5.2.1 Fundamental concepts and assumptions

This part of ISO 10303 is designed to be used in the concurrent engineering of modular electronic products. A fundamental concept of this schema is that the organization controls the configuration of product models for these types of product designs. This schema is not designed to control product designs through drawing control. It is designed to provide a vehicle to control the configuration of the design and associated data. The design in this context includes the requirements and constraints exchanged between the design organization, data suppliers (e.g., component suppliers, value added suppliers), product suppliers (e.g., piece part vendors, substrate vendors), and the customers or marketing representatives for those customers. Several engineering disciplines may share data using this schema (e.g., system, mechanical, electrical, manufacturing, inspection, logistics) for product definition and product analysis purposes. This schema provides requirements definition using requirements property definition, decomposition and operations on property definition. This schema provides a functional definition using externally defined models or the functional decomposition model defined in this schema. This schema provides a physical definition for packages, piece parts, interconnect substrate, bare die, mechanical parts, and assemblies. The physical definition includes a geometric dimensioning and tolerancing model that may be applied to any physical model. This schema provides design and usage views for functional and physical models to support design abstraction and intellectual property aspects. This schema provides data suppliers a standard infrastructure with which to build explicit product data models for modular electronic products that may be incorporated into a piece part or technology library. The explicit product data models may be standardized as instances of this schema. This schema provides support for a design organization to archive data using this schema as a design view in one product category and the marketing organization to specify the usage view in a more generic category. The functional usage view in this schema includes an explicit interface definition to allow integration with external simulation environments.

The support for this includes the capability to define product terminals only in a usage view. The product models in this schema include both abstract functional product model and physical product models. Inclusion of the functional model provides the ability to categorize functional models using the product_category entity. This schema provides support for multiple functional definitions to exist in a repository for a particular usage view, but the specific definition desired is included in the functional model exchanged. Parameters (e.g., resistance) whose values are fundamental properties of the materials and their composition and therefore independent of the product version may be exchanged using the subtypes of product_category in this schema. Parameters (e.g., timing related) that are dependent on the version of the product may be exchanged using characteristics associated with a particular product_definition entity. Signal properties and composition may be exchanged using external_definition for the interface to industry domain specific name definitions.

5.2.1.1 Relating the shape of a product to its configuration data

The shape of products in this part of ISO 10303 is represented by the shape_representation entity. This entity and its subtypes define the geometric or topological entities which make up a particular representation type. Each product or assembly that is of interest will be given by an instance of the product entity. Each product will in turn have at least one version given by an instance of the product_definition_entity entity. Each version may have one or more definitions given by the product_definition

entity. Each definition may have its shape represented. This is done using the AIM entities by relating the product_definition instance to the appropriate shape_representation instance. The concept of the shape of a product_definition is given by an instance of the entity product_definition_shape. That shape of the product is then connected to the shape_representation entity by an instance of shape_definition_representation.

A shape_definition_representation inherits attributes from its supertype property_definition_representation that reference the shape_representation entity that contains the geometry or topology for the shape of the product and a select type called characterized_definition. This type allows for the representation of a shape_aspect, shape_aspect_relationship, characterized_object, or a characterized_product_definition which is also a select type. To specify that the property of interest is the shape of the product_definition the product_definition_shape subtype of property_definition shall be used. The product_definition_shape entity is constrained to use the characterized_product_definition select type. The characterized_product_definition select type allows for the representation of a product_definition or a product_definition_relationship via a reference through its select list. This reference ensures that the product_definition_shape entity will be used to define the shape of a product_definition. If the property of interest is an aspect of the shape of the product_definition or the relationship between two aspects of the shape of the product_definition the property_definition shall be used and its definition attribute shall reference an instance of shape_aspect or shape_aspect_relationship. In order to specify the shape of a product the product_definition entity will be referenced here.

5.2.1.2 Relating the shape of a component to the shape of its assembly

There are two methods that may be used to relate the shape of a component to the shape of the assembly in which it is assembled. The first method consists of defining the shape for each component and assembly, and then relating the two shapes and providing the information that defines the orientation of the component with respect to the assembly through a transformation. The second method consists of defining the shape for each component and assembly, and then incorporating the shape of the component directly in the shape of the assembly. The first method shall be used to relate the shapes that are represented by different representation types.

The second method may be used for the incorporation of the representation of a component into the representation of an assembly if the two types are the same. Both methods employ the `shape_representation` and `product_definition` entities. The first method also employs the `product_definition_relationship`, `shape_representation_relationship` AND `representation_relationship_with_transformation` (i.e., an instance of each entity forming a complex entity instance of the two entities with an AND relationship) and `context_dependent_shape_representation` entities.

The second method employs the `mapped_item` and `representation_map` entities. When using the first method to relate the shape of the component to the shape of the assembly, each of the `shape_representation` entities that define the shapes of the component and assembly product definitions is related through references in the `shape_representation_relationship` entity. Orientation information, in this case, will be provided by the formation of a complex instance of the `shape_representation_relationship` AND `representation_relationship_with_transformation` entities. The `representation_relationship_with_transformation` entity references a transformation which is a select type allowing the orientation to be defined using an `axis2_placement_3d` entity in each representation for an `item_defined_transformation` or a `cartesian_transformation_operator` entity for a `functionally_defined_transformation`. In addition, an instance of the `context_dependent_shape_representation` must be given to explicitly relate the `shape_representation_relationship` that defines the relationship of the two shapes to the `product_definition_relationship` that defines the assembly-component relationship between the two product definitions.

When using the second method to relate the shape of the component to the shape of the assembly, the `shape_representation` entity that defines the geometry or topology for the shape of the component product is referenced by an instance of a `representation_map` entity that is referenced by the `mapping_source` attribute of an instance of the `mapped_item` entity. The attribute `mapped_representation` of the `representation_map` will reference the `shape_representation` subtype that defines the representation of the shape. The instance of the `mapped_item` entity is then added to the set of items in the `shape_representation` entity that defines the geometry or topology for the assembly product.

5.2.1.3 Types of shape representation

This part of ISO 10303 defines several types of representation for shapes of items - both 2d and 3d wireframe representations using edge based and shell based models, 2d wireframe representations that are geometrically bounded, surface models that are geometrically bounded, CSG solid models, advanced boundary representation solid models, extruded solid models, 2d Curves and basic 2d Curves. Each of the 3d types of representation is self contained meaning that one type may not contain another type. Each of the types is given by a subtype of the shape_representation entity. Each subtype contains local rules that govern the types of geometric or topological entities that can be used in it. Every shape_representation must be one of the subtypes unless it is used as the representation of the shape of an assembly used in method one above.

In that case, the shape_representation instance will contain only axis2_placement_3d entities in its set of items in order to define the orientation of the components' representations in it. Since the rules in each of the subtypes will conflict with each other, any shape_representation that is referenced by a representation_map to implement method two above must be of the same type as the shape_representation that has the mapped_item that references that representation_map in its set of items.

5.2.1.4 Use of global rules

Many of the relationships among different entities in the integrated resource parts of ISO 10303 are specified using the most generic cardinality of zero or more between two related entities. This cardinality means that the relationship is optional or there may be one or more instances of a related entity that is related to a single instance of the relating entity. This part of ISO 10303 uses global rules to constrain that cardinality. In some cases the constraint is made to be one to one, \and in some instances at least one.

EXAMPLE 1 Examples of these rules include contract_requires_person_organization, approval_requires_approval_date_time, and certification_requires_approval for exactly one, and change_request_requires_person_organization and product_requires_product_version for one or more.

Global rules are also used to restrict the values of STRING type attributes to be only those that are applicable within the context of electronic assembly, interconnect and packaging design.

EXAMPLE 2 Examples of these rules are restrict_approval_status and restrict_person_organization_role.

Global rules are also used to collect in one location all the constraints required to implement a given ARM concept.

EXAMPLE 3 Examples of these rules include operational_requirement_occurrence_relationship_constraint, geometric_tolerance_qualifier_constraint, and feature_group_relationship_constraint.

5.2.1.5 Assignment of units

Units are assigned to the representation of shape on a global basis. This is done by the creation of an instance of the `global_unit_assigned_context`. This entity contains an attribute that allows for a set of units to be assigned to a `representation_context`. Each of the `shape_representation` entities has a context for its representation. If units of measure are desired for a particular instance of `shape_representation` then that instance shall have a `global_unit_assigned_context` in its `context_of_items` attribute.

5.2.1.6 Terminal definition

Terminals are defined as aspects of the shape of a product in this schema. This is true for both terminals of functional products and terminals of physical products. The properties of the terminals interconnected in a network defined by the `functional_network_definition` may be evaluated by experimental means to determine suitability of the `product_definition`. The geometric representation of the functional product terminal is the schematic symbol for the terminal. The geometric representation of the functional product shape is the schematic symbol for the functional product.

NOTE This edition of this part of ISO 10303 does not standardize the exchange of presentation of geometric representations of terminals of functional products or shapes of functional products. In this edition of the standard, there is no standardized way to specify the position of the schematic terminal symbol in the schematic symbol for the functional product. This structure is included to assure interoperability with other parts of ISO 10303.

5.2.1.7 Product instances

This schema separates the "part" in the "part-assembly" relationship into two or three entities: one or two instances of `product_definition` and a corresponding `component_definition`. If there is only one instance of `product_definition`, then there is no separate 'design' for the part. If there are two instances of `product_definition` then one of them is the design and the other is the 'design usage'. This separation is controlled by a rule in `component_definition` that the `product_definition_formation` for `component_definition` and the `product_definition` that corresponds to the "part" concept is the same `product_definition_formation`. The correspondence is established by an instance of `product_definition_relationship` with a name of "instantiated part". The correspondence between the design and the design usage is established by an instance of `product_definition_relationship` with a name of 'design usage'.

5.2.1.8 Change management

This schema provides `action`, `action_directive`, `add_design_object_assignment`, `change`, `change_request`, `change_from_design_object_assignment`, `change_to_design_object_assignment`, `delete_object_assignment`, and `product_definition_relationship` entities to support design management processes. A data set that incorporates add, change, or delete shall include any required `action_assignment` subtype and the `product_definition_relationship` that identifies the previous `product_definition` and the current `product_definition`. Requests for change and specific change directions are provided.

5.2.1.9 Functional network definition

This schema provides `functional_unit`, `functional_unit_terminal_definition`, `component_functional_unit`, `component_functional_terminal`, and `network_node_definition` to exchange network listings (using a nodal formulation) of functional objects.

5.2.1.10 Geometric dimensioning and tolerancing

Each instance of `physical_unit_geometric_tolerance` along with supporting entity instances (e.g., `property_definition` with a description of "datum system property with material conditions") is intended to convey the data associated with a geometric tolerance requirement that is included in a single segment of a feature control frame of a technical drawing. Typically, feature control frames only have one segment. However, with composite geometric tolerances (i.e., composite position tolerance, composite linear profile tolerance, and composite surface profile tolerance) the feature control frame consists of an ordered set of segments. Associated with this set are certain order-dependent requirements as to the values that may be placed in the various compartments of the segments of these composite feature control frames.

EXAMPLE 1 If one or more data are specified in a lower segment of a composite feature control frame they must also be specified in segments that are listed above it.

To convey the data associated with a composite feature control frame, instances of `geometric_tolerance_relationship` are used to create an ordered set of `physical_unit_geometric_tolerance`. Additionally, constraints defined within the relevant `physical_unit_geometric_tolerance` (i.e., `position_tolerance`, `linear_profile_tolerance`, and `surface_profile_tolerance`) are used to specify the order-dependent requirements and to insure a valid data structure.

5.2.1.11 Physical network definition

This schema provides `physical_unit_network_definition`, `physical_connectivity_definition`, and `component_terminal` to exchange network listings (using a nodal formulation) of physical objects.

5.2.1.12 Product classification

This schema provides predefined product classifications of assembly, bare die, functionality, interconnect, material, package, physical network design, piece part, printed part, requirements model, simulation model, standard part, technology specific model, and template model. These predefined product classifications may require specific types of `product_definition` to support them or specific context values.

EXAMPLE 1 It is valid to have a package classification and to have an instance of `interconnect_definition` associated with it, but an instance of `package` will also exist that references that product instance.

5.2.1.13 Requirements definition

This schema provides `group_product_definition`, `group_shape_aspect`, `grouped_requirements_property`, `mounting_restriction_area`, `requirement_allocation_group`, `requirements_property`, and `requirements_property_group` to convey the data associated with technical requirements and the allocation of those requirements to product data.

5.2.2 electronic_assembly_interconnect_and_packaging_design type definitions

5.2.2.1 action_assigned_item

An action_assigned_item type specifies those items to which an action may be assigned.

EXPRESS specification:

```
*)
TYPE action_assigned_item = SELECT
    (product_definition_formation);
END_TYPE;
(*
```

5.2.2.2 approval_assigned_item

An approval_assigned_item type specifies those items to which an approval may be assigned which has more values than approved, unapproved.

EXPRESS specification:

```
*)
TYPE approval_assigned_item = SELECT
    (action,
     action_directive,
     certification,
     change,
     change_request,
     configuration_effectivity,
     configuration_item,
     contract,
     date,
     directed_action,
     document,
     product,
     product_definition,
     product_definition_formation,
     product_definition_formation_with_specified_source,
     representation,
     security_classification,
     start_request,
     start_work,
     versioned_action_request);
END_TYPE;
(*
```

5.2.2.3 certification_assigned_item

A certification_assigned_item type specifies those items to which a certification may be assigned.

EXPRESS specification:

```
*)
TYPE certification_assigned_item = SELECT
    (supplied_part_relationship,
     make_from_usage_option,
     product_definition_formation_with_specified_source);
END_TYPE;
(*
```

5.2.2.4 change_request_item

A change_request_item type specifies those items to which a request for change may be assigned.

EXPRESS specification:

```
*)
TYPE change_request_item = SELECT
    (product_definition_formation,
     representation_relationship);
END_TYPE;
(*
```

5.2.2.5 classification_assigned_item

A classification_assigned_item type specifies those items to which a classification may be assigned.

EXPRESS specification:

```
*)
TYPE classification_assigned_item = SELECT
    (material_designation,
     requirements_property,
     signal,
     stratum);
END_TYPE;
(*
```

5.2.2.6 contract_assigned_item

A contract_assigned_item type specifies those objects to which a contract may be assigned.

EXPRESS specification:

```
*)
TYPE contract_assigned_item = SELECT
    (alternate_product_relationship,
     directed_action,
     product,
     product_definition_formation);
END_TYPE;
(*
```

5.2.2.7 date_and_time_assigned_item

A date_and_time_assigned_item type specifies those items to which a date and a time may be assigned.

EXPRESS specification:

```
*)
TYPE date_and_time_assigned_item = SELECT
    (approval_person_organization,
     certification,
     change,
     contract,
     directed_action,
     document,
     product_definition,
     rule_action,
     security_classification,
     versioned_action_request);
END_TYPE; -- date_and_time_assigned_item
(*
```

5.2.2.8 date_assigned_item

A date_assigned_item type specifies those items to which a date may be assigned.

EXPRESS specification:

```
*)  
TYPE date_assigned_item = SELECT  
    (product_definition,  
     versioned_action_request,  
     directed_action,  
     approval_person_organization,  
     contract,  
     security_classification,  
     certification);  
END_TYPE; -- date_assigned_item  
(*
```

5.2.2.9 document_assigned_item

A document_assigned_item type specifies those items to which a document may be assigned.

EXPRESS specification:

```

*)
TYPE document_assigned_item = SELECT
    (action_method,
     assembly_component_usage,
     bond_category,
     characterized_object,
     component_definition,
     component_feature,
     component_interface_terminal,
     component_shape_aspect,
     component_terminal,
     coordinated_representation_item,
     configuration_item,
     descriptive_representation_item,
     externally_defined_item,

     product_definition_formation,
     product_definition_formation_relationship,
     property_definition,
     representation,
     representation_item,
     requirements_property,
     rule_definition,
     shape_aspect,
     signal,
     stratum,
     stratum_feature);
END_TYPE;
( *

```

5.2.2.10 document_identifier_assigned_item

A document_identifier_assigned_item type specifies those items to which a document_identifier may be assigned.

EXPRESS specification:

```
* )  
TYPE document_identifier_assigned_item = SELECT  
    (document);  
END_TYPE;  
(*
```

5.2.2.11 frozen_assigned_item

An frozen_assigned_item type specifies those items to which an approval with value of (approved, unapproved) may be assigned to indicate acceptance of a design element.

EXPRESS specification:

```

*)
TYPE frozen_assigned_item = SELECT
  (alternate_product_relationship,
   applied_date_and_time_assignment,
   applied_document_reference,
   applied_group_assignment,
   characterized_object,
   colour,
   component_definition,
   component_shape_aspect,
   composite_curve_segment,

     stratum_feature,
     stratum_surface);
END_TYPE;
( *
```

5.2.2.13 managed_design_object

A managed_design_object type specifies those items to which design management information may be assigned.

EXPRESS specification:

```

*)
TYPE managed_design_object = SELECT
  (action,
   alternate_product_relationship,
   applied_approval_assignment,
   applied_date_and_time_assignment,
   applied_document_reference,
   applied_group_assignment,
   approval,
   approval_status,
   certification,
   characterized_object,
   colour,
   composite_curve_segment,
   configuration_effectivity,
   configuration_item,
   contract,
   curve_style,
   curve_style_font,
   curve_style_font_and_scaling,
   date,
   dimension_related_tolerance_zone_element,
   dimensional_characteristic_representation,
   dimensional_size,
   document,
   document_usage_constraint,
   externally_defined_item,
   fill_area_style,
   fill_area_style_colour,
   geometric_tolerance,
   geometric_tolerance_relationship,
   group,
   layer_connection_point,
   layer_connection_point_link,
   material_designation,
   measure_with_unit,
   organization,
   person,
   person_and_organization,
   plus_minus_tolerance,
   pre_defined_item,
   product,
   product_concept,
   product_definition,
   product_definition_formation,
   product_definition_formation_relationship,
   product_definition_relationship,
   property_definition,
   property_definition_relationship,

```

```

        property_definition_representation,
        representation,
        representation_context,
        representation_item,
        representation_relationship,
        runout_zone_orientation,
        security_classification,
        shape_aspect,
        shape_aspect_relationship,
        tolerance_value,
        tolerance_zone_form,
        versioned_action_request);
END_TYPE; -- managed_design_object
(*)

```

5.2.2.14 organization_assigned_item

An organization_assigned_item type specifies those items to which an organization may be assigned.

EXPRESS specification:

```

*)
TYPE organization_assigned_item = SELECT
    (configuration_item,
    contract,
    directed_action,
    document,
    versioned_action_request,
    product,
    product_definition,
    product_definition_formation,
    product_definition_formation_with_specified_source,
    rule_definition,
    representation,
    security_classification);
END_TYPE; -- organization_assigned_item
(*)

```

5.2.2.15 owner_assigned_item

An owner_assigned_item type specifies those items to which a person_organization may be assigned to indicate direct control of a design element.

NOTE Owner in this usage indicates a single point of design control.

EXPRESS specification:

```

*)
TYPE owner_assigned_item = SELECT
  (alternate_product_relationship,
   characterized_object,
   colour,
   component_definition,
   component_shape_aspect,
   composite_curve_segment,
   curve_style,
   curve_style_font,
   curve_style_font_and_scaling,
   dimension_related_tolerance_zone_element,
   dimensional_characteristic_representation,
   dimensional_size,
   document_usage_constraint,
   externally_defined_item,
   fill_area_style,
   fill_area_style_colour,
   geometric_tolerance,
   geometric_tolerance_relationship,
   group,
   inter_stratum_feature,
   material_designation,
   measure_with_unit,
   plus_minus_tolerance,
   pre_defined_item,
   product_concept,
   product_definition_formation_relationship,
   product_definition_relationship,
   property_definition,
   property_definition_relationship,
   property_definition_representation,
   representation,
   representation_context,
   representation_item,
   representation_relationship,
   runout_zone_orientation,
   shape_aspect,
   shape_aspect_relationship,
   stratum_feature,
   tolerance_value,
   tolerance_zone_form);
END_TYPE; -- owner_assigned_item
( *

```

5.2.2.16 person_and_organization_assigned_item

A `person_and_organization_assigned_item` type specifies those items to which a person associated with an organization may be assigned.

EXPRESS specification:

```
*)
TYPE person_and_organization_assigned_item = SELECT
    (change,
     configuration_item,
     contract,
     document,
     product,
     product_definition_formation,
     product_definition,
     directed_action,
     rule_action,
     security_classification,
     versioned_action_request);
END_TYPE; -- person_and_organization_assigned_item
(*
```

5.2.2.17 person_assigned_item

A person_assigned_item type specifies those items to which a person may be assigned.

EXPRESS specification:

```
*)
TYPE person_assigned_item = SELECT
    (document);
END_TYPE;
(*
```

5.2.2.18 promissory_usage_in_product_model_assigned_item

A promissory_usage_in_product_model_assigned_item type specifies those items to which a promissory_usage_in_product_model_assignment may be made.

EXPRESS specification:

```
*)
TYPE promissory_usage_in_product_model_assigned_item = SELECT
    (product_concept,
     product_definition);
END_TYPE;
(*
```

5.2.2.19 replacement_from_item

A replacement_from_item type specifies those items for which a replacement may be specified.

EXPRESS specification:

```
*)
TYPE replacement_from_item = SELECT
    (product_definition_formation);
END_TYPE;
(*
```

5.2.2.20 replacement_to_item

A replacement_to_item type specifies those items which may be used as a replacement for another item.

EXPRESS specification:

```
*)
TYPE replacement_to_item = SELECT
    (product_definition_formation);
END_TYPE;
(*
```

5.2.2.21 security_classification_assigned_item

A security_classification_assigned_item type specifies those items to which a security classification may be assigned.

EXPRESS specification:

```
*)
TYPE security_classification_assigned_item = SELECT
    (applied_promissory_usage_in_product_model_assignment,
     assembly_component_usage,
     document,
     make_from_usage_option,
     product_definition_formation,
     product_definition);
END_TYPE;
(*
```

5.2.2.22 start_request_item

A start_request_item type specifies those items to which a request to start may be assigned.

EXPRESS specification:

```
*)
TYPE start_request_item = SELECT
    (product_definition_formation,
     representation_relationship);
END_TYPE;
( *
```

5.2.2.23 work_item

A work_item type specifies those items to which work may be performed.

EXPRESS specification:

```
*)
TYPE work_item = SELECT
    (product_definition_formation);
END_TYPE;
( *
```

5.2.3 electronic_assembly_interconnect_and_packaging_design entities

5.2.3.1 electronic_assembly_interconnect_and_packaging_design entity definitions

5.2.3.1.1 absorbed_dose_measure_with_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An absorbed_dose_measure_with_unit is a measure_with_unit that implements the ARM concept of Absorbed_dose_measure_with_unit (see ??).

EXPRESS specification:

```
*)
ENTITY absorbed_dose_measure_with_unit
    SUBTYPE OF (measure_with_unit);
WHERE
```

```

WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\measure_with_unit ||
    SELF\absorbed_dose_measure_with_unit))) = 0;

WR2: SELF\measure_with_unit.unit_component\si_unit.name = gray;

WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
    TYPEOF(SELF\measure_with_unit.unit_component);
END_ENTITY; -- absorbed_dose_measure_with_unit
(*)

```

Formal propositions:

WR1: The absorbed_dose_measure_with_unit shall not be any other type of measure_with_unit.

WR2: The absorbed_dose_measure_with_unit shall reference an si_unit with the name of gray.

WR3: The unit_component shall be an si_unit.

5.2.3.1.2 activity_measure_with_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An activity_measure_with_unit is a measure_with_unit that implements the ARM concept of Activity_-measure_with_unit (see ??).

EXPRESS specification:

```

*)
ENTITY activity_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\measure_with_unit ||
    SELF\activity_measure_with_unit))) = 0;

  WR2: SELF\measure_with_unit.unit_component\si_unit.name = becquerel;

  WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
    TYPEOF(SELF\measure_with_unit.unit_component);
END_ENTITY; -- activity_measure_with_unit
(*)

```

Formal propositions:

WR1: The activity_measure_with_unit shall not be any other type of measure_with_unit.

WR2: The activity_measure_with_unit shall reference a becquerel si_unit.

WR3: The unit_component shall be an si_unit.

5.2.3.1.3 add_design_object_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An add_design_object_assignment is an action_assignment that implements the ARM concept of Add_design_object_management_relationship (see 4.2.3).

EXPRESS specification:

```
*)
ENTITY add_design_object_assignment
  SUBTYPE OF (action_assignment);
  items : SET [1:?] OF managed_design_object;
WHERE

  WR1: SIZEOF(QUERY(it <* SELF.items |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_DEFINITION_RELATIONSHIP' IN TYPEOF(it))
    AND (it\product_definition_relationship.name =
      'design object addition')))) = 1;
END_ENTITY; -- add_design_object_assignment
(*
```

Formal propositions:

WR1: The add_design_object_assignment shall have exactly one item that is a product_definition_relationship with a name of 'design object addition'.

Informal propositions:

IP1: The add_design_object_assignment shall have exactly one item that is a managed_design_object that is not a product_definition_relationship with a name of 'design object addition' and is not referenced by another product_definition_relationship with a name of 'design object addition', 'design object change', or 'design object deletion' in the same design.

5.2.3.1.4 add_design_object_request_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `add_design_object_request_assignment` is an `action_request_assignment` that implements the ARM concepts of `Add_design_object_management_relationship` (see 4.2.3) and `Change_request` (see 4.2.97).

EXPRESS specification:

```

*)
ENTITY add_design_object_request_assignment
  SUBTYPE OF (action_request_assignment);
  items : SET [1:?] OF managed_design_object;
WHERE

  WR1: SIZEOF(QUERY(it <* SELF.items |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_DEFINITION_RELATIONSHIP' IN TYPEOF(it))
    AND (it\product_definition_relationship.name =
      'design object addition')) = 1;
END_ENTITY; -- add_design_object_request_assignment
(

```

Formal propositions:

WR1: The `add_design_object_request_assignment` shall have exactly one item that is a `product_definition_relationship` with a name of 'design object addition'.

Informal propositions:

IP1: The `add_design_object_request_assignment` shall have exactly one item that is a `managed_design_object` that is not a `product_definition_relationship` with a name of 'design object addition' and is not referenced by another `product_definition_relationship` with a name of 'design object addition', 'design object change', or 'design object deletion' in the same design.

5.2.3.1.5 **altered_package_terminal**

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `altered_package_terminal` is a `package_terminal` that implements the ARM concept of `Altered_package_terminal` (see 4.2.9).

EXPRESS specification:

```

*)
ENTITY altered_package_terminal
  ABSTRACT SUPERTYPE OF ((shape_formed_terminal ANDOR
    surface_prepped_terminal) ANDOR length_trimmed_terminal)
  SUBTYPE OF (package_terminal);
WHERE

  WR1: SIZEOF(QUERY ( sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name = 'terminal to be altered' ))
    = 1;

  WR2: (SELF.of_shape.definition\product_definition.description =
    'altered package');
END_ENTITY; -- altered_package_terminal
(

```

Formal propositions:

WR1: The `altered_package_terminal` shall be referenced by one `shape_aspect_relationship` with a description of 'terminal to be altered' as the `related_shape_aspect`.

WR2: The `altered_package_terminal` shall be an aspect of the shape of a `product_definition` with a description of 'altered package'.

5.2.3.1.6 analytical_model

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `analytical_model` is a representation that implements the ARM concept of `Analytical_model` (see 4.2.14).

EXPRESS specification:

```

*)
ENTITY analytical_model
  SUBTYPE OF (representation);
UNIQUE
  UR1: SELF\representation.name;
WHERE

```

```

WR1: sizeof (USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DOCUMENT_REFERENCE.ITEMS')) = 2;

WR2: sizeof (QUERY (dr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DOCUMENT_REFERENCE.ITEMS') |
    dr.assigned_document.kind\document_type.product_data_type =
    'language reference manual')) = 1;

WR3: sizeof (QUERY (it <* SELF.items |
    NOT ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'MODEL_PARAMETER' IN
    TYPEOF (it)))) = 0;

WR4: sizeof (QUERY (rr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'REPRESENTATION_RELATIONSHIP.REP_1') |
    (rr\representation_relationship.name = 'access mechanism') AND
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'ANALYTICAL_MODEL_PORT' IN
    TYPEOF (rr.rep_2)))) >= 1;
END_ENTITY; -- analytical_model
( *

```

Formal propositions:

UR1: The name shall be unique within a population of analytical_model.

WR1: The analytical_model shall be referenced by exactly two document_references.

WR2: The analytical_model shall be referenced by exactly one document_reference where the document_type is 'language reference manual'.

WR3: The analytical_model shall have at least one model_parameter in its set of items.

WR4: The analytical_model shall be referenced as rep_1 in at least one representation_relationship with a name of 'access mechanism' where the rep_2 references an analytical_model_port.

5.2.3.1.7 analytical_model_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An analytical_model_definition is a product_definition that implements the ARM concepts of: Analytical_model_definition (see 4.2.15)

EXPRESS specification:

```

*)
ENTITY analytical_model_definition
  SUBTYPE OF (product_definition);
WHERE

  WR1: (NOT ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_DEFINITION_WITH_ASSOCIATED_DOCUMENTS' IN
    TYPEOF (SELF))) OR
    (SIZEOF (QUERY (docs <*
    SELF\product_definition_with_associated_documents.
    documentation_ids |
    docs.kind\document_type.product_data_type = 'CAD filename')) <= 1);

  WR2: SIZEOF (QUERY (adta <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DATE_AND_TIME_ASSIGNMENT.ITEMS') |
    adta.role\date_time_role.name = 'creation date')) +
    SIZEOF (QUERY (ada <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DATE_ASSIGNMENT.ITEMS') |
    ada.role\date_role.name = 'creation date')) = 1;

  WR3: SIZEOF (USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_APPROVAL_ASSIGNMENT.ITEMS')) = 1;

  WR4: SIZEOF (QUERY (apoa <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_PERSON_AND_ORGANIZATION_ASSIGNMENT.ITEMS') |
    apoa.role\person_and_organization_role.name = 'creator')) +
    SIZEOF (QUERY (apoa <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_ORGANIZATION_ASSIGNMENT.ITEMS') |
    apoa.role\organization_role.name = 'creator')) >= 1;

  WR5: SIZEOF (USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_SECURITY_CLASSIFICATION_ASSIGNMENT.ITEMS')) = 1;

  WR6: SIZEOF (TYPEOF (SELF) - (TYPEOF (SELF\product_definition ||
    SELF\analytical_model_definition))) = 0;

```

```

WR7: SIZEOF (QUERY (prpc <* USEDIN (SELF.formation.of_product,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_RELATED_PRODUCT_CATEGORY.' +
    'PRODUCTS')) |
    prpc\product_category.name = 'simulation model')) >= 1;
END_ENTITY; -- analytical_model_definition
(*)

```

Formal propositions:

WR1: If the analytical_model_definition is a product_definition_with_associated_documents, there shall be at most one document in the set of documentation_ids that has a product_data_type of 'CAD filename'

WR2: The analytical_model_definition shall have exactly one creation date.

WR3: The analytical_model_definition shall have exactly one approval.

WR4: The analytical_model_definition shall have at least one organization or person_and_organization as the creator.

WR5: The analytical_model_definition shall have exactly one security_classification.

WR6: The analytical_model_definition shall not be any other type of product_definition.

WR7: The analytical_model_definition shall have a product_category name of 'simulation model'.

5.2.3.1.8 analytical_model_make_from_relationship

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An analytical_model_make_from_relationship is a representation and a representation_relationship that implements the ARM concept of Analytical_model_make_from (see ??).

EXPRESS specification:

```

*)
ENTITY analytical_model_make_from_relationship
    SUBTYPE OF (representation, representation_relationship);
UNIQUE
    UR1: SELF\representation_relationship.rep_1, SELF\representation_relationship.rep_2;
WHERE

    WR1: SIZEOF ([ 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'ANALYTICAL_MODEL' ] *
        TYPEOF (SELF.rep_1)) = 1;

```

```

WR2: SIZEOF ([ 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
  'ANALYTICAL_MODEL' ] *
  TYPEOF (SELF.rep_2)) = 1;

WR3: SIZEOF( QUERY(rr <* USEDIN(SELF,
  'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
  'REPRESENTATION_RELATIONSHIP.REP_1') |NOT(
  ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
  'MAKE_FROM_MODEL_PORT_RELATIONSHIP' IN TYPEOF(rr.rep_2)))))) = 0;

WR4: SIZEOF( QUERY(rr <* USEDIN(SELF,
  'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
  'REPRESENTATION_RELATIONSHIP.REP_1') |NOT(
  (rr\representation_relationship.name = 'associated make from') AND
  ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
  'MAKE_FROM_MODEL_PORT_RELATIONSHIP' IN TYPEOF(rr.rep_2)))))) = 0;

WR5: SIZEOF ([ 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
  'ANALYTICAL_MODEL' ] *
  TYPEOF (SELF)) = 0;

WR6: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\representation ||
  SELF\representation_relationship ||
  SELF\analytical_model_make_from_relationship))) = 0;
END_ENTITY; -- analytical_model_make_from_relationship
(*

```

Formal propositions:

UR1: The combination of rep_1 and rep_2 shall be unique within a population of analytical_model_-make_from_relationship.

WR1: The analytical_model_make_from_relationship shall reference an analytical_model as its rep_1.

WR2: The analytical_model_make_from_relationship shall reference an analytical_model as its rep_2.

WR3: The analytical_model_make_from_relationship shall be related to only a make_from_model_-port_relationship via a representation_relationship.

WR4: The analytical_model_make_from_relationship shall be related to only a make_from_model_-port_relationship via a representation_relationship with a name of 'associated make from'.

WR5: The analytical_model_make_from_relationship shall not be an analytical_model.

WR6: The analytical_model_make_from_relationship shall only be a representation, representation_item or in addition to itself.

5.2.3.1.9 analytical_model_port

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An analytical_model_port is a representation that describes an interface point for an analytical_model.
An analytical_model_port implements the ARM constructs of:

- Analytical_model_port (see 4.2.17);
- Analytical_model_scalar_port (see 4.2.20);
- Analytical_model_vector_port (see 4.2.21);
- Digital_analytical_model_port (see 4.2.290).

EXPRESS specification:

```

*)
ENTITY analytical_model_port
  SUBTYPE OF (representation);
WHERE

  WR1: SIZEOF (QUERY (it <* SELF.items |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +

    (it\representation_item.name = 'nominal signal flow direction') AND
    (it\descriptive_representation_item.description IN ['input direction',
    'output direction', 'bidirectional', 'unknown direction']))) = 1);
END_ENTITY; -- analytical_model_port
(

```

Formal propositions:

WR1: The analytical_model_port shall have exactly one descriptive_representation_item with a name of 'distributed property' and a description of 'true' or 'false'.

WR2: The analytical_model_port shall have at most one descriptive_representation_item with a name of 'nominal signal flow direction' and a description of 'input direction', 'output direction', 'bidirectional', 'unknown direction', or 'not applicable'.

WR3: The analytical_model_port shall have exactly one descriptive_representation_item with a name of 'port type' and a description of 'string property type', 'logical property type', 'physical property type', or 'boolean property type'.

WR4: The analytical_model_port shall be related to exactly one analytical_model as the 'access mechanism'.

WR5: The analytical_model_port shall be assigned to at most one group with a name of 'scalar port', 'digital scalar port', 'vector port', 'digital vector port', or 'digital analytical model port'.

WR6: If the analytical_model_port is assigned to a group with a name of 'vector port' or 'digital vector port', it shall have exactly one measure_representation_item with a name of 'size', a value_component that is a count_measure, and a unit_component that is a context_dependent_unit.

WR7: If the analytical_model_port is assigned to a group with a name of 'digital scalar port', 'digital vector port', or 'digital analytical model port', it shall have exactly one descriptive_representation_item with a name of 'nominal signal flow direction' and a description of 'input direction', 'output direction', 'bidirectional', or 'unknown direction'.

5.2.3.1.10 analytical_representation

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An analytical_representation is a representation that associates specific properties with an analytical_model. An analytical_representation implements the ARM concept of Analytical_representation (see 4.2.22).

EXPRESS specification:

```
*)
ENTITY analytical_representation
  SUBTYPE OF (representation);
  UNIQUE
    UR1: SELF\representation.name;
  WHERE
```

```

WR1: SIZEOF (QUERY (rr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'REPRESENTATION_RELATIONSHIP.REP_1') |
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PARAMETER_ASSIGNMENT_REPRESENTATION' IN
    TYPEOF (rr.rep_2))) >= 1;

WR2: SIZEOF (QUERY (rr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'REPRESENTATION_RELATIONSHIP.REP_2') |
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'ANALYTICAL_MODEL' IN TYPEOF (rr.rep_1))) = 1;
END_ENTITY; -- analytical_representation
(*

```

Formal propositions:

UR1: The name shall be unique within a population of analytical_representation.

WR1: The analytical_representation shall have at least one representation_relationship that references a parameter_assignment_representation.

WR2: The analytical_representation shall have exactly one representation_relationship that references an analytical_model.

5.2.3.1.11 angular_dimension_with_orientation

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An angular_dimension_with_orientation is a dimensional_location that defines the angle between two shape elements. An angular_dimension_with_orientation implements the ARM concept of Angular_dimension_with_direction_vector (see 4.2.24).

EXPRESS specification:

```

*)
ENTITY angular_dimension_with_orientation
    SUBTYPE OF (dimensional_location);
WHERE

    WR1: SELF\shape_aspect_relationship.description = 'angular';
END_ENTITY; -- angular_dimension_with_orientation
(*

```

Formal propositions:

WR1: The description of the angular_dimension_with_orientation shall be 'angular'.

Informal propositions:

IP1: The angular_dimension_with_orientation shall have exactly one property_definition with a description of 'dimensional location property', and that property_definition either shall be represented by a representation that contains a placement with a name of 'orientation' or shall relate to a property_definition with a description of 'datum based vector orientation' to specify the 'measurement orientation'.

IP2: If the angular_dimension_with_orientation has a property_definition with a description of 'dimensional location property' and that property_definition relates to a property_definition with a description of 'datum based vector orientation' to specify the 'measurement orientation', the combination of the shape_aspect specified as the related_shape_aspect, the shape_aspect specified as the relating_shape_aspect, and the property_definition with a description of 'datum based vector orientation' shall be unique.

IP3: If the angular_dimension_with_orientation has a property_definition with a description of 'dimensional location property' and that property_definition is represented by a representation that contains a placement with a name of 'orientation', the combination of the shape_aspect specified as the related_shape_aspect, the shape_aspect specified as the relating_shape_aspect, and the placement with a name of 'orientation' shall be unique.

5.2.3.1.12 angularity_tolerance

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An angularity_tolerance is a geometric_tolerance_with_specified_datum_system. An angularity_tolerance implements the ARM concept of Angularity_tolerance (see 4.2.26).

EXPRESS specification:

```
*)
ENTITY angularity_tolerance
  SUBTYPE OF (geometric_tolerance_with_specified_datum_system);
WHERE

  WR1: SELF\geometric_tolerance.name = 'angularity';
END_ENTITY; -- angularity_tolerance
(*)
```

Formal propositions:

WR1: The name for the angularity_tolerance shall be 'angularity'.

Informal propositions:

IP1: The `toleranced_shape_aspect` of the `angularity_tolerance` shall either lie on the boundary of the shape of the product; be a `centre_of_symmetry` with a description of either 'axis' or 'plane'; be a tangent with a description of 'plane'; be a `part_template_definition`; or be a `composite_shape_aspect` the 'composing' `shape_aspects` of which either are all of type `part_template_definition`, are all of type `centre_of_symmetry` and have the same description – either 'axis' or 'plane', or are all of type tangent with a description of 'plane'.

IP2: The `angularity_tolerance` shall have at most two `physical_unit_datum` in its referenced `datum_system`.

IP3: The `angularity_tolerance` shall have at least one `physical_unit_datum` in its referenced `datum_system` that has description of either 'axis' or 'plane'.

IP4: If the `toleranced_shape_aspect` of the `angularity_tolerance` is neither a `centre_of_symmetry` with a description of 'axis' nor a `composite_shape_aspect` in which the 'composing' `shape_aspects` are all of type `centre_of_symmetry` with a description of 'axis', the `tolerance_zone_boundary` shall be either a `tolerance_zone_explicit_opposing_boundary_set` or a `tolerance_zone_implicit_opposing_boundary_set`.

5.2.3.1.13 **applied_action_assignment**

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `applied_action_assignment` is an `action_assignment` that specifies a set of `action_assigned_item`.

EXPRESS specification:

```
* )
ENTITY applied_action_assignment
  SUBTYPE OF (action_assignment);
  items : SET [1:?] OF action_assigned_item;
END_ENTITY; -- applied_action_assignment
(*
```

5.2.3.1.14 **applied_approval_assignment**

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `applied_approval_assignment` is an `approval_assignment` that specifies a set of `approval_assigned_item`.

EXPRESS specification:

```

*)
ENTITY applied_approval_assignment
  SUBTYPE OF (approval_assignment);
  items : SET [1:?] OF approval_assigned_item;
END_ENTITY; -- applied_approval_assignment
( *

```

5.2.3.1.15 applied_certification_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An applied_certification_assignment is a certification_assignment that specifies a set of certification_assigned_item.

EXPRESS specification:

```

*)
ENTITY applied_certification_assignment
  SUBTYPE OF (certification_assignment);
  items : SET [1:?] OF certification_assigned_item;
END_ENTITY; -- applied_certification_assignment
( *

```

5.2.3.1.16 applied_classification_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An applied_classification_assignment is a group_assignment that specifies a set of classification_assigned_item.

EXPRESS specification:

```

*)
ENTITY applied_classification_assignment
  SUBTYPE OF (group_assignment);
  items : SET [1:?] OF classification_assigned_item;
END_ENTITY; -- applied_classification_assignment
( *

```

5.2.3.1.17 applied_contract_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `applied_contract_assignment` is a `contract_assignment` that specifies a set of `contract_assigned_item`.

EXPRESS specification:

```
*)
ENTITY applied_contract_assignment
  SUBTYPE OF (contract_assignment);
  items : SET [1:?] OF contract_assigned_item;
END_ENTITY; -- applied_contract_assignment
(*
```

5.2.3.1.18 `applied_date_and_time_assignment`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `applied_date_and_time_assignment` is a `date_and_time_assignment` that specifies a set of `date_and_time_assigned_item`.

EXPRESS specification:

```
*)
ENTITY applied_date_and_time_assignment
  SUBTYPE OF (date_and_time_assignment);
  items : SET [1:?] OF date_and_time_assigned_item;
WHERE

  WR1: applied_date_time_correlation
    (SELF, 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN');

  WR2: (NOT (SELF.role\date_time_role.name = 'participant date and time')) OR
    (SIZEOF (QUERY (ra <* QUERY (it <* SELF.items |
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'RULE_ACTION' IN
      TYPEOF (it)) |
      NOT (SIZEOF (USEDIN (ra,
        'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'APPLIED_PERSON_AND_ORGANIZATION_ASSIGNMENT.ITEMS')) = 1))) = 0));
END_ENTITY; -- applied_date_and_time_assignment
(*
```

Formal propositions:

WR1: The role of the `applied_date_and_time_assignment` shall correlate with the items of the `applied_date_and_time_assignment`.

WR2: If the `applied_date_and_time_assignment` has a role of 'participant date and time', each `rule_action` in the set of items shall have exactly one `applied_person_and_organization_assignment`.

5.2.3.1.19 `applied_date_assignment`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `applied_date_assignment` is a `date_assignment` that specifies a set of `date_assigned_item`.

EXPRESS specification:

```
*)
ENTITY applied_date_assignment
  SUBTYPE OF (date_assignment);
  items : SET [1:?] OF date_assigned_item;
WHERE

  WR1: applied_date_correlation (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN');
END_ENTITY; -- applied_date_assignment
(*
```

Formal propositions:

WR1: The role of the `applied_date_assignment` shall correlate with the items of the `applied_date_assignment`.

5.2.3.1.20 `applied_document_reference`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `applied_document_reference` is a `document_reference` that specifies a set of `document_assigned_item`.

EXPRESS specification:

```
*)
ENTITY applied_document_reference
  SUBTYPE OF (document_reference);
  items : SET [1:?] OF document_assigned_item;
END_ENTITY; -- applied_document_reference
(*
```

5.2.3.1.21 `applied_group_assignment`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `applied_group_assignment` is a `group_assignment` that specifies a set of `group_assigned_item`.

EXPRESS specification:

```
*)
ENTITY applied_group_assignment
  SUBTYPE OF (group_assignment);
  items : SET [1:?] OF group_assigned_item;
END_ENTITY; -- applied_group_assignment
(*
```

Informal propositions:

IP1: If the `applied_group_assignment` has an `assigned_group` that is a `functional_terminal_group` then it shall only have items that are `functional_unit_terminal_definitions` with a description of 'scalar terminal'.

5.2.3.1.22 `applied_organization_assignment`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `applied_organization_assignment` is an `organization_assignment` that specifies a set of `organization_assigned_item`.

EXPRESS specification:

```
*)
ENTITY applied_organization_assignment
  SUBTYPE OF (organization_assignment);
  items : SET [1:?] OF organization_assigned_item;
END_ENTITY; -- applied_organization_assignment
(*
```

5.2.3.1.23 `applied_person_and_organization_assignment`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `applied_person_and_organization_assignment` is a `person_and_organization_assignment` that specifies a set of `person_and_organization_assigned_item`.

EXPRESS specification:

```

*)
ENTITY applied_person_and_organization_assignment
  SUBTYPE OF (person_and_organization_assignment);
  items : SET [1:?] OF person_and_organization_assigned_item;
END_ENTITY; -- applied_person_and_organization_assignment
( *

```

5.2.3.1.24 applied_person_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An applied_person_assignment is a person_assignment that specifies a set of person_assigned_item.

EXPRESS specification:

```

*)
ENTITY applied_person_assignment
  SUBTYPE OF (person_assignment);
  items : SET [1:?] OF person_assigned_item;
END_ENTITY; -- applied_person_assignment
( *

```

5.2.3.1.25 applied_promissory_usage_in_product_model_assignment

An applied_promissory_usage_in_product_model_assignment is a group_assignment that specifies a set of promissory_usage_in_product_model_assigned_item. One item shall be a product_concept and the other item shall be a product_definition.

