be discussed during project development team meetings.

G.1.7**analyse board physical estimate**

an activity that includes those sub-activities that review the physical requirements of the electrical or electronic product. During project development team meetings, there is a review of the issues recorded during these activities.

G.1.8**analyse board reliability***

an activity that includes those sub-activities associated with determining the reliability of the electrical or electronic product based on customer environmental and other requirements.

G.1.9**analyse board specialty disciplines***

an activity that includes those sub-activities that address the overall product performance, environmental, functional, and physical characteristics. Results of these analyses are discussed during project development team meetings.

G.1.10**analyse component placement***

an activity that includes sub-activities that review placement of parts within or on a major structure of the electrical or electronic product. These activities review the thermal, producibility, vibratory performance and other characteristics of the product. Issues recorded are presented during meetings of the product development team.

G.1.11**analyse design and review**

an activity that includes sub-activities specifically concerned with the physical design of the electrical or electronic product. The significant physical parameters are reviewed and discussed during meetings of the project development team.

G.1.12**analyse detailed architecture***

an activity that includes sub-activities that review every aspect of the detailed architecture. Issues uncovered are presented during meetings of the project development team for resolution.

G.1.13**analyse electronic design***

an activity that includes those sub-activities used to be sure that the design meets customer requirements through various types of analysis. Some of these analyses include performance, manufacturability, and reliability.

G.1.14

analysed electronic design issues*

a collection of issues and solutions recorded during the analysis of the electronic design activity.

G.1.15

analyse other specialty disciplines*

an activity that covers analyses performed by various specialty disciplines associated with product performance, environmental, and other areas.

G.1.16

analyse producibility*

an activity that includes those sub-activities which research the relative ease with which this electrical or electronic product is produced. Issues uncovered during this analysis are presented to the project development team during its meetings.

G.1.17

analyse thermal properties*

an activity that performs thermal analyses on the electrical or electronic product and compares the results with customer requirements and specifications.

G.1.18

analyse vibration performance*

an activity that probes the performance of the electrical or electronic product under varying types of vibration. The results are compared to customer requirements and specifications. Issues discovered during these analyses are presented to the project development team during its meetings.

G.1.19

application tools*

software and hardware of all kinds which are common to the application environment and include software applications, spreadsheets, decision support tools, statistical analysis tools, project planning tools, and manual and automated design tools .

G.1.20

approved system design

the system or product architecture defined to support a customer or market need.

G.1.21

architecture concept issues*

a collection of issues and resolutions recorded during the definition of the detailed architecture concepts.

G.1.22

architecture function issues*

a collection of issues and resolutions defined during the validation of the detailed architecture functions of the product.

G.1.23**architecture manufacturability issues***

a collection of issues and resolutions recorded during analysis of board manufacturability.

G.1.24**architecture performance issues***

a collection of issues and resolutions recorded during analysis of board performance.

G.1.25**architecture physical estimate issues***

a collection of issues and resolutions recorded during analysis used to arrive at the physical estimates for the chosen architecture.

G.1.26**archival data**

the collection of all information which is maintained under strict configuration control and represents data required to build the subject PCA or PCB.

G.1.27**board definition**

a detailed enumeration of the board features including board outline.

G.1.28**board function issues***

a collection of issues and resolutions identified during analysis of board functions.

G.1.29**board performance estimate***

results which predict the degree to which the design in question will meet performance requirements.

G.1.30**board performance issues***

a collection of issues and resolutions identified during the performance estimating activity.

G.1.31**board physical estimate**

an estimate of the required physical needs of the product including the surface area required to accommodate all mounted components.

G.1.32**board physical issues***

a collection of issues and resolutions recorded during the physical estimating process for the board.

G.1.33

board requirements definition

a complete description of performance parameters for the bare board including both electrical and mechanical concerns.

G.1.34

build prototype

an activity that includes sub-activities focused on physical construction of the electrical or electronic product. Production issues may surface during these activities.

G.1.35

CAD data reference

the physical data file of the design.

G.1.36

compare material list with library

an activity that determines the viability of materials or physical resources needed to construct the product.