EXPRESS specification:

```

*)
ENTITY applied_promissory_usage_in_product_model_assignment
  SUBTYPE OF (group_assignment);
  items : SET [1:?] OF promissory_usage_in_product_model_assigned_item;
WHERE

  WR1: SIZEOF(QUERY(pm <* items |
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_CONCEPT' IN TYPEOF(pm)
  )) = 1;

```

```

WR2: sizeof(QUERY(pd <* items |
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +

    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_SECURITY_CLASSIFICATION_ASSIGNMENT.ITEMS')) <= 1;
END_ENTITY; -- applied_promissory_usage_in_product_model_assignment
(*)

```

5.2.3.1.26 applied_security_classification_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `applied_security_classification_assignment` is a `security_classification_assignment` that specifies a set of `security_classification_assigned_item`.

EXPRESS specification:

```

*)
ENTITY applied_security_classification_assignment
    SUBTYPE OF (security_classification_assignment);
    items : SET [1:?] OF security_classification_assigned_item;
END_ENTITY; -- applied_security_classification_assignment
(*)

```

5.2.3.1.27 array_placement_group_component_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `array_placement_group_component_definition` is a `assembly_group_component_definition` that implements the ARM concept of `Array_placement_group` (see 4.2.29) .

EXPRESS specification:

```

*)
ENTITY array_placement_group_component_definition
    SUPERTYPE OF (ONEOF(linear_array_placement_group_component_definition,
                        rectangular_array_placement_group_component_definition))
    SUBTYPE OF (assembly_group_component_definition);
END_ENTITY; -- array_placement_group_component_definition
( *

```

5.2.3.1.28 array_placement_group_component_shape_aspect

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An array_placement_group_component_shape_aspect is a assembly_group_component_shape_aspect that implements the ARM concepts of Array_placement_group (see 4.2.29) .

EXPRESS specification:

```

*)
ENTITY array_placement_group_component_shape_aspect
    SUPERTYPE OF (ONEOF(linear_array_placement_group_component_shape_aspect,
                        rectangular_array_placement_group_component_shape_aspect))
    SUBTYPE OF (assembly_group_component_shape_aspect);
END_ENTITY; -- array_placement_group_component_shape_aspect

typeof (sa))) >= 2))) = 0;
END_ENTITY; -- bare_die
( *

```

Formal propositions:

WR1: The bare_die shall be related to exactly one functional_unit with a frame_of_reference name of 'functional design usage' as the 'implemented function'.

WR2: The bare_die shall have exactly one property_definition that is related to exactly one property_definition with a name of 'unit technology' as the 'device unit technology'.

WR3: The bare_die shall have at least two shape_aspects that are bare_die_terminals.

Informal propositions:

IP1: The bare_die shall have exactly one representation with the name of material property data that shall be related to cartesian_points with names of 'least material condition centroid location' and 'maximum material condition centroid location'.

5.2.3.1.43 bare_die_bottom_surface

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A bare_die_bottom_surface is a shape_aspect that implements the ARM concept of Bare_die_bottom_surface (see 4.2.60).

EXPRESS specification:

```

*)
ENTITY bare_die_bottom_surface
  SUBTYPE OF (bare_die_surface);
WHERE

  WR1: SIZEOF (TYPEOF (SELF.of_shape.definition) *
    ['ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'BARE_DIE',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'EXTERNALLY_DEFINED_BARE_DIE',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'LIBRARY_DEFINED_BARE_DIE']) = 1;

  WR2: SELF\shape_aspect.product_definitional;

  WR3: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\shape_aspect ||
    SELF\bare_die_bottom_surface ||
    SELF\part_mounting_feature ||
    SELF\bare_die_surface)) = 0;
END_ENTITY; -- bare_die_bottom_surface
(

```

Formal propositions:

WR1: The bare_die_bottom_surface shall be the aspect of the shape of a bare_die, externally_defined_bare_die, or library_defined_bare_die.

WR2: The bare_die_bottom_surface shall be on the boundary of the product.

WR3: The bare_die_bottom_surface shall be no other subtype of shape_aspect.

5.2.3.1.44 bare_die_edge_segment_surface

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A bare_die_edge_segment_surface is a shape_aspect and shape_aspect_relationship that implements the ARM concept of Bare_die_edge_segment_surface (see 4.2.63).

EXPRESS specification:

```

*)
ENTITY bare_die_edge_segment_surface
  SUBTYPE OF (shape_aspect, shape_aspect_relationship);
WHERE

  WR1: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'EDGE_SEGMENT_VERTEX' IN
        TYPEOF (SELF\shape_aspect_relationship.related_shape_aspect);

  WR2: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'EDGE_SEGMENT_VERTEX' IN
        TYPEOF (SELF\shape_aspect_relationship.relying_shape_aspect);

  WR3: SELF\shape_aspect_relationship.relying_shape_aspect :<>:
        SELF\shape_aspect_relationship.related_shape_aspect;

  WR4: SIZEOF (QUERY (ce < * QUERY (sar < * USEDIN (SELF,
        'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
        sar\shape_aspect_relationship.name = 'composed surface') |
        ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'BARE_DIE_EDGE_SURFACE' IN TYPEOF
        (ce.relying_shape_aspect) ))) = 1;

  WR5: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\shape_aspect ||
        SELF\shape_aspect_relationship ||
        SELF\bare_die_edge_segment_surface)) = 0;
END_ENTITY; -- bare_die_edge_segment_surface
( *

```

Formal propositions:

WR1: The bare_die_edge_segment_surface shall be related to exactly one edge_segment_vertex through a shape_aspect_relationship related attribute.

WR2: The bare_die_edge_segment_surface shall be related to exactly one edge_segment_vertex through a shape_aspect_relationship relating attribute.

WR3: The edge_segment_vertex instances referenced shall not be the same instance of edge_segment_vertex.

WR4: The bare_die_edge_segment_surface shall be related to exactly one bare_die_edge_surface as the 'composed surface'.

WR5: The bare_die_edge_segment_surface shall not be in a complex instance other than with its immediate supertypes.

5.2.3.1.45 bare_die_edge_surface

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A bare_die_edge_surface is a shape_aspect that implements the ARM concept of Bare_die_edge_surface (see 4.2.64).

EXPRESS specification:

```

*)
ENTITY bare_die_edge_surface
  SUBTYPE OF (bare_die_surface);
WHERE

  WR1: SIZEOF (TYPEOF (SELF.of_shape.definition) *
    ['ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'BARE_DIE',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'EXTERNALLY_DEFINED_BARE_DIE',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'LIBRARY_DEFINED_BARE_DIE']) = 1;

  WR2: SELF\shape_aspect.product_definitional;

  WR3: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\shape_aspect ||
    SELF\part_mounting_feature ||
    SELF\bare_die_edge_surface ||
    SELF\bare_die_surface)) = 0;
END_ENTITY; -- bare_die_edge_surface
(

```

Formal propositions:

WR1: The bare_die_edge_surface shall be the aspect of the shape of a bare_die, externally_defined_bare_die, or library_defined_bare_die.

WR2: The bare_die_edge_surface shall be on the boundary of the product.

WR3: The bare_die_edge_surface shall be no other subtype of shape_aspect.

5.2.3.1.46 bare_die_surface

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A bare_die_surface is a shape_aspect that implements the ARM concept of Bare_die_surface (see 4.2.65).

EXPRESS specification:

```

*)
ENTITY bare_die_surface
  ABSTRACT SUPERTYPE OF (ONEOF( bare_die_bottom_surface,
                                bare_die_top_surface,
                                bare_die_edge_surface))
  SUBTYPE OF (part_mounting_feature);
WHERE

  WR1: SIZEOF (TYPEOF (SELF.of_shape.definition) *
    ['ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'BARE_DIE',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'EXTERNALLY_DEFINED_BARE_DIE',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'LIBRARY_DEFINED_BARE_DIE']) = 1;

  WR2: SELF\shape_aspect.product_definitional;
END_ENTITY; -- bare_die_surface
(*

```

Formal propositions:

WR1: The bare_die_surface shall be the aspect of the shape of a bare_die, externally_defined_bare_die, or library_defined_bare_die.

WR2: The bare_die_surface shall be on the boundary of the product.

5.2.3.1.47 bare_die_terminal

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A bare_die_terminal is a minimally_defined_bare_die_terminal that implements the ARM concept of Bare_die_terminal (see 4.2.66).

EXPRESS specification:

```

*)
ENTITY bare_die_terminal
  SUBTYPE OF (minimally_defined_bare_die_terminal);
WHERE

```

```

WR1: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'BARE_DIE' IN

WR2: SIZEOF (QUERY (eca <* QUERY (sar <* USEDIN (SELF,
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |
      sar\shape_aspect_relationship.name = 'external connection area') |
      eca.related_shape_aspect\shape_aspect.description = 'connection zone')) = 1;

WR3: SIZEOF (USEDIN (SELF,
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'MATERIAL_DESIGNATION.DEFINITIONS')) = 1;

WR4: SIZEOF (QUERY (eca <* QUERY (sar <* USEDIN (SELF,
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |
      sar\shape_aspect_relationship.name = 'seating plane zone') |
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'CONNECTION_ZONE_INTERFACE_PLANE_RELATIONSHIP' IN
      TYPEOF (eca.related_shape_aspect))) <= 1;
END_ENTITY; -- bare_die_terminal
( *

```

Formal propositions:

WR1: The bare_die_terminal shall be a terminal of a bare_die.

WR2: The bare_die_terminal shall relate to exactly one shape_aspect that has a description of 'connection zone' as the 'external connection area'.

WR3: The bare_die_terminal shall have exactly one material designation.

WR4: The bare_die_terminal shall have no more than one 'seating plane zone'.

5.2.3.1.48 bare_die_top_surface

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A bare_die_top_surface is a shape_aspect that implements the ARM concept of Bare_die_top_surface (see 4.2.68).

EXPRESS specification:

```

*)
ENTITY bare_die_top_surface
  SUBTYPE OF (bare_die_surface);
WHERE

  WR1: SIZEOF (TYPEOF (SELF.of_shape.definition) *
    ['ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'BARE_DIE',
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'EXTERNALLY_DEFINED_BARE_DIE',
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'LIBRARY_DEFINED_BARE_DIE']) = 1;

  WR2: SELF\shape_aspect.product_definitional;

  WR3: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\shape_aspect ||
    SELF\part_mounting_feature ||
    SELF\bare_die_top_surface ||
    SELF\bare_die_surface)) = 0;
END_ENTITY; -- bare_die_top_surface
(

```

Formal propositions:

WR1: The bare_die_top_surface shall be the aspect of the shape of a bare_die, externally_defined_bare_die, or library_defined_bare_die.

WR2: The bare_die_top_surface shall be on the boundary of the product.

WR3: The bare_die_top_surface shall be no other subtype of shape_aspect.

5.2.3.1.49 bond_category

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A bond_category is a group and an external_definition that implements the ARM concept of External_definition (see 4.2.361) in the role of bond category.

EXPRESS specification:

```

*)
ENTITY bond_category
  SUBTYPE OF (group, external_definition);
WHERE

```

```

    WR1: SIZEOF (USEDIN (SELF,
        'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'APPLIED_DOCUMENT_REFERENCE.ITEMS')) = 1;
END_ENTITY; -- bond_category
(*

```

Formal propositions:

WR1: The bond_category shall be referenced by exactly one document.

5.2.3.1.50 bus_element_link

A bus_element_link is a product_definition and a product_definition_relationship that implements the ARM concept of Bus_element_link (see 4.2.82)

EXPRESS specification:

```

*)
ENTITY bus_element_link
    SUBTYPE OF (product_definition, product_definition_relationship);
UNIQUE
    UR1: SELF\product_definition_relationship.related_product_definition,
        SELF\product_definition_relationship.relying_product_definition;
WHERE

    WR1: SELF\product_definition_relationship.related_product_definition :<>:
        SELF\product_definition_relationship.relying_product_definition;

    WR2: ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'BUS_STRUCTURAL_DEFINITION' IN
        TYPEOF (SELF\product_definition_relationship.related_product_definition)) OR
        ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'NETWORK_NODE_DEFINITION' IN
        TYPEOF (SELF\product_definition_relationship.related_product_definition));

    WR3: ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'BUS_STRUCTURAL_DEFINITION' IN
        TYPEOF (SELF\product_definition_relationship.relying_product_definition)) OR
        ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'NETWORK_NODE_DEFINITION' IN
        TYPEOF (SELF\product_definition_relationship.relying_product_definition));

    WR4: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\product_definition ||
        SELF\product_definition_relationship ||
        SELF\bus_element_link)) = 0;

```

```

WR5: NOT EXISTS(SELF\product_definition.name) OR
      (SELF\product_definition.name = '');

WR6: SELF\product_definition_relationship.name = '';

WR7: sizeof(USEDIN(SELF,
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'PRODUCT_DEFINITION_RELATIONSHIP.RELATED_PRODUCT_DEFINITION')) >= 1;
END_ENTITY; -- bus_element_link
(*)

```

Formal propositions:

UR1: The combination of related, relating attributes inherited from product_definition_relationship be unique within a population of bus_element_link.

WR1: The related element shall not be the relating element.

WR2: The bus_element_link shall relate to only a bus_structural_definition or a network_node_definition in the related_product_definition.

WR3: The bus_element_link shall relate to only a bus_structural_definition or a network_node_definition in the relating_product_definition.

WR4: The types of bus_element_link shall be only bus_element_link, product_definition, and product_definition_relationship.

WR5: The name attribute of the product_definition supertype shall be an empty string.

WR6: The name attribute of the product_definition_relationship supertype shall be an empty string.

WR7: Each bus_element_link shall be referenced at least once by a product_definition_relationship related_product_definition.

5.2.3.1.51 bus_structural_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A bus_structural_definition is a product_definition that implements the ARM concept of Bus_structural_definition (see 4.2.83).

EXPRESS specification:

```

*)
ENTITY bus_structural_definition
  SUBTYPE OF (product_definition);
WHERE

```

```

WR1: sizeof (QUERY (bce <* QUERY (pdr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_DEFINITION_RELATIONSHIP.RELATING_PRODUCT_DEFINITION') |
    pdr\product_definition_relationship.name = 'bus composition') |
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'BUS_ELEMENT_LINK' IN
    TYPEOF (bce.related_product_definition))) >= 1;

WR2: sizeof (QUERY (pd <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION.DEFINITION') |
    sizeof (QUERY (pdr <* USEDIN (pd,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION_RELATIONSHIP.RELATING_PROPERTY_DEFINITION') |
    pdr\property_definition_relationship.name =
    'functional unit network terminal definition bus assignment'))
    <= 1)) <= 1;

WR3: consistent_bus_structural_definition(bag_to_set(QUERY( pdr <* USEDIN(SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_DEFINITION_RELATIONSHIP.RELATING_PRODUCT_DEFINITION') |
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'BUS_ELEMENT_LINK' IN TYPEOF(pdr.related_product_definition))));
END_ENTITY; -- bus_structural_definition
(*

```

Formal propositions:

WR1: The bus_structural_definition shall relate to at least one bus_element_link.

WR2: The bus_structural_definition shall have at most one property_definition that relates to another property_definition to specify the 'functional unit network terminal definition bus assignment'.

WR3: The bus_structural_definition shall be a connected structure and shall not have any vertex with a degree greater than 2. The number of vertices shall equal the number of links + 1.

5.2.3.1.52 cable_component

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A cable_component is a component_definition that implements the ARM concept of Cable_component (see 4.2.84)

EXPRESS specification:

```

*)
ENTITY cable_component
  SUBTYPE OF (component_definition);
WHERE

  WR1: SIZEOF (QUERY (ip <* QUERY (pdr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_DEFINITION_RELATIONSHIP.RELATED_PRODUCT_DEFINITION') |
    pdr\product_definition_relationship.name = 'instantiated part') |
    (SIZEOF (['ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PHYSICAL_UNIT'] *
    TYPEOF (ip.relatng_product_definition)) = 1) AND
    (ip.relatng_product_definition.frame_of_reference.name =
    'physical design usage')))) = 1;

  WR2: SELF\product_definition.description :<>: 'laminate component';
END_ENTITY; -- cable_component
( *

```

Formal propositions:

WR1: The cable_component shall be related, as the 'instantiated part', to exactly one physical_unit that is in the 'physical design usage' product_definition_context.

WR2: The cable_component shall not have a description of 'laminate component'.

5.2.3.1.53 capacitance_measure_with_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A capacitance_measure_with_unit is a measure_with_unit that implements the ARM concept of Capacitance_measure_with_unit (see ??).

EXPRESS specification:

```

*)
ENTITY capacitance_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\measure_with_unit ||
    SELF\capacitance_measure_with_unit))) = 0;

```

```

WR2: SELF\measure_with_unit.unit_component\si_unit.name = farad;

WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
      TYPEOF(SELF\measure_with_unit.unit_component);
END_ENTITY; -- capacitance_measure_with_unit
(*)

```

Formal propositions:

WR1: The capacitance_measure_with_unit shall not be any other type of measure_with_unit.

WR2: The capacitance_measure_with_unit shall reference an si_unit with a name of farad.

WR3: The unit_component shall be an si_unit.

5.2.3.1.54 change

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A change is an action_assignment that points to a set of **work_item**.

EXPRESS specification:

```

*)
ENTITY change
  SUBTYPE OF (action_assignment);
    items : SET [1:?] OF work_item;
WHERE

  WR1: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'DIRECTED_ACTION'
        IN TYPEOF (SELF.assigned_action);

  WR2: unique_version_change_order (SELF.assigned_action,
        'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN');

END_ENTITY; -- change
(*)

```

Formal propositions:

WR1: The change shall assign a directed_action.

WR2: A single change shall not change more than one version of a single product, but may change more than one product_definition_formation if each product_definition_formation references a different product.

5.2.3.1.55 change_from_design_object_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A change_from_design_object_assignment is an action_assignment that implements the ARM concepts of:

- Change_design_object_management_relationship (see 4.2.95);
- Component_swap_specification (see 4.2.136);
- Gate_path_swap_specification (see 4.2.415);
- Terminal_swap_specification (see 4.2.891).

EXPRESS specification:

```

*)
ENTITY change_from_design_object_assignment
  SUBTYPE OF (action_assignment);
  items : SET [1:?] OF managed_design_object;
WHERE

  WR1: SIZEOF(QUERY(aa <* USEDIN(SELF\action_assignment.assigned_action,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'ACTION_ASSIGNMENT.ASSIGNED_ACTION')
    | 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'CHANGE_TO_DESIGN_OBJECT_ASSIGNMENT' IN TYPEOF(aa))) >= 1;
END_ENTITY; -- change_from_design_object_assignment
( *
```

Formal propositions:

WR1: SELF\action_assignment.assigned_action shall also be a SELF\action_assignment.assigned_action for a change_to_design_object_assignment.

Informal propositions:

IP1: The change_from_design_object_assignment shall have exactly one item that is a managed_design_object that is not referenced by another product_definition_relationship with a name of 'design object addition', 'design object change', or 'design object deletion' in the same design that is not an item of a action_assignment with the same assigned_action.

5.2.3.1.56 change_from_design_object_request_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A change_from_design_object_request_assignment is an action_request_assignment that implements the ARM concepts of:

- Change_design_object_management_relationship (see 4.2.95);
- Change_request (see 4.2.97);
- Component_swap_specification (see 4.2.136);
- Gate_path_swap_specification (see 4.2.415);
- Terminal_swap_specification (see 4.2.891).

EXPRESS specification:

```

*)
ENTITY change_from_design_object_request_assignment
  SUBTYPE OF (action_request_assignment);
  items : SET [1:?] OF managed_design_object;
WHERE

  WR1: SIZEOF(QUERY(aa <*
    USEDIN(SELF\action_request_assignment.assigned_action_request,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'ACTION_REQUEST_ASSIGNMENT.ASSIGNED_ACTION_REQUEST')
    | 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'CHANGE_TO_DESIGN_OBJECT_REQUEST_ASSIGNMENT' IN TYPEOF(aa))) >= 1;

END_ENTITY; -- change_from_design_object_request_assignment
( *
```

Formal propositions:

WR1: SELF\action_request_assignment.assigned_action_request shall also be a SELF\action_request_assignment.assigned_action_request for a change_to_design_object_request_assignment.

Informal propositions:

IP1: The `change_from_design_object_request_assignment` shall have exactly one item that is a managed_design_object that is not referenced by another `product_definition_relationship` with a name of 'design object addition', 'design object change', or 'design object deletion' in the same design that is not an item of a `action_request_assignment` with the same `assigned_action_request`.

5.2.3.1.57 change_request

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `change_request` is an `action_request_assignment` that implements the ARM concept of `Change_request` (see 4.2.97).

EXPRESS specification:

```
*)
ENTITY change_request
  SUBTYPE OF (action_request_assignment);
  items : SET [1:?] OF change_request_item;
END_ENTITY; -- change_request
(*
```

5.2.3.1.58 change_to_design_object_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `change_to_design_object_assignment` is an `action_assignment` that implements the ARM concepts of:

- `Change_design_object_management_relationship` (see 4.2.95);
- `Component_swap_specification` (see 4.2.136);
- `Gate_path_swap_specification` (see 4.2.415);
- `Terminal_swap_specification` (see 4.2.891).

EXPRESS specification:

```
*)
ENTITY change_to_design_object_assignment
  SUBTYPE OF (action_assignment);
  items : SET [1:?] OF managed_design_object;
WHERE
```

```

WR1: sizeof(QUERY(aa <* USEDIN(SELF\action_assignment.assigned_action,
'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
'ACTION_ASSIGNMENT.ASSIGNED_ACTION')
| 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
'CHANGE_FROM_DESIGN_OBJECT_ASSIGNMENT' IN TYPEOF(aa))) >= 1;

WR2: sizeof(QUERY ( pdr <* SELF.items |
('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
'PRODUCT_DEFINITION_RELATIONSHIP' IN TYPEOF(pdr)) AND
(pdr\product_definition_relationship.name = 'design object change')))) = 1;

END_ENTITY; -- change_to_design_object_assignment
( *
```

Formal propositions:

WR1: SELF\action_assignment.assigned_action shall also be a SELF\action_assignment.assigned_action for a change_from_design_object_assignment.

WR2: The change_to_design_object_assignment shall have exactly one item that is a product_definition_relationship with a name of 'design object change'.

Informal propositions:

IP1: The change_to_design_object_assignment shall have exactly one item that is a managed_design_object that is not a product_definition_relationship with a name of 'design object change' and is not referenced by another product_definition_relationship with a name of 'design object addition', 'design object change', or 'design object deletion' in the same design that is not an item of a action_assignment with the same assigned_action.

5.2.3.1.59 change_to_design_object_request_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A change_to_design_object_request_assignment is an action_request_assignment that implements the ARM concepts of:

- Change_design_object_management_relationship (see 4.2.95);
- Component_swap_specification (see 4.2.136);
- Change_request (see 4.2.97);
- Gate_path_swap_specification (see 4.2.415);
- Terminal_swap_specification (see 4.2.891).

EXPRESS specification:

```

*)
ENTITY change_to_design_object_request_assignment
  SUBTYPE OF (action_request_assignment);
  items : SET [1:?] OF managed_design_object;
WHERE

  WR1: SIZEOF(QUERY(aa <*
    USEDIN(SELF\action_request_assignment.assigned_action_request,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'ACTION_REQUEST_ASSIGNMENT.ASSIGNED_ACTION_REQUEST')
    | 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'CHANGE_FROM_DESIGN_OBJECT_REQUEST_ASSIGNMENT'
    IN TYPEOF(aa))) >= 1;

  WR2: SIZEOF(QUERY ( pdr <* SELF.items |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_DEFINITION_RELATIONSHIP' IN TYPEOF(pdr)) AND
    (pdr\product_definition_relationship.name = 'design object change')) = 1;
END_ENTITY; -- change_to_design_object_request_assignment
(*

```

Formal propositions:

WR1: SELF\action_request_assignment.assigned_action_request shall also be a SELF\action_request_assignment.assigned_action_request for a change_from_design_object_request_assignment.

WR2: The change_to_design_object_request_assignment shall have exactly one item that is a product_definition_relationship with a name of 'design object change'.

Informal propositions:

IP1: The change_to_design_object_request_assignment shall have exactly one item that is a managed_design_object that is not a product_definition_relationship with a name of 'design object change' and is not referenced by another product_definition_relationship with a name of 'design object addition', 'design object change', or 'design object deletion' in the same design that is not an item of a action_request_assignment with the same assigned_action_request.

5.2.3.1.60 characteristic_type

A characteristic_type is a group that specifies a boolean property, a numeric property whose units are in accordance with ISO 10303-41, a compound characteristic, a logical property, a string property, or an externally defined property for a characteristic.

EXPRESS specification:

```
*)
ENTITY characteristic_type
  SUBTYPE OF (group);
WHERE

  WR1: SELF\group.name IN [
    'string property',
    'logical property',
    'boolean property',
    'numeric property',
    'externally defined property',
    'compound characteristic'
  ];
END_ENTITY; -- characteristic_type
(*
```

Formal propositions:

WR1: A `characteristic_type` shall have a name that is 'string property', 'logical property', 'boolean property', 'numeric property', 'externally defined property' or 'compound characteristic'.

5.2.3.1.61 characterized_product_category

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `characterized_product_category` is a `characterized_object` and a `product_category` that implements the ARM concept of `Ee_product_category` (see 4.2.320).

EXPRESS specification:

```
*)
ENTITY characterized_product_category
  SUBTYPE OF (characterized_object, product_category);
WHERE
```

```

WR1:  SIZEOF (QUERY (pd <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION.DEFINITION') |
    (pd\property_definition.description = 'product category values') AND
    (SIZEOF (QUERY (pdr <* USEDIN (pd,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION_REPRESENTATION.DEFINITION') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PARAMETER_ASSIGNMENT_REPRESENTATION'
    IN TYPEOF (pdr.used_representation)))) >= 1 ))) <= 1;

WR2:  SIZEOF (QUERY (pd <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION.DEFINITION') |
    ((pd\property_definition.description = 'product category parameters') AND
    (SIZEOF (QUERY (pdr <* USEDIN (pd,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION_REPRESENTATION.DEFINITION') |
    (SIZEOF (QUERY (ri <* pdr.used_representation.items
    | (NOT (SIZEOF (TYPEOF (ri) *
    ['ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'MODEL_PARAMETER']) =1))) =0))) >= 1 )))) <= 1;

WR3:  SELF\characterized_object.name = SELF\product_category.name;

WR4:  SIZEOF (USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DOCUMENT_REFERENCE.ITEMS')) = 1;

```

```

END_ENTITY; -- characterized_product_category
(*)

```

Formal propositions:

WR1: The characterized_product_category shall be referenced by no more than one property_definition that has a description of 'product category values' that shall reference one or more parameter_assignment_representation.

WR2: The characterized_product_category shall be referenced by no more than one property_definition that has a description of 'product category parameters' that shall reference one or more model_parameter.

WR3: The name attribute inherited from product_category shall be the same value as the name attribute inherited from characterized_object.

WR4: The characterized_product_category shall be referenced by exactly one applied_document_reference.

NOTE The RULE characterized_product_category_unique_constraint also constrains this entity.

5.2.3.1.62 circular_runout_tolerance

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `circular_runout_tolerance` is a `geometric_tolerance_with_specified_datum_system` that implements the ARM concept of `Circular_runout_tolerance` (see 4.2.102).

EXPRESS specification:

```
*)
ENTITY circular_runout_tolerance
  SUBTYPE OF (geometric_tolerance_with_specified_datum_system);
WHERE

  WR1: SELF\geometric_tolerance.name = 'circular runout';

  WR2: NOT('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'MODIFIED_GEOMETRIC_TOLERANCE' IN TYPEOF(SELF));

  WR3: SIZEOF (QUERY (pdr <* USEDIN(SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION_RELATIONSHIP.RELATING_PROPERTY_DEFINITION') |
    (pdr\property_definition_relationship.name = 'referenced datum system definition')
    (pdr.related_property_definition\property_definition.description =
    'datum system property without material conditions')))) = 1;
END_ENTITY; -- circular_runout_tolerance
(*
```

Formal propositions:

WR1: The name for the `circular_runout_tolerance` shall be 'circular runout'.

WR2: The `circular_runout_tolerance` shall not be a `modified_geometric_tolerance`.

WR3: The `circular_runout_tolerance` shall relate to exactly one `property_definition` that has the description of 'datum system property without material conditions' to specify the 'referenced datum system definition'.

Informal propositions:

IP1: The `toleranced_shape_aspect` of the `circular_runout_tolerance` shall either be a `part_template_definition`, lie on the boundary of the shape of the product, or be a `composite_shape_aspect` the 'composing' `shape_aspects` of which are all of type `part_template_definition`.

IP2: The `circular_runout_tolerance` shall have at most two `physical_unit_datum` in its referenced `datum_system`.

IP3: The `circular_runout_tolerance` shall have at least one `physical_unit_datum` in its referenced `datum_system` that has description of 'axis'.

IP4: The `tolerance_zone_boundary` of the `circular_runout_tolerance` shall be either a `tolerance_zone_explicit_opposing_boundary_set` or a `tolerance_zone_implicit_opposing_boundary_set`.

5.2.3.1.63 **component_definition**

A `component_definition` is a `product_definition` that represents a product that is used in an assembly. The `component_definition` entity implements the ARM concepts of:

- `Array_placement_group` (see 4.2.29);
- `Assembly_component` (see 4.2.34);
- `Assembly_group_component` (see 4.2.40);
- `Assembly_module_component` (see 4.2.44);
- `Assembly_module_macro_component` (see 4.2.48);
- `Bare_die_component` (see 4.2.61);
- `Cable_component` (see 4.2.84);
- `Interconnect_module_component` (see 4.2.442);
- `Interconnect_module_macro_component` (see 4.2.455);
- `Interface_component` (see 4.2.468);
- `Interfaced_group_component` (see 4.2.473);
- `Mating_connector_component` (see 4.2.538);
- `Physical_component` (see 4.2.648);
- `Physical_laminate_component` (see 4.2.659);
- `Routed_interconnect_component` (see 4.2.777);
- `Routed_physical_component` (see 4.2.778);
- `Thermal_component` (see 4.2.900).

EXPRESS specification:

```

Formal propositions:

WR1: The component_definition shall have at most one shape_representation with a name of 'planar projected shape'.

WR2: The component_definition shall have at most one shape_representation with a name of '3d bound volume shape'.

WR3: If the component_definition has a description of 'bare die component', the component_definition shall be related, as the 'instantiated part', to exactly one bare_die, externally_defined_bare_die, or library_defined_bare_die; that is in the 'physical design usage' product_definition_context.

WR4: If the component_definition is in the 'physical occurrence' product_definition_context and has a name of 'assembly module', the component_definition shall be related, as the 'instantiated part', to exactly one physical_unit that is in the 'physical design usage' product_definition_context and has a name of 'assembly module'.

WR5: If the component_definition has a frame_of_reference name of 'physical occurrence' and it is associated with a product that is categorized as an 'assembly module', it shall have at least two shape_aspects that are component_terminals with a description of 'assembly module component terminal'.

WR6: If the component_definition is in the 'physical occurrence' product_definition_context and has a name of 'interconnect module', the component_definition shall be related, as the 'instantiated part', to exactly one physical_unit that is in the 'physical design usage' product_definition_context and has a name that is 'interconnect module'.

WR7: If the `component_definition` has a description of 'mating connector', it shall be of type `product_definition_with_associated_documents` that contains exactly one `ee_specification`, or it shall have exactly one `shape_aspect` with a description of 'part template occurrence' and is related to exactly one `part_template_definition` with a description of 'printed connector template' as the 'instantiated template', or it shall be related to exactly one `packaged_part`, `externally_defined_packaged_part`, or `library_defined_packaged_part` with a description of 'packaged connector' as the 'instantiated part'.

WR8: If the `component_definition` has a description of 'mating connector', it shall have exactly one `shape_representation` with a name of 'mating connector placement'.

WR9: If the `component_definition` has a description of 'mating connector', it shall not participate in a `next_assembly_usage_occurrence`.

WR10: If the `component_definition` is the `related_product_definition` of a `product_definition_relationship` that has a name of 'instantiated part', it shall have the same formation as the `relating_product_definition`.

WR11: The `component_definition` shall have at most one `shape_representation` with a name of 'part template non planar 2d shape' or of 'open shell based surface' or of 'non planar 2d shape'.

WR12: If the `component_definition` has a `frame_of_reference` with a name of 'layout occurrence', the `component_definition` shall be a definition of a product that is categorized as a 'template model'.

WR13: If the `component_definition` has a `frame_of_reference` with a name of 'layout occurrence', and if the `component_definition` is not a `printed_component`, the `component_definition` shall have exactly one `component_shape_aspect`.

WR14: If the `component_definition` is in the 'macro occurrence' `product_definition_context` and has a name of 'assembly module', the `component_definition` shall be related, by the 'design definition' relationship, to exactly one `physical_unit` that is in the 'physical design' `product_definition_context` and has a name of 'assembly module'.

WR15: If the `component_definition` is in the 'macro occurrence' `product_definition_context` and has a name of 'interconnect module', the `component_definition` shall be related, by the 'design definition' relationship, to exactly one `physical_unit` that is in the 'physical design' `product_definition_context` and has a name of 'interconnect module'.

WR16: If the `component_definition` is the `related_product_definition` of a `product_definition_relationship` that has a name of 'instantiated definition', it shall have the same formation as the `relating_product_definition`.

WR17: If the `component_definition` has a description of 'routed interconnect component', it shall be related to a `physical_unit` as an 'instantiated part' and shall be in the 'physical occurrence' context.

Informal propositions:

IP1: The assembly referenced by the assembly composition relationship that references this component definition shall be the same assembly as that referenced by the shape that is referenced by the component position that references that assembly composition relationship.

IP2: If the component_definition has a description of 'routed interconnect component', it shall have exactly one property_definition that is associated to exactly one representation.

5.2.3.1.64 component_feature

A component_feature is a shape_aspect. A component_feature implements the ARM concept of Component_feature (see 4.2.118) when no ARM subtype is implemented.

Formal propositions:

WR1: The component_interface_terminal shall have a description of 'interconnect component interface terminal' or 'packaged connector component interface terminal'.

WR2: The component_interface_terminal shall be an aspect of the shape of a component_definition.

WR3: The `component_interface_terminal` shall be related to at most one `shape_aspect` as the 'instantiated feature'.

WR4: The `component_interface_terminal` shall relate to at most one `shape_aspect` to specify the 'design usage'.

WR5: If the name of the `component_interface_terminal` is 'interconnect component interface terminal', it shall be an aspect of the shape of an `interface_component_definition`.

WR6: If the name of the `component_interface_terminal` is 'interconnect component interface terminal', it shall be an aspect of the shape of a `product_definition` with a `frame_of_reference` name of 'physical occurrence'.

WR7: If the `component_interface_terminal` has a description of 'interconnect component interface terminal', the `component_interface_terminal` shall relate to exactly one `shape_aspect` that has a description of 'connection zone' and that is associated with a product that is categorized as an 'interconnect module' and does not have a description of 'assembly module component', 'bare die component', 'interconnect module component', 'laminated component', or 'packaged component'.

WR8: If the name of the `component_interface_terminal` is 'packaged connector component interface terminal', it shall lie on the boundary of the shape of the `component_definition`.

WR9: If the `component_interface_terminal` has a description of 'packaged connector component interface terminal', it shall be an aspect of the shape of a `packaged_component` that has a description of 'packaged connector component' and a `frame_of_reference` name of 'physical occurrence'.

WR10: If the `component_interface_terminal` has a description of 'packaged connector component interface terminal', the `component_interface_terminal` shall be related to exactly one `packaged_part_terminal` with a description of 'interface terminal' as the 'instantiated feature'.

5.2.3.1.69 `component_location`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `component_location` is a representation that implements the ARM concepts of:

- `Component_2d_edge_location` (see 4.2.106);
- `Component_2d_location` (see 4.2.108);
- `Component_2d_stacked_location` (see 4.2.109);
- `Component_3d_location` (see 4.2.111).

END_ENTITY; -- component_location
(*

```

Formal propositions:

WR1: The component_location shall contain exactly one descriptive_representation_item with a name 'placement fixed' and the description of that descriptive_representation_item shall be either 'true' or 'false'.

WR2: The component_location shall contain exactly one descriptive_representation_item.

WR3: If the component_location has a geometric_representation_context with a coordinate_space_dimension value of 2, it shall contain exactly one cartesian_transformation_operator_2d.

WR4: If the component_location has a geometric_representation_context with a coordinate_space_dimension value of 3, it shall contain exactly one axis2_placement_3d.

WR5: The component_location shall contain exactly one mapped_item.

WR6: The component_location that contains a cto2d shall contain exactly one mapped_item that specifies the cto2d.

WR7: The component_location that contains an a2p3d shall contain exactly one mapped_item that specifies the a2p3d.

WR8: If the `component_location` has a `geometric_representation_context` with a `coordinate_space_dimension` value of 2 and if the `component_location` references a primary surface, edge surface, or edge segment surface, the determinant of the `cto2d` shall be +1.0 within a delta of 0.001.

WR9: If the `component_location` has a `geometric_representation_context` with a `coordinate_space_dimension` value of 2 and if the `component_location` references a secondary surface, the determinant of the `cto2d` shall be -1.0 within a delta of 0.001.

WR10: If the `component_location` is the location of the implementation of the ARM concept of `Laminate_component`, it shall not be associated with a `component_shape_aspect` where the description is 'interconnect module component surface feature'.

WR11: If the `component_location` has a `geometric_representation_context` with a `coordinate_space_dimension` value of 2 and is the location of the implementation of the ARM concept of `Laminate_component`, the determinant of the `cto2d` shall be +1.0 within a delta of 0.001.

WR12: The `component_location` shall not directly reference any `component_shape_aspect` where the description is 'interconnect module component surface feature'.

WR13: If the `component_location` has a `geometric_representation_context` with a `coordinate_space_dimension` value of 2 and a `context_type` of 'component stacked', it shall not reference a `component_shape_aspect` where the description is 'interconnect module component surface feature'.

WR14: If the `component_location` has a `geometric_representation_context` with a `coordinate_space_dimension` value of 2 and a `context_type` of 'component edge', it shall be associated with exactly one `assembly_joint` where the `assembly_joint` shall specify with the `related_shape_aspect` a `component_terminal` that is defined by a `primary_reference_terminal`. The `component_location` shall be associated with a `component_shape_aspect` where the description is 'interconnect module component surface feature' that is defined by an edge or edge_segment of an interconnect module. The `component_terminal` specified by the `related_shape_aspect` of the `assembly_joint` shall be a `component_terminal` of the `component_definition` being located by this `component_location`.

WR15: If the `component_location` has a `geometric_representation_context` with a `coordinate_space_dimension` value of 2 and a `context_type` of 'component stacked', it shall be associated with exactly one `assembly_joint` where the `assembly_joint` shall specify with the `related_shape_aspect` a `component_mounting_feature`. The `component_mounting_feature` referenced by the `assembly_joint` `related_shape_aspect` shall be a `component_mounting_feature` of the `component_definition` being located by this `component_location`. The `relating_shape_aspect` of the `assembly_joint` shall specify a `component_feature` of a `component_definition` that is not being located by this `component_location`.

NOTE The base component of the stack is not considered to be stacked. The `assembly_joint` referenced to support stacking are directed for stack traversal.

EXAMPLE 1 In this example, three bare die are vertically mounted on top of a substrate. The substrate is not considered to be part of the stack. The first bare die is not considered to be 'stacked'. The `component_location` references the substrate. The second bare die is considered to be 'stacked'. The `component_location` references an `assembly_joint`. The `related_shape_aspect` of the `assembly_joint` references the second bare die, and the `relating_shape_aspect` of the `assembly_joint` references the first bare die. The third bare die is considered to be 'stacked'. The `component_location` references a different `assembly_joint`. The `related_shape_aspect` of the `assembly_joint` references the third bare die, and the `relating_shape_aspect` of the `assembly_joint` references the second bare die.

WR16: If the `component_location` is the location of the implementation of the ARM concept of `Interconnect_module_component`, it shall not be associated with a `component_shape_aspect` where the description is 'interconnect module component surface feature'.

WR17: If the `component_location` has a `geometric_representation_context` with a `coordinate_space_dimension` value of 2 and a `context_type` of 'component stacked', the determinant of the `cto2d` shall be +1.0 or -1.0, in either case within a delta of 0.001.

WR18: The items in a `component_location` shall be a `mapped_item`, a `descriptive_representation_item`, a `cartesian_transformation_operator_2d`, or an `axis2_placement_3d`.

WR19: The `axis2_placement_3d` shall not have a name of 'origin'.

NOTE This does not prohibit placing the component at the origin. It prohibits an `axis2_placement_3d` that is in the role of 'origin' from serving as the location.

WR20: The `representation_item` used as a `mapping_source` shall be either an `axis2_placement_2d` or shall be an `axis2_placement_3d` and it shall have a name of 'origin'.

WR21: The `component_location` shall be used by exactly one `next_assembly_usage_occurrence`.

5.2.3.1.70 component_mating_constraint_condition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `component_mating_constraint_condition` is a `shape_aspect` that implements the ARM concept of `Component_mating_constraint_condition` (see 4.2.127).

EXPRESS specification:

```
*)
ENTITY component_mating_constraint_condition
  SUBTYPE OF (shape_aspect);
UNIQUE
  UR1: SELF\shape_aspect.name, SELF\shape_aspect.of_shape;
END_ENTITY; -- component_mating_constraint_condition
(*
```

Formal propositions:

UR1: The name shall be unique within the context of the `product_definition_shape` referenced as `of_shape` inherited from the `shape_aspect` supertype.

WR1: The `component_mating_constraint_condition` shall relate to at least one and no more than three `assembly_joint` to specify the 'constraining_joint'.

WR2: The `component_mating_constraint_condition` shall be related to at least one and no more than five `representation_items` to describe the 'degree of freedom' constrained.

WR3: The component_mating_constraint_condition shall not be any other type of shape_aspect.

5.2.3.1.71 component_mounting_feature

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A component_mounting_feature is a shape_aspect. A component_mounting_feature implements the ARM concept of Component_mounting_feature (see 4.2.129)

EXPRESS specification:

```

*)
ENTITY component_mounting_feature

END_ENTITY; -- component_mounting_feature
(*

```

Formal propositions:

- WR1:** The component_mounting_feature shall be an aspect of the shape of a component_definition.
- WR2:** The component_mounting_feature shall not be any of the following: inter_stratum_feature, probe_access_area, land.
- WR3:** The component_mounting_feature shall have at most one shape_representation with a name of 'planar projected shape'.
- WR4:** The component_mounting_feature shall have at most one shape_representation with a name of '3d bound volume shape'.
- WR5:** If the component_mounting_feature has a description of 'component feature', it shall relate to at most one shape_aspect to specify the 'design usage'.
- WR6:** The component_mounting_feature shall be related to at most one shape_aspect as an 'instantiated feature'.

5.2.3.1.72 component_shape_aspect

A component_shape_aspect is a shape_aspect. A component_shape_aspect implements the ARM concepts of:

- Conductive_interconnect_element (see 4.2.171);
- Conductive_interconnect_element_with_pre_defined_transitions (see 4.2.174);
- Conductive_interconnect_element_with_user_defined_single_transition (see 4.2.175);
- Join_two_physical_connectivity_definition_supporting_printed_component (see 4.2.481);
- Laminate_component (see 4.2.483);
- Laminate_text_component (see 4.2.488);
- Laminate_text_string_component (see 4.2.489);
- Primary_stratum_indicator_symbol (see 4.2.719);
- Special_symbol_laminate_component (see 4.2.834);
- Stratum_feature_template_component (see 4.2.862);
- Thermal_component (see 4.2.900).

Formal propositions:

WR1: The component_shape_aspect shall be an aspect of the shape of a component_definition.

WR2: The component_shape_aspect shall be an inter_stratum_feature, probe_access_area, or land, or fiducial, or assembly_group_component_shape_aspect, or material_removal_component_shape_aspect, or integral_shield, or thermal_component_shape_aspect or connected_area_component, or it shall have a description of 'laminate component', 'laminate text component', 'laminate text string component', 'part template occurrence', 'conductive interconnect element with pre defined transitions', 'join 2 physical connectivity definition supporting', 'conductive interconnect element with user defined single transition', 'special symbol laminate component', 'primary stratum indicator symbol', or 'stratum feature template component'.

WR3: The component_shape_aspect shall have at most one shape_representation with a name of 'planar projected shape'.

WR4: The component_shape_aspect shall have at most one shape_representation with a name of '3d bound volume shape'.

WR5: If the component_shape_aspect has a description of 'laminate text component', 'laminate text string component', 'special symbol laminate component', 'primary stratum indicator symbol', or 'stratum feature template component', it shall be an aspect of the shape of a component_definition that is the definition of a product that is categorized as an 'interconnect module'.

WR6: If the `component_shape_aspect` has a description of 'laminar text component', the `component_shape_aspect` shall be related to exactly one `part_text_template_definition`.

WR7: If the `component_shape_aspect` has a description of 'stratum feature template component', the `component_shape_aspect` shall be related to exactly one `stratum_feature` as the 'stratum feature implementation'.

WR8: If the `component_shape_aspect` has a description of either 'conductive interconnect element with pre defined transitions', 'join 2 physical connectivity definition supporting' or 'conductive interconnect element with user defined single transition', the `component_shape_aspect` shall relate to exactly one `stratum_feature` to specify the 'composed conductor'.

WR9: If the `component_shape_aspect` has a description of either 'conductive interconnect element with pre defined transitions', 'join 2 physical connectivity definition supporting' or 'conductive interconnect element with user defined single transition', the `component_shape_aspect` shall relate to at least two `component_terminal` that have a description of 'conductive interconnect element terminal' to specify the 'associated component'.

WR10: If the `component_shape_aspect` has a description of either 'special symbol laminar component' or 'primary stratum indicator symbol', the `component_shape_aspect` shall be related to exactly one `part_template_definition` with a description of 'special symbol part template' as an 'instantiated template'.