G.1.37

complete detailed architecture

an activity that includes sub-activities that determine if the architecture identified will satisfy the customer requirements or specifications. Included are validation, performance and manufacturability analyses.

G.1.38

complete design release

an activity that includes sub-activities that collect all pertinent project data associated with a specific electrical or electronic product and log that data into a formal configuration control system.

G.1.39

component placement data

data of one of the component placement priorities based on a functional placement approach which places important components integrated circuits or discrete in preferred locations according to board and product definitions.

G.1.40

component placement issues*

a collection of issues and resolutions recorded during component placement analysis.

G.1.41

control data*

information which governs enforcement of design rules required for routing of connections between components.

G.1.42**create electrical or electronic product**

within this activity are all of the sub-activities that accomplish product identification, design, fabrication, assembly, test and support of an electrical or electronic product. An activity that also creates new technologies that often accompany product creation and delivery.

G.1.43**create electronic design**

an activity that includes sub-activities that determine the functional interconnection of various technologies identified during the architecture design phase of the electrical or electronic product.

G.1.44**create functional test and simulation waves**

an activity that includes sub-activities that determine and create required test data.

G.1.45**create test and integrated diagnostic design***

an activity that includes sub-activities that generate and check testing strategies for the electrical or electronic product.

G.1.46**critical component issues***

a collection of issues and resolutions recorded during placement of critical components.

G.1.47**critical component placement data**

information identifying the location of specially placed parts.

G.1.48**customer operational requirements***

specifications addressing the performance of the required product, as defined by those desiring the fabrication and use of the product.

G.1.49**customer possible maintenance scenarios***

customer identified types of maintenance expected to be performed on the PCA or PCB.

G.1.50**customer requirements**

the highest level aggregation of requirements for the new product. May be that of a single customer or a market.

G.1.51**define board requirements**

an activity that includes sub-activities that address electrical or electro-mechanical requirements of the major parts of the electrical or electronic product.

G.1.52

define detailed architecture concept*

an activity that includes sub-activities that explicitly define the concepts used in meeting the requirements of the customer specifications.

G.1.53

define detailed architecture structure

an activity that identifies the hierarchy of the functional units used in satisfying the customer requirements of this electrical or electronic product.

G.1.54

define electronic design

an activity that includes sub-activities that determine in detail the interconnection of various functional blocks and their relationship to each other. Parts libraries are identified and test scenarios and test data are generated.

G.1.55

define electronic design issues*

a collection of issues and resolutions defined during the definition of the electronic design of the product.

G.1.56

design automation tools*

systems used to automate, accelerate, or accomplish the design process.

G.1.57

design mechanical PCA

an activity that includes sub-activities that identify, determine and verify the mechanical needs of the electrical or electronic product.

G.1.58

design rules data

information which governs the interconnection of components which have special requirements.

G.1.59

detail product definition development issues*

a collection of issues and resolutions recorded during detail product definition development activities.

G.1.60

detailed architecture

a complete description of the functional structure of the product to be designed and built.

G.1.61

detailed architecture concept*

a description of preliminary detailed architecture, physical, and performance estimates for the design.

G.1.62**detailed architecture issues log***

a collection of issues and resolutions recorded during the activity of developing the initial production plan.

G.1.63**detailed architecture issues***

a collection of issues and resolutions recorded during the activity associated with completing the detailed architecture and development of the initial production plan.

G.1.64**detailed architecture physical estimate***

an assessment of the physical resources required to accomplish the desired architecture.

G.1.65**detailed architecture structure**

a specific logical and functional definition of the electronic product.

G.1.66**detailed parts library issues***

a collection of issues and resolutions recorded during development of a detailed parts library.

G.1.67**determine general design rules***

an activity that includes sub-activities necessary to ascertain and acquire the necessary design rules to be used in routing the PCB.

G.1.68**determine other routing control data**

an activity that includes sub-activities necessary to ascertain and acquire the necessary control data of a more specific nature to the PCB undergoing routing.

G.1.69**determine special design rules**

an activity that includes sub-activities necessary to ascertain and acquire the specific routing requirements for any critical or special geometry or technically critical control information pertaining to the PCB undergoing routing.