WR11: If the `component_shape_aspect` has a description of 'stratum feature template component', the `component_shape_aspect` shall be related, as an 'instantiated template', to not more than one `part_template_definition` that has a description of 'stratum feature template' or to not more than one `land_physical_template`.

WR12: If the `component_shape_aspect` has a description of 'laminar text component', the `component_shape_aspect` shall be related to at least one `stratum_feature` as the 'stratum feature implementation'.

WR13: If the `component_shape_aspect` is an `inter_stratum_feature`, `probe_access_area`, or `land`, or `fiducial`, or `assembly_group_component_shape_aspect`, or `material_removal_component_shape_aspect`, or `integral_shield`, or `thermal_component_shape_aspect`, or `connected_area_component`, or if it has a description of 'laminar component', 'laminar text component', 'laminar text string component', 'conductive interconnect element with pre defined transitions', 'join 2 physical connectivity definition supporting', 'conductive interconnect element with user defined single transition', 'special symbol laminar component', 'primary stratum indicator symbol', or 'stratum feature template component', it shall be a `shape_aspect` for a `component_definition` with a `frame_of_reference` of 'layout occurrence'.

WR14: The `component_shape_aspect` shall be related to at most one `shape_aspect` as an 'instantiated template'.

WR15: If the `component_shape_aspect` has a description of 'join 2 physical connectivity definition supporting', the `component_shape_aspect` shall have exactly one `property_definition` that is related, as the 'requirement implementation', to exactly one `property_definition` that is the property of a `shape_aspect_relationship` that relates one `physical_connectivity_definition` to another `physical_connectivity_definition` as an 'ordered physical connectivity definition'.

Informal propositions:

IP1: If the `component_shape_aspect` has a description of 'conductive interconnect element with pre defined transitions', there shall be at least one `shape_aspect_relationship` with name of 'connected points' that relates the `component_shape_aspect` (as `relating_shape_aspect`) to one `layer_connection_point_link` (as `related_shape_aspect`).

IP2: If the `component_shape_aspect` has a description of 'conductive interconnect element with pre defined transitions' or 'conductive interconnect element with user defined single transition', each `shape_aspect_relationship` that uses the `component_shape_aspect` as its `relating_shape_aspect` and has a name of 'connected points' shall have a unique description.

IP3: The aggregation of design views referenced by the path in the ARM of `stratum_feature_implementation.resident_stratum.assembly.assembly` shall be the same aggregation of design views as that reference by the path in the ARM of `assembly.assembly` when the `component_shape_aspect` is an implementation of the ARM concept of `Stratum_feature_template_component`

5.2.3.1.73 component_terminal

A `component_terminal` is a `shape_aspect` that implements the ARM concepts of:

- `Assembly_module_component_terminal` (see 4.2.45);
- `Assembly_module_macro_component_join_terminal` (see 4.2.49);
- `Bare_die_component_terminal` (see 4.2.62);
- `Component_terminal` (see 4.2.137);
- `Component_termination_passage_join_terminal` (see 4.2.149);
- `Conductive_interconnect_element_terminal` (see 4.2.172);
- `Interconnect_component_join_terminal` (see 4.2.439);
- `Interconnect_module_component_terminal` (see 4.2.445);
- `Interconnect_module_macro_component_join_terminal` (see 4.2.456);
- `Land_join_terminal` (see 4.2.492);
- `Minimally_defined_component_terminal` (see 4.2.546);
- `Non_functional_land_join_terminal` (see 4.2.564);
- `Package_terminal_occurrence` (see 4.2.583);

- Packaged_component_join_terminal (see 4.2.586);
- Printed_component_join_terminal (see 4.2.722);
- Via_terminal (see 4.2.954).

Formal propositions:

WR1: The component_terminal shall have a description of 'assembly module component terminal', 'bare die component terminal', 'component termination passage join terminal', 'conductive interconnect element terminal', 'interconnect component join terminal', 'interconnect module component terminal', 'land join terminal', 'minimally defined component terminal', 'non functional land join terminal', 'packaged component join terminal', 'printed component join terminal', 'package terminal occurrence', or 'via terminal' or shall be an assembly_module_macro_component_join_terminal or shall be an interconnect_module_macro_component_join_terminal.

WR2: The component_terminal shall be an aspect of the shape of a component_definition.

WR3: The component_terminal shall be related to at most one shape_aspect as the 'instantiated feature'.

WR4: The component_terminal shall be related to at most one physical_connectivity_definition as 'associated terminals'.

WR5: The component_terminal shall be related to at most one physical_network as the 'connectivity requirement'.

WR6: The component_terminal shall relate to at most one shape_aspect to specify the 'design usage'.

WR7: If the component_terminal has a description of 'assembly module component terminal', 'bare die component terminal', 'package terminal occurrence', 'packaged component join terminal', or 'printed component join terminal', it shall lie on the boundary of the shape.

WR8: If the component_terminal has a description of 'assembly module component terminal', it shall be an aspect of the shape of a component_definition that has a frame_of_reference name of 'physical occurrence' or it shall be an assembly_module_macro_component_join_terminal and it shall be an aspect of the shape of a component_definition that is associated with a product that is a 'assembly module'.

WR9: If the component_terminal has a description of 'assembly module component terminal', the component_terminal shall be related to exactly one assembly_module_terminal as an 'instantiated feature'.

WR10: If the component_terminal has a description of 'bare die component terminal', it shall be an aspect of the shape of a product_definition that has a description of 'bare die component'.

WR11: If the component_terminal has a description of 'bare die component terminal', the component_terminal shall be related to exactly one bare_die_terminal as the 'instantiated feature'.

WR12: If the `component_terminal` has a description of 'component termination passage join terminal', the `component_terminal` shall be related to exactly one `plated_passage` with a description of 'component termination passage' as the 'associated component'.

WR13: If the `component_terminal` has a description of 'component termination passage join terminal', the `component_terminal` shall be related to exactly one `shape_aspect` with a description of 'component termination passage template join terminal' as the 'instantiated feature'.

WR14: If the `component_terminal` has a description of 'conductive interconnect element terminal', the `component_terminal` shall be related to exactly one `component_shape_aspect` with a description of either 'conductive interconnect element with pre defined transitions' or 'conductive interconnect element with user defined single transition' as the 'associated component'.

WR15: If the `component_terminal` has a description of 'conductive interconnect element terminal', 'interconnect component join terminal' or 'printed component join terminal', the `component_terminal` shall relate to zero or one `shape_aspect` that has a name of 'connection zone'.

WR16: If the `component_terminal` has a description of 'interconnect module component terminal', it shall be an aspect of the shape of a `component_definition` that has a `frame_of_reference` name of 'physical occurrence' or it shall be an `interconnect_module_macro_component_join_terminal` and it shall be an aspect of the shape of a `component_definition` that is associated with a product that is a 'interconnect module'.

WR17: If the `component_terminal` has a description of 'interconnect module component terminal', the `component_terminal` shall be related to exactly one `interconnect_module_terminal` as the 'instantiated feature' where the `interconnect_module_terminal` is on a `product_definition` of a product that is an 'interconnect module'.

WR18: If the `component_terminal` has a description of either 'land join terminal' or 'non functional land join terminal', the `component_terminal` shall be related to exactly one `land_template_terminal` as the 'instantiated feature'.

WR19: If the `component_terminal` has a description of 'land join terminal', the `component_terminal` shall be related to exactly one `land` as the 'associated component'.

WR20: If the `component_terminal` has a description of 'minimally defined component terminal' the `component_terminal` shall be the definition of exactly one `property_definition_representation` with a `used_representation.name` of 'part terminal external reference'.

WR21: If the `component_terminal` has a description of 'non functional land join terminal', the `component_terminal` shall be related to exactly one `land` that has a description of 'non functional land', 'via dependent non functional land', 'via and contact size dependent non functional land', 'component termination passage dependent non functional land', 'contact size dependent non functional land', 'component termination passage and contact size dependent non functional land', or 'unsupported passage dependent non functional land' as the 'associated component'.

WR22: If the `component_terminal` has a description of 'package terminal occurrence', the `component_terminal` shall be related to exactly one `package_terminal` as the 'usage definition'.

WR23: If the `component_terminal` has a description of 'package terminal occurrence', or 'packaged component join terminal' it shall be an aspect of the shape of a `packaged_component` that has a `frame_of_reference` name of 'physical occurrence'.

WR24: If the `component_terminal` has a description of 'packaged component join terminal', the `component_terminal` shall be related to exactly one `packaged_part_terminal` with a description of 'join terminal' as the 'instantiated feature'.

WR25: If the `component_terminal` has a description of 'packaged component join terminal', it shall have at most one `property_definition` that has at most one representation that contains at most two `length_measure_with_units`.

WR26: If the `component_terminal` has a description of 'packaged component join terminal', it shall have at most one `property_definition` that has at most one representation that contains at most one `length_measure_with_unit` with a name of 'maximum wire length'.

WR27: If the `component_terminal` has a description of 'packaged component join terminal', it shall have at most one `property_definition` that has at most one representation that contains at most one `length_measure_with_unit` with a name of 'minimum wire length'.

WR28: If the `component_terminal` has a description of 'printed component join terminal', it shall be an aspect of the shape of a `component_definition` that has a `frame_of_reference` name of 'layout occurrence' and that is associated with a product that is an 'interconnect module'.

WR29: If the `component_terminal` has a description of 'printed component join terminal', the `component_terminal` shall be related to exactly one `printed_part_template_terminal` with a description of 'join terminal' as the 'instantiated feature'.

WR30: If the `component_terminal` has a description of 'printed component join terminal', the `component_terminal` shall be related, as an 'implementation', to exactly one `component_shape_aspect` with a description of `stratum_feature_template_component`.

WR31: If the `component_terminal` has a description of 'via terminal', the `component_terminal` shall be related to exactly one `plated_passage` that has a description of 'buried via', 'interfacial connection', 'bonded conductive base blind via', 'non conductive base blind via', or 'plated conductive base blind via' as the 'associated component'.

WR32: If the `component_terminal` has a description of 'via terminal', the `component_terminal` shall be related to exactly one `shape_aspect` with a description of 'via template terminal' as the 'instantiated feature'.

WR33: If the `component_terminal` has a description of 'interconnect component join terminal', it shall be an aspect of the shape of a `component_definition` that has a `frame_of_reference` name of 'physical occurrence' and that is associated with a product that does not have a description of 'assembly module component', 'bare die component', 'interconnect module component', 'laminated component', or 'packaged component'.

WR34: The `component_terminal` shall be the definition for at most one `property_definition` that is the definition of a `property_definition_representation` that has a used representation that has an item that is a `descriptive_representation_item` with a name of 'global swappable' and a description of 'true' or 'false'.

WR35: The `component_terminal` shall be the definition for at most one `property_definition` that is the definition of a `property_definition_representation` that has a used representation that has an item that is a `descriptive_representation_item` with a name of 'local swappable' and a description of 'true' or 'false'.

WR36: The `component_terminal` shall be the definition for at most one `property_definition` that is the definition of a `property_definition_representation` that has a used representation that has an item that is a `descriptive_representation_item` with a name of 'swap code'.

Informal propositions:

IP1: If the `component_terminal` has a description of either 'land join terminal' or 'non functional land join terminal', the `component_terminal` shall be associated with the stratum referenced by the `stratum_surface`.

5.2.3.1.74 `composite_array_shape_aspect`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `composite_array_shape_aspect` is a `composite_shape_aspect` that implements the ARM concept of `Part_array_feature` (see 4.2.604) .

EXPRESS specification:

```
*)
ENTITY composite_array_shape_aspect
  SUPERTYPE OF (ONEOF( linear_composite_array_shape_aspect,
                        rectangular_composite_array_shape_aspect))
  SUBTYPE OF (composite_shape_aspect);
END_ENTITY; -- composite_array_shape_aspect
(*
```

5.2.3.1.75 `composite_array_shape_aspect_link`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `composite_array_shape_aspect_link` is a `shape_aspect` and a `shape_aspect_relationship` that implements the ARM concept of `Part_feature_placement_link` (see 4.2.612)

EXPRESS specification:

```
*)
ENTITY composite_array_shape_aspect_link
  SUBTYPE OF (shape_aspect, shape_aspect_relationship);
WHERE
```

```

WR1: SELF\shape_aspect_relationship.related_shape_aspect :<>:
      SELF\shape_aspect_relationship.relate_shape_aspect;

WR2: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'SHAPE_ASPECT' IN
      TYPEOF (SELF\shape_aspect_relationship.related_shape_aspect);

WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'SHAPE_ASPECT' IN
      TYPEOF (SELF\shape_aspect_relationship.relate_shape_aspect);

WR4: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\shape_aspect ||
      SELF\shape_aspect_relationship ||
      SELF\composite_array_shape_aspect_link)) = 0;

WR5: SELF\shape_aspect.name = '';

WR6: SELF\shape_aspect_relationship.name = '';

WR7: SIZEOF(USEDIN(SELF,
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT')) = 1;
END_ENTITY; -- composite_array_shape_aspect_link
(*

```

Formal propositions:

WR1: The related element shall not be the relating element.

WR2: The composite_array_shape_aspect_link shall relate to a shape_aspect in the related_shape_aspect.

WR3: The composite_array_shape_aspect_link shall relate to a shape_aspect in the relating_shape_aspect.

WR4: The types of composite_array_shape_aspect_link shall be only composite_array_shape_aspect_link, shape_aspect, and shape_aspect_relationship.

WR5: The name attribute of the shape_aspect supertype shall be an empty string.

WR6: The name attribute of the shape_aspect_relationship supertype shall be an empty string.

WR7: Each composite_array_shape_aspect_link shall be referenced exactly once by a shape_aspect_relationship related_shape_aspect.

5.2.3.1.76 composite_group_shape_aspect

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `composite_group_shape_aspect` is a `composite_shape_aspect` that implements the ARM concept of `Composite_group_shape_element` (see 4.2.159).

EXPRESS specification:

```
*)
ENTITY composite_group_shape_aspect
  SUBTYPE OF (composite_shape_aspect);
END_ENTITY; -- composite_group_shape_aspect
(*
```

5.2.3.1.77 `composite_signal_property_relationship`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `composite_signal_property_relationship` is a `property_definition_relationship` that implements the ARM concept of `Composite_signal_property_relationship` (see 4.2.164)

EXPRESS specification:

```
*)
ENTITY composite_signal_property_relationship
  SUBTYPE OF (property_definition_relationship);
WHERE

  WR1: SELF\property_definition_relationship.related_property_definition.definition :<>:
        SELF\property_definition_relationship.relying_property_definition.definition;

  WR2: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\property_definition_relationship ||
        SELF\composite_signal_property_relationship || SELF\property_definition)) = 0;

  WR3: SELF\property_definition_relationship.related_property_definition.name =
        'signal property';

  WR4: SELF\property_definition_relationship.relying_property_definition.name =
        'composite signal property';

  WR5: SELF\property_definition.name = '';

  WR6: SELF\property_definition.description = '';

  WR7: SELF\property_definition_relationship.name = '';
```

```

WR8: SELF\property_definition_relationship.description = '';

WR9: ( 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'CHARACTERIZED_OBJECT' IN TYPEOF(SELF\property_definition.definition)) AND
      (SELF\property_definition.definition.description = 'aggregate operation');

WR10: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'EXTERNAL_DEFINITION' IN TYPEOF(SELF\property_definition.definition);
END_ENTITY; -- composite_signal_property_relationship
(*)

```

Formal propositions:

WR1: The composite_signal_property_relationship shall not relate to the same property_definition definition through the related and relating attributes.

WR2: The composite_signal_property_relationship shall not be any other subtype of property_definition_relationship or property_definition.

WR3: The composite_signal_property_relationship shall reference only a 'signal property' through the related attribute.

WR4: The composite_signal_property_relationship shall reference only a 'composite signal property' through the relating attribute.

WR5: The composite_signal_property_relationship name inherited from property_definition shall be blank.

WR6: The composite_signal_property_relationship description inherited from property_definition shall be blank.

WR7: The composite_signal_property_relationship name inherited from property_definition_relationship shall be blank.

WR8: The composite_signal_property_relationship description inherited from property_definition_relationship shall be blank.

WR9: The composite_signal_property_relationship shall reference exactly one characterized_object that has a description of 'aggregate operation'.

WR10: The composite_signal_property_relationship shall reference exactly one characterized_object that is also an external_definition.

5.2.3.1.78 composite_unit_shape_aspect

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A composite_unit_shape_aspect is a composite_shape_aspect that implements the ARM concept of Composite_unit_shape_element (see 4.2.167).

EXPRESS specification:

```

*)
ENTITY composite_unit_shape_aspect
  SUBTYPE OF (composite_shape_aspect);
END_ENTITY; -- composite_unit_shape_aspect
( *

```

5.2.3.1.79 concentricity_tolerance

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A concentricity_tolerance is a geometric_tolerance_with_specified_datum_system that implements the ARM concept of Concentricity_and_coaxiality_tolerance (see 4.2.168).

EXPRESS specification:

```

*)
ENTITY concentricity_tolerance
  SUBTYPE OF (geometric_tolerance_with_specified_datum_system);
WHERE

  WR1: SELF\geometric_tolerance.name = 'concentricity';
END_ENTITY; -- concentricity_tolerance
( *

```

Formal propositions:

WR1: The name for the concentricity_tolerance shall be 'concentricity'.

Informal propositions:

IP1: The tolerated_shape_aspect of the concentricity_tolerance shall either be a centre_of_symmetry with a description of either 'axis' or 'point'; or a composite_shape_aspect in which the 'composing' shape_aspects are all of type centre_of_symmetry and have the same description, either 'axis' or 'point'.

IP2: The concentricity_tolerance shall have exactly one physical_unit_datum in its referenced datum_system.

IP3: If the tolerated_shape_aspect of the concentricity_tolerance is either a centre_of_symmetry with a description of 'point', or a composite_shape_aspect in which the 'composing' shape_aspects are all of type centre_of_symmetry with a description of 'point'; the physical_unit_datum of the datum_system shall have a description of 'point'.

IP4: If the `toleranced_shape_aspect` of the `concentricity_tolerance` is either a `centre_of_symmetry` with a description of 'axis', or a `composite_shape_aspect` in which the 'composing' `shape_aspects` are all of type `centre_of_symmetry` with a description of 'axis'; the `physical_unit_datum` of the `datum_system` shall have a description of 'axis'.

IP5: The `tolerance_zone_boundary` of the `concentricity_tolerance` shall have a description of 'circular or cylindrical or spherical'.

5.2.3.1.80 `conductance_measure_with_unit`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `conductance_measure_with_unit` is a `measure_with_unit` that implements the ARM concept of `Conductance_measure_with_unit` (see ??).

EXPRESS specification:

```
*)
ENTITY conductance_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

  WR1: sizeof(typeof(self) - (typeof(self\measure_with_unit ||
    self\conductance_measure_with_unit))) = 0;

  WR2: self\measure_with_unit.unit_component\si_unit.name = siemens;

  WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
    typeof(self\measure_with_unit.unit_component);
END_ENTITY; -- conductance_measure_with_unit
(*
```

Formal propositions:

WR1: The `conductance_measure_with_unit` shall not be any other type of `measure_with_unit`.

WR2: The `conductance_measure_with_unit` shall reference an `si_unit` with the name of `siemens`.

WR3: The `unit_component` shall be an `si_unit`.

5.2.3.1.81 `conductive_interconnect_element_terminal_link`

A `conductive_interconnect_element_terminal_link` is a `shape_aspect` and a `shape_aspect_relationship` that implements the ARM concept of `Conductive_interconnect_element_terminal_link` (see 4.2.173).

EXPRESS specification:

```

*)
ENTITY conductive_interconnect_element_terminal_link
  SUBTYPE OF (shape_aspect, shape_aspect_relationship);
WHERE

  WR1: SELF\shape_aspect_relationship.related_shape_aspect :<>:
        SELF\shape_aspect_relationship.relate_shape_aspect;

  WR2: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'COMPONENT_TERMINAL' IN
        TYPEOF (SELF\shape_aspect_relationship.related_shape_aspect);

  WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'COMPONENT_TERMINAL' IN
        TYPEOF (SELF\shape_aspect_relationship.relate_shape_aspect);

  WR4: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\shape_aspect ||
        SELF\shape_aspect_relationship ||
        SELF\conductive_interconnect_element_terminal_link)) = 0;

  WR5: SELF\shape_aspect.name = '';

  WR6: SELF\shape_aspect_relationship.name = '';

  WR7: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'COMPONENT_DEFINITION' IN
        TYPEOF (SELF\shape_aspect.of_shape.definition);

  WR8: SELF\shape_aspect_relationship.related_shape_aspect.description = 'conductive interconnect_element_terminal';

  WR9: SELF\shape_aspect_relationship.relate_shape_aspect.description = 'conductive interconnect_element_terminal';

  WR10: SELF\shape_aspect.of_shape.definition\product_definition.description = 'laminate conductive interconnect_element_terminal';
END_ENTITY; -- conductive_interconnect_element_terminal_link
(

```

Formal propositions:

WR1: The related point shall not be the relating point.

WR2: The conductive_interconnect_element_terminal_link shall relate to only a conductive_interconnect_element_terminal in the related_shape_aspect.

WR3: The `conductive_interconnect_element_terminal_link` shall relate to only a `conductive_interconnect_element_terminal` in the `relating_shape_aspect`.

WR4: The types of `conductive_interconnect_element_terminal_link` shall be only `conductive_interconnect_element_terminal_link`, `shape_aspect`, and `shape_aspect_relationship`.

WR5: The name attribute of the `shape_aspect` supertype shall be an empty string.

WR6: The name attribute of the `shape_aspect_relationship` supertype shall be an empty string.

WR7: The `shape_aspect` supertype shall reference a `component_definition`

WR8: The related `shape_aspect` description shall be a 'conductive interconnect element terminal'.

WR9: The relating `shape_aspect` description shall be a 'conductive interconnect element terminal'.

WR10: The associated `product_definition` description shall be a 'laminated component'.

5.2.3.1.82 **connected_area_component**

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `connected_area_component` is a `component_shape_aspect` that implements the ARM concept of `Connected_area_component` (see 4.2.183)

EXPRESS specification:

*)

```
ENTITY connected_area_component
  SUBTYPE OF (component_shape_aspect);
WHERE
```

```
WR1: ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'COMPONENT_DEFINITION' IN
      TYPEOF (SELF.of_shape.definition)) AND
      (SIZEOF (QUERY (prpc <*
        USEDIN (SELF.of_shape.definition.formation.of_product,
        'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'PRODUCT_RELATED_PRODUCT_CATEGORY.PRODUCTS') |
        prpc\product_category.name = 'template model')) >= 1);
```

```
WR2: SIZEOF (QUERY (sfi <* QUERY (sar <* USEDIN (SELF,
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
      sar\shape_aspect_relationship.name = 'stratum feature implementation') |
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'STRATUM_FEATURE' IN
      TYPEOF (sfi.relying_shape_aspect))) = 1;
```

```

WR3: SIZEOF (QUERY (sfi <* QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name = 'associated layer connection point') |
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'LAYER_CONNECTION_POINT' IN
    TYPEOF (sfi.relateing_shape_aspect))) >= 1;

WR4: SELF\shape_aspect.description = 'stratum feature template component';

WR5: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\shape_aspect ||
    SELF\component_shape_aspect||
    SELF\connected_area_component)) = 0;
END_ENTITY; -- connected_area_component
(*

```

Formal propositions:

WR1: The `connected_area_component` shall be an aspect of the shape of a `component_definition` that is the definition of a product that is categorized as an 'template module'.

WR2: The `connected_area_component` shall be related to exactly one `stratum_feature` as a 'stratum feature implementation'.

WR3: The `connected_area_component` shall be related to at least one `layer_connection_point` as an 'associated layer connection point'.

WR4: The `connected_area_component` shall have a description of 'stratum feature template component'.

WR5: The `connected_area_component` shall not be a complex instance other than with its direct super-types.

5.2.3.1.83 connection_zone_based_assembly_joint

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `connection_zone_based_assembly_joint` is an `assembly_joint` that includes the identification of the connection zones that are to be mated in addition to the specific features that are to be mated. A `connection_zone_based_assembly_joint` implements the ARM concept of `Connection_zone_based_assembly_joint` (see 4.2.186).

EXPRESS specification:

```

*)
ENTITY connection_zone_based_assembly_joint
  SUBTYPE OF (assembly_joint);
WHERE

  WR1: SIZEOF (QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name = 'zone 1')) = 1;

  WR2: SIZEOF (QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name = 'zone 2')) = 1;

  WR3: SIZEOF (QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
    sar.relating_shape_aspect\shape_aspect.description = 'connection zone')) = 2;

END_ENTITY; -- connection_zone_based_assembly_joint
(

```

Formal propositions:

WR1: The connection_zone_based_assembly_joint shall be related to exactly one shape_aspect as 'zone 1' by a shape_aspect_relationship.related_shape_aspect.

WR2: The connection_zone_based_assembly_joint shall be related to exactly one shape_aspect as 'zone 2' by a shape_aspect_relationship.relating_shape_aspect.

WR3: The connection_zone_based_assembly_joint shall be related to only shape_aspects with a description of 'connection_zone'.

5.2.3.1.84 connection_zone_based_fabrication_joint

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A connection_zone_based_fabrication_joint is an fabrication_joint that includes the identification of the connection zones that are to be mated in addition to the specific features that are to be mated. A connection_zone_based_fabrication_joint implements the ARM concept of Connection_zone_based_fabrication_joint (see 4.2.187).

EXPRESS specification:

```

*)
ENTITY connection_zone_based_fabrication_joint
  SUBTYPE OF (fabrication_joint);
WHERE

  WR1: SIZEOF (QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name = 'zone 1')) = 1;

  WR2: SIZEOF (QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name = 'zone 2')) = 1;

  WR3: SIZEOF (QUERY (sar <* USEDIN (SELF,

    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
    sar.relating_shape_aspect\shape_aspect.description = 'connection zone')) = 2;

END_ENTITY; -- connection_zone_based_fabrication_joint
( *

```

Formal propositions:

WR1: The connection_zone_based_fabrication_joint shall be related to exactly one shape_aspect as 'zone 1' by a shape_aspect_relationship.related_shape_aspect.

WR2: The connection_zone_based_fabrication_joint shall be related to exactly one shape_aspect as 'zone 2' by a shape_aspect_relationship.relating_shape_aspect.

WR3: The connection_zone_based_fabrication_joint shall be related to only shape_aspects with a description of 'connection_zone'.

5.2.3.1.85 connection_zone_interface_plane_relationship

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A connection_zone_interface_plane_relationship is a shape_aspect and shape_aspect_relationship that implements the ARM concept of Connection_zone_interface_plane_relationship (see 4.2.188).

EXPRESS specification:

```

*)
ENTITY connection_zone_interface_plane_relationship
  SUBTYPE OF (shape_aspect, shape_aspect_relationship);
UNIQUE
  UR1: SELF\shape_aspect_relationship.name;
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\shape_aspect_relationship ||

    dz.related_shape_aspect\shape_aspect.description = 'connection zone')) = 1;
END_ENTITY; -- connection_zone_interface_plane_relationship
(

```

Formal propositions:

UR1: The name shall be unique.

WR1: A connection_zone_interface_plane_relationship shall not be any other type of shape_aspect_relationship or any other type of shape_aspect.

WR2: A connection_zone_interface_plane_relationship shall relate to a seating_plane.

WR3: A connection_zone_interface_plane_relationship shall relate to a seating_plane, with a name of 'plane'.

WR4: A connection_zone_interface_plane_relationship shall relate to a shape_aspect with a description of 'connection zone'.

WR5: A connection_zone_interface_plane_relationship shall have a description of 'area' or 'edge'.

WR6: A connection_zone_interface_plane_relationship shall have the same of_shape through the shape_aspect supertype and through the related_shape_aspect in the shape_aspect_relationship supertype.

WR7: A connection_zone_interface_plane_relationship shall have the same of_shape through the shape_aspect supertype and through the relating_shape_aspect in the shape_aspect_relationship supertype.

WR8: A connection_zone_interface_plane_relationship shall be related to one shape_aspect with a description of 'connection zone' as the 'derived zone'.

5.2.3.1.86 connection_zone_map_identification

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A connection_zone_map_identification is a shape_aspect and a representation_relationship that implements the ARM concept of Connection_zone_map_identification (see 4.2.189)

EXPRESS specification:

*)

```
ENTITY connection_zone_map_identification
  SUBTYPE OF (shape_aspect, representation_relationship);
WHERE
```

```
  WR1: SELF\representation_relationship.rep_2 :<>:
        SELF\representation_relationship.rep_1;

        'USAGE_VIEW_CONNECTION_ZONE_TERMINAL_SHAPE_RELATIONSHIP' IN
  TYPEOF(SELF\representation_relationship.rep_1);
```

```
  WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'USAGE_VIEW_CONNECTION_ZONE_TERMINAL_SHAPE_RELATIONSHIP' IN
  TYPEOF(SELF\representation_relationship.rep_2);
```

```
  WR4: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\shape_aspect ||
        SELF\representation_relationship ||
        SELF\connection_zone_map_identification)) = 0;
```

```
  WR5: SELF\shape_aspect.name = '';
```

```

WR6: SELF\representation_relationship.name = '';

WR7: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'FOOTPRINT_DEFINITION' IN TYPEOF(SELF.of_shape.definition);
END_ENTITY; -- connection_zone_map_identification
(*)

```

Formal propositions:

- WR1:** The related zone shall not be the relating zone.
- WR2:** The connection_zone_map_identification shall relate to only a usage_view_connection_zone-terminal_shape_relationship in the rep_1.
- WR3:** The connection_zone_map_identification shall relate to only a usage_view_connection_zone-terminal_shape_relationship in the rep_2.
- WR4:** The types of connection_zone_map_identification shall be only connection_zone_map_identification, shape_aspect, and representation_relationship.
- WR5:** The name attribute of the shape_aspect supertype shall be an empty string.
- WR6:** The name attribute of the representation_relationship supertype shall be an empty string.
- WR7:** Each connection_zone_map_identification shall be a shape_aspect for a footprint_definition.

5.2.3.1.87 coordinated_representation_item

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A coordinated_representation_item is a representation and a representation_item that implements the ARM concepts of:

- Plus_minus_tolerance_characteristic (see 4.2.691);
- Statistical_tolerance_characteristic (see 4.2.842);
- Symmetrical_tolerance_characteristic (see 4.2.882);
- Tolerance_characteristic (see 4.2.911).

EXPRESS specification:

```

*)
ENTITY coordinated_representation_item
  SUBTYPE OF (representation, representation_item);
WHERE

```

```

WR1: SIZEOF (QUERY (pdr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +

) = 1)
);
END_ENTITY; -- coordinated_representation_item
( *

```

Formal propositions:

WR1: The coordinated_representation_item shall represent at most one property that is an element of at most one data_environment.

WR2: The coordinated_representation_item shall be referenced by exactly one document.

WR3: If the `coordinated_representation_item` has a `representation_item` name of 'tolerance', it shall contain at least one `measure_representation_item`.

WR4: If the `coordinated_representation_item` has a `representation_item` name of 'plus minus tolerance', it shall contain exactly three `measure_representation_items`.

WR5: If the `coordinated_representation_item` has a `representation_item` name of 'symmetrical tolerance', it shall contain exactly two `measure_representation_items`.

WR6: If the `coordinated_representation_item` has a `representation_item` name of 'plus minus tolerance', the three contained `measure_representation_items` shall have their `name` attribute satisfied by 'basic value', 'plus value', and 'minus value'.

WR7: If the `coordinated_representation_item` has a `representation_item` name of 'symmetrical tolerance', the two contained `measure_representation_items` shall have their `name` attribute satisfied by 'basic value' and 'deviation value'.

Informal propositions:

IP1: If the `coordinated_representation_item` has a `representation_item` name of 'plus minus tolerance', each contained `measure_representation_items` shall have the same `unit_components` for the `dimensions` attribute.

IP2: If the `coordinated_representation_item` has a `representation_item` name of 'plus minus tolerance', the `measure_representation_item` with a `name` attribute of 'minus value' shall have a `value_component` less than that of the `measure_representation_item` with a `name` attribute of 'basic value' which shall have a `value_component` less than that of the `measure_representation_item` with a `name` attribute of 'plus_value'.

5.2.3.1.88 `csg_2d_shape_representation`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `csg_2d_shape_representation` is a `shape_representation` that implements the ARM concept of `Area_2d_shape_definition` (see ??). A `csg_2d_shape_representation` is a two-dimensional `shape_representation` that represents the shape of a product using constructive solid geometry operations and techniques. The solid objects may be either 2D primitives, or half-space 2D solids.

EXPRESS specification:

```
* )
ENTITY csg_2d_shape_representation
  SUBTYPE OF (shape_representation);
  WHERE
```

```

WR1: SELF.context_of_items\
    geometric_representation_context.coordinate_space_dimension = 2;

WR2 : SIZEOF (QUERY (it <* SELF.items| NOT
    (SIZEOF(['ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.CSG_SOLID',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.MAPPED_ITEM',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.AXIS2_PLACEMENT_2D']
    * TYPEOF(it)) = 1 ))) = 0;

WR3: SIZEOF(QUERY ( it <* SELF.items |
    (SIZEOF(['ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.CSG_SOLID']
    * TYPEOF(it)) = 1)
OR
    (('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.MAPPED_ITEM'
    IN TYPEOF(it)) AND
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'CSG_2D_SHAPE_REPRESENTATION'
    IN TYPEOF(it\mapped_item.mapping_source.mapped_representation)))
    )) >= 1;

WR4: SIZEOF(QUERY ( it <* SELF.items |
    (('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.MAPPED_ITEM'
    IN TYPEOF(it)) AND (NOT ((
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'CSG_2D_SHAPE_REPRESENTATION')
    IN TYPEOF(it\mapped_item.mapping_source.mapped_representation)))))) = 0;

WR5: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\shape_representation ||
    SELF\csg_2d_shape_representation || SELF\representation)) = 0;
END_ENTITY; -- csg_2d_shape_representation
(*

```

Formal propositions:

WR1: The `geometric_representation_context` of the `csg_2d_shape_representation` shall have a `coordinate_space_dimension` equal to two.

WR2: The items in a `csg_2d_shape_representation` shall be a `csg_solid`, `mapped_item`, or an `axis2_placement_2d`.

WR3: At least one of the items in a `csg_2d_shape_representation` shall be a `csg_solid`, or a `mapped_item` with a `mapped_representation` of the `mapping_source` attribute of the type `csg_2d_shape_representation`.

WR4: If a `mapped_item` is in the items set then the `mapped_representation` of the `mapping_source` attribute shall be a `csg_2d_shape_representation`.

WR5: The `csg_2d_shape_representation` shall not be another type of `shape_representation`.

NOTE Since WR1 requires a coordinate_space_dimension equal to two, the leaves of the tree_root_expression in csg_solid can be built by only half_space_2d or primitive_2d elements.

5.2.3.1.89 curve_dimension

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A curve_dimension is a dimensional_size that implements the ARM concept of Curve_dimension (see 4.2.204).

EXPRESS specification:

```
*)
ENTITY curve_dimension
  SUBTYPE OF (dimensional_size);
WHERE

  WR1: SELF\dimensional_size.name <> 'angular' ;
END_ENTITY; -- curve_dimension
(*
```

Formal propositions:

WR1: The name of the curve_dimension shall not be 'angular'.

5.2.3.1.90 cutout_edge_segment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A cutout_edge_segment is an inter_stratum_feature and a shape_aspect_relationship that implements the ARM concept of Cutout_edge_segment (see 4.2.209).

EXPRESS specification:

```
*)
ENTITY cutout_edge_segment
  SUPERTYPE OF (plated_cutout_edge_segment)
  SUBTYPE OF (inter_stratum_feature, shape_aspect_relationship);
WHERE

  WR1: SELF\shape_aspect.description IN [
    'plated cutout edge segment',
    'cutout edge segment'];
```

```

WR2: sizeof (QUERY (cc <* QUERY (sar <* USEDIN (SELF,

    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name = 'composed cutout') |(
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'INTER_STRATUM_FEATURE' IN
    TYPEOF (cc.relatng_shape_aspect)) AND
(cc.relatng_shape_aspect\shape_aspect.description IN ['cutout',
    'physical connectivity interrupting cutout', 'plated cutout']))
    )) = 1;

WR3: ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'EDGE_SEGMENT_VERTEX' IN
    TYPEOF (SELF\shape_aspect_relationship.relatng_shape_aspect));

WR4: ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'EDGE_SEGMENT_VERTEX' IN
    TYPEOF (SELF\shape_aspect_relationship.related_shape_aspect));

WR5: SELF\shape_aspect_relationship.related_shape_aspect :<:
    SELF\shape_aspect_relationship.relatng_shape_aspect;
END_ENTITY; -- cutout_edge_segment
(*

```

Formal propositions:

WR1: The cutout_edge_segment shall have a name of 'cutout edge segment' and a relating_shape_aspect_description of 'cutout', 'physical connectivity interrupting cutout', or 'plated cutout'. 'plated cutout edge segment'.

WR2: The cutout_edge_segment shall relate to an edge_segment_vertex in the relating role.

WR3: The cutout_edge_segment shall relate to an edge_segment_vertex in the related role.

WR4: The relating_shape_aspect and the related_shape_aspect shall not be the same instance of shape_aspect.

Informal propositions:

IP1: The associated passage_technology shall have descriptive_representation_item with a description of 'true'.

5.2.3.1.91 data_set_representation_item

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A data_set_representation_item is a compound_representation_item that implements the ARM concept of Characteristic_data_set (see 4.2.99).

EXPRESS specification:

```

*)
ENTITY data_set_representation_item
  SUBTYPE OF (compound_representation_item);
WHERE

  WR1: SIZEOF (USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_GROUP_ASSIGNMENT.ITEMS')) > 0;

  WR2: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SET_REPRESENTATION_ITEM'
    IN TYPEOF(SELF\compound_representation_item.item_element);
END_ENTITY; -- data_set_representation_item
( *

```

Formal propositions:

WR1: The data_set_representation_item shall be referenced by exactly one applied_document_reference.

WR2: The item_element attribute shall be a list_representation_item.

5.2.3.1.92 datum_difference

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A datum_difference is a subtype of shape_aspect and shape_aspect_relationship that implements the ARM concept of Datum_difference (see 4.2.221)

EXPRESS specification:

```

*)
ENTITY datum_difference
  SUBTYPE OF (shape_aspect, shape_aspect_relationship);
WHERE

  WR1: ( 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PHYSICAL_UNIT_DATUM' IN TYPEOF
    (SELF\shape_aspect_relationship.relate_shape_aspect)) AND
    ( 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PHYSICAL_UNIT_DATUM' IN TYPEOF
    (SELF\shape_aspect_relationship.related_shape_aspect));

```

```

WR2: SELF\shape_aspect.name = SELF\shape_aspect_relationship.name;

WR3: SELF\shape_aspect.description = SELF\shape_aspect_relationship.
      description;

WR4: SELF\shape_aspect_relationship.relate_shape_aspect :<>:
      SELF\shape_aspect_relationship.related_shape_aspect;

WR5: SIZEOF (TYPEOF(SELF) - (TYPEOF(SELF\shape_aspect ||
      SELF\shape_aspect_relationship || SELF\datum_difference))) = 0;
END_ENTITY; -- datum_difference
(*)

```

Formal propositions:

- WR1:** The datum_difference shall be applied to only physical_unit_datum.
- WR2:** The datum_difference name attribute inherited shall be identical in each supertypes.
- WR3:** The datum_difference description attribute inherited shall be identical in each supertypes.
- WR4:** The datum_difference shall be applied to only different physical_unit_datum.
- WR5:** The datum_difference shall not be in a complex instance of other types of shape_aspect or shape_aspect_relationship.

5.2.3.1.93 datum_difference_analytical_model_port_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A datum_difference_analytical_model_port_assignment is a subtype of property_definition_representation that implements the ARM concept of Datum_difference_analytical_model_port_assignment (see 4.2.222)

EXPRESS specification:

```

*)
ENTITY datum_difference_analytical_model_port_assignment
  SUBTYPE OF (property_definition_representation);
WHERE

```

```

WR1: ( 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +

      )) = 0);
END_ENTITY; -- datum_reference_frame
(*

```

Formal propositions:

WR1: The datum_reference_frame shall not be a complex instance, except with the supertype shape_aspect.

WR2: The datum_reference_frame shall not lie on the boundary of the shape of the product.

WR3: The datum_reference_frame shall relate to at most three physical_unit_datum that have a description of 'axis' to specify the 'reference axis'.

WR4: The datum_reference_frame shall relate to at most three physical_unit_datum that have a description of 'plane' to specify the 'reference plane'.

WR5: The datum_reference_frame shall relate to at most one physical_unit_datum that has a description of 'point' to specify the 'reference origin'.

WR6: The datum_reference_frame shall be related to at least one datum_system as the 'established datum reference frame'.

WR7: The datum_reference_frame shall relate to at least one physical_unit_datum that has a description of 'axis' or 'plane' or 'point' to specify the 'reference axis' or 'reference plane' or 'reference origin', respectively.

WR8: Each 'reference origin' related to the datum_reference_frame shall also be a derived_shape_aspect that has a description of 'point'.

Informal propositions:

IP1: Each reference_axis shall be specified to be either a constituent of, or normal to each of the reference_planes and this specification shall be consistent with the mutually perpendicular reference_planes.

5.2.3.1.98 datum_system

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A datum_system is a shape_aspect that implements the ARM concept of Datum_system (see 4.2.236).

EXPRESS specification:

```

*)
ENTITY datum_system
  SUBTYPE OF (shape_aspect);
WHERE

  WR1: SELF\shape_aspect.product_definitional = False;

  WR2: (SIZEOF (QUERY (sar <* USEDIN(SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name =
      'established datum reference frame')) = 1);

  WR3: (SIZEOF (QUERY (sar <* USEDIN(SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name =
      'datum usage in datum system')) >= 1);

  WR4: (SIZEOF (QUERY (pd <* USEDIN(SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION.DEFINITION') |
    (pd\property_definition.description =
      'datum system property with material conditions')
    OR (pd\property_definition.description =
      'datum system property without material conditions')))) = 1);
END_ENTITY; -- datum_system
(

```

Formal propositions:

WR1: The datum_system shall not lie on the boundary of the shape of the product.

WR2: The datum_system shall relate to at exactly one shape_aspect to specify the 'established datum reference frame'.

WR3: The datum_system shall relate to at least one shape_aspect to specify the 'datum usage in datum system'.

WR4: The datum_system shall have exactly one property_definition that has the description of either 'datum system property with material conditions' or 'datum system property without material conditions'.

Informal propositions:

IP1: Any particular physical_unit_datum_feature shall be used no more than one time to establish the datum_system.

IP2: Any particular physical_unit_datum_target shall be used no more than one time to establish the datum_system.

5.2.3.1.99 datum_system_based_dimensional_location

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A datum_system_based_dimensional_location is a dimensional_location that implements the ARM concept of Dimension_location_with_specified_datum_system (see 4.2.293).

EXPRESS specification:

```
*)
ENTITY datum_system_based_dimensional_location
    SUBTYPE OF (dimensional_location);
END_ENTITY; -- datum_system_based_dimensional_location
(*
```

Informal propositions:

IP1: The datum_system_based_dimensional_location shall have exactly one property_definition with a description of 'dimensional location property', and that property_definition shall relate to a property_definition with a description of 'datum system property without material conditions' to specify the 'referenced datum system property'.

5.2.3.1.100 delete_design_object_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A delete_design_object_assignment is an action_assignment that implements the ARM concept of Delete_design_object_management_relationship (see 4.2.257).

EXPRESS specification:

```

*)
ENTITY delete_design_object_assignment
  SUBTYPE OF (action_assignment);
  items : SET [1:?] OF managed_design_object;
WHERE

  WR1: SIZEOF(QUERY(it <* SELF.items |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
     'PRODUCT_DEFINITION_RELATIONSHIP' IN TYPEOF(it))
    AND (it\product_definition_relationship.name = 'design object deletion')) = 1;
END_ENTITY; -- delete_design_object_assignment
(*

```

Formal propositions:

WR1: The delete_design_object_assignment shall have exactly one item that is a product_definition_relationship with a name of 'design object deletion'.

Informal propositions:

IP1: The delete_design_object_assignment shall have exactly one item that is a managed_design_object that is not a product_definition_relationship with a name of 'design object deletion' and that is not referenced by another product_definition_relationship with a name of 'design object addition', 'design object change', or 'design object deletion' in the same design.

5.2.3.1.101 delete_design_object_request_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A delete_design_object_request_assignment is an action_request_assignment that implements the ARM concepts of Change_request (see 4.2.97) and Delete_design_object_management_relationship (see 4.2.257).

EXPRESS specification:

```

*)
ENTITY delete_design_object_request_assignment
  SUBTYPE OF (action_request_assignment);
  items : SET [1:?] OF managed_design_object;
WHERE

```

```

WR1: sizeof(QUERY(it <* SELF.items |
  ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
  'PRODUCT_DEFINITION_RELATIONSHIP' IN TYPEOF(it))
  AND (it\product_definition_relationship.name = 'design object deletion')) = 1;
END_ENTITY; -- delete_design_object_request_assignment
(*

```

Formal propositions:

WR1: The delete_design_object_request_assignment shall have exactly one item that is a product_definition_relationship with a name of 'design object deletion'.

Informal propositions:

IP1: The delete_design_object_request_assignment shall have exactly one item that is a managed_design_object that is not a product_definition_relationship with a name of 'design object deletion' and that is not referenced by another product_definition_relationship with a name of 'design object addition', 'design object change', or 'design object deletion' in the same design.

5.2.3.1.102 dependent_material_removal_feature_template

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A dependent_material_removal_feature_template is a part_template_definition that implements the ARM concept of Dependent_material_removal_feature_template (see 4.2.258)

EXPRESS specification:

```

*)
ENTITY dependent_material_removal_feature_template
  SUBTYPE OF (part_template_definition);
WHERE

```

```

WR1: SELF\shape_aspect.description = 'material removal feature template';

```

```

WR2: SIZEOF (QUERY (am <* QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name = 'associated template') |
    (('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'LAND_PHYSICAL_TEMPLATE' IN
    TYPEOF (am.relate_shape_aspect)) AND
    (am.relate_shape_aspect.description IN
    ['default attachment size and component termination passage based',
    'default attachment size based',
    'default attachment size and via based',
    'default component termination passage based',
    'default via based',
    'default unsupported passage based'])))
    )) = 1;
END_ENTITY; -- dependent_material_removal_feature_template
(*

```

Formal propositions:

WR1: The `dependent_material_removal_feature_template` shall have a description that is 'material removal feature template'.

WR2: The `dependent_material_removal_feature_template` shall be related to exactly one `land_physical_template` with a description of 'default attachment size and component termination passage based', or 'default attachment size based', or 'default attachment size and via based', or 'default component termination passage based', or 'default via based', or 'default unsupported passage based'.

5.2.3.1.103 design_layer_type_specific_padstack_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `design_layer_type_specific_padstack_definition` is a `product_definition` that implements the ARM concepts of: `Design_layer_type_specific_padstack_definition` (see ??)

EXPRESS specification:

```

*)
ENTITY design_layer_type_specific_padstack_definition
  SUBTYPE OF (padstack_definition);
END_ENTITY; -- design_layer_type_specific_padstack_definition
(*

```

5.2.3.1.104 design_make_from_relationship

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `design_make_from_relationship` is a `product_definition_relationship` that implements the ARM concept of `Engineering_make_from` (see 4.2.353).

EXPRESS specification:

```

*)
ENTITY design_make_from_relationship
  SUBTYPE OF (product_definition_relationship);
WHERE

  WR1: SIZEOF ([ 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PHYSICAL_UNIT',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'FUNCTIONAL_UNIT' ] *
    TYPEOF (SELF.relying_product_definition)) = 1;

  WR2: SIZEOF ([ 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PHYSICAL_UNIT',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'FUNCTIONAL_UNIT' ] *
    TYPEOF (SELF.related_product_definition)) = 1;

  WR3: SIZEOF( QUERY(pds <* USEDIN(SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION_DEFINITION') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_DEFINITION_SHAPE' IN TYPEOF(pds)))) = 0;
END_ENTITY; -- design_make_from_relationship
( *
```

Formal propositions:

WR1: The `design_make_from_relationship` shall reference a `physical_unit` or a `functional_unit` as its `relying_product_definition`.

WR2: The `design_make_from_relationship` shall reference a `physical_unit` or a `functional_unit` as its `related_product_definition`.

WR3: The `design_make_from_relationship` shall not be the definition of a `product_definition_shape`.

5.2.3.1.105 **design_object**

A `design_object` is a `characterized_object` that implements the ARM concept of `Layout_spacing_requirement_occurrence` (see 4.2.509).

EXPRESS specification:

```

*)
ENTITY design_object
  SUBTYPE OF (characterized_object);
END_ENTITY; -- design_object
( *

```

5.2.3.1.106 device_terminal_map

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A device_terminal_map is a shape_aspect and a shape_aspect_relationship that implements the ARM concept of Device_terminal_map (see 4.2.285).

EXPRESS specification:

```

*)
ENTITY device_terminal_map
  SUBTYPE OF (shape_aspect, shape_aspect_relationship);
UNIQUE
  UR1: SELF\shape_aspect_relationship.related_shape_aspect,
        SELF\shape_aspect_relationship.relying_shape_aspect;
WHERE

  WR1: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'PACKAGED_PART_TERMINAL'
        IN TYPEOF (SELF.relying_shape_aspect);
END_ENTITY; -- device_terminal_map
( *

```

Formal propositions:

UR1: The combination of related_shape_aspect and relating_shape_aspect of shape_aspect_relationship shall be unique within a population of device_terminal_map.

WR1: The relating_shape_aspect shall be a packaged_part_terminal.

5.2.3.1.107 dimensional_location_with_direction

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A dimensional_location_with_direction is a dimensional_location that implements the ARM concept of Dimension_location_with_direction_vector (see 4.2.292).

EXPRESS specification:

```

*)
ENTITY dimensional_location_with_direction
  SUBTYPE OF (dimensional_location);
WHERE

  WR1: SELF\shape_aspect_relationship.description = 'linear';
END_ENTITY; -- dimensional_location_with_direction
( *

```

Formal propositions:

WR1: The description of the `dimensional_location_with_direction` shall be 'linear'.

Informal propositions:

IP1: The `dimensional_location_with_direction` shall have exactly one `property_definition` with a description of 'dimensional location property', and that `property_definition` either shall be represented by a representation that contains a placement with a name of 'orientation' or shall relate to a `property_definition` with a description of 'datum based vector orientation' to specify the 'measurement orientation'.

IP2: If the `dimensional_location_with_direction` has a `property_definition` with a description of 'dimensional location property' and that `property_definition` relates to a `property_definition` with a description of 'datum based vector orientation' to specify the 'measurement orientation', the combination of the `shape_aspect` specified as the `related_shape_aspect`, the `shape_aspect` specified as the `relating_shape_aspect`, and the `property_definition` with a description of 'datum based vector orientation' shall be unique.

IP3: If the `dimensional_location_with_direction` has a `property_definition` with a description of 'dimensional location property' and that `property_definition` is represented by a representation that contains a placement with a name of 'orientation', the combination of the `shape_aspect` specified as the `related_shape_aspect`, the `shape_aspect` specified as the `relating_shape_aspect`, and the placement with a name of 'orientation' shall be unique.

5.2.3.1.108 dimensional_size_property

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `dimensional_size_property` is a `dimensional_size` and a `property_definition`.

EXPRESS specification:

```

*)
ENTITY dimensional_size_property
  SUBTYPE OF (dimensional_size, property_definition);
END_ENTITY; -- dimensional_size_property
( *

```

5.2.3.1.109 directed_dimensional_location

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A directed_dimensional_location is a dimensional_location that implements the ARM concept of Dimensional_location (see 4.2.300) where the ARM attribute "directed" of that concept has a value of TRUE.

EXPRESS specification:

```

*)
ENTITY directed_dimensional_location
  SUBTYPE OF (dimensional_location);
END_ENTITY; -- directed_dimensional_location
( *

```

5.2.3.1.110 discrete_shield

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A discrete_shield is a component_definition that implements the ARM concept of Shield (see 4.2.821) when the shield is comprised of a component or components that are manufactured separately from the interconnect component.

EXPRESS specification:

```

*)
ENTITY discrete_shield
  SUBTYPE OF (component_definition);
WHERE

  WR1: SELF.frame_of_reference.name = 'physical occurrence';

```

```

WR2: SIZEOF (QUERY (si <* QUERY (pdr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_DEFINITION_RELATIONSHIP.RELATED_PRODUCT_DEFINITION') |
    pdr\product_definition_relationship.name = 'shielded item') |
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'COMPONENT_DEFINITION' IN
    TYPEOF (si.relatng_product_definition))) >= 1;
END_ENTITY; -- discrete_shield
(*

```

Formal propositions:

WR1: The discrete_shield shall have a frame_of_reference name of 'physical occurrence'.

WR2: The discrete_shield shall be related to at least one component_definition or at least one component_shape_aspect as the 'shielded item'.

5.2.3.1.111 document_identifier

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A document_identifier is a group that specifies an identifier qualified by a name for a document.

EXPRESS specification:

```

*)
ENTITY document_identifier
  SUBTYPE OF (group);
UNIQUE
  UR1: SELF\group.name, SELF\group.description;
WHERE

  WR1: SIZEOF (USEDIN(SELF, '')) = 1;
END_ENTITY; -- document_identifier
(*

```

Formal propositions:

UR1: The combination of name and description inherited from group shall be unique.

WR1: A document_identifier shall be referenced exactly once.

5.2.3.1.112 document_identifier_assignment

A document_identifier_assignment is a group_assignment that specifies one or more of document_identifier_assigned_item. If there are more than one, then the items are all revisions of the same drawing.

EXAMPLE 1 A schematic diagram may have a base identifier and each revision identification of that diagram differs from other revisions identification only in the document.description.

NOTE Due to a constraint on document_identifier, no member of document_identifier may be referenced more than once, guaranteeing uniqueness of assigned_group.

EXPRESS specification:

```
*)
ENTITY document_identifier_assignment
  SUBTYPE OF (group_assignment);
  SELF\group_assignment.assigned_group : document_identifier;
  items : SET [1:?] OF document_identifier_assigned_item;
END_ENTITY; -- document_identifier_assignment
(*
```

5.2.3.1.113 dose_equivalent_measure_with_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A dose_equivalent_measure_with_unit is a measure_with_unit that implements the ARM concept of Dose_equivalent_measure_with_unit (see ??).

EXPRESS specification:

```
*)
ENTITY dose_equivalent_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\measure_with_unit ||
    SELF\dose_equivalent_measure_with_unit))) = 0;

  WR2: SELF\measure_with_unit.unit_component\si_unit.name = sievert;

  WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
    TYPEOF(SELF\measure_with_unit.unit_component);
END_ENTITY; -- dose_equivalent_measure_with_unit
(*
```

Formal propositions:

WR1: The dose_equivalent_measure_with_unit shall not be any other type of measure_with_unit.

WR2: The dose_equivalent_measure_with_unit shall reference an si_unit with the name of sievert.

WR3: The unit_component shall be an si_unit.

5.2.3.1.114 edge_based_2d_wireframe_shape_representation

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An edge_based_2d_wireframe_shape_representation is a shape_representation that implements the ARM concepts of Edge_based_2d_wireframe (see 4.2.309) and Edge_based_wireframe (see 4.2.310).

EXPRESS specification:

```

*)
ENTITY edge_based_2d_wireframe_shape_representation
  SUBTYPE OF (shape_representation);
WHERE

  WR1: SIZEOF (QUERY (it <* SELF\representation.items |
    NOT (SIZEOF (

  TYPEOF (it)) |
  NOT ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'EDGE_BASED_2D_WIREFRAME_SHAPE_REPRESENTATION' IN
    TYPEOF (mi\mapped_item.mapping_source.mapped_representation)))) = 0;

WR10: SELF\representation.
  context_of_items\geometric_representation_context.
  coordinate_space_dimension = 2;
END_ENTITY; -- edge_based_2d_wireframe_shape_representation
(*

```

Formal propositions:

WR1: The items in an edge_based_2d_wireframe_shape_representation shall be an edge_based_wireframe_model, a mapped_item, or an axis2_placement_2d.

WR2: At least one of the items in an edge_based_2d_wireframe_shape_representation shall be either an edge_based_wireframe_model or a mapped_item.

WR3: Every edge in an `edge_based_wireframe_model` shall be an `edge_curve`.

WR4: Every polyline that underlies an edge of an `edge_based_wireframe_model` shall be defined by more than two distinct points.

WR5: Every vertex defined for an `edge_based_wireframe_model` shall be a `vertex_point`.

WR6: The `edge_geometry` that underlies an edge for an `edge_based_wireframe_model` shall be a line, circle, ellipse, parabola, hyperbola, `b_spline_curve`, `offset_curve_2d`, `polyline`, or a `curve_replica`. For each curve that has a basis defined by another curve, the basis curve shall be one of these types also.

WR7: The `vertex_geometry` that underlies the edges for an `edge_based_wireframe_model` shall be a `cartesian_point` or `point_replica` and the `point_replica` shall replicate either another `point_replica` or a `cartesian_point`.

WR8: All conics shall be positioned by an `axis2_placement_2d`.

WR9: If there is a `mapped_item` in an `edge_based_2d_wireframe_shape_representation`, the source of the `mapped_item` shall be an `edge_based_2d_wireframe_shape_representation`.

WR10: The `edge_based_2d_wireframe_shape_representation` shall have a `coordinate_space_dimension` equal to two.

5.2.3.1.115 `edge_segment_cross_section`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `edge_segment_cross_section` is a `volume_shape_intersection` that implements the ARM concept of `Edge_segment_cross_section` (see 4.2.311).

EXPRESS specification:

```
*)
ENTITY edge_segment_cross_section
  SUBTYPE OF (volume_shape_intersection);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\representation ||
    SELF\representation_relationship ||
    SELF\shape_representation_relationship ||
    SELF\volume_shape_intersection ||
    SELF\edge_segment_cross_section))) = 0;
END_ENTITY; -- edge_segment_cross_section
(*
```

Formal propositions:

WR1: The `edge_segment_cross_section` shall not be a complex subtype of other than its direct super-types.

5.2.3.1.116 edge_segment_vertex

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An edge_segment_vertex is a physical_unit_datum that implements the ARM concept of Edge_segment_vertex (see 4.2.312).

EXPRESS specification:

```

*)
ENTITY edge_segment_vertex
  SUBTYPE OF (physical_unit_datum);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\physical_unit_datum ||
    SELF\edge_segment_vertex)) = 0;

  WR2: SIZEOF (QUERY (pd <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION.DEFINITION') |
    pd\property_definition.description = 'shape element characterization'
  )) = 1;

  WR3: SELF\shape_aspect.of_shape\property_definition.definition.
    frame_of_reference\application_context_element.name
    IN ['physical design occurrence', 'physical design usage'];

  WR4: SELF\shape_aspect.name = 'single datum';
END_ENTITY; -- edge_segment_vertex
(

```

Formal propositions:

WR1: The edge_segment_vertex shall not participate in a complex instance of shape_aspect other than with the physical_unit_datum supertype.

WR2: The edge_segment_vertex shall be related to one representation with a name of 'shape element characterization'.

WR3: The edge_segment_vertex shall be in the 'physical design occurrence' or 'physical design usage' context.

WR4: The edge_segment_vertex shall be a single datum.

5.2.3.1.117 ee_specification

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An ee_specification is a document which implements the ARM concepts of:

- Assembly_technology_specification (see 4.2.55);
- Design_specification (see 4.2.280);
- Ee_specification (see 4.2.338);
- Fabrication_technology_specification (see 4.2.369);
- Interface_specification (see 4.2.472);
- Language_reference_manual (see 4.2.497);
- Lead_form_specification (see 4.2.510);
- Material_specification (see 4.2.537);
- Process_specification (see 4.2.740);
- Surface_finish_specification (see 4.2.880);
- Test_specification (see 4.2.898).

EXPRESS specification:

```

*)
ENTITY ee_specification
  SUBTYPE OF (document);
WHERE

  WR1: SIZEOF (QUERY (apoa <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_PERSON_AND_ORGANIZATION_ASSIGNMENT.ITEMS') |
    apoa.role\person_and_organization_role.name = 'document source')) +
    SIZEOF (QUERY (apoa <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_ORGANIZATION_ASSIGNMENT.ITEMS') |
    apoa.role\organization_role.name = 'document source')) >= 1;

```

```

WR2: SELF\document.kind\document_type.product_data_type IN
    ['assembly technology specification',
     'design specification', 'fabrication technology specification',
     'interface specification', 'language reference manual',
     'lead form specification', 'material specification',
     'reference document', 'source code',
     'process specification', 'surface finish specification',
     'test specification'];
END_ENTITY; -- ee_specification
(*)

```

Formal propositions:

WR1: The ee_specification shall have at least one organization or person_and_organization specified as its 'document source'.

WR2: The ee_specification shall be a assembly_technology_specification, design_specification, fabrication_technology_specification, interface_specification, language_reference_manual, lead_form_specification, material_specification, reference document, source code, process_specification, surface_finish_specification, or a test_specification.

5.2.3.1.118 electric_charge_measure_with_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An electric_charge_measure_with_unit is a measure_with_unit that implements the ARM concept of Electric_charge_measure_with_unit (see ??).

EXPRESS specification:

```

*)
ENTITY electric_charge_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\measure_with_unit ||
    SELF\electric_charge_measure_with_unit))) = 0;

  WR2: SELF\measure_with_unit.unit_component\si_unit.name = coulomb;

  WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
    TYPEOF(SELF\measure_with_unit.unit_component);
END_ENTITY; -- electric_charge_measure_with_unit
(*)

```

Formal propositions:

WR1: The electric_charge_measure_with_unit shall not be any other type of measure_with_unit.

WR2: The electric_charge_measure_with_unit shall reference an si_unit with the name of coulomb.

WR3: The unit_component shall be an si_unit.

5.2.3.1.119 electrical_isolation_component_shape_aspect

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An electrical_isolation_component_shape_aspect is a filled_area_material_removal_component_shape_aspect that implements the ARM concept of Electrical_isolation_laminate_component (see 4.2.342).

EXPRESS specification:

```
*)
ENTITY electrical_isolation_component_shape_aspect
  SUBTYPE OF (filled_area_material_removal_component_shape_aspect);
END_ENTITY; -- electrical_isolation_component_shape_aspect
(*
```

5.2.3.1.120 electrical_isolation_removal_template_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An electrical_isolation_removal_template_definition is a part_template_definition that implements the ARM concept of Electrical_isolation_removal_template (see 4.2.344) .

EXPRESS specification:

```
*)
ENTITY electrical_isolation_removal_template_definition
  SUBTYPE OF (part_template_definition);
(*
WHERE
```

```

5.2.3.1.121 electrical_network

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `electrical_network` is a `functional_unit` that implements the ARM concept of `Electrical_network_-definition` (see 4.2.345).

EXPRESS specification:

```
*)
ENTITY electrical_network
  SUBTYPE OF (functional_unit);
END_ENTITY; -- electrical_network
(*
```

5.2.3.1.122 `electromotive_force_measure_with_unit`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `electromotive_force_measure_with_unit` is a `measure_with_unit` that implements the ARM concept of `Electromotive_force_measure_with_unit` (see ??).

EXPRESS specification:

```
*)
ENTITY electromotive_force_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

  WR1: sizeof(typeof(self) - (typeof(self\measure_with_unit ||
    self\electromotive_force_measure_with_unit))) = 0;

  WR2: self\measure_with_unit.unit_component\si_unit.name = volt ;

  WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
    typeof(self\measure_with_unit.unit_component);
END_ENTITY; -- electromotive_force_measure_with_unit
(*
```

Formal propositions:

WR1: The `electromotive_force_measure_with_unit` shall not be any other type of `measure_with_unit`.

WR2: The `electromotive_force_measure_with_unit` shall reference an `si_unit` with a name of `volt`.

WR3: The `unit_component` shall be an `si_unit`.

5.2.3.1.123 `energy_measure_with_unit`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An energy_measure_with_unit is a measure_with_unit that implements the ARM concept of Energy_measure_with_unit (see ??).

EXPRESS specification:

```
*)
ENTITY energy_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\measure_with_unit ||
    SELF\energy_measure_with_unit))) = 0;

  WR2: SELF\measure_with_unit.unit_component\si_unit.name = joule;

  WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
    TYPEOF(SELF\measure_with_unit.unit_component);
END_ENTITY; -- energy_measure_with_unit
(*
```

Formal propositions:

WR1: The energy_measure_with_unit shall not be any other type of measure_with_unit.

WR2: The energy_measure_with_unit shall reference an si_unit with a name of joule.

WR3: The unit_component shall be an si_unit.

5.2.3.1.124 evaluated_characteristic

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An evaluated_characteristic is a representation and a representation_relationship that implements the ARM concept of Evaluated_characteristic (see 4.2.356).

EXPRESS specification:

```

*)
ENTITY evaluated_characteristic
  SUBTYPE OF (representation, representation_relationship);
UNIQUE
  UR1: SELF\representation_relationship.rep_1, SELF\representation_relationship.rep_2;
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\representation ||
    SELF\representation_relationship ||
    SELF\representation_relationship_with_transformation ||
    SELF\evaluated_characteristic))) = 0;

  WR2: SELF\representation_relationship.rep_1 <>
    SELF\representation_relationship.rep_2;

  WR3: SELF\representation_relationship.name = '';

  WR4: SELF\representation.name = '';

  WR5: SELF\representation_relationship.rep_1.name = 'planned characteristic';
END_ENTITY; -- evaluated_characteristic
(*

```

Formal propositions:

UR1: The combination of rep_1 and rep_2 shall be unique within a population of evaluated_characteristic.

WR1: The evaluated_characteristic shall only be a representation, representation_relationship, or representation_relationship_with_transformation in addition to itself.

WR2: The evaluated_characteristic rep_1 shall not be the rep_2.

WR3: The name attribute inherited from representation_relationship shall be an empty string.

WR4: The name attribute inherited from representation shall be an empty string.

WR5: The name attribute of representation_relationship.rep_1 shall be 'planned characteristic'.

5.2.3.1.125 evaluation_product_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An evaluation_product_definition is a product_definition that implements the ARM concept of: Evaluation_product_definition (see 4.2.357)

EXPRESS specification:

```

*)
ENTITY evaluation_product_definition
  SUBTYPE OF (product_definition);
END_ENTITY; -- evaluation_product_definition
( *

```

5.2.3.1.126 external_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An external_definition is a characterized_object and an externally_defined_representation_item and a descriptive_representation_item that implements the ARM concept of External_definition (see 4.2.361).

EXPRESS specification:

```

*)
ENTITY external_definition
  SUPERTYPE OF(ONEOF(bond_category))
  SUBTYPE OF (characterized_object, descriptive_representation_item,
              externally_defined_representation_item);
WHERE

  WR1: SIZEOF (USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DOCUMENT_REFERENCE.ITEMS')) = 1;
END_ENTITY; -- external_definition
( *

```

Formal propositions:

WR1: The external_definition shall be referenced by exactly one document.

5.2.3.1.127 externally_defined_assembly_definition

An externally_defined_assembly_definition is an externally_defined_physical_unit that implements the ARM concept of Pca_usage_view (see 4.2.641).

EXPRESS specification:

```

*)
ENTITY externally_defined_assembly_definition
  SUBTYPE OF (externally_defined_physical_unit);
WHERE

  WR1: EXISTS(SELF\product_definition.name);

  WR2: NOT EXISTS(SELF\product_definition.name) OR
        (SELF\product_definition.name = 'assembly module');

  WR3: (NOT (SELF.frame_of_reference\application_context_element.name = 'physical design usage'
        OR (SIZEOF (QUERY (pd <* USEDIN (SELF,
        'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'PROPERTY_DEFINITION.DEFINITION') |

    'BARE_DIE_TERMINAL' IN
    TYPEOF (sa))) >= 2))) = 0;
END_ENTITY; -- externally_defined_bare_die
(

```

Formal propositions:

WR1: The externally_defined_bare_die shall be related to exactly one functional_unit with a frame_of_reference name of 'functional design usage' as the 'implemented function'.

WR2: The externally_defined_bare_die shall have exactly one property_definition that is related to exactly one property_definition with a name of 'unit technology' as the 'device unit technology'.

WR3: The externally_defined_bare_die shall have at least two shape_aspects that are bare_die_terminals.

5.2.3.1.129 externally_defined_functional_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An externally_defined_functional_unit is a functional_unit and an externally_defined_product_definition that implements the ARM concepts of:

- Ee_product_definition (see 4.2.323);
- Externally_defined_ee_product_definition (see 4.2.364);
- Functional_unit_definition (see 4.2.401);
- Functional_unit_usage_view (see 4.2.410).

EXPRESS specification:

```

*)
ENTITY externally_defined_functional_unit
  SUBTYPE OF (functional_unit, externally_defined_product_definition);
END_ENTITY; -- externally_defined_functional_unit
( *
```

5.2.3.1.130 externally_defined_interconnect_definition

An externally_defined_interconnect_definition is an externally_defined_physical_unit that implements the ARM concept of Pcb_usage_view (see 4.2.643).

EXPRESS specification:

```

*)
ENTITY externally_defined_interconnect_definition
  SUBTYPE OF (externally_defined_physical_unit);
WHERE

  WR1: EXISTS(SELF\product_definition.name);

  WR2: NOT EXISTS(SELF\product_definition.name) OR
        (SELF\product_definition.name = 'interconnect module');
END_ENTITY; -- externally_defined_interconnect_definition
( *
```

Formal propositions:

WR1: The name shall exist.

WR2: The externally_defined_interconnect_definition shall be a definition with a name of 'interconnect module'.

5.2.3.1.131 externally_defined_package

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An externally_defined_package is an externally_defined_physical_unit that implements the ARM concepts of Altered_package (see 4.2.8) and Package (see 4.2.573).

EXPRESS specification:

```

*)
ENTITY externally_defined_package
  SUBTYPE OF (externally_defined_physical_unit);

```

Formal propositions:

WR1: The externally_defined_package shall have a frame_of_reference name of 'physical design usage'.

WR2: The externally_defined_package shall have at least one representation with the name of 'registered case style'.

WR3: The externally_defined_package shall have exactly one shape_representation with the name of 'seating plane'.

WR4: The externally_defined_package shall have at most one package_body.

WR5: The externally_defined_package shall have at least one package_terminal.

WR6: If the `externally_defined_package` has a description of 'altered package', it shall be related to exactly one package, `externally_defined_package`, or `library_defined_package` as the 'package preparation'.

Informal propositions:

IP1: Each three-dimensional shape representation of the `externally_defined_package` shall have exactly one `geometric_representation_item` that is an `axis2_placement_3d` and that `axis2_placement_3d` shall define the location and orientation of the seating plane in that representation. The normal of the seating plane in that representation shall be congruent with and the same direction as the Z axis of the `axis2_placement_3d`. The plane of the seating plane in that representation shall be congruent with the plane established by the X and Y axes of the `axis2_placement_3d`.

5.2.3.1.132 `externally_defined_packaged_connector`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `externally_defined_packaged_connector` is an `externally_defined_packaged_part` that implements the ARM concept of `Packaged_connector` (see 4.2.587).

EXPRESS specification:

```
*)
ENTITY externally_defined_packaged_connector
  SUBTYPE OF (externally_defined_packaged_part);
END_ENTITY; -- externally_defined_packaged_connector
(*
```

Informal propositions:

IP1: There shall be at least one `shape_aspect` that is a `packaged_connector_terminal_relationship` for the `externally_defined_packaged_connector`.

5.2.3.1.133 `externally_defined_packaged_part`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `externally_defined_packaged_part` is an `externally_defined_physical_unit` that implements the ARM concepts of `Altered_packaged_part` (see 4.2.10) and `Packaged_part` (see 4.2.591).

EXPRESS specification:

```

*)
ENTITY externally_defined_packaged_part
  SUPERTYPE OF (externally_defined_packaged_connector)
  SUBTYPE OF (externally_defined_physical_unit);
WHERE

  WR1: (NOT (SELF.frame_of_reference.name = 'physical design usage')) OR

TYPEOF (upkg.relatng_product_definition)) = 1)) >= 1);
END_ENTITY; -- externally_defined_packaged_part
(*)

```

Formal propositions:

WR1: If the externally_defined_packaged_part has a frame_of_reference name of 'physical design usage', it shall have at least one shape_aspect that is a packaged_part_terminal.

WR2: If the externally_defined_packaged_part has a frame_of_reference name of 'physical design usage', it shall have exactly one material_designation.

WR3: If the externally_defined_packaged_part has a frame_of_reference name of 'physical design usage', it shall be related to exactly one functional_unit with a frame_of_reference name of 'functional design usage' as the 'implemented function'.

WR4: If the externally_defined_packaged_part has a frame_of_reference name of 'physical design usage', it shall relate to exactly one package to specify the 'used package'.

WR5: If the externally_defined_packaged_part has a description of 'altered packaged part', it shall be related to at least one packaged_part, externally_defined_packaged_part, or library_defined_packaged_part with a frame_of_reference name of 'physical design usage' as the 'base packaged part'.

WR6: If the `externally_defined_packaged_part` has a description of 'altered packaged part', it shall be related to at least one `package`, `externally_defined_package`, or `library_defined_package` as the 'used package'.

5.2.3.1.134 `externally_defined_physical_unit`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `externally_defined_physical_unit` is a `physical_unit` and an `externally_defined_product_definition` that implements the ARM concepts of:

- `Assembly_module_usage_view` (see 4.2.51);
- `Ee_product_definition` (see 4.2.323);
- `Externally_defined_ee_product_definition` (see 4.2.364);
- `Interconnect_module_usage_view` (see 4.2.465);
- `Physical_unit` (see 4.2.664);
- `Physical_unit_usage_view` (see 4.2.672).

EXPRESS specification:

```

*)
ENTITY externally_defined_physical_unit
  SUPERTYPE OF (ONEOF (externally_defined_package, externally_defined_packaged_part,
    externally_defined_bare_die, externally_defined_assembly_definition,
    externally_defined_interconnect_definition))
  SUBTYPE OF (physical_unit, externally_defined_product_definition);
END_ENTITY; -- externally_defined_physical_unit
( *
```

5.2.3.1.135 `externally_defined_product_definition`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `externally_defined_product_definition` is a `product_definition` and an `externally_defined_item` that implements the ARM concept of: `Externally_defined_ee_product_definition` (see 4.2.364)

EXPRESS specification:

```

*)
ENTITY externally_defined_product_definition
  SUPERTYPE OF (library_defined_product_definition)
  SUBTYPE OF (product_definition, externally_defined_item);
END_ENTITY; -- externally_defined_product_definition
( *

```

5.2.3.1.136 externally_defined_representation_item

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An externally_defined_representation_item is an externally_defined_item and a representation_item that implements the ARM concept of External_definition (see 4.2.361).

EXPRESS specification:

```

*)
ENTITY externally_defined_representation_item
  SUBTYPE OF (externally_defined_item, representation_item);
WHERE

  WR1: SIZEOF (USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DOCUMENT_REFERENCE.ITEMS')) = 1;
END_ENTITY; -- externally_defined_representation_item
( *

```

Formal propositions:

WR1: The externally_defined_representation_item shall be referenced by exactly one applied_document_reference.

5.2.3.1.137 fabrication_joint

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A fabrication_joint is a shape_aspect and a shape_aspect_relationship that implements the ARM concept of Fabrication_joint (see 4.2.368).

EXPRESS specification:

```

*)
ENTITY fabrication_joint
  SUBTYPE OF (shape_aspect, shape_aspect_relationship);
WHERE

  WR1: (('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'COMPONENT_TERMINAL' IN
    TYPEOF (SELF.related_shape_aspect)) AND
    (SELF.related_shape_aspect\shape_aspect.description IN
    ['via terminal', 'printed component join terminal',
    'non functional land join terminal',
    'land join terminal', 'conductive interconnect element terminal',
    'component termination passage join terminal']));

  WR2: (('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'COMPONENT_TERMINAL' IN
    TYPEOF (SELF.relate_shape_aspect)) AND
    (SELF.relate_shape_aspect\shape_aspect.description IN
    ['via terminal', 'printed component join terminal',
    'non functional land join terminal',
    'land join terminal', 'conductive interconnect element terminal',
    'component termination passage join terminal']));

  WR3: SIZEOF (QUERY (ajm <* QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name = 'auxiliary joint material') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'LAND' IN
    TYPEOF (ajm.related_shape_aspect)) OR
    (('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'COMPONENT_SHAPE_ASPECT' IN
    TYPEOF (ajm.related_shape_aspect)) AND
    (ajm.related_shape_aspect\shape_aspect.description =
    'stratum feature template component')))) <= 1;

  WR4: acyclic_shape_aspect_relationship(SELF,
    [SELF\shape_aspect_relationship.related_shape_aspect],
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'FABRICATION_JOINT');
END_ENTITY; -- fabrication_joint
(

```

Formal propositions:

WR1: The fabrication_joint relating_shape_aspect attribute shall relate to exactly one component_terminals that have a description of 'via terminal', 'printed component join terminal', 'non functional land join terminal', 'land join terminal', 'conductive interconnect element terminal', or 'component termination passage join terminal' to specify the 'fabrication features'.

WR2: The fabrication_joint related_shape_aspect attribute shall relate to exactly one component_terminals that have a description of 'via terminal', 'printed component join terminal', 'non functional land join terminal', 'land join terminal', 'conductive interconnect element terminal', or 'component termination passage join terminal' to specify the 'fabrication features'.

WR3: The fabrication_joint shall relate to either at most one land or to at most one component_shape_aspect that has a description of 'stratum feature template component', to specify the 'auxiliary joint material'.

WR4: The fabrication_joint shall not participate in a cyclic relationship.

5.2.3.1.138 feature_shape_occurrence_relationship

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A feature_shape_occurrence_relationship is a representation and a shape_representation_relationship that implements the ARM concept of Feature_shape_occurrence_relationship (see ??).

EXPRESS specification:

```

*)
ENTITY feature_shape_occurrence_relationship
  SUBTYPE OF (representation, shape_representation_relationship);
UNIQUE
  UR1: SELF\representation_relationship.rep_1, SELF\representation_relationship.rep_2;
WHERE

  WR1: SELF\representation_relationship.rep_1 :<>: SELF\representation_relationship.rep_2;

  WR2: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\representation ||
    SELF\representation_relationship ||
    SELF\shape_representation_relationship ||
    SELF\feature_shape_occurrence_relationship))) = 0;
END_ENTITY; -- feature_shape_occurrence_relationship
(

```

Formal propositions:

UR1: The combination of rep_1 and rep_2 shall be unique within a population of feature_shape_occurrence_relationship.

WR1: The feature_shape_occurrence_relationship rep_1 shall not be rep_2.

WR2: The feature_shape_occurrence_relationship shall not be a complex subtype of other than its direct supertypes.

5.2.3.1.139 fiducial

A fiducial is a component_shape_aspect that implements the ARM concept of Fiducial (see 4.2.373).

EXPRESS specification:

```

*)
ENTITY fiducial
  SUBTYPE OF (component_shape_aspect);
WHERE

  WR1: (( 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
          'COMPONENT_DEFINITION') IN TYPEOF(SELF.of_shape.definition))
        AND (SELF.of_shape.definition\product_definition.description =
          'lamine component');
END_ENTITY; -- fiducial
( *
```

Formal propositions:

WR1: The fiducial shall be an aspect of a definition with a name of 'interconnect module'.

5.2.3.1.140 fiducial_part_feature

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A fiducial_part_feature is a part_tooling_feature that implements the ARM concept of Fiducial_part_feature (see 4.2.374).

EXPRESS specification:

```
*)  
ENTITY fiducial_part_feature  
  SUBTYPE OF (part_tooling_feature);  
END_ENTITY; -- fiducial_part_feature  
(*
```

5.2.3.1.141 fiducial_stratum_feature

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `fiducial_stratum_feature` is a `stratum_feature` that implements the ARM concept of `Fiducial_stratum_feature` (see 4.2.375).

EXPRESS specification:

```
*)  
ENTITY fiducial_stratum_feature  
  SUBTYPE OF (stratum_feature);  
END_ENTITY; -- fiducial_stratum_feature  
(*
```

5.2.3.1.142 filled_area_material_removal_component_shape_aspect

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `filled_area_material_removal_component_shape_aspect` is a `material_removal_component_shape_aspect` that implements the ARM concept of `Filled_area_material_removal_laminate_component` (see 4.2.384).

EXPRESS specification:

```
*)  
ENTITY filled_area_material_removal_component_shape_aspect  
  SUBTYPE OF (material_removal_component_shape_aspect);  
END_ENTITY; -- filled_area_material_removal_component_shape_aspect  
(*
```

5.2.3.1.143 footprint_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `footprint_definition` is a `product_definition` that implements the ARM concepts of: `Footprint_definition` (see 4.2.388)

EXPRESS specification:

```

*)
ENTITY footprint_definition
  SUBTYPE OF (product_definition);
WHERE

  WR1: (NOT ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_DEFINITION_WITH_ASSOCIATED_DOCUMENTS' IN
    TYPEOF (SELF))) OR
    (SIZEOF (QUERY (docs <*
    SELF\product_definition_with_associated_documents.
    documentation_ids |
    docs.kind\document_type.product_data_type = 'CAD filename')) <= 1);

  WR2: SIZEOF (QUERY (adta <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DATE_AND_TIME_ASSIGNMENT.ITEMS') |
    adta.role\date_time_role.name = 'creation date')) +
    SIZEOF (QUERY (ada <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DATE_ASSIGNMENT.ITEMS') |
    ada.role\date_role.name = 'creation date')) = 1;

  WR3: SIZEOF (USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_APPROVAL_ASSIGNMENT.ITEMS')) = 1;

  WR4: SIZEOF (QUERY (apoa <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_PERSON_AND_ORGANIZATION_ASSIGNMENT.ITEMS') |
    apoa.role\person_and_organization_role.name = 'creator')) +
    SIZEOF (QUERY (apoa <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_ORGANIZATION_ASSIGNMENT.ITEMS') |
    apoa.role\organization_role.name = 'creator')) >= 1;

  WR5: SIZEOF (USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_SECURITY_CLASSIFICATION_ASSIGNMENT.ITEMS')) = 1;

  WR6: SIZEOF (TYPEOF (SELF) - (TYPEOF (SELF\product_definition ||
    SELF\footprint_definition))) = 0;

  WR7: SELF.frame_of_reference.name IN ['layout design usage' ];

```

```

WR8: SIZEOF (QUERY (prpc <* USEDIN (SELF.formation.of_product,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_RELATED_PRODUCT_CATEGORY.' +
    'PRODUCTS') |
    prpc\product_category.name = 'template model')) = 1;
END_ENTITY; -- footprint_definition
(*

```

Formal propositions:

WR1: If the footprint_definition is a product_definition_with_associated_documents, there shall be at most one document in the set of documentation_ids that has a product_data_type of 'CAD filename'

WR2: The footprint_definition shall have exactly one creation date.

WR3: The footprint_definition shall have exactly one approval.

WR4: The footprint_definition shall have at least one organization or person_and_organization as the creator.

WR5: The footprint_definition shall have exactly one security_classification.

WR6: The footprint_definition shall not be any other type of product_definition.

WR7: The footprint_definition shall have a frame_of_reference with a name of 'layout design usage'.

WR8: The footprint_definition shall be associated with a product that is a template model.

5.2.3.1.144 footprint_occurrence

A footprint_occurrence is an assembly_group_component_shape_aspect that implements the ARM concept of Footprint_occurrence (see 4.2.390).

EXPRESS specification:

```

*)
ENTITY footprint_occurrence
    SUBTYPE OF (assembly_group_component_shape_aspect);
END_ENTITY; -- footprint_occurrence
(*

```

5.2.3.1.145 footprint_occurrence_shape_aspect_relationship

A footprint_occurrence_shape_aspect_relationship is a shape_aspect_relationship that implements the ARM concept of Footprint_occurrence_sub_assembly_relationship (see 4.2.391)

EXPRESS specification:

```

*)
ENTITY footprint_occurrence_shape_aspect_relationship
  SUBTYPE OF (shape_aspect_relationship);
WHERE

  WR1: SELF\shape_aspect_relationship.related_shape_aspect :<>:
        SELF\shape_aspect_relationship.relying_shape_aspect;

  WR2: SELF\shape_aspect_relationship.name = 'footprint occurrence sub assembly relationship';
END_ENTITY; -- footprint_occurrence_shape_aspect_relationship
( *

```

Formal propositions:

WR1: The related shape_aspect shall not be the relating shape_aspect.

WR2: The footprint_occurrence_shape_aspect_relationship name shall be 'footprint occurrence sub assembly relationship'.

5.2.3.1.146 force_measure_with_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A force_measure_with_unit is a measure_with_unit that implements the ARM concept of Force_measure_with_unit (see ??).

EXPRESS specification:

```

*)
ENTITY force_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\measure_with_unit ||
        SELF\force_measure_with_unit))) = 0;

  WR2: SELF\measure_with_unit.unit_component\si_unit.name = newton;

  WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
        TYPEOF(SELF\measure_with_unit.unit_component);
END_ENTITY; -- force_measure_with_unit
( *

```

Formal propositions:

WR1: The force_measure_with_unit shall not be any other type of measure_with_unit.

WR2: The force_measure_with_unit shall reference an si_unit with a name of newton.

WR3: The unit_component shall be an si_unit.

5.2.3.1.147 frequency_measure_with_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A frequency_measure_with_unit is a measure_with_unit that implements the ARM concept of Frequency_measure_with_unit (see ??).

EXPRESS specification:

```
*)
ENTITY frequency_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\measure_with_unit ||
    SELF\frequency_measure_with_unit))) = 0;

  WR2: SELF\measure_with_unit.unit_component\si_unit.name = hertz;

  WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
    TYPEOF(SELF\measure_with_unit.unit_component);
END_ENTITY; -- frequency_measure_with_unit
(*
```

Formal propositions:

WR1: The frequency_measure_with_unit shall not be any other type of measure_with_unit.

WR2: The frequency_measure_with_unit shall reference an si_unit with a name of hertz.

WR3: The unit_component shall be an si_unit.

5.2.3.1.148 frozen_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An frozen_assignment is an approval_assignment that specifies a set of frozen_assigned_item. An item that is 'approved' is frozen. An item that is 'not yet approved' is not frozen.

EXAMPLE 1 A component placement is considered frozen (i.e., the component cannot be moved) if its next_assembly_usage_occurrence is a member of the set of frozen_assigned_item and the approval_status is "approved".

EXPRESS specification:

```
*)
ENTITY frozen_assignment
  SUBTYPE OF (approval_assignment);
  items : SET [1:?] OF frozen_assigned_item;
WHERE

  WR1: SELF\approval_assignment.assigned_approval.status.name in ['approved', 'not yet approved'];
END_ENTITY; -- frozen_assignment
(*
```

Formal propositions:

WR1: The approval status shall either be 'approved' or 'not yet approved'.

5.2.3.1.149 functional_specification

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An functional_specification is a representation that implements the ARM concept of Functional_specification (see 4.2.396).

EXPRESS specification:

```
*)
ENTITY functional_specification
  SUBTYPE OF (representation);
WHERE

  WR1: SIZEOF (QUERY (rr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'REPRESENTATION_RELATIONSHIP.REP_2') |
    (rr\representation_relationship.name = 'functional characteristic category') AND
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'EXTERNAL_DEFINITION' IN
    TYPEOF (rr.rep_1.items[1])))) = 1;
```

```

WR2: sizeof (QUERY (rr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'REPRESENTATION_RELATIONSHIP.REP_1') |
    (rr\representation_relationship.name = 'characterizing signal' +
    'for functional specification')
    )) = 1;

WR3: sizeof (QUERY (rr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'REPRESENTATION_RELATIONSHIP.REP_1') |
    (rr\representation_relationship.name = 'reference signal for' +
    'functional specification')
    )) = 1;

WR4: sizeof (typeof (SELF) - typeof (SELF\representation ||
    SELF\functional_specification)) = 0;

WR5: SELF\representation.name = '';

WR6: sizeof (QUERY (pdr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION_REPRESENTATION.USED_REPRESENTATION') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'COMPONENT_FUNCTIONAL_UNIT' IN typeof (pdr.definition.definition))
    )) = 0;
END_ENTITY; -- functional_specification
(*

```

Formal propositions:

- WR1:** The functional_specification shall be in exactly one 'functional characteristic category'.
- WR2:** The functional_specification shall reference exactly one 'characterizing signal for functional specification'.
- WR3:** The functional_specification shall reference exactly one 'reference signal for functional specification'.
- WR4:** The functional_specification shall be no other type of representation.
- WR5:** The functional_specification name shall be blank.
- WR6:** The functional_specification shall reference exactly one component_functional_unit.

5.2.3.1.150 functional_specification_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A functional_specification_definition is a functional_unit that implements the ARM concept of functional_specification_definition (see 4.2.397).

EXPRESS specification:

```

*)
ENTITY functional_specification_definition
  SUBTYPE OF (functional_unit);
WHERE

  WR1: SELF.frame_of_reference\application_context_element.name =
        'functional network design';

  WR2: SIZEOF (QUERY (pd <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION.DEFINITION') |
    (SIZEOF (QUERY (pdr <* USEDIN (pd,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +

Formal propositions:

WR1: The functional_specification_definition context shall be 'functional network design'.

WR2: The functional_specification_definition shall be related to at least one functional_specification.

5.2.3.1.151 functional_terminal_group

A functional_terminal_group is a group that specifies a type for the terminals assigned to the group.

EXPRESS specification:

```

*)
ENTITY functional_terminal_group
  SUBTYPE OF (group);
UNIQUE
  UR1: SELF\group.name;
END_ENTITY; -- functional_terminal_group
( *

```

Formal propositions:

UR1: The name shall be unique.

5.2.3.1.152 functional_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A functional_unit is the characterization of the functionality of an occurrence of an electrical device or of an abstract component. A functional_unit implements the ARM concepts of:

- Ee_product_definition (see 4.2.323);
- Electrical_network_definition (see 4.2.345);
- Functional_specification_definition (see 4.2.397);
- Functional_unit_definition (see 4.2.401);
- Functional_unit_network_definition (see 4.2.402);
- Functional_unit_usage_view (see 4.2.410);
- Thermal_network_definition (see 4.2.906).

EXPRESS specification:

```

*)
ENTITY functional_unit
  SUPERTYPE OF ((electrical_network)
                ANDOR (thermal_network)
                ANDOR (functional_specification_definition))

)) =0);
END_ENTITY; -- geometric_tolerance_group
(*

```

Formal propositions:

WR1: The `geometric_tolerance_group` shall have a description of either 'separate requirement' or 'simultaneous requirement'.

WR2: If the `geometric_tolerance_group` has a description of 'separate requirement', the `geometric_tolerance_group` shall relate to at least one `geometric_tolerance_with_specified_datum_system` to specify the 'group geometric tolerance'.

WR3: If the `geometric_tolerance_group` has a description of 'simultaneous requirement', the `geometric_tolerance_group` shall relate to at least two `physical_unit_geometric_tolerances` to specify the 'group geometric tolerance'.

WR4: If the `geometric_tolerance_group` has a description of 'separate requirement', the `geometric_tolerance_group` shall relate to exactly zero `linear_profile_tolerance` with a name of 'linear profile refinement' to specify the 'group geometric tolerance'.

WR5: If the `geometric_tolerance_group` has a description of 'separate requirement', the `geometric_tolerance_group` shall relate to exactly zero `surface_profile_tolerance` with a name of 'surface profile refinement' to specify the 'group geometric tolerance'.

WR6: If the `geometric_tolerance_group` has a description of 'separate requirement', the `geometric_tolerance_group` shall relate to exactly zero `position_tolerance` with a name of 'feature relating position' to specify the 'group geometric tolerance'.

WR7: If the `geometric_tolerance_group` has a description of 'separate requirement', the `geometric_tolerance_group` shall relate to exactly zero `physical_unit_geometric_tolerance`, to specify the 'group geometric tolerance', that are not either `linear_profile_tolerance`, `surface_profile_tolerance`, or `position_tolerance`.