G.1.70**determine special routing features**

an activity that includes sub-activities necessary to accommodate special features of the PCB such as keep out areas, cut-outs or special symbols.

G.1.71

develop drawing set

an activity that includes sub-activities necessary to produce engineering drawings that describe the electrical or electronic product in enough detail for production within the enterprise or at other facilities.

G.1.72

develop prototype test*

an activity that focuses on producing a test plan that, when executed, will fully exercise the prototype electrical or electronic products. This test plan forms the basis for future production testing activities.

G.1.73

develop detail product definition

an activity that includes all sub-activities associated with the physical design of the electrical or electronic product.

G.1.74

develop detailed architecture*

these activities include sub-activities which refine the electrical or electronic product architecture. These activities include definition of the structure, concept, and production plans. Analysis of the resulting architecture is performed during an activity of that segment.

G.1.75

develop detailed parts library*

an activity that includes sub-activities that develop, update or otherwise refine parts libraries associated with the electrical or electronic products.

G.1.76

develop initial production plan*

an activity that includes sub-activities that define how the electrical or electronic products will be produced. A draft production plan is created for review and discussion by the full product development team.

G.1.77

develop preliminary product definition

an activity that includes the sub-activities that define the architecture and electronic design of the product. An activity that further performs requirements analyses that are compared to customer functional specifications.

G.1.78

develop product

an activity that includes all the engineering activities that perform electrical or electronic (functional) design, physical design, and those analyses that simulate the behaviour of the unit to verify aspects of performance of the design in its intended environment. All sub-activities required to transform the conceptual design into a manufacturable product are within this activity.

G.1.79**develop structural tests***

an activity that includes those sub-activities associated with testing functional or logical structure of the product.

G.1.80**discrete issues***

a collection of issues and resolutions recorded during placement of discrete components to be used during the routing and layout of the PCB.

G.1.81**do conceptual design**

an activity that includes all of the sub-activities associated with transforming customer's requirements or request from ideas to a detailed conceptual design.

G.1.82**documentation issues***

a collection of issues and resolutions recorded during compilation of complete documentation of the design project.

G.1.83**draft detailed parts library***

an early version of the parts library for detailed design.

G.1.84**draft initial production plan***

a preliminary outline of the initial production plan.

G.1.85**draft preliminary product definition***

a pre-release version of the preliminary product definition. See preliminary product definition for additional information.

G.1.86**draft preliminary test and integrated diagnostic plan***

a draft of the preliminary test and integrated diagnostic plan. See preliminary test and integrated diagnostic plan for detailed definition.

G.1.87**drawing set issues***

a collection of issues and resolutions recorded during compilation of drawings associated with the development of the product.

G.1.88

electrical or electronic product*

the net result of satisfying requirements for a specific device, designed and manufactured according to standards, policies and procedures of one or more enterprises.

G.1.89

electronic design

the functional circuit design of the product with no physical layout information attached.

G.1.90

electronic design issues*

a collection of issues and resolutions recorded during the creation of the electronic design.

G.1.91

engineering drawings*

the graphical representation of the developed design with textual annotations as required.

G.1.92

engineering release notice*

document that authorizes the collected package of documents, parts lists, data, etc., to be released to manufacturing under configuration control.

G.1.93

engineering released documentation set

final approved set of complete documentation that represents a complete product design.

G.1.94

enhanced component packing data

the optimized placement information for components based on component shape and size.

G.1.95

enterprise facilities and equipment

the aggregation of capital equipment, buildings, and other support items necessary to carry out the goals of the enterprise.

G.1.96

enterprise personnel*

the total of the personnel employed at the facility producing the product.

G.1.97

enterprise policies, rules and standards*

all policies, procedures and practices acknowledged by the enterprise as well as designation of materials, parts, and such processes, which are used repetitively by the enterprise.

G.1.98**evaluate material physical characteristics**

an activity that includes sub-activities that determine the proper materials for construction of the electrical or electronic product.

G.1.99**evaluate functional mechanical characteristics**

an activity that includes sub-activities that review customer requirements and the demands they will place on the electrical or electronic product associated with mechanical or physical constraints.