Informal propositions:

IP1: If the `geometric_tolerance_group` has a description of 'separate requirement' and the `geometric_tolerance_group` relates to at least two `geometric_tolerance_with_specified_datum_systems` to specify the 'group geometric tolerance', all of the `geometric_tolerance_with_specified_datum_system` shall relate to the same `property_definition` to specify the 'referenced datum system definition', and that `property_definition` shall have a description of either 'datum system property with material conditions' or 'datum system property without material conditions'.

IP2: If the `geometric_tolerance_group` has a description of 'simultaneous requirement' and the `geometric_tolerance_group` relates to at least two `physical_unit_geometric_tolerances` to specify the 'group geometric tolerance', all of the `physical_unit_geometric_tolerance` either shall not relate to a `property_definition` to specify the 'referenced datum system definition' or shall relate to the same `property_definition` to specify the 'referenced datum system definition', and that `property_definition` shall have a description of either 'datum system property with material conditions' or 'datum system property without material conditions'.

IP3: If the `geometric_tolerance_group` has a description of 'simultaneous requirement', the `geometric_tolerance_group` shall relate to exactly zero `physical_unit_geometric_tolerance`, to specify the 'group geometric tolerance', that are not either a `linear_profile_tolerance` with a description of 'linear profile refinement', a `surface_profile_tolerance` with a description of 'surface profile refinement', or a `position_tolerance` with a description of 'feature relating position'.

5.2.3.1.155 `geometric_tolerance_with_specified_datum_system`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `geometric_tolerance_with_specified_datum_system` is a `physical_unit_geometric_tolerance` that implements the ARM concepts of:

- `Boundary_based_position_tolerance` (see 4.2.77);
- `Composite_feature_locating_position_tolerance` (see 4.2.157);
- `Composite_linear_profile_locating_tolerance` (see 4.2.160);
- `Composite_surface_profile_locating_tolerance` (see 4.2.165);

- Geometric_tolerance_with_referenced_datum_system (see 4.2.422);
- Position_tolerance_with_referenced_datum_system (see 4.2.696);
- Profile_of_any_line_tolerance_with_referenced_datum_system (see 4.2.745);
- Profile_of_any_surface_tolerance_with_referenced_datum_system (see 4.2.748).

```

Formal propositions:

WR1: The `inter_stratum_feature` shall have a description of 'bonded conductive base blind via', 'buried via', 'component termination passage', 'interfacial connection', 'non conductive base blind via', 'plated conductive base blind via', 'partially plated cutout', 'plated cutout', 'plated cutout edge segment', 'plated interconnect module edge segment', 'partially plated interconnect module edge', 'plated interconnect module edge', 'unsupported passage', 'cutout', 'physical connectivity interrupting cutout', 'dielectric material passage', 'cutout edge segment', 'interconnect module edge segment', or 'interconnect module edge'.

WR2: The `inter_stratum_feature` shall have exactly one `descriptive_representation_item` with a name of 'feature of size' and a description of 'true' or 'false'.

WR3: The `inter_stratum_feature` shall be related, as an instantiated template, to exactly one `part_template_definition` that has a description of 'inter stratum feature template', 'via template', 'component termination passage template', or 'unsupported passage template'.

WR4: If the `inter_stratum_feature` has a description of 'cutout edge segment', the `inter_stratum_feature` shall be related to exactly one `inter_stratum_feature` with a description of either 'cutout' or 'physical connectivity interrupting cutout' or 'partially plated cutout' as the 'composed cutout'.

WR5: If the `inter_stratum_feature` has a description of 'interconnect module edge segment', the `inter_stratum_feature` shall be related to exactly one `inter_stratum_feature` with a description of 'interconnect module edge' or of 'partially plated interconnect module edge' as a 'composed edge'.

WR6: If the `inter_stratum_feature` has a description of 'dielectric material passage', the `inter_stratum_feature` shall be related to exactly one `inter_stratum_feature` with a description of either 'cutout' or 'physical connectivity interrupting cutout' or 'partially plated cutout' as the 'precedent passage'.

WR7: If the `inter_stratum_feature` has a description of 'dielectric material passage', it shall have at most one `requirements_property` with a name of 'feature material' or be the definition for at most one `material_designation`.

WR8: If the `inter_stratum_feature` has a description of 'physical connectivity interrupting cutout', the `inter_stratum_feature` shall be related to at least one `shape_aspect` with a name of 'conductive interconnect element' as 'interrupted connectivity elements'.

WR9: If the `inter_stratum_feature` has a description of 'unsupported passage', the `inter_stratum_feature` shall be related to exactly one `part_template_definition` with a description of 'unsupported passage template' as an 'instantiated template'.

WR10: The `inter_stratum_feature` shall be an aspect of the shape of a `component_definition` that is the definition of a product that is categorized as an 'interconnect module'.

WR11: If the `inter_stratum_feature` has a description of 'cutout edge segment', the `inter_stratum_feature` shall be related, as an 'instantiated template', to exactly one `inter_stratum_feature_edge_segment_template`.

WR12: If the `inter_stratum_feature` has a description of 'plated cutout edge segment', the `inter_stratum_feature` shall be related, as an 'instantiated template', to exactly one `inter_stratum_feature_edge_segment_template`.

WR13: If the `inter_stratum_feature` has a description of 'interconnect module edge segment', the `inter_stratum_feature` shall be related, as an 'instantiated template', to exactly one `inter_stratum_feature_edge_segment_template`.

WR14: If the `inter_stratum_feature` has a description of 'plated interconnect module edge segment', the `inter_stratum_feature` shall be related, as an 'instantiated template', to exactly one `inter_stratum_feature_edge_segment_template`.

5.2.3.1.164 `inter_stratum_feature_edge_segment_template`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `inter_stratum_feature_edge_segment_template` is an `inter_stratum_feature` and `shape_aspect_relationship` that implements the ARM concept of `Interconnect_module_edge_segment` (see 4.2.450).

EXPRESS specification:

```

Formal propositions:

WR1: The `physical_unit` name shall exist.

WR2: The `interconnect_module_terminal` shall be an aspect of the shape of a `physical_unit` that is an 'interconnect module' and that is a 'physical design usage'.

WR3: The `interconnect_module_terminal` shall have at least one `property_definition` that is represented by a `shape_representation`.

WR4: The `interconnect_module_terminal` shall be related to at most one `part_connected_terminals_definition` as a 'member connected terminal'.

WR5: The `interconnect_module_terminal` shall be related to no more than one `shape_aspect` with a description of 'connection zone'.

5.2.3.1.177 interface_access_component_shape_aspect

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An interface_access_component_shape_aspect is a component_shape_aspect that implements the ARM concept of Interface_access_laminate_component (see ??).

EXPRESS specification:

```
*)
ENTITY interface_access_component_shape_aspect
  SUBTYPE OF (component_shape_aspect);
END_ENTITY; -- interface_access_component_shape_aspect
(*
```

5.2.3.1.178 interface_access_material_removal_component_shape_aspect

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An interface_access_material_removal_component_shape_aspect is a material_removal_component_shape_aspect that implements the ARM concept of Interface_access_material_removal_laminate_component (see 4.2.466).

EXPRESS specification:

```
*)
ENTITY interface_access_material_removal_component_shape_aspect
  SUBTYPE OF (material_removal_component_shape_aspect);
END_ENTITY; -- interface_access_material_removal_component_shape_aspect
(*
```

5.2.3.1.179 interface_component_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An interface_component_definition is a component_definition that implements the ARM concept of interface_component (see 4.2.468) .

EXPRESS specification:

```

*)
ENTITY interface_component_definition
  SUBTYPE OF (component_definition);
WHERE

  WR1: (SIZEOF (QUERY (pd <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +

    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'COMPONENT_INTERFACE_TERMINAL' IN
    TYPEOF (sa)) AND
    (sa\shape_aspect.description IN ['interconnect component interface terminal',
    'packaged connector component interface terminal']))) >= 1)) >= 1);
END_ENTITY; -- interface_component_definition
(

```

Formal propositions:

WR1: The interface_component_definition shall have at least one shape_aspect that is a component_interface_terminal with a description of 'interconnect component interface terminal' or 'packaged connector component interface terminal'.

5.2.3.1.180 interface_mounted_join

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An interface_mounted_join is a shape_aspect and a shape_aspect_relationship that relates a component_terminal to a component_interface_terminal. An interface_mounted_join implements the ARM concept of an Interface_mounted_join (see 4.2.470).

EXPRESS specification:

```

*)
ENTITY interface_mounted_join
  SUBTYPE OF (shape_aspect_relationship, shape_aspect);
WHERE

```

```

WR1: ( 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'COMPONENT_INTERFACE_TERMINAL' IN
      TYPEOF (SELF.related_shape_aspect)) AND
      (SELF.related_shape_aspect\shape_aspect.description =
      'packaged connector component interface terminal');

WR2: ( 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'COMPONENT_TERMINAL' IN
      TYPEOF (SELF.relate_shape_aspect)) AND
      ((SELF.relate_shape_aspect\shape_aspect.description =
      'packaged connector component interface terminal') OR

      (SELF.relate_shape_aspect\shape_aspect.description =
      'packaged connector component interface terminal') OR
      (SELF.relate_shape_aspect\shape_aspect.description =
      'packaged connector component interface terminal') OR
      (SELF.relate_shape_aspect\shape_aspect.description =
      'packaged connector component interface terminal')));
END_ENTITY; -- interface_mounted_join
(*)

```

Formal propositions:

WR1: The interface_mounted_join shall have a 'packaged connector component interface terminal' as the related_shape_aspect.

WR2: The interface_mounted_join shall have a component_terminal with the listed description as the relate_shape_aspect.

5.2.3.1.181 interfaced_group_component_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An interfaced_group_component_definition is a assembly_group_component_definition that implements the ARM concept of Interfaced_group_component (see 4.2.473) .

EXPRESS specification:

```

*)
ENTITY interfaced_group_component_definition
  SUBTYPE OF (assembly_group_component_definition);
WHERE

```

```

WR1: (SIZEOF (QUERY (gc <* QUERY (pdr <* USEDIN (SELF,

    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'INTERFACE_COMPONENT_DEFINITION' IN
    TYPEOF (gc.related_product_definition))))
    >= 1);
END_ENTITY; -- interfaced_group_component_definition
(*)

```

Formal propositions:

WR1: The `interfaced_group_component_definition` shall relate to at least one `interface_component_definition` to specify a 'group component'.

5.2.3.1.182 join_shape_aspect

A `join_shape_aspect` is a `shape_aspect` that implements the ARM concepts of:

- `Inter_stratum_join_relationship` (see 4.2.437);
- `Intra_stratum_join_relationship` (see 4.2.477);
- `Join_relationship` (see 4.2.479);
- `Unrouted_join_relationship` (see 4.2.938).

EXPRESS specification:

```

*)
ENTITY join_shape_aspect

Formal propositions:

WR1: The land shall be an aspect of the shape of a component_definition that is the definition of a product that is categorized as an 'template module'.

WR2: The land shall be related to exactly one land_physical_template as the 'instantiated template'.

WR3: The land shall be related to at most one land_physical_template as the 'alternate usage definition'.

WR4: The land shall be related to exactly one stratum_feature as a 'stratum feature implementation'.

WR5: If the land has a description of 'via and contact size dependent land', or 'component termination passage and contact size dependent land', the land may relate to zero or more component_shape_aspect that has a description of 'land interface terminal' to specify the 'associated component'.

NOTE A contact size dependent land may have more than one interface terminal.

WR6: If the land has a description of 'functional land', 'via dependent land', 'via and contact size dependent land', 'component termination passage dependent land', 'contact size dependent land', or 'component termination passage and contact size dependent land', the land shall relate to at least one component_terminal that has a description of 'land join terminal' to specify the 'associated component'.

WR7: If the land has a description of 'via and contact size dependent non functional land', 'component termination passage and contact size dependent non functional land', the land shall relate to exactly one component_shape_aspect that has a description of 'non functional land interface terminal' to specify the 'associated component'.

WR8: If the land has a description of 'non functional land', 'via dependent non functional land', 'via and contact size dependent non functional land', 'component termination passage dependent non functional land', 'contact size dependent non functional land', 'component termination passage and contact size dependent non functional land', or 'unsupported passage dependent non functional land', the land shall relate to at least one component_terminal that has a description of 'non functional land join terminal' to specify the 'associated component'.

WR9: If the land has a description of 'component termination passage and contact size dependent land', 'component termination passage and contact size dependent non functional land', 'component termination passage dependent land', or 'component termination passage dependent non functional land', the land shall be related to exactly one plated_passage with a description of 'component termination passage' as a 'reference passage'.

WR10: If the land has a description of 'via and contact size dependent land', 'via and contact size dependent non functional land', 'via dependent land', or 'via dependent non functional land', the land shall be related to exactly one plated_passage that has a description of 'buried via', 'interfacial connection', 'bonded conductive base blind via', 'non conductive base blind via', or 'plated conductive base blind via' as a 'reference via'.

WR11: If the land has a description of 'unsupported passage dependent non functional land', the land shall be related to exactly one inter_stratum_feature with a description of 'unsupported passage' as a 'reference passage'.

WR12: If the land has a description of either 'component termination passage dependent land' or 'component termination passage dependent non functional land', the land shall be related to exactly one land_physical_template with a description of 'default component termination passage based' as an 'instantiated template'.

WR13: If the land has a description of either 'component termination passage and contact size dependent land' or 'component termination passage and contact size dependent non functional land', the land shall be related to exactly one land_physical_template with a description of 'default attachment size and component termination passage based' as an 'instantiated template'.

WR14: If the land has a description of either 'contact size dependent land' or 'contact size dependent non functional land', the land shall be related to exactly one land_physical_template with a description of 'default attachment size based' as an 'instantiated template'.

WR15: If the land has a description of either 'via and contact size dependent land' or 'via and contact size dependent non functional land', the land shall be related to exactly one land_physical_template with a description of 'default attachment size and via based' as an 'instantiated template'.

WR16: If the land has a description of either 'via dependent land' or 'via dependent non functional land', the land shall be related to exactly one land_physical_template with a description of 'default via based' as an 'instantiated template'.

WR17: If the land has a description of 'unsupported passage dependent non functional land', the land shall be related to exactly one land_physical_template with a description of 'default unsupported passage based' as an 'instantiated template'.

5.2.3.1.187 land_physical_template

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A land_physical_template is a part_template_definition that implements the ARM concepts of:

- Default_attachment_size_and_component_termination_passage_based_land_physical_template (see 4.2.245);
- Default_attachment_size_and_via_based_land_physical_template (see 4.2.246);
- Default_attachment_size_based_land_physical_template (see 4.2.247);
- Default_component_termination_passage_based_land_physical_template (see 4.2.248);
- Default_land_physical_template (see 4.2.250);
- Default_passage_based_land_physical_template (see 4.2.251);
- Default_via_based_land_physical_template (see 4.2.255);
- Land_physical_template (see 4.2.493).

```

Formal propositions:

UR1: The name shall be unique within a population of layer.

WR1: The layer shall be referenced by at most one document that has a usage constraint which specifies the 'layer definition'.

WR2: The layer shall be an aspect of the shape of a product_definition_relationship with a name of 'inter stratum extent'.

Informal propositions:

IP1: The same geometric representation shall be attached to each of the stratum specified by the layer.

IP2: The name shall be unique.

5.2.3.1.190 layer_connection_point

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A layer_connection_point is a shape_aspect that implements the ARM concepts of:

- Dependently_located_layer_connection_point (see 4.2.259);
- Explicitly_located_layer_connection_point (see 4.2.360);
- Layer_connection_point (see 4.2.499).

EXPRESS specification:

Formal propositions:

WR1: The library_defined_bare_die shall be related to exactly one functional_unit with a frame_of_-reference name of 'functional design usage' as the 'implemented function'.

WR2: The library_defined_bare_die shall have exactly one property_definition that is related to exactly one property_definition with a name of 'unit technology' as the 'device unit technology'.

WR3: The library_defined_bare_die shall have at least two shape_aspects that are bare_die_terminals.

5.2.3.1.199 library_defined_functional_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `library_defined_functional_unit` is an `externally_defined_functional_unit` that implements the ARM concepts of:

- `Ee_product_definition` (see 4.2.323);
- `Functional_unit_definition` (see 4.2.401);
- `Functional_unit_usage_view` (see 4.2.410);
- `Library_ee_product_definition` (see 4.2.513).

EXPRESS specification:

```
*)
ENTITY library_defined_functional_unit
  SUBTYPE OF (externally_defined_functional_unit);
DERIVE
  library : external_source := SELF\externally_defined_item.source;
END_ENTITY; -- library_defined_functional_unit
(*
```

5.2.3.1.200 library_defined_interconnect_definition

A `library_defined_interconnect_definition` is a `library_defined_physical_unit` that implements the ARM concept of `Pcb_usage_view` (see 4.2.643) in conjunction with `Library_item` (see ??).

EXPRESS specification:

```
*)
ENTITY library_defined_interconnect_definition
  SUBTYPE OF (library_defined_physical_unit);
WHERE

  WR1: EXISTS(SELF\product_definition.name);

  WR2: SELF\product_definition.name = 'interconnect module';
END_ENTITY; -- library_defined_interconnect_definition
(*
```

Formal propositions:

WR1: The name shall exist.

WR2: The `library_defined_interconnect_definition` shall be a definition with a name of 'interconnect module'.

5.2.3.1.201 library_defined_package

A library_defined_package is a library_defined_physical_unit that implements the ARM concepts of Altered_package (see 4.2.8) and Package (see 4.2.573) in conjunction with Library_item (see ??).

EXPRESS specification:

```

*)
ENTITY library_defined_package
  SUBTYPE OF (library_defined_physical_unit);
WHERE

  WR1: SELF.frame_of_reference.name = 'physical design usage';

(*

```

Formal propositions:

WR1: The library_defined_package shall have a frame_of_reference name of 'physical design usage'.

WR2: The library_defined_package shall have at least one property_definition.

WR3: The library_defined_package shall have one seating_plane.

WR4: The library_defined_package shall have at most one package_body.

WR5: If the library_defined_package has a description of 'altered package', it shall be related to exactly one package, externally_defined_package, or library_defined_package as the 'package preparation'.

Informal propositions:

IP1: Each three-dimensional shape representation of the library_defined_package shall have exactly one geometric_representation_item that is an axis2_placement_3d and that axis2_placement_3d shall define the location and orientation of the seating plane in that representation. The normal of the seating plane in that representation shall be congruent with and the same direction as the Z axis of the axis2_placement_3d. The plane of the seating plane in that representation shall be congruent with the plane established by the X and Y axes of the axis2_placement_3d.

5.2.3.1.202 library_defined_packaged_connector

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A library_defined_packaged_connector is a library_defined_packaged_part that implements the ARM concept of Packaged_connector (see 4.2.587) in conjunction with Library_item (see ??).

EXPRESS specification:

```

*)
ENTITY library_defined_packaged_connector
  SUBTYPE OF (library_defined_packaged_part);
END_ENTITY; -- library_defined_packaged_connector
( *

```

Informal propositions:

IP1: There shall be at least one shape_aspect that is a packaged_connector_terminal_relationship for the library_defined_packaged_part.

5.2.3.1.203 library_defined_packaged_part

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A library_defined_packaged_part is a library_defined_physical_unit that implements the ARM concepts of Altered_packaged_part (see 4.2.10) and Packaged_part (see 4.2.591) in conjunction with Library_item (see ??).

      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'GEOMETRIC_TOLERANCE_RELATIONSHIP.RELATING_GEOMETRIC_TOLERANCE') |
      (('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'LINEAR_PROFILE_TOLERANCE' IN
      TYPEOF(gtr.relating_geometric_tolerance))
      AND (gtr.related_geometric_tolerance\geometric_tolerance.name =
      'linear profile refinement')
      AND (gtr\geometric_tolerance_relationship.name = 'linear profile refining control')
      )) <= 1);

WR5: NOT('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'MODIFIED_GEOMETRIC_TOLERANCE' IN TYPEOF(SELF));
END_ENTITY; -- linear_profile_tolerance
(*)

```

Formal propositions:

WR1: If the linear_profile_tolerance has a name of 'linear profile refinement', it shall be related as the 'linear profile refining control' to exactly one linear_profile_tolerance with a name of either 'linear profile locating' or 'linear profile refinement'.

WR2: If the linear_profile_tolerance has a name of 'linear profile locating', it shall relate to exactly one linear_profile_tolerance with a name of 'linear profile refinement' to specify the 'linear profile refining control'.

WR3: If the linear_profile_tolerance is not a geometric_tolerance_with_specified_datum_system and has a name of 'linear profile refinement', it shall relate to exactly zero linear_profile_tolerance with a name of 'linear profile refinement' to specify the 'linear profile refining control'.

WR4: If the linear_profile_tolerance has a name of 'linear profile refinement', it shall relate to at most one linear_profile_tolerance with a name of 'linear profile refinement' to specify the 'linear profile refining control'.

WR5: The linear_profile_tolerance shall not be a modified_geometric_tolerance.

Informal propositions:

IP1: If linear_profile_tolerance is a geometric_tolerance_with_specified_datum_system it shall have a name of either 'linear profile', 'linear profile refinement', or 'linear profile locating'; otherwise, it shall have the name of either 'linear profile' or 'linear profile refinement'.

IP2: If the linear_profile_tolerance has a name of 'linear profile refinement', it shall be related as the 'linear profile refining control' to exactly one linear_profile_tolerance with a name of either 'linear profile locating' or 'linear profile refinement'. Both of these linear_profile_tolerances shall specify the same shape_aspect as the toleranced_shape_aspect.

IP3: If the `linear_profile_tolerance` has a name of 'linear profile refinement' and it is related as the 'linear profile refining control' to exactly one `linear_profile_tolerance` with a name of 'linear profile refinement', it shall either not reference a `datum_system` or it shall have less `physical_unit_datum` in its referenced `datum_system` than the `datum_system` referenced by the `linear_profile_tolerance` to which it is related as the 'linear profile refining control'.

IP4: If the `linear_profile_tolerance` has a name of 'linear profile refinement' and it is related as the 'linear profile refining control' to exactly one `linear_profile_tolerance` with a name of 'linear profile locating', it shall either not reference a `datum_system` or it shall have less than or an equal number of `physical_unit_datum` in its referenced `datum_system` than the `datum_system` referenced by the `linear_profile_tolerance` to which it is related as the 'linear profile refining control'.

IP5: If the `linear_profile_tolerance` has a name of 'linear profile refinement' and it is a `geometric_tolerance_with_specified_datum_system`, the `physical_unit_datum` of its referenced `datum_system` shall be `physical_unit_datum` of the `datum_system` of the `linear_profile_tolerance` to which it is related as the 'linear profile refining control' and shall be assigned the same precedence.

IP6: If the `linear_profile_tolerance` has a name of 'linear profile refinement' and it is a `geometric_tolerance_with_specified_datum_system` that relates to a `property_definition` of a `datum_system` that has the description of 'datum system property without material conditions' to specify its 'referenced datum system definition', the `linear_profile_tolerance` to which it is related as the 'linear profile refining control' shall also be a `geometric_tolerance_with_specified_datum_system` that relates to a `property_definition` of a `datum_system` that has the description of 'datum system property without material conditions' to specify its 'referenced datum system definition'.

IP7: If the `linear_profile_tolerance` has a name of 'linear profile refinement' and it is a `geometric_tolerance_with_specified_datum_system` that relates to a `property_definition` of a `datum_system` that has the description of 'datum system property with material conditions' to specify its 'referenced datum system definition', the `linear_profile_tolerance` to which it is related as the 'linear profile refining control' shall also be a `geometric_tolerance_with_specified_datum_system` that relates to a `property_definition` of a `datum_system` that has the description of 'datum system property with material conditions' to specify its 'referenced datum system definition', and each of these `property_definition` shall relate to `property_definition` with a description of 'datum feature material condition property' to specify their 'applied material condition property'. These `property_definition` shall be applied to `physical_unit_datum_features` in the context of the `datum_systems` referenced by each of the `linear_profile_tolerance`. The name of the `property_definition` applied to each of the `physical_unit_datum_feature` in the context of the `datum_system` referenced by this `linear_profile_tolerance` shall be the same as the name of the `property_definition` applied to the same `physical_unit_datum_feature` in the context of the `datum_system` referenced by the `linear_profile_tolerance` to which this `linear_profile_tolerance` is related as the 'linear profile refining control'.

IP8: If the `linear_profile_tolerance` has a name of 'linear profile refinement', it shall specify a `measure_with_unit` as its magnitude that is less than the `measure_with_unit` specified as the magnitude of the `linear_profile_tolerance` to which it is related as the 'linear profile refining control'.

IP9: If the `linear_profile_tolerance` has a name of 'linear profile refinement', there shall exist a `property_definition` that has a description of 'true profile' that is related as the 'basic profile' to a `property_definition` of the `tolerance_zone_boundary` of this `linear_profile_tolerance` and to a `property_definition` of the `tolerance_zone_boundary` of the `linear_profile_tolerance` that this `linear_profile_tolerance` is related to as the 'linear profile refining control', and these `property_definition` shall have the description of 'boundary zone definition with specified size' and a name of either 'profile boundary' or 'profile boundary with offsets'.

IP10: If the `linear_profile_tolerance` has a name of 'linear profile refinement' and its `tolerance_zone` has a `property_definition` that has a description of 'tolerance zone orientation' that relates to a `property_definition` with a description of 'viewing plane based orientation' to specify the 'zone orientation', it shall be related to a `linear_profile_tolerance` as the 'linear profile refining control' the `tolerance_zone` of which has a `property_definition` that has a description of 'tolerance zone orientation' that relates to the same `property_definition` with a description of 'viewing plane based orientation' to specify its 'zone orientation'.

IP11: The `toleranced_shape_aspect` of the `linear_profile_tolerance` shall either be a `part_template_definition`, lie on the boundary of the shape of the product, or be a `composite_shape_aspect` the 'composing' `shape_aspects` of which are all of type `part_template_definition`.

IP12: The `tolerance_zone_boundary` of the `linear_profile_tolerance` shall have a `property_definition` with a description of 'boundary zone definition with specified size' and a name of either 'profile boundary' or 'profile boundary with offsets'.

IP13: If the `linear_profile_tolerance` is not a `geometric_tolerance_with_specified_datum_system`, its `tolerance_zone` shall have a `property_definition` that has a description of 'tolerance zone orientation' that relates to a `property_definition` with a description of 'viewing plane based orientation' to specify the 'zone orientation'.

5.2.3.1.213 luminous_flux_measure_with_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `luminous_flux_measure_with_unit` is a `measure_with_unit` that implements the ARM concept of `Luminous_flux_measure_with_unit` (see ??).

EXPRESS specification:

```
*)
ENTITY luminous_flux_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\measure_with_unit ||
    SELF\luminous_flux_measure_with_unit))) = 0;

  WR2: SELF\measure_with_unit.unit_component\si_unit.name = lumen;
```

```

    WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
        TYPEOF(SELF\measure_with_unit.unit_component);
END_ENTITY; -- luminous_flux_measure_with_unit
(*)

```

Formal propositions:

WR1: The luminous_flux_measure_with_unit shall not be any other type of measure_with_unit.

WR2: The luminous_flux_measure_with_unit shall reference an si_unit with a name of lumen.

WR3: The unit_component shall be an si_unit.

5.2.3.1.214 magnetic_flux_density_measure_with_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A magnetic_flux_density_measure_with_unit is a measure_with_unit that implements the ARM concept of Magnetic_flux_density_measure_with_unit (see ??).

EXPRESS specification:

```

*)
ENTITY magnetic_flux_density_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

    WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\measure_with_unit ||
        SELF\magnetic_flux_density_measure_with_unit))) = 0;

    WR2: SELF\measure_with_unit.unit_component\si_unit.name = tesla;

    WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
        TYPEOF(SELF\measure_with_unit.unit_component);
END_ENTITY; -- magnetic_flux_density_measure_with_unit
(*)

```

Formal propositions:

WR1: The magnetic_flux_density_measure_with_unit shall not be any other type of measure_with_unit.

WR2: The magnetic_flux_density_measure_with_unit shall reference an si_unit with a name of tesla.

WR3: The unit_component shall be an si_unit.

5.2.3.1.215 magnetic_flux_measure_with_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A magnetic_flux_measure_with_unit is a measure_with_unit that implements the ARM concept of Magnetic_flux_measure_with_unit (see ??).

EXPRESS specification:

```
*)
ENTITY magnetic_flux_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\measure_with_unit ||
    SELF\magnetic_flux_measure_with_unit))) = 0;

  WR2: SELF\measure_with_unit.unit_component\si_unit.name = weber;

  WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
    TYPEOF(SELF\measure_with_unit.unit_component);
END_ENTITY; -- magnetic_flux_measure_with_unit
(*
```

Formal propositions:

WR1: The magnetic_flux_measure_with_unit shall not be any other type of measure_with_unit.

WR2: The magnetic_flux_measure_with_unit shall reference an si_unit with a name of weber.

WR3: The unit_component shall be an si_unit.

5.2.3.1.216 make_from_connectivity_relationship

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A make_from_connectivity_relationship is a shape_aspect_relationship that implements the ARM concept of Physical_connectivity_make_from_relationship (see 4.2.656).

EXPRESS specification:

```

*)
ENTITY make_from_connectivity_relationship
  SUBTYPE OF (shape_aspect_relationship);
WHERE

  WR1: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'PHYSICAL_CONNECTIVITY_DEFINITION'
        IN TYPEOF (SELF.relateing_shape_aspect);

  WR2: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'PHYSICAL_CONNECTIVITY_DEFINITION'
        IN TYPEOF (SELF.related_shape_aspect);
END_ENTITY; -- make_from_connectivity_relationship
(

```

Formal propositions:

WR1: The make_from_connectivity_relationship shall have a relateing_shape_aspect that references a physical_connectivity_definition.

WR2: The make_from_connectivity_relationship shall have a related_shape_aspect that references a physical_connectivity_definition.

5.2.3.1.217 make_from_feature_relationship

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A make_from_feature_relationship is a shape_aspect_relationship that implements the ARM concept of Component_feature_make_from_relationship (see 4.2.120).

EXPRESS specification:

```

*)
ENTITY make_from_feature_relationship
  SUBTYPE OF (shape_aspect, shape_aspect_relationship);
WHERE

```

```

WR1: sizeof ([ 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
'COMPONENT_TERMINAL',
'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
'COMPONENT_INTERFACE_TERMINAL',
'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
'COMPONENT_SHAPE_ASPECT'] *
typeof (SELF.relateing_shape_aspect)) = 1;

WR2: sizeof ([ 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +

WHERE

  WR1: SELF\group.name IN ['conductive', 'non conductive', 'resistive',
    'semi conductive'];
END_ENTITY; -- material_electrical_conductivity_category
(*
```

Formal propositions:

WR1: The material_electrical_conductivity_category shall have a name of 'conductive', 'non conductive', 'resistive', or 'semi conductive'

5.2.3.1.223 material_functional_category

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A material_functional_category is a group that specifies the role of material for the ARM concepts of:

- Marking (see 4.2.526);
- Packaged_part (see 4.2.591);
- Part_device (see 4.2.606).

.

EXPRESS specification:

```
*)  
ENTITY material_functional_category  
  SUBTYPE OF (group);  
WHERE  
  
  WR1: SELF\group.name IN  
    ['bonding agent', 'potting compound', 'marking material'];  
END_ENTITY; -- material_functional_category  
(*
```

Formal propositions:

WR1: The material_functional_category shall have a name of 'bonding agent', 'potting compound', or 'marking material'.

5.2.3.1.224 material_optical_conductivity_category

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A material_optical_conductivity_category is a group that specifies the optical conductivity characteristic for the ARM concept of Ee_material (see 4.2.318).

EXPRESS specification:

```

*)
ENTITY material_optical_conductivity_category
  SUBTYPE OF (group);
WHERE

  WR1: SELF\group.name IN ['conductive', 'non conductive', 'resistive',
    'semi conductive'];
END_ENTITY; -- material_optical_conductivity_category
( *

```

Formal propositions:

WR1: The material_optical_conductivity_category shall have a name of 'conductive', 'non conductive', 'resistive', or 'semi conductive'

5.2.3.1.225 material_removal_component_shape_aspect

A material_removal_component_shape_aspect is a component_shape_aspect that implements the ARM concept of Material_removal_component (see ??).

EXPRESS specification:

```

*)
ENTITY material_removal_component_shape_aspect
  SUBTYPE OF (component_shape_aspect);
END_ENTITY; -- material_removal_component_shape_aspect
( *

```

5.2.3.1.226 material_thermal_conductivity_category

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A material_thermal_conductivity_category is a group that specifies the thermal conductivity characteristic for the ARM concept of Ee_material (see 4.2.318).

EXPRESS specification:

```

*)
ENTITY material_thermal_conductivity_category
  SUBTYPE OF (group);
WHERE

```

```

    WR1: SELF\group.name IN ['conductive', 'non conductive', 'resistive',
        'semi conductive'];
END_ENTITY; -- material_thermal_conductivity_category
(*)

```

Formal propositions:

WR1: The material_thermal_conductivity_category shall have a name of 'conductive', 'non conductive', 'resistive', or 'semi conductive'

5.2.3.1.227 minimally_defined_bare_die_terminal

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A minimally_defined_bare_die_terminal is a shape_aspect that implements the ARM concepts of Guided_wave_bare_die_terminal (see 4.2.426) or Minimally_defined_bare_die_terminal (see 4.2.545).

EXPRESS specification:

```

*)
ENTITY minimally_defined_bare_die_terminal
    SUPERTYPE OF (bare_die_terminal)
    SUBTYPE OF (shape_aspect);
WHERE

    WR1: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'BARE_DIE' IN
        TYPEOF (SELF.of_shape.definition);

    WR2: SIZEOF (QUERY (eca <* QUERY (sar <* USEDIN (SELF,
        'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |
        sar\shape_aspect_relationship.name = 'external connection area') |
        eca.related_shape_aspect\shape_aspect.description = 'connection zone')) <= 1;

    WR3: SIZEOF (USEDIN (SELF,
        'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'MATERIAL_DESIGNATION.DEFINITIONS')) <= 1;

```

```

WR4: SIZEOF (QUERY (mct <* QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name = 'member connected terminal') |
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PART_CONNECTED_TERMINALS_DEFINITION'
    IN TYPEOF (mct.relate_shape_aspect))) <= 1;
END_ENTITY; -- minimally_defined_bare_die_terminal
(*)

```

Formal propositions:

WR1: The `minimally_defined_bare_die_terminal` shall be a terminal of a `bare_die`.

WR2: The `minimally_defined_bare_die_terminal` shall relate to at most one `shape_aspect` that has a description of 'connection zone' as the 'external connection area'.

WR3: The `minimally_defined_bare_die_terminal` shall have at most one material designation.

WR4: The `minimally_defined_bare_die_terminal` shall be related to at most one `part_connected_terminals_definition` as a 'member connected terminal'.

5.2.3.1.228 **model_parameter**

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `model_parameter` is a `representation_item` that implements the ARM concept of `Model_parameter` (see 4.2.549).

EXPRESS specification:

```

*)
ENTITY model_parameter
  SUBTYPE OF (representation_item);
WHERE

  WR1: SIZEOF (USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DOCUMENT_REFERENCE.ITEMS')) = 1;

  WR2: SIZEOF (QUERY (cri <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'REPRESENTATION.ITEMS') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'COORDINATED_REPRESENTATION_ITEM' IN TYPEOF(cri)) AND
    (cri\representation.name =
    'model parameter with valid range value')))) <= 1;

```

```

WR3: sizeof (QUERY (aga <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_GROUP_ASSIGNMENT.ITEMS') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PARAMETER_TYPE' IN
    TYPEOF (aga.assigned_group)) AND
    (aga.assigned_group\group.name IN ['string property type',
    'logical property type', 'physical property type',
    'boolean property type']))) = 1;
END_ENTITY; -- model_parameter
(*

```

Formal propositions:

WR1: The model_parameter shall be referenced by exactly one document.

WR2: The model_parameter shall be an item in at most one coordinated_representation_item that has a representation name of 'model parameter with valid range value'.

WR3: The model_parameter shall be assigned to exactly one parameter_type with a name of 'string property type', 'logical property type', 'physical property type', or 'boolean property type'.

5.2.3.1.229 mounting_restriction_area

A mounting_restriction_area is a shape_aspect that implements the ARM concept of Mounting_restriction_area (see 4.2.550).

EXPRESS specification:

```

*)
ENTITY mounting_restriction_area
  SUBTYPE OF (shape_aspect);
WHERE

```

WR1: EXISTS(SELF.of_shape.definition\product_definition.name);

WR2: ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
 'PHYSICAL_UNIT' IN TYPEOF (SELF.of_shape.definition));

WR3: SELF.of_shape.definition.frame_of_reference.name IN ['physical design'];

WR4: SELF.of_shape.definition\product_definition.name = 'assembly module';

```

WR5: sizeof (QUERY (pd <* USEDIN (SELF,

    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION_REPRESENTATION.DEFINITION') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_REPRESENTATION' IN
    TYPEOF (pdr.used_representation)) AND
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'CSG_2D_SHAPE_REPRESENTATION' IN
    TYPEOF (pdr.used_representation)))) = 1))) = 0;

WR6: sizeof (QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |
    ((sar\shape_aspect_relationship.name = 'mounting surface') AND
    (sar.related_shape_aspect\shape_aspect.description =
    'interconnect module component surface feature')))) = 1;

WR7: sizeof (typeof (SELF) - (typeof (SELF\shape_aspect ||
    SELF\mounting_restriction_area))) = 0;

END_ENTITY; -- mounting_restriction_area
(*)

```

Formal propositions:

WR1: The name of the physical_unit shall exist.

WR2: The mounting_restriction_area shall be an aspect of the shape of a physical_unit.

WR3: The mounting_restriction_area shall be an aspect of a product_definition that is in the physical design context.

WR4: The mounting_restriction_area shall be an aspect of the shape of an assembly module.

WR5: The mounting_restriction_area shall have exactly one shape_representation that shall be a csg_2d_shape_representation.

WR6: The mounting_restriction_area shall be related to exactly one component_shape_aspect with a description of 'interconnect module component surface feature' as the 'mounting surface'.

WR7: The mounting_restriction_area shall not be any other type of shape_aspect.

5.2.3.1.230 mounting_restriction_volume

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A mounting_restriction_volume is a shape_aspect that implements the ARM concept of Mounting_restriction_volume (see 4.2.551).

EXPRESS specification:

```

*)
ENTITY mounting_restriction_volume
  SUBTYPE OF (shape_aspect);
WHERE

  WR1: ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'PHYSICAL_UNIT' IN TYPEOF (SELF.of_shape.definition));

  WR2: SELF.of_shape.definition.frame_of_reference.name IN ['physical design'];

  WR3: SELF.of_shape.definition.name = 'assembly module';

  WR4: SIZEOF (QUERY (pd <* USEDIN (SELF,

    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION_REPRESENTATION.DEFINITION') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_REPRESENTATION' IN
    TYPEOF (pdr.used_representation)) AND
    (pdr.used_representation\representation.context_of_items\
    geometric_representation_context.coordinate_space_dimension = 3)
    )) = 1))) = 0;

  WR5: SIZEOF (QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'COMPONENT_SHAPE_ASPECT' IN
    TYPEOF (sar.related_shape_aspect)) AND
    (sar\shape_aspect_relationship.name = 'mounting surface') AND
    (sar.related_shape_aspect\shape_aspect.description =
    'interconnect module component surface feature')))) = 1;

  WR6: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\shape_aspect ||
    SELF\mounting_restriction_volume))) = 0;
END_ENTITY; -- mounting_restriction_volume
(

```

Formal propositions:

WR1: The mounting_restriction_volume shall be an aspect of the shape of a physical_unit.

WR2: The mounting_restriction_volume shall be an aspect of a product_definition that is in the physical design context.

WR3: The mounting_restriction_volume shall be an aspect of the shape of an assembly module.

WR4: The mounting_restriction_volume shall have exactly one shape_representation that shall be a 3 dimensional shape representation.

WR5: The mounting_restriction_volume shall be related to exactly one component_shape_aspect with a description of 'interconnect module component surface feature' as the 'mounting surface'.

WR6: The mounting_restriction_volume shall not be any other type of shape_aspect.

5.2.3.1.231 multi_layer_component_shape_aspect

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A multi_layer_component_shape_aspect is a component_shape_aspect that implements the ARM concept of Multi_layer_stratum_feature_template_component (see 4.2.554).

EXPRESS specification:

```
*)
ENTITY multi_layer_component_shape_aspect
  SUBTYPE OF (component_shape_aspect);
END_ENTITY; -- multi_layer_component_shape_aspect
(*)
```

5.2.3.1.232 multi_layer_material_removal_component_shape_aspect

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A multi_layer_material_removal_component_shape_aspect is a material_removal_component_shape_aspect that implements the ARM concept of Multi_layer_material_removal_laminate_component (see 4.2.552).

EXPRESS specification:

```
*)
ENTITY multi_layer_material_removal_component_shape_aspect
  SUBTYPE OF (material_removal_component_shape_aspect);
END_ENTITY; -- multi_layer_material_removal_component_shape_aspect
(*)
```

5.2.3.1.233 multi_layer_stratum_feature

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A multi_layer_stratum_feature is a stratum_feature that implements the ARM concept of Multi_layer_stratum_feature (see 4.2.553).

EXPRESS specification:

```
*)
ENTITY multi_layer_stratum_feature
  SUBTYPE OF (stratum_feature);
END_ENTITY; -- multi_layer_stratum_feature
(*
```

5.2.3.1.234 network_node_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A network_node_definition is a product_definition that implements the ARM concept of Functional_unit_network_node_definition (see 4.2.403).

EXPRESS specification:

```
*)
ENTITY network_node_definition
  SUBTYPE OF (product_definition);
WHERE

  WR1: SELF.frame_of_reference.name = 'functional network design';
```

```

WR2: SIZEOF (QUERY (pd <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION.DEFINITION') |
    SIZEOF (QUERY (funtdna <* QUERY (pdr <* USEDIN (pd,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION_RELATIONSHIP.RELATING_PROPERTY_DEFINITION') |
    pdr\property_definition_relationship.name =
    'functional unit network terminal definition node assignment') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_DEFINITION_SHAPE' IN
    TYPEOF (funtdna.related_property_definition)) AND
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'FUNCTIONAL_UNIT_TERMINAL_DEFINITION' IN
    TYPEOF
    (funtdna.related_property_definition.definition)))) <= 1)) <= 1;

WR3: SIZEOF (QUERY (funn <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_DEFINITION_RELATIONSHIP.RELATED_PRODUCT_DEFINITION') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'FUNCTIONAL_UNIT' IN
    TYPEOF (funn.relying_product_definition)) AND
    (funn.relying_product_definition.frame_of_reference.name =
    'functional network design')) = 1;
END_ENTITY; -- network_node_definition
(*)

```

Formal propositions:

WR1: The network_node_definition shall have its context element with a name of 'functional network design'.

WR2: The network_node_definition shall have at most one property that relates to at most one product_definition_shape of a functional_unit_terminal_definition to specify the 'functional unit network terminal definition node assignment'.

WR3: The network_node_definition shall be related to exactly one functional_unit that has a context element with a name of 'functional network design' as the 'functional unit network node'.

Informal propositions:

IP1: This is an IP for now, as it obviously uses arm constructs. It will be converted to DERIVE and then the electrical and thermal network structural validity can be exchanged based on approval. Probably need something like "valid structure".

NOTE

5.2.3.1.235 opposing_boundary_dimensional_size

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `opposing_boundary_dimensional_size` is a `dimensional_size` that implements the ARM concept of `Dimensional_size_based_on_opposing_boundaries` (see 4.2.302).

EXPRESS specification:

```
*)
ENTITY opposing_boundary_dimensional_size
  SUBTYPE OF (dimensional_size);
WHERE

    WR1: SELF\dimensional_size.name IN ['angular', 'linear'];
END_ENTITY; -- opposing_boundary_dimensional_size
(*
```

Formal propositions:

WR1: The name of the `opposing_boundary_dimensional_size` shall be either 'angular' or 'linear'.

Informal propositions:

IP1: The `opposing_boundary_dimensional_size` applies_to a `composite_unit_shape_aspect`.

5.2.3.1.236 owner_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `owner_assignment` is an `person_and_organization_assignment` that specifies a set of `owner_assigned_item`. An item that is owned cannot be changed without the permission of the owner.

EXAMPLE 1 A component position may be owned by the mechanical design department, in which case movement of the component is to be negotiated with that department.

EXPRESS specification:

```
*)
ENTITY owner_assignment
  SUBTYPE OF (person_and_organization_assignment);
  items : SET [1:?] OF owner_assigned_item;
END_ENTITY; -- owner_assignment
(*
```

5.2.3.1.237 package

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A package is a `physical_unit` that implements the ARM concepts of `Altered_package` (see 4.2.8) and `Package` (see 4.2.573).

EXPRESS specification:

```

*)
ENTITY package
  SUBTYPE OF (physical_unit);

```

Formal propositions:

WR1: The package shall have a frame_of_reference name of 'physical design usage'.

WR2: The package shall have at most one package_body.

WR3: The package shall have at least one package_terminal.

WR4: If the package has a description of 'altered package', it shall be related to exactly one package, externally_defined_package, or library_defined_package as the 'package alteration'.

WR5: The package shall have exactly one representation with the name of 'package mounting data'.

WR6: The package shall have one item in its representation with the name of 'package mounting data' that shall be a length_measure_with_unit and that shall have a name of 'maximum body height above seating plane'.

WR7: The package shall have no more than one item in the representation with the name of 'package mounting data' that shall be a length_measure_with_unit and that shall have a name of 'maximum body height below seating plane'.

WR8: The package shall have no more than one item in the representation with the name of 'package mounting data' that shall be a length_measure_with_unit and that shall have a name of 'maximum body clearance above seating plane'.

WR9: The package shall have no more than one item in the representation with the name of 'package mounting data' that shall be a length_measure_with_unit and that shall have a name of 'maximum body clearance below seating plane'.

WR10: The package shall have no more than one item in the representation with the name of 'package mounting data' that shall be a length_measure_with_unit and that shall have a name of 'minimum body clearance above seating plane'.

WR11: The package shall have no more than one item in the representation with the name of 'package mounting data' that shall be a length_measure_with_unit and that shall have a name of 'minimum body clearance below seating plane'.

WR12: The package shall have no more than one item in the representation with the name of 'package mounting data' that shall be a length_measure_with_unit and that shall have a name of 'maximum lead length below seating plane'.

WR13: The package shall have no more than one item in the representation with the name of 'package mounting data' that shall be a length_measure_with_unit and that shall have a name of 'least lead length below seating plane'.

WR14: The seating_plane for this package shall be related to a shape_aspect of this package through a shape_aspect_relationship with the name of 'package seating plane'.

WR15: The package shall have exactly one seating plane.

WR16: The package shall have at most one datum_reference_frame.

WR17: The package shall have at most one primary_reference_terminal.

Informal propositions:

IP1: Each three-dimensional shape representation of the package shall have exactly two geometric_representation_item that are axis2_placement_3d and one axis2_placement_3d shall define the location and orientation of the seating plane in that representation. The normal of the seating plane in that representation shall be congruent with and the same direction as the Z axis of the axis2_placement_3d. The plane of the seating plane in that representation shall be congruent with the plane established by the X and Y axes of the axis2_placement_3d.

IP2: Each two-dimensional shape representation of the package shall have exactly one geometric_representation_item that is an axis2_placement_2d that shall define the origin of the geometric model, and the location and orientation of the seating plane.

IP3: The package shall have no more than one representation with the name of 'material property data' that shall be related to cartesian_points with names of 'least material condition centroid location' and 'maximum material condition centroid location'.

5.2.3.1.238 package_body

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A package_body is a shape_aspect that implements the ARM concept of Package_body (see 4.2.574).

EXPRESS specification:

```
* )
ENTITY package_body
  SUBTYPE OF (shape_aspect);
WHERE
```

```

WR1: SIZEOF (TYPEOF (SELF.of_shape.definition) *
  ['ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +

Formal propositions:

WR1: The packaged_component shall be related, as the 'instantiated part', to exactly one packaged_part, externally_defined_packaged_part, or library_defined_packaged_part that is in the 'physical design usage' product_definition_context.