G.1.100**examine mechanical requirement**

an activity that includes sub-activities that analyse the customer requirements from a physical or structural view point. Special mechanical requirements are identified and addressed.

G.1.101**execute board routing**

an activity that includes sub-activities that execute the physical connections necessary to realize the functionality of the electrical or electronic product.

G.1.102**fabrication data***

data necessary to fabricate a prototype of the electronic or electrical product.

G.1.103**finish detailed PCA definition**

an activity that includes sub-activities associated with completing the physical design of an electrical or electronic product not specifically addressed during the mechanical activities. Some of these activities include further update of the parts library, placement of parts on major sub-assemblies, analysis of placement, and refinement of component arrangements.

G.1.104**functional mechanical characteristics issues***

a collection of issues and resolutions recorded during evaluation of mechanical characteristics of the product.

G.1.105**functional test and simulation waves***

the simulation waveforms used to verify the functional performance of the circuit in a simulation.

G.1.106**generate material information***

an activity that includes sub-activities that provide information on available resources.

G.1.107

IC issues*

a collection of issues and resolutions recorded during the placement of integrated circuits on the PCB.

G.1.108

identify product*

an activity that includes all of the sub-activities required to identify new products. The activities are initiated from within the enterprise or as the result of an external customer request or requirement.

G.1.109

initial production plan*

the production plan intended to make a prototype PCA from an approved physical design.

G.1.110

locate components

an activity that defines the relative placement and location of all components used in the electrical or electronic product.

G.1.111

make prototype

an activity that includes sub-activities that allow for the construction and testing of prototype electrical or electronic products focused on meeting customer requirements and specifications.

G.1.112

make prototype issues*

a collection of issues and resolutions recorded during construction of prototype products.

G.1.113

manufacture product*

an activity that includes sub-activities that install components in or on the electrical or electronic product to complete the intended design.

G.1.114

manufacturing planners and production personnel*

those employees of the enterprise whose functions are to plan the processes to manufacture products and those employees who execute the processes.

G.1.115

material library issues*

a collection of issues and resolutions recorded during comparisons of the material lists and library resources.

G.1.116

material physical characteristics issues*

a collection of issues and resolutions recorded during review of the material physical characteristics.

G.1.117**mechanical board design**

generated mechanical data, physical concept, characteristics and constraints, chassis measurement, physical constraints, plus identified limits on temperature, humidity, vibration, and EMI needed to completely describe the mechanical configuration of the product.

G.1.118**mechanical configuration**

the mechanical aspect of the product that includes spatial requirement, chassis measurement, physical constraints for PCA boards (limits on width, length, height, tolerance, clearance), environmental and working requirements, limits on temperature, humidity, vibration, and EMI.

G.1.119**mechanical parts list**

a list of parts required for the PCA which are necessary in addition to those parts used to accomplish the electrical functionality of the design.

G.1.120**mechanical PCA issues***

a collection of issues and resolutions recorded during design of the mechanical aspects of the printed circuit assembly.

G.1.121**needs for design change***

descriptions of issues found in the manufacturing processes that appear to require changes in the PCA design for solution.

G.1.122**needs for facilities and equipment***

an identification and recognition of the necessity for additional resources in the form of technically innovative or new facilities or other equipment which will facilitate implementation of a new technology.

G.1.123**new parts request***

a request made by a designer or design team member to add or modify component information to an official library used by an enterprise.

G.1.124**new technology block concept***

the ideas and theory behind new areas of technology to be used in development of the product.

G.1.125**new technology block definition***

the description and requirements for a new technology to be used in development of the product.

G.1.126

optimize packing density

an activity that refines the relative placement and location of all components used in the electrical or electronic product in order to minimize overall volume of the product.

G.1.127

optimized routed board

the last iteration of board routing and analysis which represents a satisfactory solution to the issues of routing.

G.1.128

PCA definition issues*

a collection of issues and resolutions recorded during completion of PCA definition.

G.1.129

perform calculations*

an activity that involves the calculations that must provide additional information to higher sub-assemblies that may incorporate the electrical or electronic product being designed. Such calculations may include mass properties, center of gravity, radiation analysis, and others.