WR2: The packaged_component shall be related, as the 'package alternate', to at most one package, externally_defined_package, or library_defined_package that has a description of 'altered package'.

WR3: The packaged_component shall have at least one shape_aspect that is a component_terminal with a description of 'packaged component join terminal'.

WR4: If the packaged_component has description of 'packaged connector component', the packaged_component shall be related, as the 'instantiated part', to exactly one packaged_part, externally_defined_packaged_part, or library_defined_packaged_part that is in the 'packaged connector' product_definition_context.

WR5: If the packaged_component has a description of 'packaged connector component', it shall have at least one shape_aspect that is a component_interface_terminal with a description of 'packaged component join terminal'.

WR6: If the packaged_component has a description of 'routed packaged component', it shall have exactly one shape_aspect that has exactly one property_definition that is associated to exactly one representation.

5.2.3.1.246 packaged_connector

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A packaged_connector is a packaged_part that implements the ARM concept of Packaged_connector (see 4.2.587).

EXPRESS specification:

```

*)
ENTITY packaged_connector
  SUBTYPE OF (packaged_part);
WHERE

  WR1: SIZEOF (QUERY (pd <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +

END_ENTITY; -- padstack_definition
(*

```

Formal propositions:

WR1: If the padstack_definition is a product_definition_with_associated_documents, there shall be at most one document in the set of documentation_ids that has a product_data_type of 'CAD filename'

WR2: The padstack_definition shall have exactly one creation date.

WR3: The padstack_definition shall have exactly one approval.

WR4: The padstack_definition shall have at least one organization or person_and_organization as the creator.

WR5: The padstack_definition shall have exactly one security_classification.

WR6: The padstack_definition shall not be any other type of product_definition.

WR7: The padstack_definition shall have a frame_of_reference with a name of 'layout design usage'.

WR8: The padstack_definition shall be associated with a product that is a template model.

5.2.3.1.251 padstack_occurrence

A padstack_occurrence is an assembly_group_component_shape_aspect that implements the ARM concept of Padstack_occurrence (see 4.2.599).

EXPRESS specification:

```
*)
ENTITY padstack_occurrence
  SUBTYPE OF (assembly_group_component_shape_aspect);
END_ENTITY; -- padstack_occurrence
(*
```

5.2.3.1.252 padstack_occurrence_shape_aspect_relationship

A padstack_occurrence_shape_aspect_relationship is a shape_aspect_relationship that implements the ARM concept of Padstack_occurrence_sub_assembly_relationship (see 4.2.600)

EXPRESS specification:

```
*)
ENTITY padstack_occurrence_shape_aspect_relationship
  SUBTYPE OF (shape_aspect_relationship);
WHERE
```

```
  WR1: SELF\shape_aspect_relationship.related_shape_aspect :<>:
        SELF\shape_aspect_relationship.relatng_shape_aspect;
```

```
WR2: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\shape_aspect ||
      SELF\shape_aspect_relationship ||
      SELF\padstack_occurrence_shape_aspect_relationship)) = 0;
```

```
WR3: SELF\shape_aspect_relationship.name = 'padstack occurrence sub assembly relationship'
END_ENTITY; -- padstack_occurrence_shape_aspect_relationship
(*
```

Formal propositions:

WR1: The related shape_aspect shall not be the relating shape_aspect.

WR2: The types of padstack_occurrence_shape_aspect_relationship shall be only padstack_occurrence_shape_aspect_relationship, shape_aspect, and shape_aspect_relationship.

WR3: The name attribute of the shape_aspect_relationship supertype shall be 'padstack occurrence sub assembly relationship'.

5.2.3.1.253 parallelism_tolerance

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A parallelism_tolerance is a geometric_tolerance_with_specified_datum_source that implements the ARM concept of Parallelism_tolerance (see 4.2.602).

EXPRESS specification:

```
*)
ENTITY parallelism_tolerance
  SUBTYPE OF (geometric_tolerance_with_specified_datum_system);
WHERE
```

```
WR1: SELF\geometric_tolerance.name = 'parallelism';
END_ENTITY; -- parallelism_tolerance
(*
```

Formal propositions:

WR1: The name for the parallelism_tolerance shall be 'parallelism'.

Informal propositions:

IP1: The `toleranced_shape_aspect` of the `parallelism_tolerance` shall either lie on the boundary of the shape of the product; be a `centre_of_symmetry` with a description of either 'axis' or 'plane'; be a tangent with a description of 'plane'; be a `part_template_definition`; or be a `composite_shape_aspect` the 'composing' `shape_aspects` of which either are all of type `part_template_definition`, are all of type `centre_of_symmetry` and have the same description – either 'axis' or 'plane', or are all of type tangent with a description of 'plane'.

IP2: The `parallelism_tolerance` shall have at most two `physical_unit_datum` in its referenced `datum_system`.

IP3: The `parallelism_tolerance` shall have at least one `physical_unit_datum` in its referenced `datum_system` that has description of either 'axis' or 'plane'.

IP4: If the `toleranced_shape_aspect` of the `parallelism_tolerance` is neither a `centre_of_symmetry` with a description of 'axis' nor a `composite_shape_aspect` in which the 'composing' `shape_aspects` are all of type `centre_of_symmetry` with a description of 'axis', the `tolerance_zone_boundary` shall be either a `tolerance_zone_explicit_opposing_boundary_set` or a `tolerance_zone_implicit_opposing_boundary_set`.

5.2.3.1.254 parameter_assignment_representation

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `parameter_assignment_representation` is a representation that implements the ARM concept of `Parameter_assignment` (see 4.2.603).

EXPRESS specification:

```

*)
ENTITY parameter_assignment_representation
  SUBTYPE OF (representation);
WHERE

  WR1: SIZEOF (SELF.items) = 2;

  WR2: SIZEOF (QUERY (it <* SELF.items |

        'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'APPLIED_GROUP_ASSIGNMENT.ITEMS') |
            (sizeof (typeof ( aga\group_assignment.assigned_group) *
                ['ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
                'CHARACTERISTIC_TYPE']) = 1)))
    = 1))) <= 1;

WR5: sizeof(typeof(SELF) - typeof(SELF\representation ||
    SELF\parameter_assignment_representation)) = 0;
END_ENTITY; -- parameter_assignment_representation
(*

```

Formal propositions:

WR1: The parameter_assignment_representation shall have exactly two representation_items.

WR2: The parameter_assignment_representation shall have exactly one item that is a model_parameter.

WR3: The parameter_assignment_representation shall have no more than one item that is a coordinated_characteristic.

WR4: The parameter_assignment_representation shall have no more than one item that is a characteristic.

WR5: The parameter_assignment_representation shall not be any other type other than a representation.

5.2.3.1.255 parameter_type

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A parameter_type is a group that specifies a boolean_property_type, a logical_property_type, a physical_property_type or a string_property_type for a model_parameter.

EXPRESS specification:

```

*)
ENTITY parameter_type
    SUBTYPE OF (group);
WHERE

    WR1: SELF\group.name IN ['string property type', 'logical property type',
        'physical property type', 'boolean property type'];
END_ENTITY; -- parameter_type
(*

```

Formal propositions:

WR1: A parameter_type shall have a name that is 'string property type', 'logical property type', 'physical property type', or 'boolean property type'.

5.2.3.1.256 part_connected_terminals_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A part_connected_terminals_definition is a shape_aspect that implements the ARM concept of Part_connected_terminals_definition (see 4.2.605).

EXPRESS specification:

```

*)
ENTITY part_connected_terminals_definition
  SUBTYPE OF (shape_aspect);
  UNIQUE
    UR1: SELF\shape_aspect.name;
  WHERE

    WR1: SIZEOF (QUERY (mct <* QUERY (sar <* USEDIN (SELF,
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |
      sar\shape_aspect_relationship.name = 'member connected terminal') |

(

```

Formal propositions:

UR1: The name shall be unique.

WR1: The part_connected_terminals_definition shall relate to at least two instances of assembly_module_terminal, bare_die_terminal, interconnect_module_terminal, package_terminal, or packaged_part_terminal to specify a 'member connected terminal'.

Informal propositions:

IP1: Each terminal related by this part_connected_terminals_definition shall be a terminal of the same product version.

5.2.3.1.257 part_interface_access_feature

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A part_interface_access_feature is a shape_aspect that implements the ARM concept of Part_interface_access_feature (see 4.2.614).

EXPRESS specification:

```
*)
ENTITY part_interface_access_feature
  SUBTYPE OF (shape_aspect);
WHERE

  WR1: SIZEOF (QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |
    (sar\shape_aspect_relationship.name = 'interface_access area') AND
    (sar.related_shape_aspect\shape_aspect.description = 'connection zone')))) = 1;
END_ENTITY; -- part_interface_access_feature
(*
```

Formal propositions:

WR1: The part_interface_access_feature shall be related as the 'interface_access area' to exactly one shape_aspect with a description of 'connection zone'.

5.2.3.1.258 part_mating_feature

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A part_mating_feature is a shape_aspect that implements the ARM concept of Part_mating_feature (see 4.2.617).

EXPRESS specification:

```

*)
ENTITY part_mating_feature
  SUBTYPE OF (shape_aspect);
WHERE

  WR1: SIZEOF (QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |
    (sar\shape_aspect_relationship.name = 'mating area') AND
    (sar.related_shape_aspect\shape_aspect.description = 'connection zone')))) = 1;
END_ENTITY; -- part_mating_feature
( *

```

Formal propositions:

WR1: The part_mating_feature shall be related as the 'mating area' to exactly one shape_aspect with a description of 'connection zone'.

5.2.3.1.259 part_mounting_feature

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A part_mounting_feature is a shape_aspect that implements the ARM concept of Part_mounting_feature (see 4.2.618).

EXPRESS specification:

```

*)
ENTITY part_mounting_feature
  SUPERTYPE OF (bare_die_surface)
  SUBTYPE OF (shape_aspect);
WHERE

  WR1: SIZEOF (QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |

    (sar.related_shape_aspect\shape_aspect.description = 'connection zone')))) = 1;
END_ENTITY; -- part_mounting_feature
( *

```

Formal propositions:

WR1: The part_mounting_feature shall be related as the 'mounting area' to exactly one shape_aspect with a description of 'connection zone'.

5.2.3.1.260 part_template_definition

A part_template_definition is a shape_aspect that implements the ARM concepts of:

- Blind_passage_template (see 4.2.70);
- Component_termination_passage_template (see 4.2.150);
- Counterbore_passage_template (see 4.2.198);
- Countersunk_passage_template (see 4.2.199);
- Default_trace_template (see 4.2.252);
- Dependent_material_removal_feature_template (see 4.2.258);
- Inter_stratum_feature_template (see 4.2.435);
- Material_addition_feature_template (see 4.2.529);
- Material_removal_feature_template (see 4.2.534);
- Non_conductive_cross_section_template (see 4.2.558);
- Part_template (see 4.2.620);
- Part_text_template (see 4.2.632);
- Physical_feature_or_part_template (see 4.2.658);
- Printed_connector_template (see 4.2.726);
- Printed_part_cross_section_template (see 4.2.728);
- Printed_part_template (see 4.2.730);
- Special_symbol_part_template (see 4.2.835);
- Stratum_feature_template (see 4.2.861);
- Trace_template (see 4.2.930);

- Unsupported_passage_template (see 4.2.941);
- Via_template (see 4.2.952).

Formal propositions:

WR1: The part_template_definition shall be an aspect of the shape of a product_definition that has an application_context_element with a name of 'template definition'.

WR2: The part_template_definition shall have at most one representation that is an analytical_model and has a name of 'part template analytical model'.

WR3: If the part_template_definition has a description of 'component termination passage template', it shall be related to a passage_technology with a description of 'default component termination passage definition' as a 'inter stratum feature passage technology'.

WR4: If the part_template_definition has a description of 'component termination passage template', it shall be used to relate at least two shape_aspects with a description of either 'component termination passage template interface terminal' or 'component termination passage template join terminal' to specify the 'access mechanism'.

WR5: If the part_template_definition has a description of 'default trace template' it shall have a property that is related to a property of a stratum_technology as the 'technology usage'.

WR6: If the part_template_definition has a description of 'inter stratum feature template', it shall be related to a passage_technology as an 'inter stratum feature passage technology'.

WR7: If the part_template_definition has a description of 'printed connector template', it shall be used to relate at least one shape_aspect to specify a 'connector'.

WR8: If the part_template_definition has a description of 'printed part cross section template', it shall be represented by exactly one analytical_model with a name of 'transmission line model'.

WR9: If the part_template_definition has a description of 'printed part cross section template', it shall have a representation that contains exactly two length_measure_with_units.

WR10: If the `part_template_definition` has a description of 'printed part cross section template', it shall have a representation that contains exactly one `length_measure_with_unit` with a name of 'maximum width'.

WR11: If the `part_template_definition` has a description of 'printed part cross section template', it shall have a representation that contains exactly one `length_measure_with_unit` with a name of 'minimum width'.

WR12: If the `part_template_definition` has a description of 'printed part template', it shall be an aspect of the shape of a `product_definition` that is the 'implemented function' for exactly one `functional_unit` with a `frame_of_reference` name of 'functional design usage'.

WR13: If the `part_template_definition` has a description of 'printed part template', it shall be used to relate two or more `printed_part_template_terminals` with a description of either 'interface terminal' or 'join terminal' to specify an 'associated definition'.

WR14: If the `part_template_definition` has a description of 'trace template', it shall have a representation that contains exactly one `styled_item` with a name of 'trace style' that specifies a `curve_style`.

WR15: If the `part_template_definition` has a description of 'unsupported passage template', it shall be related to exactly one `passage_technology` with a description of 'default unsupported passage definition'.

WR16: If the `part_template_definition` has a description of 'via template', it shall be related to exactly one `passage_technology` with a description of 'default via definition'.

WR17: If the `part_template_definition` has a description of 'via template', it shall relate at least two `shape_aspects` with a description of 'via template terminal' as the 'access mechanism'.

WR18: The `part_template_definition` name shall exist.

NOTE This is a placeholder rule.

WR19: If the `part_template_definition` has a description of 'non conductive cross section template' it shall have a property that is related to a property of a `stratum_technology` as the 'technology usage'.

WR20: If the `part_template_definition` has a description of 'non conductive cross section template', it shall have a representation that contains exactly one `length_measure_with_unit` with a name of 'nominal width'.

WR21: If the `part_template_definition` has a description of 'printed connector template', it shall be used to relate two or more `printed_part_template_terminals` with a description of either 'interface terminal' or 'join terminal' to specify an 'associated definition'.

WR22: If the `part_template_definition` has a description of 'printed part cross section template', and if there are horizontally adjacent disjoint materials, the subsequent boundary shall be the 'right' boundary for each material link between two materials.

WR23: If the `part_template_definition` has a description of 'printed part cross section template', and if there are horizontally adjacent disjoint materials, the precedent boundary shall be the 'left' boundary for each material link between two materials.

WR24: If the `part_template_definition` has a description of 'printed part cross section template', and if there are vertically adjacent disjoint materials, the subsequent boundary shall be the 'top' boundary for each material link between two materials.

WR25: If the `part_template_definition` has a description of 'printed part cross section template', and if there are vertically adjacent disjoint materials, the precedent boundary shall be the 'bottom' boundary for each material link between two materials.

WR26: The name inherited from `shape_aspect` shall be 'NULL'.

5.2.3.1.261 `part_text_template_definition`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `part_text_template_definition` is a `part_template_definition` that implements the ARM concept of `Part_text_template` (see 4.2.632) .

```

Formal propositions:

UR1: The name shall be unique within the scope of the referenced shape.

WR1: The passage_technology shall be an aspect of the shape of a product_definition.

WR2: The passage_technology shall have at most one material designation.

WR3: The passage_technology shall have exactly one representation with a name of 'physical characteristics representation'.

WR4: The passage_technology shall have at least one and at most eight items in its representation with a name of 'physical characteristics representation'.

WR5: The items in the representation with a name of 'physical characteristics representation' of a passage_technology shall have a name of either 'maximum aspect ratio', 'plated passage', 'maximum allowed component terminal extent', 'minimum allowed component terminal extent', 'maximum as finished deposition thickness', 'minimum as finished deposition thickness', 'maximum as finished passage extent', or 'minimum as finished passage extent'.

WR6: At most one item in the representation with a name of 'physical characteristics representation' of a passage_technology shall be a measure_representation_item and a ratio_measure_with_unit with a name of 'maximum aspect ratio' and a value greater than 1.0.

WR7: Exactly one item in the representation with a name of 'physical characteristics representation' of a passage_technology shall be a descriptive_representation_item with a name of 'plated passage' and a description of 'true' or 'false'.

WR8: At most one item in the representation with a name of 'physical characteristics representation' of a passage_technology shall be a measure_representation_item and a length_measure_with_unit with a name of 'minimum as finished passage extent'.

WR9: At most one item in the representation with a name of 'physical characteristics representation' of a passage_technology shall be a measure_representation_item and a length_measure_with_unit with a name of 'maximum as finished deposition thickness'.

WR10: At most one item in the representation with a name of 'physical characteristics representation' of a passage_technology shall be a measure_representation_item and a length_measure_with_unit with a name of 'minimum as finished deposition thickness'.

WR11: If the passage_technology has a description of 'default via definition' or 'default component termination passage definition', it shall have exactly one material_designation.

WR12: If the passage_technology has a description of 'default component termination passage definition', 'default unsupported passage definition' or 'default via definition', exactly one item in the representation with a name of 'physical characteristics representation' of a passage_technology shall be a measure_representation_item and a length_measure_with_unit with a name of 'minimum as finished passage extent'.

WR13: If the passage_technology has a description of 'default component termination passage definition', exactly one item in the representation with a name of 'physical characteristics representation' of a passage_technology shall be a measure_representation_item and a length_measure_with_unit with a name of 'minimum as finished deposition thickness'.

WR14: If the passage_technology has a description of 'default component termination passage definition', exactly one item in the representation with a name of 'physical characteristics representation' of a passage_technology shall be a measure_representation_item and a length_measure_with_unit with a name of 'minimum allowed component terminal extent'.

WR15: If the passage_technology has a description of 'default component termination passage definition', exactly one item in the representation with a name of 'physical characteristics representation' of a passage_technology shall be a measure_representation_item and a length_measure_with_unit with a name of 'maximum allowed component terminal extent'.

WR16: If the passage_technology has a description of 'default via definition', exactly one item in the representation with a name of 'physical characteristics representation' of a passage_technology shall be a measure_representation_item and a length_measure_with_unit with a name of 'minimum as finished deposition thickness'.

WR17: The passage_technology shall relate to exactly one shape_aspect of a shape with a description of 'finished stratum extent' of a product_definition_relationship with a name of 'inter stratum extent' to specify the 'as finished inter stratum extent'.

Informal propositions:

IP1: If the passage_technology is related to a inter_stratum_feature with a description of 'interconnect module edge' or 'interconnect module edge segment' it, shall not be related to a representation_item with a name of 'maximum as finished passage extent'

IP2: If the item in the representation with a name of 'physical characteristics representation' of a passage_technology has a descriptive_representation_item with a name of 'plated passage' and a description of 'true' then the material designation shall have be the designation for a material_designation_characterization with a property that is a material_property_representation that has a definition that is a material_property and a used_representation with a name of 'conductivity classification representation' that has an item that is a descriptive_representation_item with a name of 'electrical conductivity classification' and a description of 'conductive'.

5.2.3.1.264 perpendicularity_tolerance

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A perpendicularity_tolerance is a geometric_tolerance_with_specified_datum_source that implements the ARM concept of Perpendicularity_tolerance (see 4.2.645).

EXPRESS specification:

```
*)
ENTITY perpendicularity_tolerance
  SUBTYPE OF (geometric_tolerance_with_specified_datum_system);
WHERE

  WR1: SELF\geometric_tolerance.name = 'perpendicularity';
END_ENTITY; -- perpendicularity_tolerance
(*
```

Formal propositions:

WR1: The name for the perpendicularity_tolerance shall be 'perpendicularity'.

Informal propositions:

IP1: The toleranced_shape_aspect of the perpendicularity_tolerance shall either lie on the boundary of the shape of the product; be a centre_of_symmetry with a description of either 'axis' or 'plane'; be a tangent with a description of 'plane'; be a part_template_definition; or be a composite_shape_aspect the 'composing' shape_aspects of which either are all of type part_template_definition, are all of type centre_of_symmetry and have the same description – either 'axis' or 'plane', or are all of type tangent with a description of 'plane'.

IP2: The perpendicularity_tolerance shall have at most two physical_unit_datum in its referenced datum_system.

IP3: The perpendicularity_tolerance shall have at least one physical_unit_datum in its referenced datum_system that has description of either 'axis' or 'plane'.

IP4: If the `toleranced_shape_aspect` of the `perpendicularity_tolerance` is neither a `centre_of_symmetry` with a description of 'axis' nor a `composite_shape_aspect` in which the 'composing' `shape_aspects` are all of type `centre_of_symmetry` with a description of 'axis', the `tolerance_zone_boundary` shall be either a `tolerance_zone_explicit_opposing_boundary_set` or a `tolerance_zone_implicit_opposing_boundary_set`.

5.2.3.1.265 `physical_connectivity_definition`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `physical_connectivity_definition` is a `shape_aspect` that implements the ARM concepts of `Physical_connectivity_definition` (see 4.2.652) and `Physical_connectivity_structure_definition` (see 4.2.657).

EXPRESS specification:

```
*)
ENTITY physical_connectivity_definition
  SUBTYPE OF (shape_aspect);

    pdr\property_definition_relationship.name = 'connectivity allocation')) = 1)
    ))
    <= 1;
END_ENTITY; -- physical_connectivity_definition
(*

```

Formal propositions:

UR1: The name shall be unique within the context of the product_definition_shape in the role of of_shape for the shape_aspect supertype.

NOTE Since there may be only one product_definition for a product_definition_shape, this guarantees uniqueness within the context of the product_definition.

WR1: The physical_connectivity_definition shall relate to two or more physical_component_terminal to specify the 'associated terminals'.

WR2: The physical_connectivity_definition shall be related by at most one property_definition_relationship as a 'connectivity allocation'.

Informal propositions:

IP1: All component_terminals related to a physical_connectivity_definition shall be in the same design view.

IP2: All component_terminals related to a physical_connectivity_definition shall not be in the set of terminals of the components that implement the connectivity defined by the physical_connectivity_definition.

NOTE The terminals identified by the physical_connectivity_definition are a subset of the terminals referenced by the members of assembly_joint or by the members of the implementation of the ARM concept of Interface_mounted_join.

5.2.3.1.266 physical_connectivity_element

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A physical_connectivity_element is a shape_aspect_relationship and a shape aspect that implement the ARM concept of Physical_connectivity_element (see 4.2.654).

EXPRESS specification:

```

*)
ENTITY physical_connectivity_element
  SUBTYPE OF (shape_aspect_relationship, shape_aspect);

(

```

Formal propositions:

WR1: The `physical_connectivity_element` shall have a `relatng_shape_aspect` that either has a description of 'topological junction', or is a `component_terminal`.

WR2: The `physical_connectivity_element` shall have a `related_shape_aspect` that either has a description of 'topological junction', or is a `component_terminal`.

WR3: The `physical_connectivity_element` shall be related to exactly one `physical_connectivity_definition` as a 'structure element'.

WR4: The `physical_connectivity_element` shall be an aspect of the shape of a `physical_unit` that has a `frame_of_reference` name of 'physical design'.

5.2.3.1.267 `physical_network`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `physical_network` is a `shape_aspect` that implements the ARM concept of `Physical_network` (see 4.2.660).

NOTE A `physical_network` should not be confused with the like sounding term `physical_unit_network_definition`.

EXPRESS specification:

```
*)
ENTITY physical_network
  SUBTYPE OF (shape_aspect);
WHERE

  WR1: SIZEOF (QUERY (cr <* QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT') |

    'PART_CONNECTED_TERMINALS_DEFINITION' IN
    TYPEOF (nt.relatng_shape_aspect))) <= 1;
END_ENTITY; -- physical_network
(*

```

Formal propositions:

WR1: The `physical_network` shall relate to at least two `component_terminals` with the specified descriptions to specify a 'connectivity requirement'.

WR2: The `physical_network` shall relate to at least one `join_shape_aspect` to specify a 'network topology'.

WR3: The `physical_network` shall relate to no more than one `part_connected_terminals_definition` to specify 'reference connected terminals'.

Informal propositions:

IP1: All `component_terminals` related to a `physical_network` in the role of `connectivity_requirement_element` shall be in the same design view as the `physical_network` (`interconnect_module`.)

IP2: All `join_relationships` related to a `physical_network` in the role of `interconnect_module_net_topology_element` shall be in the same design view as the `physical_network` (`interconnect_module`.)

IP3: All `interconnect_module_net_topology_element` and `connectivity_requirement_element` related to `physical_network` shall be in the same design view (`interconnect_module`.)

IP4: The `material_electrical_conductivity_category` shall be the same for all materials that participate in the `physical_network`.

IP5: The `physical_network` shall not be referenced by more than one `property_definition_relationship` that relates the `physical_network` to an aggregate connectivity requirement implementation.

5.2.3.1.268 `physical_node_requirement_to_implementing_component_allocation`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `physical_node_requirement_to_implementing_component_allocation` is a `shape_aspect_relationship` and a `shape_aspect` that is the allocation of a physical node to the component that is partially or wholly responsible for implementing that node in the assembly. The relating and related `shape_aspects` are the node and a `shape_aspect` of the component respectively. A `physical_node_requirement_to_implementing_component_allocation` implements the ARM concept of `Physical_node_requirement_to_implementing_component_allocation` (see 4.2.663).

EXPRESS specification:

```

*)
ENTITY physical_node_requirement_to_implementing_component_allocation

*)
END_ENTITY; -- physical_node_requirement_to_implementing_component_allocation
(*)

```

Formal propositions:

WR1: The physical_node_requirement_to_implementing_component_allocation shall have a related_shape_aspect that references a component_definition that is not a laminate component.

WR2: The physical_node_requirement_to_implementing_component_allocation shall have a relating_shape_aspect that references a physical_connectivity_definition.

WR3: The members of physical_node_requirement_to_implementing_component_allocation shall form a directed acyclic graph with the relating_shape_aspect, related_shape_aspect attributes of physical_node_requirement_to_implementing_component_allocation.

WR4: A member of physical_node_requirement_to_implementing_component_allocation shall not be any other subtype of shape_aspect or shape_aspect_relationship.

WR5: in arm terms: SIZEOF(QUERY (pct <* physical_node_requirement.associated_terminals | pct\component_feature.associated_component = implementation_component)) = 0;

5.2.3.1.269 physical_unit

A physical_unit is a product_definition that implements the ARM concepts of:

- Assembly_module (see 4.2.43);
- Assembly_module_usage_view (see 4.2.51);
- Externally_defined_ee_product_definition (see 4.2.364);
- Ee_product_definition (see 4.2.323);
- Interconnect_module (see 4.2.440);
- Interconnect_module_usage_view (see 4.2.465);
- Library_defined_ee_product_definition (see ??);
- Physical_unit (see 4.2.664);
- Physical_unit_design_view (see 4.2.667);
- Physical_unit_usage_view (see 4.2.672).

EXPRESS specification:

Formal propositions:

WR1: If the physical_unit is a product_definition_with_associated_documents, there shall be at most one document in the set of documentation_ids that has a product_data_type of 'CAD filename'

WR2: The physical_unit shall have exactly one creation date.

WR3: The physical_unit shall have exactly one approval.

WR4: The physical_unit shall have at least one organization or person_and_organization as the creator.

WR5: The physical_unit shall have exactly one security_classification.

WR6: The physical_unit shall have a frame_of_reference with a name of 'physical design' or 'physical design usage'.

WR7: The physical_unit shall be related to at most one property with a name of 'unit technology'.

WR8: If the physical_unit is a 'physical design usage' of an 'assembly module', it shall have at least one shape_aspect that is of type assembly_module_terminal.

WR9: If the physical_unit is a 'physical design usage' of an 'assembly module', it shall have at most one representation with a name of 'maximum negative component height'

WR10: If the physical_unit is a 'physical design usage' of an 'assembly module', it shall have at most one representation with a name of 'maximum positive component height'.

WR11: If the `physical_unit` is a 'physical design usage' of an 'assembly module', it shall have exactly one 'functional design usage' specified as the implemented function.

WR12: If the `physical_unit` is a 'physical design' of an 'assembly module', it shall have no laminate components.

WR13: If the `physical_unit` is a 'physical design usage' of an 'interconnect module', it shall have no more than one 'functional design usage' specified as the 'implemented function'.

WR14: If the `physical_unit` is a 'physical design usage' of an 'interconnect module', it shall have at most one `requirements_property` with a name of 'located interconnect module thickness'

WR15: If the `physical_unit` is a physical design usage of an interconnect module it shall be the definition for at most one `property_definition` with a name of 'interconnect module usage view physical characteristics'.

WR16: If the `physical_unit` is a physical design usage of an interconnect module it shall be the definition for at most one `property_definition` with a name of 'interconnect module usage view physical characteristics' and related to a `length_measure_with_unit` with a name of 'minimum thickness over metal requirement'

WR17: If the `physical_unit` is a physical design usage of an interconnect module it shall be the definition for at most one `property_definition` with a name of 'interconnect module usage view physical characteristics' and related to a `length_measure_with_unit` with a name of 'maximum thickness over metal requirement'

WR18: If the `physical_unit` is a physical design usage of an interconnect module it shall be the definition for at most one `property_definition` with a name of 'interconnect module usage view physical characteristics' and related to a `length_measure_with_unit` with a name of 'minimum thickness over dielectric requirement'

WR19: If the `physical_unit` is a physical design usage of an interconnect module it shall be the definition for at most one `property_definition` with a name of 'interconnect module usage view physical characteristics' and related to a `length_measure_with_unit` with a name of 'maximum thickness over dielectric requirement'

WR20: If the `physical_unit` is a physical design usage of an interconnect module it shall be the definition for at most one `property_definition` with a name of 'restraint' or 'tolerance specific restraint'.

WR21: If the `physical_unit` is a 'physical design usage' of an 'interconnect module', it shall have no more than one `shape_aspect` that is implementation of secondary surface.

WR22: If the `physical_unit` is a 'physical design usage' of an 'interconnect module', it shall have no more than one `shape_aspect` that is implementation of primary surface.

WR23: If the `physical_unit` is a 'physical design usage' of an 'interconnect module', it shall have no more than one `shape_aspect` that is implementation of edge surface.

WR24: If the `physical_unit` that is a design view of an assembly module is referenced by an `assembly_joint` through the `of_shape` attribute, at least one of the members of `component_definition` that are related by the `relating_shape_aspect` of that `assembly_joint` shall be related by members of `assembly_component_usage` to this `physical_unit`.

WR25: If the `physical_unit` that is a design view of an assembly module is referenced by an `assembly_joint` through the `of_shape` attribute, each member of `component_definition` that are related by the `related_shape_aspect` of that `assembly_joint` shall be related by members of `assembly_component_usage` to this `physical_unit`.

WR26: If the `physical_unit` that is a design view of an assembly module is referenced by an `assembly_joint` through the `of_shape` attribute, the `component_definition` that is related by the `assembly_joint\shape_aspect_relationship.related_shape_aspect` attribute of that `assembly_joint` shall be positioned by a member of `component_location` which also references that `assembly_joint`.

WR27: If the `physical_unit` that is a design view of an interconnect module, there shall be exactly one primary design layer stratum related to the `physical_unit` by an `assembly_component_usage`.

5.2.3.1.270 `physical_unit_datum`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `physical_unit_datum` is a `shape_aspect` that implements the ARM concepts of:

- `Common_datum` (see 4.2.105);
- `Datum` (see 4.2.214);
- `Datum_axis` (see 4.2.215);
- `Datum_plane` (see 4.2.232);
- `Datum_point` (see 4.2.233);
- `Edge_segment_vertex` (see 4.2.312);
- `Single_datum` (see 4.2.828).

EXPRESS specification:

```

END_ENTITY; -- physical_unit_geometric_tolerance
( *

```

Formal propositions:

WR1: The value of two name attributes of the `physical_unit_geometric_tolerance` shall be identical.

WR2: The `shape_aspect` specified as the definition of the `physical_unit_geometric_tolerance` shall be the same `shape_aspect` specified as the `toleranced_shape_aspect` by the `physical_unit_geometric_tolerance`.

WR3: If the `physical_unit_geometric_tolerance` is neither a `geometric_tolerance_with_specified_datum_system`, a `linear_profile_tolerance`, a `surface_profile_tolerance`, nor a `position_tolerance`, the name of the `physical_unit_geometric_tolerance` shall be either 'circularity', 'cylindricity', 'flatness', or 'straightness'.

WR4: If the name of the `physical_unit_geometric_tolerance` is 'circularity', it shall not be a `modified_geometric_tolerance`.

WR5: If the name of the `physical_unit_geometric_tolerance` is 'cylindricity', it shall not be a `modified_geometric_tolerance`.

WR6: If the name of the `physical_unit_geometric_tolerance` is 'flatness', it shall not be a `modified_geometric_tolerance`.

WR7: The `physical_unit_geometric_tolerance` shall be related to at most one `geometric_tolerance_group` with a description of 'simultaneous requirement' as the 'group geometric tolerance'.

Informal propositions:

IP1: The `physical_unit_geometric_tolerance` either shall relate to exactly one `property_definition` that has a description of either 'conical tolerance zone boundary size', 'positional boundary member property', 'profile related positional boundary property' to specify the 'defined boundary'; or shall be the `defining_tolerance` of exactly one `tolerance_zone` that is the zone of exactly one `tolerance_zone_definition`.

IP2: The `toleranced_shape_aspect` of the `physical_unit_geometric_tolerance` shall either lie on the boundary of the shape of the product; be a `centre_of_symmetry` with a description of either 'axis', 'plane', or 'point'; be a tangent with a description of 'plane'; be a `part_template_definition`; or be a `composite_shape_aspect` the 'composing' `shape_aspects` of which either are all of type `part_template_definition`, are all of type tangent with a description of 'plane', or are all of type `centre_of_symmetry` and have the same description – either 'axis', 'plane', or 'point'.

IP3: If the name of the `physical_unit_geometric_tolerance` is 'circularity', the `toleranced_shape_aspect` shall either be a `part_template_definition`, lie on the boundary of the shape of the product, or be a `composite_shape_aspect` the 'composing' `shape_aspects` of which are all of type `part_template_definition`.

IP4: If the name of the `physical_unit_geometric_tolerance` is 'circularity', the `tolerance_zone_boundary` shall be either a `tolerance_zone_explicit_opposing_boundary_set` or a `tolerance_zone_implicit_opposing_boundary_set`.

IP5: If the name of the `physical_unit_geometric_tolerance` is 'cylindricity', the `toleranced_shape_aspect` shall either be a `part_template_definition`, lie on the boundary of the shape of the product, or be a `composite_shape_aspect` the 'composing' `shape_aspects` of which are all of type `part_template_definition`.

IP6: If the name of the `physical_unit_geometric_tolerance` is 'cylindricity', the `tolerance_zone_boundary` shall be either a `tolerance_zone_explicit_opposing_boundary_set` or a `tolerance_zone_implicit_opposing_boundary_set`.

IP7: If the name of the `physical_unit_geometric_tolerance` is 'flatness', the `toleranced_shape_aspect` shall either be a `part_template_definition`, lie on the boundary of the shape of the product, or be a `composite_shape_aspect` the 'composing' `shape_aspects` of which are all of type `part_template_definition`.

IP8: If the name of the `physical_unit_geometric_tolerance` is 'flatness', the `tolerance_zone_boundary` shall be either a `tolerance_zone_explicit_opposing_boundary_set` or a `tolerance_zone_implicit_opposing_boundary_set`.

IP9: If the name of the `physical_unit_geometric_tolerance` is 'flatness' and the `physical_unit_geometric_tolerance` is the defining `tolerance` of a `tolerance_zone` that has a `property_definition` with a description of 'tolerance zone per unit size', the `property_definition` shall have exactly one representation that contains two `length_measure_with_unit` with a name of 'per unit size'.

IP10: There shall exist exactly one `requirements_property` that has a representation that contains a `descriptive_representation_item` that has the name of 'requirements description' and a description of 'geometric dimensioning and tolerancing reference', and that `requirements_property` shall be an item of one or more `document_reference` the assigned `document` of which are `ee_specification`.

IP11: If the name of the `physical_unit_geometric_tolerance` is 'straightness'; the `toleranced_shape_aspect` shall either lie on the boundary of the shape of the product; be a `centre_of_symmetry` with a description of either 'axis' or 'plane', be a `part_template_definition`; or be a `composite_shape_aspect` the 'composing' `shape_aspects` of which either are all of type `part_template_definition`, or are all of type `centre_of_symmetry` and have the same description – either 'axis' or 'plane'.

IP12: If the name of the `physical_unit_geometric_tolerance` is 'straightness' and the `toleranced_shape_-aspect` of the `physical_unit_geometric_tolerance` is either a `centre_of_symmetry` with a description of 'axis', or a `composite_shape_aspect` the 'composing' `shape_aspects` of which are all of type `centre_of_symmetry` and have a description of 'axis'; the `tolerance_zone_boundary` shall have a description of 'circular or cylindrical or spherical'.

IP13: If the name of the `physical_unit_geometric_tolerance` is 'straightness' and the `toleranced_shape_-aspect` of the `physical_unit_geometric_tolerance` is neither a `centre_of_symmetry` with a description of 'axis', nor a `composite_shape_aspect` the 'composing' `shape_aspects` of which are all of type `centre_of_symmetry` and have a description of 'axis'; the `tolerance_zone_boundary` shall be either a `tolerance_zone_explicit_opposing_boundary_set` or a `tolerance_zone_implicit_opposing_boundary_set`.

IP14: If the name of the `physical_unit_geometric_tolerance` is 'straightness' and the `toleranced_shape_-aspect` either is a `part_template_definition`, lies on the boundary of the shape of the product, or is a `composite_shape_aspect` in which all the 'composing' `shape_aspects` are of type `part_template_definition`; the `physical_unit_geometric_tolerance` shall be the `defining_tolerance` of a `tolerance_zone` that has exactly one `property_definition` with a description of 'tolerance zone orientation' that relates to a `property_definition` with a description of 'viewing plane based orientation' to specify its 'zone orientation'.

IP15: If the name of the `physical_unit_geometric_tolerance` is 'straightness' and the `toleranced_shape_-aspect` is not a `part_template_definition`, does not lie on the boundary of the shape of the product, or is not a `composite_shape_aspect` in which all the 'composing' `shape_aspects` are of type `part_template_definition`; the `physical_unit_geometric_tolerance` shall be the `defining_tolerance` of a `tolerance_zone` that has exactly zero `property_definition` with a description of 'tolerance zone orientation'.

5.2.3.1.275 `physical_unit_network_definition`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `physical_unit_network_definition` is a `product_definition` that implements the ARM concept of `Physical_unit_network_definition` (see 4.2.668)

EXPRESS specification:

```
*)
ENTITY physical_unit_network_definition
  SUBTYPE OF (product_definition);
WHERE

  WR1: (NOT ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_DEFINITION_WITH_ASSOCIATED_DOCUMENTS' IN
    TYPEOF (SELF))) OR
    (SIZEOF (QUERY (docs <*
    SELF\product_definition_with_associated_documents.
    documentation_ids |
    docs.kind\document_type.product_data_type = 'CAD filename')) <= 1);
```

```

WR2: sizeof (QUERY (adta <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DATE_AND_TIME_ASSIGNMENT.ITEMS') |
    adta.role\date_time_role.name = 'creation date')) +
    sizeof (QUERY (ada <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DATE_ASSIGNMENT.ITEMS') |
    ada.role\date_role.name = 'creation date')) = 1;

WR3: sizeof (USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_APPROVAL_ASSIGNMENT.ITEMS')) = 1;

WR4: sizeof (QUERY (apoa <* USEDIN (SELF,

    'plated cutout')))) = 1);
END_ENTITY; -- plated_cutout_edge_segment
(*
```

Formal propositions:

WR1: The `plated_cutout_edge_segment` shall have a description of 'plated cutout edge segment'.

WR2: The `plated_cutout_edge_segment` shall be related to at most one `join_shape_aspect` with a name of 'inter stratum join' as a 'join implementation'.

WR3: The `plated_cutout_edge_segment` shall be related to exactly one cutout with a description of 'plated cutout' as the 'composed cutout'.

5.2.3.1.277 **plated_inter_stratum_feature**

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `plated_inter_stratum_feature` is an `inter_stratum_feature` that implements the ARM concepts of:

- `Inter_stratum_join_implementation` (see 4.2.436);
- `Join_two_physical_connectivity_definition_supporting_inter_stratum_feature` (see 4.2.480);
- `Physical_network_supporting_inter_stratum_feature` (see 4.2.661);
- `Plated_cutout` (see 4.2.685);
- `Plated_inter_stratum_feature` (see 4.2.687);
- `Plated_interconnect_module_edge` (see 4.2.688).

EXPRESS specification:

```

*)
ENTITY plated_inter_stratum_feature
  SUPERTYPE OF (ONEOF(plated_passage,plated_cutout_edge_segment,
    plated_interconnect_module_edge_segment))
  SUBTYPE OF (inter_stratum_feature);
WHERE

  WR1: (SELF\shape_aspect.description IN ['bonded conductive base blind via',
    'buried via',
    'component termination passage', 'interfacial connection',

(

```

Formal propositions:

WR1: The plated_interconnect_module_edge_segment shall have a description of 'plated interconnect module edge segment'.

WR2: The plated_interconnect_module_edge_segment shall be related to at most one join_shape_aspect with a name of 'inter stratum join' as a 'join implementation'.

WR3: The plated_interconnect_module_edge_segment shall be related to exactly one interconnect_module_edge with a description of 'plated interconnect module edge' as the 'composed edge'.

Informal propositions:

IP1: The associated passage_technology shall have descriptive_representation_item with a description of 'true'.

5.2.3.1.279 plated_passage

A plated_passage is a plated_inter_stratum_feature that implements the ARM concepts of:

- Blind_via (see 4.2.71);
- Bonded_conductive_base_blind_via (see 4.2.74);
- Buried_via (see 4.2.81);
- Component_termination_passage (see 4.2.143);
- Interfacial_connection (see 4.2.474);
- Non_conductive_base_blind_via (see 4.2.557);
- Plated_conductive_base_blind_via (see 4.2.684);
- Plated_passage (see 4.2.690);
- Via (see 4.2.947).

EXPRESS specification:

```
*)  
ENTITY plated_passage  
  SUBTYPE OF (plated_inter_stratum_feature);  
WHERE  
  