G.1.130

place component issues*

a collection of issues and resolutions recorded during the placement of components on the printed circuit board.

G.1.131

place components

an activity that includes sub-activities that determine the position of components in and on sub-assemblies, constituting the basis for the electrical or electronic product.

G.1.132

place critical components

an activity that defines the relative placement and location of critical components used in the electrical or electronic product.

G.1.133

place discrete components*

an activity that defines the relative placement and location of discrete components used in the electrical or electronic product.

G.1.134

place IC components

an activity that defines the relative placement and location of IC components used in the electrical or electronic product.

G.1.135**placement analysis data**

data obtained after analysing component placement to assure compatibility to preliminary product definition and physical concept.

G.1.136**placement data**

information about the placed components on a printed circuit board.

G.1.137**placement parameters**

factors which set the proper operating environment for placing components on a printed circuit board.

G.1.138**preliminary parts library**

the initial parts library that is available to support electrical design.

G.1.139**preliminary parts list**

a list of parts that the project or organization has designated as preferred parts during product identification.

G.1.140**preliminary product definition**

the net-list, schematic, board outline, connectors, and estimates of area, performance, and thermal characteristics which meet initial requirements of the product.

G.1.141**preliminary routed board data**

the information resulting from a first pass or gross routing of the PCB.

G.1.142**preliminary test and integrated diagnostics plan***

an outline and detail of planned tests. Details on integrated diagnostics are identified for review and use with this plan.

G.1.143**prepare for placement**

an activity that includes sub-activities that coordinate all necessary resources used in the positioning of components of the electrical or electronic product.

G.1.144**prepare for routing**

an activity that includes sub-activities necessary to gather all required resources, rules, requirements, and associated supporting entities needed in the routing process.

G.1.145

product concept*

documentation to define the new product which includes an architectural concept, maintenance concept, marketing concept, manufacturing concept, or support concept.

G.1.146

product data

all data that is used to describe aspects of a product.

G.1.147

product development issues*

a collection of issues and resolutions related to the product development phase.

G.1.148

product qualification issues*

a collection of issues and resolutions recorded during product qualification activities.

G.1.149

product support*

the process of providing product-specific and usage-specific technical information through documentation, on-line help, tutorial, training, and other methods to users of the product.

G.1.150

production release notice*

a formal communication indicating the design is released to the production activity.

G.1.151

production released product data set

the final collection of all data needed to produce the product that exist in a formal configuration control system.

G.1.152

project development team*

circuit designers, test engineers, physical designers, design engineers, manufacturing engineers, managers, and other enterprise resources assembled to accomplish a specific task.

G.1.153

qualify product*

an activity that includes sub-activities required by the enterprise to ensure full compliance with customer requirements have been met prior to release for production. This activity may also provide first article or proof of concept functions.

G.1.154

reassign references

an activity that updates the references designators for individual components placement data.

G.1.155**refine placement**

an activity that presents alternative and optimal placement of all components associated with the product. Any trade-offs that may affect product functionality are reported to the product development team.

G.1.156**refine routing**

an activity that is specifically focused on establishing the optimum physical connectivity of the electrical or electronic product. Concerns with space utilization are also addressed.

G.1.157**refinement issues***

a collection of issues and resolutions recorded during the placement refinement activity.

G.1.158**release engineering design**

an activity that includes sub-activities that prepare the necessary documentation, consolidation, and distribution of the completed design. These sub-activities formalize the design for release to manufacturing processes or external customers.

G.1.159**release engineering design issues log***

a collection of issues and resolutions gathered during activities associated with releasing the engineering design.

G.1.160**release preliminary definition**

an activity that includes sub-activities that prepare the necessary documentation, consolidation, and distribution of the preliminary design. These sub-activities formalize the design for preliminary release to manufacturing processes or external customers.

G.1.161**route board**

an activity that includes sub-activities associated with defining the physical interconnection of the electrical or electronic product.

G.1.162**routed board data**

data obtained from routing operation executed according to the board definition.

G.1.163**routing control data**

routing parameters that govern the way conducting paths are placed on a printed circuit assembly.