  WR1: SELF\shape_aspect.description IN ['bonded conductive base blind via',

END_ENTITY; -- position_tolerance
(*

```

Formal propositions:

WR1: If the position_tolerance has a name of 'boundary based position', it shall be a modified_geometric_tolerance.

WR2: If the position_tolerance has a name of 'boundary based position', it shall relate to at most one geometric_tolerance_with_specified_datum_system that is a surface_profile_tolerance with a name of either 'surface profile', 'surface profile locating', or 'surface profile refinement' to specify the 'profile control'.

WR3: If the `position_tolerance` has a name of 'feature relating position', it shall be related as the 'position refining control' to exactly one `position_tolerance` with a name of either 'feature locating position' or 'feature relating position'.

WR4: If the `position_tolerance` has a name of 'feature locating position', it shall relate to exactly one `position_tolerance` with a name of 'feature relating position' to specify the 'position refining control'.

WR5: If the `position_tolerance` has a name of 'feature relating position', it shall relate to at most one `position_tolerance` with a name of 'feature relating position' to specify the 'position refining control'.

Informal propositions:

IP1: If `position_tolerance` is a `geometric_tolerance_with_specified_datum_system`, it shall have a name of either 'position', 'feature relating position', 'feature locating position', or 'boundary based position'; otherwise, it shall have the name of either 'position' or 'feature relating position'.

IP2: If the name of the `position_tolerance` is 'boundary based position', the `toleranced_shape_aspect` shall either be a `part_template_definition`, lie on the boundary of the shape of the product, or be a `composite_shape_aspect` the 'composing' `shape_aspects` of which are all of type `part_template_definition`.

IP3: If the `position_tolerance` has a name of 'boundary based position' and it relates to exactly one `geometric_tolerance_with_specified_datum_system` that is a `surface_profile_tolerance` with a name of either 'surface profile', 'surface profile locating', or 'surface profile refinement' to specify the 'profile control', the `position_tolerance` and `surface_profile_tolerance` shall specify the same `shape_aspect` as their `toleranced_shape_aspect`.

IP4: If the `position_tolerance` has a name of 'boundary based position' and it relates to exactly one `geometric_tolerance_with_specified_datum_system` that is a `surface_profile_tolerance` with a name of either 'surface profile', 'surface profile locating', or 'surface profile refinement' to specify the 'profile control', the `physical_unit_datum` of the `datum_system` referenced by the `surface_profile_tolerance` shall also be `physical_unit_datum` of the `datum_system` referenced by the `position_tolerance` and shall be assigned the same precedence.

IP5: If the `position_tolerance` has a name of 'boundary based position' and it relates to exactly one `geometric_tolerance_with_specified_datum_system` that is a `surface_profile_tolerance` with a name of either 'surface profile', 'surface profile locating', or 'surface profile refinement' to specify the 'profile control', the `position_tolerance` shall relate to a `property_definition` that has a description of 'profile related positional boundary property' to specify the 'defined boundary'.

IP6: If the `position_tolerance` has a name of 'boundary based position' and it does not relate to a `geometric_tolerance_with_specified_datum_system` that is a `surface_profile_tolerance` with a name of either 'surface profile', 'surface profile locating', or 'surface profile refinement' to specify the 'profile control', the `position_tolerance` shall relate to a `property_definition` that has a description of 'positional boundary member property' to specify the 'defined boundary'.

IP7: If the name of the `position_tolerance` is 'feature locating position', the `toleranced_shape_aspect` shall be a `composite_group_shape_aspect`.

IP8: If the position_tolerance has a name of 'feature relating position', it shall be related as the 'position refining control' to exactly one position_tolerance with a name of either 'feature locating position' or 'feature relating position'. Both of these position_tolerances shall specify the same shape_aspect as the toleranced_shape_aspect.

IP9: If the position_tolerance is not a geometric_tolerance_with_specified_datum_system and has a name of 'feature relating position', it shall not relate to a position_tolerance with a name of 'feature relating position' to specify the 'position refining control'.

IP10: If the position_tolerance has a name of 'feature relating position' and it is related as the 'position refining control' to exactly one position_tolerance with a name of 'feature relating position', it shall either not reference a datum_system or it shall have less physical_unit_datum in its referenced datum_system than the datum_system referenced by the position_tolerance to which it is related as the 'position refining control'.

IP11: If the position_tolerance has a name of 'feature relating position' and it is related as the 'position refining control' to exactly one position_tolerance with a name of 'feature locating position', it shall either not reference a datum_system or it shall have less than or an equal number of physical_unit_datum in its referenced datum_system than the datum_system referenced by the position_tolerance to which it is related as the 'position refining control'.

IP12: If the position_tolerance has a name of 'feature relating position' and it is a geometric_tolerance_with_specified_datum_system, the physical_unit_datum of its referenced datum_system shall be physical_unit_datum of the datum_system of the position_tolerance to which it is related as the 'position refining control' and shall be assigned the same precedence.

IP13: If the position_tolerance has a name of 'feature relating position' and it is a geometric_tolerance_with_specified_datum_system that relates to a property_definition of a datum_system that has the description of 'datum system property without material conditions' to specify its 'referenced datum system definition', the position_tolerance to which it is related as the 'position refining control' shall also be a geometric_tolerance_with_specified_datum_system that relates to a property_definition of a datum_system that has the description of 'datum system property without material conditions' to specify its 'referenced datum system definition'.

IP14: If the position_tolerance has a name of 'feature relating position' and it is a geometric_tolerance_with_specified_datum_system that relates to a property_definition of a datum_system that has the description of 'datum system property with material conditions' to specify its 'referenced datum system definition', the position_tolerance to which it is related as the 'position refining control' shall also be a geometric_tolerance_with_specified_datum_system that relates to a property_definition of a datum_system that has the description of 'datum system property with material conditions' to specify its 'referenced datum system definition', and each of these property_definition shall relate to property_definition with a description of 'datum feature material condition property' to specify their 'applied material condition property'. These property_definition shall be applied to physical_unit_datum_features in the context of the datum_systems referenced by each of the position_tolerance. The name of the property_definition applied to each of the physical_unit_datum_feature in the context of the datum_system referenced by this position_tolerance shall be the same as the name of the property_definition applied to the same physical_unit_datum_feature in the context of the datum_system referenced by the position_tolerance to which this position_tolerance is related as the 'position refining control'.

IP15: If the `position_tolerance` has a name of 'feature relating position', it shall specify a `measure_with_unit` as its magnitude that is less than the `measure_with_unit` specified as the magnitude of the `position_tolerance` to which it is related as the 'position refining control'.

IP16: If the `position_tolerance` has a name of 'feature relating position' and it is specified as the defining `tolerance` by a `tolerance_zone` that has a description of 'conical', the `position_tolerance` that is related to this `position_tolerance` as the 'position refining control' shall also be specified as the defining `tolerance` by a `tolerance_zone` that has a description of 'conical'.

IP17: If the `position_tolerance` has a name of 'feature relating position' and it is specified as the defining `tolerance` by a `tolerance_zone` that is the zone of a `projected_zone_definition`, the `position_tolerance` that is related to this `position_tolerance` as the 'position refining control' shall also be specified as the defining `tolerance` by a `tolerance_zone` that is the zone of a `projected_zone_definition`.

IP18: If the `position_tolerance` has a name of 'feature relating position' and it is specified as the defining `tolerance` by a `tolerance_zone` that has a `property_definition` with the description of 'tolerance zone orientation', the `position_tolerance` that is related to this `position_tolerance` as the 'position refining control' shall also be specified as the defining `tolerance` by a `tolerance_zone` that has a `property_definition` with the description of 'tolerance zone orientation'.

IP19: If the `position_tolerance` has a name of 'feature relating position' and its `tolerance_zone_boundary` has a description of 'conical', the `position_tolerance` that is related to this `position_tolerance` as the 'position refining control' shall also have a `tolerance_zone_boundary` that has a description of 'conical'.

IP20: If the `position_tolerance` has a name of 'feature relating position' and its `tolerance_zone_boundary` has a description of 'circular or cylindrical or spherical', the `position_tolerance` that is related to this `position_tolerance` as the 'position refining control' shall also have a `tolerance_zone_boundary` that has a description of 'circular or cylindrical or spherical'.

IP21: If the `position_tolerance` has a name of 'feature relating position' and its `tolerance_zone_boundary` is a `tolerance_zone_explicit_opposing_boundary_set`, the `position_tolerance` that is related to this `position_tolerance` as the 'position refining control' shall also have a `tolerance_zone_boundary` that is a `tolerance_zone_explicit_opposing_boundary_set`.

IP22: If the `position_tolerance` has a name of 'feature relating position' and its `tolerance_zone_boundary` is a `tolerance_zone_implicit_opposing_boundary_set`, the `position_tolerance` that is related to this `position_tolerance` as the 'position refining control' shall also have a `tolerance_zone_boundary` that is a `tolerance_zone_implicit_opposing_boundary_set`.

IP23: The `toleranced_shape_aspect` of the `position_tolerance` shall either lie on the boundary of the shape of the product; be a `centre_of_symmetry` with a description of either 'axis', 'plane', or 'point'; be a `part_template_definition`; or be a `composite_shape_aspect` the 'composing' `shape_aspects` of which either are all of type `part_template_definition`, or are all of type `centre_of_symmetry` and have the same description – either 'axis', 'plane', or 'point'.

IP24: If the `toleranced_shape_aspect` of the `position_tolerance` is either a `centre_of_symmetry` with a description of 'plane', or a `composite_shape_aspect` in which the 'composing' `shape_aspects` are all of type `centre_of_symmetry` with a description of 'plane'; the `tolerance_zone_boundary` shall be either a `tolerance_zone_explicit_opposing_boundary_set` or a `tolerance_zone_implicit_opposing_boundary_set`.

IP25: If the `toleranced_shape_aspect` of the `position_tolerance` is either a `centre_of_symmetry` with a description of 'point', or a `composite_shape_aspect` in which the 'composing' `shape_aspects` are all of type `centre_of_symmetry` with a description of 'point'; the `position_tolerance` shall be specified as the defining `tolerance` by exactly one `tolerance_zone` that is specified as the zone of a `tolerance_zone_definition`.

5.2.3.1.281 `positional_boundary`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `positional_boundary` is a `shape_aspect` that implements the ARM concepts of:

- `Dimension_related_positional_boundary` (see 4.2.295);
- `Positional_boundary` (see 4.2.698);
- `Profile_related_positional_boundary` (see 4.2.750).

EXPRESS specification:

```

*)
ENTITY positional_boundary
  SUBTYPE OF (shape_aspect);
WHERE

  WR1: SELF\shape_aspect.description IN
    ['dimension related positional boundary',
     'profile related positional boundary'];

  WR2: SELF\shape_aspect.product_definitional = False;

  WR3: (NOT(SELF\shape_aspect.description =
    'dimension related positional boundary'))
    OR (SIZEOF(QUERY(sar <* USEDIN(SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATING_SHAPE_ASPECT')

END_ENTITY; -- positional_boundary
(

```

Formal propositions:

WR1: The `positional_boundary` shall have a description of either 'dimension related positional boundary' or 'profile related positional boundary'.

WR2: The `positional_boundary` shall not lie on the boundary of the shape of the product.

WR3: If the description of the `positional_boundary` is 'dimension related positional boundary', the `positional_boundary` shall relate to at least one `positional_boundary_member` to specify the 'boundary member'.

WR4: If the description of the `positional_boundary` is 'dimension related positional boundary', the `positional_boundary` shall either relate to exactly one `shape_aspect` that lies on the boundary of the shape of the product to specify the 'constrained feature' or relate to exactly one `part_template_definition` to specify the 'constrained feature'.

WR5: If the description of the `positional_boundary` is 'dimension related positional boundary', the `positional_boundary` shall have exactly one `property_definition` that has the description of 'dimension related positional boundary property'.

WR6: If the description of the `positional_boundary` is 'profile related positional boundary', the `positional_boundary` shall have exactly one `property_definition` that has the description of 'profile related positional boundary property'.

WR7: If the description of the `positional_boundary` is 'profile related positional boundary' it shall relate to exactly one `shape_aspect` to specify the 'positional boundary and profile boundary member'.

5.2.3.1.282 `positional_boundary_member`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `positional_boundary_member` is a `shape_aspect` that implements the ARM concept of `Positional_boundary_member` (see 4.2.701).

EXPRESS specification:

*)

ENTITY `positional_boundary_member`

SUBTYPE OF (`shape_aspect`);

WHERE

WR1: SELF\shape_aspect.product_definitional = False;

```

WR2: SIZEOF(QUERY(pd <* USEDIN(SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION.DEFINITION')

    ) = 1;

WR3: SIZEOF(QUERY(sar <* USEDIN(SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT')
    | (sar\shape_aspect_relationship.name = 'boundary member') AND
      ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'POSITIONAL_BOUNDARY' IN TYPEOF(sar.relate_shape_aspect))
      AND (sar.relate_shape_aspect\shape_aspect.description =
      'dimension related positional boundary')))) = 1;
END_ENTITY; -- positional_boundary_member
(*)

```

Formal propositions:

WR1: The positional_boundary_member shall not lie on the boundary of the shape of the product.

WR2: The positional_boundary_member shall have exactly one property_definition that has the description of 'positional boundary member property'.

WR3: The positional_boundary_member shall be related to exactly one positional_boundary as the 'boundary member', and that positional_boundary shall have a description of 'dimension related positional boundary'.

5.2.3.1.283 power_measure_with_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A power_measure_with_unit is a measure_with_unit that implements the ARM concept of Power_measure_with_unit (see ??).

EXPRESS specification:

```

*)
ENTITY power_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\measure_with_unit ||
  SELF\power_measure_with_unit))) = 0;

WR2: SELF\measure_with_unit.unit_component\si_unit.name = watt;

```

```

    WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
        TYPEOF(SELF\measure_with_unit.unit_component);
END_ENTITY; -- power_measure_with_unit
(*

```

Formal propositions:

WR1: The power_measure_with_unit shall not be any other type of measure_with_unit.

WR2: The power_measure_with_unit shall reference an si_unit with a name of watt.

WR3: The unit_component shall be an si_unit.

5.2.3.1.284 pre_defined_parallel_datum_axis_symbol_3d_2d_relationship

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An pre_defined_parallel_datum_axis_symbol_3d_2d_relationship is a volume_shape_intersection that implements the ARM concept of Pre_defined_parallel_datum_axis_symbol_3d_2d_relationship (see 4.2.710).

EXPRESS specification:

```

*)
ENTITY pre_defined_parallel_datum_axis_symbol_3d_2d_relationship
    SUBTYPE OF (volume_shape_intersection);
WHERE

    WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\representation ||
        SELF\representation_relationship ||
        SELF\shape_representation_relationship ||
        SELF\volume_shape_intersection ||
        SELF\pre_defined_parallel_datum_axis_symbol_3d_2d_relationship))) = 0;
END_ENTITY; -- pre_defined_parallel_datum_axis_symbol_3d_2d_relationship
(*

```

Formal propositions:

WR1: The pre_defined_parallel_datum_axis_symbol_3d_2d_relationship shall not be a complex subtype of other than its direct supertypes.

5.2.3.1.285 pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship` is a `volume_shape_intersection` that implements the ARM concept of `Pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship` (see 4.2.712).

EXPRESS specification:

```

*)
ENTITY pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship
  SUBTYPE OF (volume_shape_intersection);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\representation ||
    SELF\representation_relationship ||
    SELF\shape_representation_relationship ||
    SELF\volume_shape_intersection ||
    SELF\pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship))) = 0;
END_ENTITY; -- pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship
( *

```

Formal propositions:

WR1: The `pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship` shall not be a complex subtype of other than its direct supertypes.

5.2.3.1.286 `pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

An `pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship` is a `volume_shape_intersection` that implements the ARM concept of `Pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship` (see 4.2.714).

EXPRESS specification:

```

*)
ENTITY pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship
  SUBTYPE OF (volume_shape_intersection);
WHERE

```

```

    WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\representation ||
        SELF\representation_relationship ||
        SELF\shape_representation_relationship ||
        SELF\volume_shape_intersection ||
        SELF\pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship))) = 0;
END_ENTITY; -- pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship
(*)

```

Formal propositions:

WR1: The `pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship` shall not be a complex subtype of other than its direct supertypes.

5.2.3.1.287 **pressure_measure_with_unit**

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `pressure_measure_with_unit` is a `measure_with_unit` that implements the ARM concept of `Pressure_measure_with_unit` (see ??).

EXPRESS specification:

```

*)
ENTITY pressure_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

    WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\measure_with_unit ||
        SELF\pressure_measure_with_unit))) = 0;

    WR2: SELF\measure_with_unit.unit_component\si_unit.name = pascal;

    WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.SI_UNIT' IN
        TYPEOF(SELF\measure_with_unit.unit_component);
END_ENTITY; -- pressure_measure_with_unit
(*)

```

Formal propositions:

WR1: The `pressure_measure_with_unit` shall not be any other type of `measure_with_unit`.

WR2: The `pressure_measure_with_unit` shall reference an `si_unit` with a name of `pascal`.

WR3: The `unit_component` shall be an `si_unit`.

5.2.3.1.288 primary_orientation_feature

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A primary_orientation_feature is a physical_unit_datum_feature that implements the ARM concept of Primary_orientation_feature (see 4.2.717).

EXPRESS specification:

```

*)
ENTITY primary_orientation_feature
  SUBTYPE OF (physical_unit_datum_feature);
WHERE

  WR1: SELF\shape_aspect.product_definitional = TRUE;

  WR2: SIZEOF (QUERY (it <* QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name = 'associated body vertical extent') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PACKAGE_BODY_BOTTOM_SURFACE' IN
    TYPEOF (it.relying_shape_aspect))
  )) <= 1;

  WR3: SIZEOF (QUERY (it <* QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name = 'associated body vertical extent') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PACKAGE_BODY_TOP_SURFACE' IN
    TYPEOF (it.relying_shape_aspect))
  )) <= 1;
END_ENTITY; -- primary_orientation_feature
(

```

Formal propositions:

WR1: A primary_orientation_feature shall be on the surface of the product.

WR2: A primary_orientation_feature shall be associated with no more than one package_body_bottom_surface.

WR3: A primary_orientation_feature shall be associated with no more than one package_body_top_surface.

5.2.3.1.289 primary_reference_terminal

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A primary_reference_terminal is a package_terminal that implements the ARM concept of Primary_reference_terminal (see 4.2.718).

EXPRESS specification:

```
*)
ENTITY primary_reference_terminal
  SUBTYPE OF (package_terminal);
WHERE

WR1: SIZEOF(QUERY ( sar <* USEDIN (SELF,
  'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
  'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
  sar\shape_aspect_relationship.name = 'precedent feaure' ))
  = 0;

WR2: SIZEOF(QUERY ( sar <* USEDIN (SELF,

      )) >= 1;
END_ENTITY; -- printed_component
(*

```

Formal propositions:

WR1: The printed_component shall have a frame_of_reference with a name of 'layout occurrence'.

WR2: The printed_component shall have a description that is 'printed component'.

WR3: The printed_component shall have exactly one shape_aspect with a name of 'part template occurrence' that is related to a part_template_definition with a description of 'printed part template', 'printed part cross section template', or 'printed connector template'.

WR4: The printed_component shall have at least one shape_aspect that is a component_terminal with a description of 'printed component join terminal'.

WR5: If the printed_component has a description of 'printed connector component', it shall have at least one shape_aspect that is a laminate_component_interface_terminal with a description of 'printed connector component interface terminal'.

WR6: If the printed_component has a description of 'printed connector component', it shall have exactly one shape_aspect with a name of 'part template occurrence' that is related to a part_template_definition with a description of 'printed connector template'.

WR7: The printed_component shall be associated to at least one component_shape_aspect with a description of 'stratum feature template component' as a 'stratum feature implementation'.

5.2.3.1.291 printed_component_link

A printed_component_link is a product_definition and a product_definition_relationship that implements the ARM concept of Printed_component_link (see 4.2.723)

EXPRESS specification:

```

*)
ENTITY printed_component_link
  SUBTYPE OF (product_definition, product_definition_relationship);
WHERE

  WR1: SELF\product_definition_relationship.related_product_definition :<>:
        SELF\product_definition_relationship.relateing_product_definition;

  WR2: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'COMPONENT_DEFINITION' IN
        TYPEOF (SELF\product_definition_relationship.related_product_definition);

  WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'COMPONENT_DEFINITION' IN

```

```

WR4: sizeof(TYPEOF(SELF) - TYPEOF(SELF\product_definition ||
    SELF\product_definition_relationship ||
    SELF\printed_component_link)) = 0;

WR5: EXISTS(SELF\product_definition.name);

WR6: SELF\product_definition.name = '';

WR7: SELF\product_definition_relationship.name = '';

WR8: sizeof(USEDIN(SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRODUCT_DEFINITION_RELATIONSHIP.RELATED_PRODUCT_DEFINITION')) = 1;
END_ENTITY; -- printed_component_link
(*)

```

Formal propositions:

WR1: The related element shall not be the relating element.

WR2: The printed_component_link shall relate to only a component_definition in the related_product_definition.

WR3: The printed_component_link shall relate to only a component_definition in the relating_product_definition.

WR4: The types of printed_component_link shall be only printed_component_link, product_definition, and product_definition_relationship.

WR5: The name attribute of the product_definition supertype shall exist.

WR6: The name attribute of the product_definition supertype shall be an empty string.

WR7: The name attribute of the product_definition_relationship supertype shall be an empty string.

WR8: Each printed_component_link shall be referenced exactly once by a product_definition_relationship related_product_definition.

5.2.3.1.292 printed_connector_template_terminal_relationship

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A printed_connector_template_terminal_relationship is a shape_aspect and a shape_aspect_relationship that implements the ARM concept of Printed_connector_template_terminal_relationship (see 4.2.727).

EXPRESS specification:

```

*)
ENTITY printed_connector_template_terminal_relationship

```

Formal propositions:

UR1: The relating_shape_aspect, related_shape_aspect combination shall be unique.

WR1: The related boundary shall not be the relating boundary.

WR2: The `printed_part_template_material_link` shall relate to only a `template_material_cross_section_-boundary` in the `related_shape_aspect`.

WR3: The `printed_part_template_material_link` shall relate to only a `template_material_cross_section_-boundary` in the `relating_shape_aspect`.

WR4: The types of `printed_part_template_material_link` shall be only `printed_part_template_material_-link`, `shape_aspect`, and `shape_aspect_relationship`.

WR5: The name attribute of the `shape_aspect` supertype shall be an empty string.

WR6: The name attribute of the `shape_aspect_relationship` supertype shall be an empty string.

WR7: The shape specified by the `related_shape_aspect` shall not be the shape specified by the `relating_shape_aspect`.

WR8: The description attribute of the relating boundary shall be 'bottom' or 'right'.

WR9: The description attribute of the related boundary shall be 'top' or 'left'.

5.2.3.1.298 `printed_part_template_terminal`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `printed_part_template_terminal` is a `shape_aspect` that implements the ARM concepts of:

- `Printed_part_cross_section_template_terminal` (see 4.2.729);
- `Printed_part_template_interface_terminal` (see 4.2.732);
- `Printed_part_template_join_terminal` (see 4.2.733);
- `Printed_part_template_terminal` (see 4.2.737).

EXPRESS specification:

```

Formal propositions:

WR1: The printed_part_template_terminal shall have a description of 'interface terminal' or 'join terminal'.

WR2: The `printed_part_template_terminal` shall be in exactly one `printed_part_template_terminal_connection_zone_category`.

WR3: The `printed_part_template_terminal` shall relate to at least one 'connection zone'.

WR4: The `printed_part_template_terminal` shall have at least one property that is represented by a `shape_representation`.

WR5: The `printed_part_template_terminal` shall be related to exactly one `part_template_definition` with a description of 'printed part template' or 'printed connector template' as the 'associated definition'.

WR6: The `printed_part_template_terminal` shall be related to at most one `printed_part_template_connected_terminals_definition` as the 'member connected terminal'.

NOTE Inverse cardinality rules required by Application Objects are implemented in rule `printed_connector_template_terminal_relationship_unique_constraint`.

5.2.3.1.299 `printed_part_template_terminal_connection_zone_category`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `printed_part_template_terminal_connection_zone_category` is a group that specifies either an `area_edge_segment`, a `curve_edge_segment`, a `surface_area`, or a `surface_point` for a `Printed_part_template_terminal` (see 4.2.737).

EXPRESS specification:

```
*)
ENTITY printed_part_template_terminal_connection_zone_category
    SUBTYPE OF (group);
WHERE

    WR1: SELF\group.name IN ['area edge segment', 'curve edge segment',
        'surface area', 'surface point'];
END_ENTITY; -- printed_part_template_terminal_connection_zone_category
(*)
```

Formal propositions:

WR1: The `printed_part_template_terminal_connection_zone_category` shall have a name equal to 'area edge segment', 'curve edge segment', 'surface area', or 'surface point'.

5.2.3.1.300 `probe_access_area`

A `probe_access_area` is a `component_shape_aspect` that implements the ARM concepts of `Internal_probe_access_area` (see 4.2.475) and `Probe_access_area` (see 4.2.739).

EXPRESS specification:

```

*)
ENTITY probe_access_area
  SUBTYPE OF (component_shape_aspect);
WHERE

  WR1: EXISTS(SELF.of_shape.definition\product_definition.name);

  WR2: ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +

(*

```

Formal propositions:

WR1: The rule_conclusion_definition shall have one property_definition_representation that references a rule definition.

WR2: The rule_conclusion_definition shall have at least one representation_relationship that references a rule_simple_clause.

WR3: The rule_conclusion_definition shall not be a complex instance.

5.2.3.1.319 rule_definition

A rule_definition is a product_definition that implements the ARM concept of Ee_rule_definition (see 4.2.333).

EXPRESS specification:

```

*)
ENTITY rule_definition
  SUBTYPE OF (product_definition);
WHERE

  WR1: SELF\product_definition.formation.description = 'rule version';
END_ENTITY; -- rule_definition
( *

```

Formal propositions:

WR1: The rule_definition shall reference a product_definition_formation with a description of 'rule version'.

5.2.3.1.320 rule_function_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A rule_function_definition is a representation that implements the ARM concept of Ee_rule_function (see 4.2.334).

EXPRESS specification:

```

*)
ENTITY rule_function_definition
  SUBTYPE OF (representation);
WHERE

  WR1: SIZEOF (QUERY (it <* SELF.items |
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'MODEL_PARAMETER' IN
    TYPEOF (it))) >= 1;

  WR2: SIZEOF(QUERY(adf <* USEDIN(SELF,

    'source code') AND
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'EE_SPECIFICATION' IN
    TYPEOF(adf\document_reference.assigned_document)))) = 1;
END_ENTITY; -- rule_function_definition
(*

```

Formal propositions:

WR1: The rule_function_definition shall contain at least one model_parameter.

WR2: The rule_function_definition shall contain exactly one document or ee_specification with a document_type of 'reference document'.

WR3: The rule_function_definition shall contain exactly one ee_specification with a document_type of 'source code'.

Informal propositions:

IP1: The combination of identifier and the item which has a document type of 'reference document' shall be unique for rule_function_definition.

5.2.3.1.321 rule_premise_definition

A rule_premise_definition is a representation that implements the ARM concept of Ee_rule_premise_definition (see 4.2.335).

EXPRESS specification:

```

*)
ENTITY rule_premise_definition
  SUBTYPE OF (representation);
WHERE

WR1: SIZEOF (QUERY (pdr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION_REPRESENTATION.USED_REPRESENTATION') |
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'RULE_DEFINITION' IN TYPEOF
    (pdr.definition.definition))) = 1;

```

```

WR2: SIZEOF (QUERY (rr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'REPRESENTATION_RELATIONSHIP.REP_2') |
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'RULE_COMPLEX_CLAUSE' IN TYPEOF
    (rr\representation_relationship.rep_1))) >= 1;

WR3: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\representation ||
    SELF\rule_premise_definition)) = 0;
END_ENTITY; -- rule_premise_definition
(*

```

Formal propositions:

WR1: The rule_premise_definition shall have one property_definition_representation that references a rule definition.

WR2: The rule_premise_definition shall have at least one representation_relationship that references a rule_complex_clause.

WR3: The rule_premise_definition shall not be a complex instance.

5.2.3.1.322 rule_replacement_from_assignment

The rule_replacement_from_assignment is an action_assignment that specifies a rule version which is being superseded in a Rule_supersedence (see 4.2.795).

EXPRESS specification:

```

*)
ENTITY rule_replacement_from_assignment
    SUBTYPE OF (action_assignment);
    items : SET [1:?] OF replacement_from_item;
END_ENTITY; -- rule_replacement_from_assignment
(*

```

5.2.3.1.323 rule_replacement_to_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A rule_replacement_to_assignment is an action_assignment that specifies a rule version which is superseding another rule version in a Rule_supersedence (see 4.2.795).

EXPRESS specification:

```
*)
ENTITY rule_replacement_to_assignment
  SUBTYPE OF (action_assignment);
    items : SET [1:?] OF replacement_to_item;
END_ENTITY; -- rule_replacement_to_assignment
(*
```

Informal propositions:

IP1: The assigned_action shall be in the role of a related_action for an action_relationship where the relating_action is an action that has been assigned by a rule_replacement_from_assignment.

5.2.3.1.324 rule_set

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A rule_set is a group that implements the ARM concepts of Rule_set (see 4.2.792) and Rule_set_group (see 4.2.793).

EXPRESS specification:

```
*)
ENTITY rule_set
  SUBTYPE OF (group);
  UNIQUE
    UR1: SELF\group.name;
WHERE
```

```

WR1: (SIZEOF (QUERY (aga <* QUERY (ga <* USEDIN (SELF,

gr\group_relationship.name = 'rule set group element') |
'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
'RULE_SET' IN
TYPEOF (rsge.related_group))) >= 2);
END_ENTITY; -- rule_set
(*

```

Formal propositions:

UR1: The name shall be unique.

WR1: The rule_set shall be assigned to at least one rule_definition that has at least one property that has at least one representation with a name of 'rule priority', or it shall relate to at least one rule_sets to specify a 'rule set group element'.

5.2.3.1.325 rule_simple_clause

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A rule_simple_clause is a representation that implements the ARM concept of Ee_rule_simple_clause (see 4.2.336).

EXPRESS specification:

```

*)
ENTITY rule_simple_clause
  SUBTYPE OF (representation);
  UNIQUE
    UR1: SELF\representation.name;
  WHERE

    WR1: SIZEOF (QUERY (rr <* USEDIN (SELF,
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +

      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'RULE_FUNCTION_DEFINITION' IN TYPEOF (rr.rep_1))) = 1;

    WR3: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\representation ||
      SELF\rule_simple_clause)) = 0;
END_ENTITY; -- rule_simple_clause
(*)

```

Formal propositions:

UR1: The name shall be unique within a population of rule_simple_clause.

WR1: The rule_simple_clause shall have at least one representation_relationship that references a parameter_assignment_representation.

WR2: The rule_simple_clause shall have exactly one representation_relationship that references a rule_function_definition.

WR3: The rule_simple_clause shall not be a complex instance.

5.2.3.1.326 scalar_terminal_definition_link

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A scalar_terminal_definition_link is a shape_aspect and a shape_aspect_relationship that implements the ARM concept of Scalar_terminal_definition_link (see 4.2.800)

EXPRESS specification:

```

*)
ENTITY scalar_terminal_definition_link
  SUBTYPE OF (shape_aspect, shape_aspect_relationship);
UNIQUE
  UR1: related_shape_aspect, relating_shape_aspect;
WHERE

  WR1: SELF\shape_aspect_relationship.related_shape_aspect :<>:
        SELF\shape_aspect_relationship.relatng_shape_aspect;

  WR2: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'FUNCTIONAL_UNIT_TERMINAL_DEFINITION' IN
        TYPEOF (SELF\shape_aspect_relationship.related_shape_aspect);

  WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'FUNCTIONAL_UNIT_TERMINAL_DEFINITION' IN
        TYPEOF (SELF\shape_aspect_relationship.relatng_shape_aspect);

  WR4: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\shape_aspect ||
        SELF\shape_aspect_relationship ||
        SELF\scalar_terminal_definition_link)) = 0;

  WR5: SELF\shape_aspect.name = '';

  WR6: SELF\shape_aspect_relationship.name = '';

  WR7: SELF\shape_aspect_relationship.relatng_shape_aspect\shape_aspect.description = 'sc

  WR8: SELF\shape_aspect_relationship.related_shape_aspect\shape_aspect.description = 'sc
END_ENTITY; -- scalar_terminal_definition_link
(*)

```

Formal propositions:

UR1: The related_shape_aspect in combination with the relating shape_aspect shall be unique.

WR1: The related point shall not be the relating point.

WR2: The scalar_terminal_definition_link shall relate to only a functional_unit_terminal_definition in the related_shape_aspect.

WR3: The scalar_terminal_definition_link shall relate to only a functional_unit_terminal_definition in the relating_shape_aspect.

WR4: The types of scalar_terminal_definition_link shall be only scalar_terminal_definition_link, shape_aspect, and shape_aspect_relationship.

WR5: The name attribute of the shape_aspect supertype shall be an empty string.

WR6: The name attribute of the shape_aspect_relationship supertype shall be an empty string.

WR7: The scalar_terminal_definition_link shall relate to only a functional_unit_terminal_definition in the relating_shape_aspect that has a description of 'scalar terminal'.

WR8: The scalar_terminal_definition_link shall relate to only a functional_unit_terminal_definition in the related_shape_aspect that has a description of 'scalar terminal'.

5.2.3.1.327 scattering_parameter_measure_with_unit

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A scattering_parameter_measure_with_unit is a measure_with_unit that implements the ARM concept of Scattering_parameter_measure_with_unit (see ??).

EXPRESS specification:

```
*)
ENTITY scattering_parameter_measure_with_unit
  SUBTYPE OF (measure_with_unit);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - (TYPEOF(SELF\measure_with_unit ||
    SELF\scattering_parameter_measure_with_unit))) = 0;

  WR2: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.RATIO_UNIT' IN
    TYPEOF(SELF\measure_with_unit.unit_component);
END_ENTITY; -- scattering_parameter_measure_with_unit
(*
```

Formal propositions:

WR1: The scattering_parameter_measure_with_unit shall not be any other type of measure_with_unit.

WR2: The unit_component shall be a ratio_unit.

5.2.3.1.328 seating_plane

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

The seating_plane is a shape_aspect that implements the ARM concept of Seating_plane (see 4.2.802).

EXPRESS specification:

```

*)
ENTITY seating_plane
  SUBTYPE OF (shape_aspect);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\shape_aspect ||
    SELF\seating_plane)) = 0;
END_ENTITY; -- seating_plane
( *

```

Formal propositions:

WR1: The seating_plane shall not be any other subtype of shape_aspect.

5.2.3.1.329 secondary_orientation_feature

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A secondary_orientation_feature is a physical_unit_datum_feature that implements the ARM concept of Secondary_orientation_feature (see 4.2.803).

EXPRESS specification:

```

*)
ENTITY secondary_orientation_feature
  SUBTYPE OF (physical_unit_datum_feature);
WHERE

  WR1:SIZEOF ((TYPEOF (SELF)) *
    [ 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'PRIMARY_ORIENTATION_FEATURE',
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'SEATING_PLANE',
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'VIEWING_PLANE',
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'PHYSICAL_UNIT_DATUM',
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'COMPONENT_SHAPE_ASPECT' ]) = 0;

  WR2: SELF.product_definitional = TRUE;

```

```

WR3: SIZEOF (QUERY (it <* QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |

    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PACKAGE_BODY_TOP_SURFACE' IN
    TYPEOF (it.relate_shape_aspect))
    )) <= 1;
END_ENTITY; -- secondary_orientation_feature
(*)

```

Formal propositions:

WR1: The secondary_orientation_feature shall not be a primary_orientation_feature, a seating_plane, a viewing_plane, a component_shape_aspect, or a physical_unit_datum.

WR2: A secondary_orientation_feature shall be on the surface of the product.

WR3: A primary_orientation_feature shall be associated with no more than one package_body_bottom_surface.

WR4: A primary_orientation_feature shall be associated with no more than one package_body_top_surface.

5.2.3.1.330 sequential_laminate_passage_based_fabrication_joint

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A sequential_laminate_passage_based_fabrication_joint is a shape_aspect that implements the ARM concept of Interconnect_module_product_assembly_view_fabrication_joint (see 4.2.458).

EXPRESS specification:

```

*)
ENTITY sequential_laminate_passage_based_fabrication_joint
    SUBTYPE OF (shape_aspect);

    dr.relatng_document.kind\document_type.product_data_type =
    'material specification')) = 1))) = 1));
END_ENTITY; -- shape_formed_terminal
(*
```

Formal propositions:

WR1: The shape_formed_terminal shall have exactly one document_reference where the assigned_document is an ee_specification with a product_data_type of 'lead form specification' and is related to a document with a product_data_type of 'material specification'.

5.2.3.1.332 shape_modification

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A shape_modification is a shape_aspect that implements the ARM concepts of:

- Design_intent_modification (see 4.2.267);
- Electrical_isolation_removal_structure (see 4.2.343);

- Filled_area_material_removal_structure (see 4.2.385);
- Material_addition_feature (see 4.2.528);
- Material_removal_feature (see 4.2.533);
- Material_shape_modification (see 4.2.536);
- Thermal_isolation_removal_structure (see 4.2.903).

EXPRESS specification:

```

Formal propositions:

WR1: The items in a shell_based_2d_wireframe_shape_representation shall be a shell_based_wireframe_model, a mapped_item, or an axis2_placement_2d.

WR2: At least one of the items in a shell_based_2d_wireframe_shape_representation shall be either a shell_based_wireframe_model or a mapped_item.

WR3: Every edge defined for an edge_loop in a shell_based_wireframe_model shall be an edge_curve.

WR4: Every polyline that underlies an edge in a shell_based_wireframe_model shall contain more than two distinct points.

WR5: The edge_geometry that underlies an edge for a shell_based_wireframe_model shall be a line, circle, ellipse, parabola, hyperbola, b_spline_curve, offset_curve_2d, polyline, or curve_replica and the curves that have a basis defined by other curves shall be defined consistently.

WR6: Every vertex defined as the start or end vertex for an edge in a shell_based_wireframe_model shall be a vertex_point.

WR7: The vertex_geometry that underlies the vertices that define the boundaries of the edges in an edge_loop for a shell_based_wireframe_model shall be a cartesian_point or point_replica, and the point_replica shall replicate either another point_replica or a cartesian_point.

WR8: The position of a conic that underlies an edge in an edge_loop for a shell_based_wireframe_model shall only be an axis2_placement_2d.

WR9: The vertex that defines the vertex_loop which is used as a bound in a shell_based_wireframe_model shall be a vertex_point.

WR10: The vertex that defines the vertex_loop which is used as a bound in a shell_based_wireframe_model shall be underlaid by a cartesian_point or point_replica, and the point_replica shall replicate either another point_replica or a cartesian_point.

WR11: The vertex that defines the vertex_loop which is used as the vertex_shell_extent for a vertex_shell in a shell_based_wireframe_model shall be a vertex_point.

WR12: The vertex that defines the vertex_loop which is used as the vertex_shell_extent for a vertex_shell in a shell_based_wireframe_model shall be underlaid by a cartesian_point or point_replica, and the point_replica shall replicate either another point_replica or a cartesian_point.

WR13: If there is a mapped_item in a shell_based_2d_wireframe_shape_representation, the source of the mapped_item shall be a shell_based_2d_wireframe_shape_representation.

WR14: The dimensionality of the shell_based_2d_wireframe_shape_representation is two.

5.2.3.1.335 signal

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A signal is a characterized_object that implements the ARM concept of Signal (see 4.2.823).

EXPRESS specification:

```
*)
ENTITY signal
  SUBTYPE OF (characterized_object);
WHERE

  WR1: SIZEOF (QUERY (aca <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_CLASSIFICATION_ASSIGNMENT.ITEMS') |

    'SIGNAL_CATEGORY' IN
    TYPEOF (aca.assigned_group))) >= 1;

  WR2: (SIZEOF (QUERY (ada <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DOCUMENT_REFERENCE.ITEMS') |
    SIZEOF (QUERY (duc <* USEDIN (ada.assigned_document,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'DOCUMENT_USAGE_CONSTRAINT.SOURCE') |
    duc\document_usage_constraint.subject_element = 'signal category')) = 1)) = 1);
```

```

    WR3: SIZEOF (USEDIN (SELF,
        'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'APPLIED_DOCUMENT_REFERENCE.ITEMS')) = 1;
END_ENTITY; -- signal
(*)

```

Formal propositions:

WR1: The signal shall be classified in at least one signal_category.

WR2: The signal shall be referenced by exactly one document that has a usage constraint that identifies the 'signal category'.

WR3: The signal shall be referenced by exactly one document.

5.2.3.1.336 signal_category

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A signal_category is a group and an externally_defined_item that specifies the External_definition (see 4.2.361) for a Signal_property (see 4.2.824).

EXPRESS specification:

```

*)
ENTITY signal_category
    SUBTYPE OF (group, externally_defined_item);
WHERE

    WR1: SELF\group.description IN ['signal characteristic category',
        'signal property category'];
END_ENTITY; -- signal_category
(*)

```

Formal propositions:

WR1: The signal_category shall have a group description of either 'signal characteristic category' or 'signal property category'.

5.2.3.1.337 solid_curve_font

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A solid_curve_font is a pre_defined_curve_font that implements the ARM concept of Solid_curve (see 4.2.831).

EXPRESS specification:

```

*)
ENTITY solid_curve_font
  SUBTYPE OF (pre_defined_curve_font);
END_ENTITY; -- solid_curve_font
( *

```

5.2.3.1.338 start_request

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A start_request is a formal notification of a desire to begin a new design for a product or group of **products**.

EXPRESS specification:

```

*)
ENTITY start_request
  SUBTYPE OF (action_request_assignment);
    items : SET [1:?] OF start_request_item;
END_ENTITY; -- start_request
( *

```

5.2.3.1.339 start_work

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A start_work identifies the **start_requests** that have been fulfilled and, as a result, have established a new version of a product.

EXPRESS specification:

```

*)
ENTITY start_work
  SUBTYPE OF (action_assignment);
    items : SET [1:?] OF work_item;
WHERE

    WR1: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'DIRECTED_ACTION' IN
        TYPEOF (SELF.assigned_action);
END_ENTITY; -- start_work
( *

```

Formal propositions:

WR1: The start_work shall assign a directed_action.

5.2.3.1.340 statistical_dimensional_location

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A statistical_dimensional_location is a dimensional_location that implements the combination of the ARM concepts Statistical_dimensional_tolerance (see 4.2.840) and Dimensional_location (see 4.2.300).

EXPRESS specification:

```
*)
ENTITY statistical_dimensional_location
  SUBTYPE OF (dimensional_location);
END_ENTITY; -- statistical_dimensional_location
(*
```

Informal propositions:

IP1: The statistical_dimensional_location shall have exactly one property_definition with a description of 'dimensional location property', and that property_definition shall be related to at most one property_definition, of a dimensional_location, with a description of 'dimensional location property' as the 'substitutable dimension'.

IP2: The statistical_dimensional_location shall have exactly one property_definition with a description of 'dimensional location property', and that property_definition shall relate to a requirements_property to specify the 'dimensional tolerance statistical control requirement'.

IP3: The statistical_dimensional_location shall have exactly one property_definition with a description of 'dimensional location property', and if that property_definition is related to a property_definition, of a dimensional_location, with a description of 'dimensional location property' as the 'substitutable dimension', that dimensional_location shall not be a statistical_dimensional_location.

IP4: The statistical_dimensional_location shall have exactly one property_definition with a description of 'dimensional location property', and if that property_definition is related to a property_definition, of a dimensional_location, with a description of 'dimensional location property' as the 'substitutable dimension', both the statistical_dimensional_location and the dimensional_location shall specify the same two shape_aspects as the related_shape_aspect and the relating_shape_aspect.

5.2.3.1.341 statistical_dimensional_size

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `statistical_dimensional_size` is a `dimensional_size_property` that implements the combination of the ARM concepts `Statistical_dimensional_tolerance` (see 4.2.840) and `Dimensional_size` (see 4.2.301).

EXPRESS specification:

```

*)
ENTITY statistical_dimensional_size
  SUBTYPE OF (dimensional_size_property);

Formal propositions:

UR1: The name shall be unique in the context of the version of the product.

WR1: The name shall exist.

WR2: The stratum shall have exactly one property_definition that is related to a property_definition of a stratum_technology as the 'technology usage'.

WR3: The stratum shall be referenced by at most one document with a usage constraint that specifies the 'attachment region size', or it shall have at most one property that is related to an external_definition as the 'stratum usage'.

WR4: The stratum shall have at most one shape_representation with a name of '3d bound volume shape'.

WR5: The stratum shall have at most one shape_representation with a name of 'planar projected shape'.

WR6: The stratum shall be the component in at least one assembly_component_usage as the 'interconnect module stratum assembly relationship'.

WR7: If the stratum is a definition of a product that has a name of 'design layer', it shall have exactly one property_definition that is related to exactly one property_definition of a stratum_technology with a description of 'design layer' as the 'technology usage'.

WR8: If the stratum is a definition of a product that has a name of 'design layer', it shall have at least one layer_connection_point.

WR9: If the stratum is a definition of a product that has a name of 'documentation layer', it shall have exactly one property_definition that is related to exactly one property_definition of a stratum_technology with a description of 'documentation layer' as the 'technology usage'.

WR10: If the stratum is a definition of a product that has a name of 'design layer', then either the description shall be 'primary design layer stratum' and it shall be assigned to an interconnect module primary surface, or the description shall be 'non primary design layer stratum' and it shall not be assigned to an interconnect module primary surface.

5.2.3.1.344 stratum_concept_relationship

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A stratum_concept_relationship is a shape_aspect and a shape_aspect_relationship that implements the ARM concepts of:

- Dielectric_crossover_area (see 4.2.288);
- Inter_stratum_join_implementation (see 4.2.436);
- Physical_network_supporting_stratum_feature_conductive_join (see 4.2.662);
- Stratum_concept_relationship (see 4.2.849);
- Stratum_feature_conductive_join (see 4.2.853).