G.1.164

routing features data

information which governs the use and application of special routing features or special symbols.

G.1.165

routing issues*

a collection of issues and resolutions encountered during the routing operation, such as identification of un-routable traces, design rule violations, or high density routing areas.

G.1.166

routing layout data

the information governing the use and application of conducting paths on each layer of a printed circuit board.

G.1.167

spawn new technology

an activity that includes all of the sub-activities involved in creating new technology bases. New and advanced technologies are utilized that meet critical and demanding customer requirements.

G.1.168

specialty issues*

a collection of issues and resolutions recorded during analysis of the specialty disciplines.

G.1.169

support product*

an activity that includes sub-activities necessary to complete full life cycle support. These activities may include, repair, replacement, instructional, field modification, and disposal of the electrical or electronic product.

G.1.170

swap device or gates

an activity that refines layout by reorganizing the device or gate functionality to component assignment.

G.1.171

swapped device or gate data

the information which identifies final device or gate relationships with the required conductors.

G.1.172

technology library*

a collection of applicable detail PCA technology information which may be enterprise-specific, product-line-specific, product-specific, or technology-specific.

G.1.173

test prototype

an activity that includes sub-activities that determine the actual performance of a prototype. Proof of testing procedures are also verified during this testing phase.

G.1.174**test equipment requirements***

identified capabilities of test equipment necessary to insure the proper functioning of the subject PCA or PCB.

G.1.175**test and integrated diagnostics plan***

a plan intended to test a prototype PCB to assure that it can meet requirements of the original product specification.

G.1.176**unavailable mechanical parts list***

a list of mechanical parts that are required for the collection of the design which are not currently in any parts library.

G.1.177**unavailable parts list***

a parts list that identifies those parts that are required in a design, but are not available in the parts library.

G.1.178**untested prototype**

the result of physically assembling all required components called out in the design of the subject PCA or PCB before confirmation of working functionality.

G.1.179**update part library**

an activity that includes sub-activities that furnish the project part library with the latest information on resources needed in the physical realization of the architectural concept and required functionality.

G.1.180**updated mechanical parts library***

the mechanical parts library that contains newly added mechanical parts that are required by the product design.

G.1.181**updated parts list**

a complete list of parts and quantities necessary to complete the product design.

G.1.182**validate detailed architecture function***

an activity that includes sub-activities that verify that the architectural concept presented for the electrical or electronic product is viable, sound, and technically possible.

G.1.183

validated mechanical configuration

the mechanical configuration that meets product spatial, environmental, and operational requirements for the product.

G.1.184

waves issues*

a collection of issues and resolutions associated with creation of functional test or simulation data.

G.2 Application activity model figures

The application activity model diagrams are given in figures G.1 through G.21. The graphical form of the application activity model is presented in the IDEF0 activity modelling format. Activities and data flows that are out of scope are marked with asterisks.

Annex H (informative) Application reference model

This annex provides the application reference model for this Part of ISO 10303 and is given in figures H.1 through H.243. The application reference model is a graphical representation of the structure and constraints of the application objects specified in clause 4. The graphical form of the application reference model is presented in EXPRESS-G. The application reference model is independent from any implementation method.

Annex K
(informative)
AIM EXPRESS listing

This annex references a listing of the complete EXPRESS schema specified in Annex A of this part of ISO 10303 without comments or other explanatory text. It also references a listing of the EXPRESS entity names and corresponding short names as specified in Annex B of this part of ISO 10303. These listings are available in computer-interpretable form and can be found at the following URLs:

- EXPRESS: <http://www.mel.nist.gov/step/parts/part210/is/>
- Short names: <http://www.mel.nist.gov/div826/subject/apde/snr/>

If there is difficulty accessing these sites, contact ISO Central Secretariat or contact the ISO TC 184/SC4 Secretariat directly at: sc4sec@cme.nist.gov.

NOTE The information provided in computer-interpretable form at the above URLs is informative. The information that is contained in the body of this part of ISO 10303 is normative.

Annex L (informative) Technical discussions

This annex provides two examples of how this application protocol might be used to represent a partial data set for a printed circuit assembly. The physical files are incomplete examples.