END_ENTITY; -- stratum_technology
( *

```

Formal propositions:

UR1: The name shall be unique.

WR1: The stratum_technology shall have exactly one material designation.

WR2: The stratum_technology shall have at most one representation with a name of 'stiffness class representation'.

WR3: The stratum_technology shall have exactly one representation with a name of 'physical characteristics representation'.

WR4: Exactly one item in the representation with a name of 'stiffness class representation' shall be a descriptive_representation_item with a name of 'laminate stiffness class' and a description of 'fluid like', 'conformal coat', or 'stiff laminate'.

WR5: The stratum_technology shall have at least two and at most eight items in its representation with a name of 'physical characteristics representation'.

WR6: The items in the representation with a name of 'physical characteristics representation' of a stratum_technology shall have a name of either 'documentation layer purpose', 'design layer purpose', 'design layer position', 'maximum feature size requirement', 'minimum finished feature spacing', 'minimum finished feature size', 'maximum stratum thickness', or 'minimum stratum thickness'.

WR7: Exactly one item in the representation with a name of 'physical characteristics representation' of a stratum_technology shall be a measure_representation_item and a length_measure_with_unit with a name of 'minimum finished feature size'.

WR8: Exactly one item in the representation with a name of 'physical characteristics representation' of a stratum_technology shall be a measure_representation_item and a length_measure_with_unit with a name of 'maximum stratum thickness'.

WR9: Exactly one item in the representation with a name of 'physical characteristics representation' of a stratum_technology shall be a measure_representation_item and a length_measure_with_unit with a name of 'minimum stratum thickness'.

WR10: At most one item in the representation with a name of 'physical characteristics representation' of a stratum_technology shall be a measure_representation_item and a length_measure_with_unit with a name of 'maximum feature size requirement'.

WR11: At most one item in the representation with a name of 'physical characteristics representation' of a stratum_technology shall be a measure_representation_item and a length_measure_with_unit with a name of 'minimum finished feature spacing'.

WR12: If the stratum_technology has a description of 'documentation layer', exactly one item in its representation with a name of 'physical characteristics representation' shall be a descriptive_representation_item with a name of 'layer purpose'.

WR13: If the stratum_technology has a description of 'design layer', exactly one item in its representation with a name of 'physical characteristics representation' shall be a measure_representation_item and a length_measure_with_unit with a name of 'minimum finished feature spacing'.

WR14: If the stratum_technology has a description of 'design layer', exactly one item in its representation with a name of 'physical characteristics representation' shall be a descriptive_representation_item with a name of 'layer purpose' and a description of 'power or ground', 'other signal', or 'lands only'.

WR15: If the stratum_technology has a description of 'design layer', exactly one item in its representation with a name of 'physical characteristics representation' shall be a descriptive_representation_item with a name of 'layer position' and a description of 'primary', 'secondary', 'all', 'external' or 'internal'.

WR16: If the description attribute exists, it shall be either 'design layer' or 'documentation layer'.

5.2.3.1.349 stratum_technology_link

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A stratum_technology_link is a property_definition_relationship that implements the ARM concept of Stratum_technology_link (see 4.2.872)

EXPRESS specification:

```

*)
ENTITY stratum_technology_link
  SUPERTYPE OF ( printed_part_template_link )
  SUBTYPE OF ( property_definition, property_definition_relationship );
WHERE

  WR1: SELF\property_definition_relationship.related_property_definition.definition :<>:
        SELF\property_definition_relationship.relateing_property_definition.definition;

  WR2: ( SIZEOF( TYPEOF( SELF ) - TYPEOF( SELF\property_definition_relationship ||
        SELF\stratum_technology_link || SELF\property_definition ) ) = 0 ) OR
        ( 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
          'PRINTED_PART_TEMPLATE_LINK' IN TYPEOF( SELF ) );

  WR3: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'STRATUM_TECHNOLOGY' IN
        TYPEOF( SELF\property_definition_relationship.related_property_definition.definition );

  WR4: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'STRATUM_TECHNOLOGY' IN
        TYPEOF( SELF\property_definition_relationship.relateing_property_definition.definition );

  WR5: SELF\property_definition.name = '';

  WR6: SELF\property_definition.description = '';

  WR7: SELF\property_definition_relationship.name = '';

  WR8: SELF\property_definition_relationship.description = '';

```

```

WR9: ( 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'PART_TEMPLATE_DEFINITION' IN TYPEOF(SELF\property_definition.definition)) AND
      (SELF\property_definition.definition.description = 'printed part template');

WR10: SIZEOF (QUERY (pdr <* USEDIN (SELF,
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'PROPERTY_DEFINITION_RELATIONSHIP.RELATING_PROPERTY_DEFINITION') |
      pdr.name = 'precedent stratum technology link')) <= 1;

WR11: SIZEOF (QUERY (pdr <* USEDIN (SELF,
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'PROPERTY_DEFINITION_RELATIONSHIP.RELATED_PROPERTY_DEFINITION') |
      pdr.name = 'precedent stratum technology link')) <= 1;
END_ENTITY; -- stratum_technology_link
(*

```

Formal propositions:

WR1: The stratum_technology_link shall not relate to the same property_definition definition through the related and relating attributes.

WR2: The stratum_technology_link shall not be any other subtype of property_definition_relationship or property_definition.

WR3: The stratum_technology_link shall reference only a stratum_technology through the related attribute.

WR4: The stratum_technology_link shall reference only a stratum_technology through the relating attribute.

WR5: The stratum_technology_link name inherited from property_definition shall be blank.

WR6: The stratum_technology_link description inherited from property_definition shall be blank.

WR7: The stratum_technology_link name inherited from property_definition_relationship shall be blank.

WR8: The stratum_technology_link description inherited from property_definition_relationship shall be blank.

WR9: The stratum_technology_link shall be referenced exactly once by a part_template_definition that has a description of 'printed part template'.

WR10: The stratum_technology_link shall be referenced as a relating_property_definition no more than once by another stratum_technology_link.

WR11: The stratum_technology_link shall be referenced as a related_property_definition no more than once by another stratum_technology_link.

NOTE The stratum_technology_link that is not referenced as a related_property_definition but that is referenced by a relating_property_definition attribute of a property_definition_relationship with a name of 'precedent stratum technology link' is considered the initial link. The stratum_technology itself has no instance information and the sequence is only defined for printed part template purposes. The actual stackup in the interconnect is not formally constrained in this standard.

5.2.3.1.350 stratum_type_independent_padstack_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A stratum_type_independent_padstack_definition is a product_definition that implements the ARM concepts of: Stratum_type_independent_padstack_definition (see 4.2.873)

EXPRESS specification:

```
*)
ENTITY stratum_type_independent_padstack_definition
  SUBTYPE OF (padstack_definition);
END_ENTITY; -- stratum_type_independent_padstack_definition
(*
```

5.2.3.1.351 structured_text_representation_context

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A structured_text_representation_context is a context that implements the ARM concept of Structured_text (see 4.2.874) in association with the structured_text_representation_item.

EXPRESS specification:

```
*)
ENTITY structured_text_representation_context
  SUBTYPE OF (representation_context);
WHERE

  WR1: SIZEOF (QUERY (rep <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'REPRESENTATION.CONTEXT_OF_ITEMS') | NOT (
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'STRUCTURED_TEXT_REPRESENTATION_ITEM' IN
    TYPEOF (rep)))) = 0;
END_ENTITY; -- structured_text_representation_context
(*
```

Formal propositions:

WR1: The structured_text_representation_context shall only be a context for representations that contain structured_text_representation_items.

5.2.3.1.352 structured_text_representation_item

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A structured_text_representation_item is a representation and a descriptive_representation_item that implements the ARM concept of Structured_text (see 4.2.874).

EXPRESS specification:

```

*)
ENTITY structured_text_representation_item
  SUBTYPE OF (representation, descriptive_representation_item);
WHERE

  WR1: SIZEOF (QUERY (rr <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'REPRESENTATION_RELATIONSHIP.REP_2') |
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'STRUCTURED_TEXT_REPRESENTATION_ITEM' IN
    TYPEOF (rr.rep_1) ))<= 1;

  WR2: SIZEOF (USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DOCUMENT_REFERENCE.ITEMS')) >= 1;

  WR3: (SIZEOF (QUERY (it <* SELF\representation.items |
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'EXTERNALLY_DEFINED_REPRESENTATION_ITEM' IN
    TYPEOF (it))) = 1);
END_ENTITY; -- structured_text_representation_item
( *
```

Formal propositions:

WR1: The structured_text_representation_item shall relate to at most one structured_text_representation_item through a representation_relationship.

WR2: The structured_text_representation_item shall be referenced by at least one document.

WR3: The structured_text_representation_item shall contain exactly one externally_defined_representation_item.

5.2.3.1.353 supplied_part_relationship

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `supplied_part_relationship` relates the identifications of two **products** and specifies that one is the identification used by the internal design organization and the other is the identification used by a supplier.

EXPRESS specification:

```
*)
ENTITY supplied_part_relationship
  SUBTYPE OF (product_definition_relationship);
WHERE

  WR1: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'PRODUCT_DEFINITION_FORMATION_WITH_SPECIFIED_SOURCE' IN
        TYPEOF (SELF.related_product_definition.formation);

  WR2: NOT ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
            'PROPERTY_DEFINITION.DEFINITION' IN ROLESOF (SELF));
END_ENTITY; -- supplied_part_relationship
(*)
```

Formal propositions:

WR1: The `supplied_part_relationship` shall have a `related_product_definition` in which the source is specified.

WR2: The `supplied_part_relationship` shall not be the definition of a `product_definition_shape`.

5.2.3.1.354 **surface_prepped_terminal**

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `surface_prepped_terminal` is a `package_terminal` that implements the ARM concept of `Surface_prepped_terminal` (see 4.2.881).

EXPRESS specification:

```
*)
ENTITY surface_prepped_terminal
  SUBTYPE OF (altered_package_terminal);
WHERE
```

```

WR2: (SIZEOF (QUERY (ada <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_DOCUMENT_REFERENCE.ITEMS') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'EE_SPECIFICATION' IN
    TYPEOF (ada.assigned_document)) AND
    (ada.assigned_document.kind\document_type.product_data_type =
    'surface finish specification')) = 1);
END_ENTITY; -- surface_prepped_terminal
(*

```

Formal propositions:

WR1: The `surface_prepped_terminal` shall have exactly one `document_reference` where the `assigned_document` is an `ee_specification` with a `product_data_type` of 'surface finish specification'.

5.2.3.1.355 **surface_profile_tolerance**

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `surface_profile_tolerance` is a `physical_unit_geometric_tolerance` that implements the ARM concepts of:

- `Composite_surface_profile_locating_tolerance` (see 4.2.165);
- `Composite_surface_profile_refinement_tolerance` (see 4.2.166);
- `Profile_of_any_surface_tolerance` (see 4.2.747);
- `Profile_of_any_surface_tolerance_with_referenced_datum_system` (see 4.2.748);
- `Profile_of_any_surface_tolerance_without_referenced_datum_system` (see 4.2.749).

EXPRESS specification:

```

*)
ENTITY surface_profile_tolerance
  SUBTYPE OF (physical_unit_geometric_tolerance);
WHERE

```

```

WR1: (NOT(SELF\geometric_tolerance.name =
        'surface profile refinement'))

AND (gtr\geometric_tolerance_relationship.name = 'surface profile refining control'
)) = 1);

WR5: NOT('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'MODIFIED_GEOMETRIC_TOLERANCE' IN TYPEOF(SELF));
END_ENTITY; -- surface_profile_tolerance
(*)

```

Formal propositions:

WR1: If the surface_profile_tolerance has a name of 'surface profile refinement', it shall be related as the 'surface profile refining control' to exactly one surface_profile_tolerance with a name of either 'surface profile locating' or 'surface profile refinement'.

WR2: If the surface_profile_tolerance has a name of 'surface profile locating', it shall relate to exactly one surface_profile_tolerance with a name of 'surface profile refinement' to specify the 'surface profile refining control'.

WR3: If the surface_profile_tolerance is not a geometric_tolerance_with_specified_datum_system and has a name of 'surface profile refinement', it shall not relate to a surface_profile_tolerance with a name of 'surface profile refinement' to specify the 'surface profile refining control'.

WR4: If the surface_profile_tolerance has a name of 'surface profile refinement', it shall relate to at most one surface_profile_tolerance with a name of 'surface profile refinement' to specify the 'surface profile refining control'.

WR5: The surface_profile_tolerance shall not be a modified_geometric_tolerance.

Informal propositions:

IP1: If surface_profile_tolerance is a geometric_tolerance_with_specified_datum_system, it shall have a name of either 'surface profile', 'surface profile refinement', or 'surface profile locating'; otherwise, it shall have the name of either 'surface profile' or 'surface profile refinement'.

IP2: If the surface_profile_tolerance has a name of 'surface profile refinement', it shall be related as the 'surface profile refining control' to exactly one surface_profile_tolerance with a name of either 'surface profile locating' or 'surface profile refinement'. Both of these surface_profile_tolerances shall specify the same shape_aspect as the toleranced_shape_aspect.

IP3: If the `surface_profile_tolerance` has a name of 'surface profile refinement' and it is related as the 'surface profile refining control' to exactly one `surface_profile_tolerance` with a name of 'surface profile refinement', it shall either not reference a `datum_system` or it shall have less `physical_unit_datum` in its referenced `datum_system` than the `datum_system` referenced by the `surface_profile_tolerance` to which it is related as the 'surface profile refining control'.

IP4: If the `surface_profile_tolerance` has a name of 'surface profile refinement' and it is related as the 'surface profile refining control' to exactly one `surface_profile_tolerance` with a name of 'surface profile locating', it shall either not reference a `datum_system` or it shall have less than or an equal number of `physical_unit_datum` in its referenced `datum_system` than the `datum_system` referenced by the `surface_profile_tolerance` to which it is related as the 'surface profile refining control'.

IP5: If the `surface_profile_tolerance` has a name of 'surface profile refinement' and it is a `geometric_tolerance_with_specified_datum_system`, the `physical_unit_datum` of its referenced `datum_system` shall be `physical_unit_datum` of the `datum_system` of the `surface_profile_tolerance` to which it is related as the 'surface profile refining control' and shall be assigned the same precedence.

IP6: If the `surface_profile_tolerance` has a name of 'surface profile refinement' and it is a `geometric_tolerance_with_specified_datum_system` that relates to a `property_definition` of a `datum_system` that has the description of 'datum system property without material conditions' to specify its 'referenced datum system definition', the `surface_profile_tolerance` to which it is related as the 'surface profile refining control' shall also be a `geometric_tolerance_with_specified_datum_system` that relates to a `property_definition` of a `datum_system` that has the description of 'datum system property without material conditions' to specify its 'referenced datum system definition'.

IP7: If the `surface_profile_tolerance` has a name of 'surface profile refinement' and it is a `geometric_tolerance_with_specified_datum_system` that relates to a `property_definition` of a `datum_system` that has the description of 'datum system property with material conditions' to specify its 'referenced datum system definition', the `surface_profile_tolerance` to which it is related as the 'surface profile refining control' shall also be a `geometric_tolerance_with_specified_datum_system` that relates to a `property_definition` of a `datum_system` that has the description of 'datum system property with material conditions' to specify its 'referenced datum system definition', and each of these `property_definition` shall relate to `property_definition` with a description of 'datum feature material condition property' to specify their 'applied material condition property'. These `property_definition` shall be applied to `physical_unit_datum_features` in the context of the `datum_systems` referenced by each of the `surface_profile_tolerance`. The name of the `property_definition` applied to each of the `physical_unit_datum_feature` in the context of the `datum_system` referenced by this `surface_profile_tolerance` shall be the same as the name of the `property_definition` applied to the same `physical_unit_datum_feature` in the context of the `datum_system` referenced by the `surface_profile_tolerance` to which this `surface_profile_tolerance` is related as the 'surface profile refining control'.

IP8: If the `surface_profile_tolerance` has a name of 'surface profile refinement', it shall specify a `measure_with_unit` as its magnitude that is less than the `measure_with_unit` specified as the magnitude of the `surface_profile_tolerance` to which it is related as the 'surface profile refining control'.

IP9: If the `surface_profile_tolerance` has a name of 'surface profile refinement', there shall exist a `property_definition` that has a description of 'true profile' that is related as the 'basic profile' to a `property_definition` of the `tolerance_zone_boundary` of this `surface_profile_tolerance` and to a `property_definition` of the `tolerance_zone_boundary` of the `surface_profile_tolerance` that this `surface_profile_tolerance` is related to as the 'surface profile refining control', and these `property_definition` shall have the description of 'boundary zone definition with specified size' and a name of either 'profile boundary' or 'profile boundary with offsets'.

IP10: The `toleranced_shape_aspect` of the `surface_profile_tolerance` shall either be a `part_template_definition`, lie on the boundary of the shape of the product, or be a `composite_shape_aspect` the 'composing' `shape_aspects` of which are all of type `part_template_definition`.

IP11: The `tolerance_zone_boundary` of the `surface_profile_tolerance` shall have a `property_definition` with a description of 'boundary zone definition with specified size' and a name of either 'profile boundary' or 'profile boundary with offsets'.

5.2.3.1.356 symmetry_tolerance

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `symmetry_tolerance` is a `geometric_tolerance_with_specified_datum_system` that implements the ARM concept of `Symmetry_tolerance` (see 4.2.883).

EXPRESS specification:

```
* )
ENTITY symmetry_tolerance
  SUBTYPE OF (geometric_tolerance_with_specified_datum_system);
WHERE

  WR1: SELF\geometric_tolerance.name = 'symmetry';
END_ENTITY; -- symmetry_tolerance
( *
```

Formal propositions:

WR1: The name for the `symmetry_tolerance` shall be 'symmetry'.

Informal propositions:

IP1: The `toleranced_shape_aspect` of the `symmetry_tolerance` shall either be a `centre_of_symmetry` with a description of 'plane', or a `composite_shape_aspect` in which the 'composing' `shape_aspects` are all of type `centre_of_symmetry` with a description of 'plane'.

IP2: The symmetry_tolerance shall have at most two physical_unit_datum in its referenced datum_system.

IP3: The symmetry_tolerance shall have at least one physical_unit_datum in its referenced datum_system that has description of 'plane'.

IP4: The tolerance_zone_boundary of the symmetry_tolerance shall be either a tolerance_zone_explicit_opposing_boundary_set or a tolerance_zone_implicit_opposing_boundary_set.

5.2.3.1.357 table_representation_item

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A table_representation_item is a compound_representation_item that implements the ARM concept of Characteristic_data_table (see 4.2.100).

EXPRESS specification:

```
*)
ENTITY table_representation_item
  SUBTYPE OF (compound_representation_item);
WHERE

  WR1: SIZEOF (USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'APPLIED_GROUP_ASSIGNMENT.ITEMS')) > 0;

  WR2: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'LIST_REPRESENTATION_ITEM'
    IN TYPEOF(SELF\compound_representation_item.item_element);
END_ENTITY; -- table_representation_item
(*
```

Formal propositions:

WR1: The table_representation_item shall be referenced by exactly one applied_document_reference.

WR2: The item_element attribute shall be a list_representation_item.

5.2.3.1.358 template_material_cross_section_boundary

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A template_material_cross_section_boundary is a shape_aspect that implements the ARM concepts of: Template_material_cross_section_boundary (see 4.2.888)

EXPRESS specification:

```

*)
ENTITY template_material_cross_section_boundary
  SUBTYPE OF (shape_aspect);
WHERE

  WR1: SIZEOF(TYPEOF(SELF) - TYPEOF(SELF\shape_aspect ||
    SELF\template_material_cross_section_boundary)) = 0;

  WR2: 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRINTED_PART_TEMPLATE_MATERIAL' IN TYPEOF
    (SELF.of_shape\property_definition.definition);

  WR3: SELF\shape_aspect.description IN
    ['top', 'left', 'right', 'bottom'];
END_ENTITY; -- template_material_cross_section_boundary
(

```

Formal propositions:

WR1: The template_material_cross_section_boundary shall not participate in a complex instance.

WR2: The template_material_cross_section_boundary shall be an aspect of a printed_part_template_material.

WR3: The land_physical_template description shall only be 'top', 'bottom', 'left' or 'right'.

5.2.3.1.359 template_stratum_assignment

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A template_stratum_assignment relates a specific part_template_definition to a specific stratum for the purposes of binding them for one or more padstack definition.

EXPRESS specification:

```

*)
ENTITY template_stratum_assignment
  SUBTYPE OF (shape_aspect_relationship);
END_ENTITY; -- template_stratum_assignment
(

```

5.2.3.1.360 tertiary_orientation_feature

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A tertiary_orientation_feature is a physical_unit_datum_feature that implements the ARM concept of Tertiary_orientation_feature (see 4.2.893).

EXPRESS specification:

```

*)
ENTITY tertiary_orientation_feature
  SUBTYPE OF (physical_unit_datum_feature);
WHERE

  WR1: SIZEOF ((TYPEOF (SELF)) *
    ['ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PRIMARY_ORIENTATION_FEATURE',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SECONDARY_ORIENTATION_FEATURE',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SEATING_PLANE',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'VIEWING_PLANE',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PHYSICAL_UNIT_DATUM',
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'COMPONENT_SHAPE_ASPECT']) = 0;

  WR2: SELF.product_definitional = TRUE;

  WR3: SIZEOF (QUERY (it <* QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name = 'associated body vertical extent') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PACKAGE_BODY_BOTTOM_SURFACE' IN
    TYPEOF (it.relying_shape_aspect))
    )) <= 1;

  WR4: SIZEOF (QUERY (it <* QUERY (sar <* USEDIN (SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
    sar\shape_aspect_relationship.name = 'associated body vertical extent') |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PACKAGE_BODY_TOP_SURFACE' IN
    TYPEOF (it.relying_shape_aspect))
    )) <= 1;
END_ENTITY; -- tertiary_orientation_feature
(

```

Formal propositions:

WR1: The tertiary_orientation_feature shall not be a primary_orientation_feature, a secondary_orientation_feature, a seating_plane, a viewing_plane, a component_shape_aspect, or a physical_unit_datum.

WR2: A tertiary_orientation_feature shall be on the surface of the product.

WR3: A tertiary_orientation_feature shall be associated with no more than one package_body_bottom_surface.

WR4: A tertiary_orientation_feature shall be associated with no more than one package_body_top_surface.

5.2.3.1.361 test_point_part_feature

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A test_point_part_feature is a part_tooling_feature that implements the ARM concept of Fiducial_part_feature (see 4.2.374).

EXPRESS specification:

```
* )
ENTITY test_point_part_feature
  SUBTYPE OF (part_tooling_feature);
END_ENTITY; -- test_point_part_feature
( *
```

5.2.3.1.362 thermal_component

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A thermal_component is a component_definition that implements the ARM concept of Thermal_component (see 4.2.900).

EXPRESS specification:

```
* )
ENTITY thermal_component
  SUBTYPE OF (component_definition);
END_ENTITY; -- thermal_component
( *
```

5.2.3.1.363 thermal_component_shape_aspect

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A thermal_component_shape_aspect is a component_shape_aspect that implements the ARM concept of Thermal_component (see 4.2.900).

EXPRESS specification:

```
*)
ENTITY thermal_component_shape_aspect
  SUBTYPE OF (component_shape_aspect);
END_ENTITY; -- thermal_component_shape_aspect
(*
```

5.2.3.1.364 thermal_feature

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A thermal_feature is a shape_aspect that implements the ARM concept of Thermal_feature (see 4.2.901).

EXPRESS specification:

```
*)
ENTITY thermal_feature
  SUBTYPE OF (shape_aspect);
END_ENTITY; -- thermal_feature
(*
```

5.2.3.1.365 thermal_isolation_component_shape_aspect

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A thermal_isolation_component_shape_aspect is a filled_area_material_removal_component_shape_aspect that implements the ARM concept of Thermal_isolation_laminate_component (see 4.2.902).

EXPRESS specification:

```
*)
ENTITY thermal_isolation_component_shape_aspect
  SUBTYPE OF (filled_area_material_removal_component_shape_aspect);
END_ENTITY; -- thermal_isolation_component_shape_aspect
(*
```

5.2.3.1.366 thermal_isolation_removal_template_definition

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A thermal_isolation_removal_template_definition is a part_template_definition that implements the ARM concept of Thermal_isolation_removal_template (see 4.2.904) .

EXPRESS specification:

```

*)
ENTITY thermal_isolation_removal_template_definition
  SUBTYPE OF (part_template_definition);
( *
WHERE

  WR1: (SIZEOF (QUERY (pd <* USEDIN (SELF,

```

5.2.3.1.367 thermal_network

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A thermal_network is a functional_unit that implements the ARM concept of Thermal_network_definition (see 4.2.906).

EXPRESS specification:

```

*)
ENTITY thermal_network
  SUBTYPE OF (functional_unit);
END_ENTITY; -- thermal_network
(*

```

5.2.3.1.368 tolerance_zone_boundary

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A tolerance_zone_boundary is a shape_aspect that implements the ARM concepts of:

- Conical_tolerance_zone_boundary (see 4.2.178);
- Tolerance_zone_boundary (see 4.2.915);
- Tolerance_zone_circular_or_cylindrical_or_spherical_boundary (see 4.2.919).

EXPRESS specification:

```

*)
ENTITY tolerance_zone_boundary
  SUBTYPE OF (shape_aspect);
WHERE

  WR1: (NOT(SELF\shape_aspect.description = 'conical'))
    OR (NOT(('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'TOLERANCE_ZONE_EXPLICIT_OPPOSING_BOUNDARY_SET'
      IN TYPEOF(SELF))
    OR('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'TOLERANCE_ZONE_IMPLICIT_OPPOSING_BOUNDARY_SET'
      IN TYPEOF(SELF))));

  WR2: (NOT(SELF\shape_aspect.description =
    'circular or cylindrical or spherical'))
    OR (NOT(('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'TOLERANCE_ZONE_EXPLICIT_OPPOSING_BOUNDARY_SET'
      IN TYPEOF(SELF))
    OR('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'TOLERANCE_ZONE_IMPLICIT_OPPOSING_BOUNDARY_SET'
      IN TYPEOF(SELF))));

  WR3: SELF\shape_aspect.product_definitional = False;

  WR4: NOT(('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'TOLERANCE_ZONE_EXPLICIT_OPPOSING_BOUNDARY_SET'
    IN TYPEOF(SELF))
    AND ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'TOLERANCE_ZONE_IMPLICIT_OPPOSING_BOUNDARY_SET'
    IN TYPEOF(SELF)));

  WR5: SIZEOF(QUERY(pd <* USEDIN(SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PROPERTY_DEFINITION.DEFINITION') | (pd\property_definition.description =
    'boundary zone definition with specified size') OR
    (pd\property_definition.description = 'conical tolerance zone boundary')
    )) = 1;

  WR6: SIZEOF(USEDIN(SELF,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'TOLERANCE_ZONE_DEFINITION.BOUNDARIES')) = 1;
END_ENTITY; -- tolerance_zone_boundary
(

```

Formal propositions:

WR1: If the description of the tolerance_zone_boundary is 'conical', it shall not be either a tolerance_zone_explicit_opposing_boundary_set or a tolerance_zone_implicit_opposing_boundary_set.

WR2: If the description of the tolerance_zone_boundary is 'circular or cylindrical or spherical', it shall not be either a tolerance_zone_explicit_opposing_boundary_set or a tolerance_zone_implicit_opposing_boundary_set.

WR3: The tolerance_zone_boundary shall not lie on the boundary of the shape of the product.

WR4: The tolerance_zone_boundary shall not be both a tolerance_zone_explicit_opposing_boundary_set and a tolerance_zone_implicit_opposing_boundary_set.

WR5: The tolerance_zone_boundary shall have exactly one property_definition that has the description of either 'boundary zone definition with specified size' or 'conical tolerance zone boundary'.

WR6: The tolerance_zone_boundary shall be specified as the boundaries by exactly one tolerance_zone_definition.

Informal propositions:

IP1: If the description of the tolerance_zone_boundary is 'conical', the tolerance_zone_boundary shall relate to exactly two shape_aspect to specify the 'conical tolerance zone boundary and surface'.

IP2: If the description of the tolerance_zone_boundary is 'circular or cylindrical or spherical', the tolerance_zone_boundary shall have exactly one property_definition with a description of 'boundary zone definition with specified size', and that property_definition shall be represented by exactly one representation that has a name of 'diametrical boundary size'.

5.2.3.1.369 tolerance_zone_explicit_opposing_boundary_set

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A tolerance_zone_explicit_opposing_boundary_set is a tolerance_zone_boundary that implements the ARM concepts of Tolerance_zone_explicit_opposing_boundary_set (see 4.2.923) and Tolerance_zone_opposing_boundary_set (see 4.2.926).

EXPRESS specification:

```
* )
ENTITY tolerance_zone_explicit_opposing_boundary_set
  SUBTYPE OF (tolerance_zone_boundary);
END_ENTITY; -- tolerance_zone_explicit_opposing_boundary_set
(*
```

Informal propositions:

IP1: The `tolerance_zone_explicit_opposing_boundary_set` shall relate to exactly two `shape_aspect` instances that have a description of 'tolerance zone boundary member' to specify the 'zone boundary member'.

IP2: The `tolerance_zone_explicit_opposing_boundary_set` shall have exactly one `property_definition` with a description of 'boundary zone definition with specified size', and that `property_definition` shall be represented by exactly one representation that has a name of 'opposing boundary set size'.

5.2.3.1.370 `tolerance_zone_implicit_opposing_boundary_set`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `tolerance_zone_implicit_opposing_boundary_set` is a `tolerance_zone_boundary` that implements the ARM concept of `Tolerance_zone_implicit_opposing_boundary_set` (see 4.2.925).

EXPRESS specification:

```
*)
ENTITY tolerance_zone_implicit_opposing_boundary_set
  SUBTYPE OF (tolerance_zone_boundary);
END_ENTITY; -- tolerance_zone_implicit_opposing_boundary_set
(*
```

Informal propositions:

IP1: The `tolerance_zone_implicit_opposing_boundary_set` shall have exactly one `property_definition` with a description of 'boundary zone definition with specified size', and that `property_definition` shall be represented by exactly one representation that has a name of 'opposing boundary set size'.

5.2.3.1.371 `total_runout_tolerance`

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A `total_runout_tolerance` is a `geometric_tolerance_with_specified_datum_system` that implements the ARM concept of `Total_runout_tolerance` (see 4.2.929).

EXPRESS specification:

```

*)
ENTITY total_runout_tolerance
  SUBTYPE OF (geometric_tolerance_with_specified_datum_system);
WHERE

  WR1: SELF\geometric_tolerance.name = 'total runout';

  WR2: NOT('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'MODIFIED_GEOMETRIC_TOLERANCE' IN TYPEOF(SELF));
END_ENTITY; -- total_runout_tolerance
( *

```

Formal propositions:

WR1: The name for the total_runout_tolerance shall be 'total runout'.

WR2: The total_runout_tolerance shall not be a modified_geometric_tolerance.

Informal propositions:

IP1: The toleranced_shape_aspect of the total_runout_tolerance shall either be a part_template_definition, lie on the boundary of the shape of the product, or be a composite_shape_aspect the 'composing' shape_aspects of which are all of type part_template_definition.

IP2: The total_runout_tolerance shall have at most two physical_unit_datum instances in its referenced datum_system.

IP3: The total_runout_tolerance shall have at least one physical_unit_datum in its referenced datum_system that has a description of 'axis'.

IP4: The total_runout_tolerance shall relate to exactly one property_definition that has the description of 'datum system property without material conditions' to specify the 'referenced datum system definition'.

IP5: The tolerance_zone_boundary of the total_runout_tolerance shall be either a tolerance_zone_explicit_opposing_boundary_set or a tolerance_zone_implicit_opposing_boundary_set.

5.2.3.1.372 usage_view_connection_zone_terminal_shape_relationship

A usage_view_connection_zone_terminal_shape_relationship is a representation and a representation_relationship_with_transformation that implements the ARM concept of Usage_view_connection_zone_terminal_shape_relationship (see 4.2.943).

EXPRESS specification:

```

*)
ENTITY usage_view_connection_zone_terminal_shape_relationship
  SUBTYPE OF (representation, representation_relationship_with_transformation);
UNIQUE
  UR1: SELF\representation_relationship.rep_1, SELF\representation_relationship.rep_2;
WHERE

  WR1: SIZEOF ([ 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_REPRESENTATION' ] *
    TYPEOF (SELF.rep_1)) = 1;

  WR2: SIZEOF ([ 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_REPRESENTATION' ] *
    TYPEOF (SELF.rep_2)) = 1;

  WR3: SIZEOF (TYPEOF (SELF) - (TYPEOF (SELF\representation ||
    SELF\representation_relationship ||
    SELF\representation_relationship_with_transformation ||
    SELF\usage_view_connection_zone_terminal_shape_relationship))) = 0;

  WR4: SELF\representation_relationship.rep_1 <>
    SELF\representation_relationship.rep_2;
END_ENTITY; -- usage_view_connection_zone_terminal_shape_relationship
(*)

```

Formal propositions:

UR1: The combination of rep_1 and rep_2 shall be unique within a population of usage_view_connection_zone_terminal_shape_relationship.

WR1: The usage_view_connection_zone_terminal_shape_relationship shall reference a shape_representation as its rep_1.

WR2: The usage_view_connection_zone_terminal_shape_relationship shall reference a shape_representation as its rep_2.

WR3: The usage_view_connection_zone_terminal_shape_relationship shall only be a representation, representation_relationship, or representation_relationship_with_transformation in addition to itself.

WR4: The usage_view_connection_zone_terminal_shape_relationship rep_1 shall not be the rep_2.

5.2.3.1.373 viewing_plane

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

The viewing_plane is a shape_aspect that implements the ARM concept of Viewing_plane (see 4.2.956).

EXPRESS specification:

```

*)
ENTITY viewing_plane
  SUBTYPE OF (shape_aspect);
  WHERE

    WR1: SELF\shape_aspect.description = 'affected plane';

    WR2: (SIZEOF(QUERY ( pd <* USEDIN (SELF,
      'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
      'PROPERTY_DEFINITION.' + 'DEFINITION') | (pd\property_definition.description =
      'viewing plane property')))) =1;

    WR3: NOT SELF\shape_aspect.product_definitional;
END_ENTITY; -- viewing_plane
(

```

Formal propositions:

WR1: The viewing_plane shall have a description of 'affected plane'.

WR2: The viewing_plane shall have exactly one property_definition that has the description of 'viewing plane property'.

WR3: The viewing_plane shall not lie on the boundary of the shape of the product.

5.2.3.1.374 volume_shape_intersection

NOTE The local rules for this entity have not been fully updated to agree with the changes in clause 4.2.

A volume_shape_intersection is a representation and a shape_representation_relationship that implements the ARM concept of Volume_shape_intersection (see 4.2.960).

EXPRESS specification:

*)

ENTITY volume_shape_intersection

SUPERTYPE OF (ONEOF(edge_segment_cross_section,
pre_defined_parallel_datum_axis_symbol_3d_2d_relationship,
pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship,

```

Formal propositions:

WR1: The wire_terminal shall have a representation that contains exactly two length_measure_with_-units.

WR2: The wire_terminal shall have a representation that contains exactly one length_measure_with_-unit with a name of 'maximum wire terminal length'.

WR3: The wire_terminal shall have a representation that contains exactly one length_measure_with_-unit with a name of 'minimum wire terminal length'.

WR4: The wire_terminal shall be related to exactly one shape_aspect with a description of 'connection zone' as the 'internal connection zone'.

5.2.3.2 electronic_assembly_interconnect_and_packaging_design imported entity modifications

5.2.3.2.1 action

The base definition of the action entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of action is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the action entity:

- rule_supersedence_constraint (See ??) ;
- subtype_mandatory_action (See ??) .

5.2.3.2.2 action_assignment

The base definition of the action_assignment entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of action_assignment is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the action_assignment entity:

- subtype_combination_action_assignment (See ??) .

5.2.3.2.3 action_directive

The base definition of the action_directive entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of action_directive is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the action_directive entity:

- dependent_instantiable_action_directive (See 5.2.3.99) .

5.2.3.2.4 action_request_assignment

The base definition of the action_request_assignment entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of action_request_assignment is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the action_request_assignment entity:

- subtype_exclusive_action_request_assignment (See ??) .

5.2.3.2.5 action_request_status

The base definition of the action_request_status entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of action_request_status is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the action_request_status entity:

- restrict_action_request_status (See ??) ;
- versioned_action_request_requires_status (See ??) .

5.2.3.2.6 address

The base definition of the address entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of address is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the address entity:

- dependent_instantiable_address (See ??) ;
- subtype_mandatory_address (See ??) .

5.2.3.2.7 alternate_product_relationship

The base definition of the alternate_product_relationship entity is given in ISO 10303-44. The following modifications apply to this Part of ISO 10303.

The definition of alternate_product_relationship is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the `alternate_product_relationship` entity:

- `assembly_alternate_product_constraint` (See 5.2.3.16) .

5.2.3.2.8 angular_size

The base definition of the `angular_size` entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of `angular_size` is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the `angular_size` entity:

- `angular_size_dimension_constraint` (See 5.2.3.10) .

5.2.3.2.9 annotation_fill_area_occurrence

The base definition of the `annotation_fill_area_occurrence` entity is given in ISO 10303-46. The following modifications apply to this Part of ISO 10303.

The definition of `annotation_fill_area_occurrence` is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the `annotation_fill_area_occurrence` entity:

- `fill_area_occurrence_constraint` (See ??) .

5.2.3.2.10 application_context

The base definition of the `application_context` entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of `application_context` is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the `application_context` entity:

- `application_context_requires_ap_definition` (See 5.2.3.11) .

5.2.3.2.11 application_protocol_definition

The base definition of the application_protocol_definition entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of application_protocol_definition is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the application_protocol_definition entity:

- application_context_requires_ap_definition (See 5.2.3.11) .

5.2.3.2.12 approval

The base definition of the approval entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of approval is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the approval entity:

- approval_requires_approval_date_time (See 5.2.3.12) ;
- approval_requires_approval_person_organization (See 5.2.3.13) ;
- approvals_are_assigned (See 5.2.3.15) .

5.2.3.2.13 approval_assignment

The base definition of the approval_assignment entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of approval_assignment is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the approval_assignment entity:

- approvals_are_assigned (See 5.2.3.15) .

5.2.3.2.14 approval_date_time

The base definition of the approval_date_time entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of approval_date_time is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the approval_date_time entity:

- approval_requires_approval_date_time (See 5.2.3.12) .

5.2.3.2.15 approval_person_organization

The base definition of the approval_person_organization entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of approval_person_organization is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the approval_person_organization entity:

- approval_requires_approval_person_organization (See 5.2.3.13) .

5.2.3.2.16 approval_status

The base definition of the approval_status entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of approval_status is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the approval_status entity:

- dependent_instantiable_approval_status (See 5.2.3.100) ;
- restrict_approval_status (See ??) .

5.2.3.2.17 assembly_component_usage

The base definition of the assembly_component_usage entity is given in ISO 10303-44. The following modifications apply to this Part of ISO 10303.

The definition of assembly_component_usage is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the assembly_component_usage entity:

- acu_requires_security_classification (See ??) ;
- assembly_composition_relationship_constraint (See ??) ;
- assembly_composition_relationship_unique_constraint (See 5.2.3.17) ;
- interconnect_module_stratum_assembly_relationship_constraint (See ??);
- interconnect_module_stratum_assembly_relationship_unique_constraint (See ??);
- material_assembly_relationship_constraint (See ??);
- material_assembly_relationship_unique_constraint (See ??).

5.2.3.2.18 assembly_component_usage_substitute

The base definition of the assembly_component_usage_substitute entity is given in ISO 10303-44. The following modifications apply to this Part of ISO 10303.

The definition of assembly_component_usage_substitute is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the assembly_component_usage_-substitute entity:

- substitute_product_constraint (See ??) .

5.2.3.2.19 centre_of_symmetry

The base definition of the centre_of_symmetry entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of centre_of_symmetry is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the centre_of_symmetry entity:

- centre_of_symmetry_constraint (See 5.2.3.28) .

5.2.3.2.20 certification_type

The base definition of the certification_type entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of certification_type is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the certification_type entity:

- dependent_instantiable_certification_type (See 5.2.3.101) .

5.2.3.2.21 characterized_object

The base definition of the characterized_object entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of characterized_object is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the characterized_object entity:

- dependent_instantiable_certification_type (See 5.2.3.101) ;
- subtype_mandatory_characterized_object (See ??) .

5.2.3.2.22 composite_shape_aspect

The base definition of the composite_shape_aspect entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of composite_shape_aspect is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the composite_shape_aspect entity:

- composite_shape_element_constraint (See 5.2.3.57) ;
- part_feature_unique_constraint (See ??) ;
- subtype_mandatory_composite_shape_aspect (See ??) .

5.2.3.2.23 configuration_effectivity

The base definition of the configuration_effectivity entity is given in ISO 10303-44. The following modifications apply to this Part of ISO 10303.

The definition of configuration_effectivity is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the configuration_effectivity entity:

- planned_effectivity_constraint (See ??) ;
- planned_effectivity_unique_constraint (See ??) .

5.2.3.2.24 configuration_item

The base definition of the configuration_item entity is given in ISO 10303-44. The following modifications apply to this Part of ISO 10303.

The definition of configuration_item is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the configuration_item entity:

- configuration_item_requires_person_organization (See 5.2.3.63) ;
- ee_product_configuration_constraint (See ??) ;
- ee_product_configuration_unique_constraint (See ??) ;
- product_concept_requires_configuration_item (See ??).

5.2.3.2.25 contract

The base definition of the contract entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of contract is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the contract entity:

- contract_constraint (See ??) ;
- contract_unique_constraint (See 5.2.3.69) .

5.2.3.2.26 contract_type

The base definition of the contract_type entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of contract_type is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the contract_type entity:

- dependent_instantiable_contract_type (See 5.2.3.102) .

5.2.3.2.27 curve_style

The base definition of the curve_style entity is given in ISO 10303-46. The following modifications apply to this Part of ISO 10303.

The definition of curve_style is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the curve_style entity:

- curve_style_requires_length_measure_with_unit (See 5.2.3.72) .

5.2.3.2.28 date

The base definition of the date entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of date is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the date entity:

- date_constraint (See 5.2.3.75) ;
- dependent_instantiable_date (See 5.2.3.103) ;
- subtype_mandatory_date (See ??) .

5.2.3.2.29 date_and_time

The base definition of the date_and_time entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of date_and_time is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the date_and_time entity:

- date_and_time_require_minute_and_second (See 5.2.3.74) .

5.2.3.2.30 date_role

The base definition of the date_role entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of date_role is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the date_role entity:

- dependent_instantiable_date_role (See 5.2.3.104) ;
- restrict_date_role (See ??) .

5.2.3.2.31 date_time_role

The base definition of the date_time_role entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of date_time_role is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the date_time_role entity:

- dependent_instantiable_date_time_role (See 5.2.3.105) .

5.2.3.2.32 derived_shape_aspect

The base definition of the derived_shape_aspect entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of derived_shape_aspect is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the derived_shape_aspect entity:

- derived_shape_element_constraint (See ??) ;
- directed_axis_constraint (See ??) ;
- directed_axis_unique_constraint (See ??) .

5.2.3.2.33 descriptive_representation_item

The base definition of the descriptive_representation_item entity is given in ISO 10303-45. The following modifications apply to this Part of ISO 10303.

The definition of descriptive_representation_item is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the descriptive_representation_item entity:

- component_feature_external_reference_constraint (See 5.2.3.36) ;
- component_feature_external_reference_unique_constraint (See 5.2.3.37) ;
- configuration_controlled_message_constraint (See 5.2.3.62) ;
- package_terminal_external_reference_constraint (See ??);
- package_terminal_external_reference_unique_constraint (See ??).

5.2.3.2.34 dimensional_location

The base definition of the dimensional_location entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of dimensional_location is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the dimensional_location entity:

- dimensional_characteristic_constraint (See ??) ;
- dimensional_location_constraint (See ??) ;
- shape_element_locating_relationship_constraint (See ??) ;
- shape_element_locating_relationship_unique_constraint (See ??);
- subtype_exclusive_dimensional_location (See ??).

5.2.3.2.35 dimensional_size

The base definition of the dimensional_size entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of dimensional_size is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the dimensional_size entity:

- dimensional_characteristic_constraint (See ??) ;
- dimensional_size_constraint (See ??) ;
- subtype_exclusive_dimensional_size (See ??) .

5.2.3.2.36 directed_action

The base definition of the directed_action entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of directed_action is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the directed_action entity:

- directed_action_requires_approval (See ??) ;
- directed_action_requires_date_or_date_and_time (See ??) ;
- work_order_constraint (See ??) ;
- work_order_unique_constraint (See ??).

5.2.3.2.37 document

The base definition of the document entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of document is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the document entity:

- ee_document_constraint (See ??) ;
- ee_document_identifier_unique_constraint (See ??) ;
- ee_document_unique_constraint (See ??) .

5.2.3.2.38 **document_type**

The base definition of the document_type entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of document_type is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the document_type entity:

— dependent_instantiable_document_type (See ??) .

5.2.3.2.39 **externally_defined_item**

The base definition of the externally_defined_item entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of externally_defined_item is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the externally_defined_item entity:

— subtype_mandatory_externally_defined_item (See ??) .

5.2.3.2.40 **externally_defined_text_font**

The base definition of the externally_defined_text_font entity is given in ISO 10303-46. The following modifications apply to this Part of ISO 10303.

The definition of externally_defined_text_font is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the externally_defined_text_font entity:

- registered_font_constraint (See ??) ;
- registered_font_unique_constraint (See ??) .

5.2.3.2.41 geometric_tolerance

The base definition of the geometric_tolerance entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of geometric_tolerance is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the geometric_tolerance entity:

- subtype_mandatory_geometric_tolerance (See ??) .

5.2.3.2.42 global_unit_assigned_context

The base definition of the global_unit_assigned_context entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of global_unit_assigned_context is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the global_unit_assigned_context entity:

- cartesian_coordinate_system_constraint (See 5.2.3.26) .

5.2.3.2.43 group

The base definition of the group entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of group is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the group entity:

- subtype_mandatory_group (See ??) .

5.2.3.2.44 make_from_usage_option

The base definition of the make_from_usage_option entity is given in ISO 10303-44. The following modifications apply to this Part of ISO 10303.

The definition of make_from_usage_option is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the make_from_usage_option entity:

- no_shape_for_make_from (See ??) ;
- stratum_make_from_relationship_constraint (See ??) .

5.2.3.2.45 mapped_item

The base definition of the mapped_item entity is given in ISO 10303-43. The following modifications apply to this Part of ISO 10303.

The definition of mapped_item is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the mapped_item entity:

- design_intent_modification_in_stratum_3d_position_constraint (See ??) ;
- design_intent_modification_in_stratum_planar_position_constraint (See ??) ;
- device_2d_position_constraint (See ??) ;
- device_3d_position_constraint (See ??);
- stratum_feature_in_stratum_3d_position_constraint (See ??);
- stratum_feature_in_stratum_planar_position_constraint (See ??);
- stratum_interconnect_module_3d_position_constraint (See ??);
- stratum_interconnect_module_planar_position_constraint (See ??);
- stratum_surface_in_stratum_3d_position_constraint (See ??);
- subtype_exclusive_mapped_item (See ??).

5.2.3.2.46 material_designation

The base definition of the material_designation entity is given in ISO 10303-45. The following modifications apply to this Part of ISO 10303.

The definition of material_designation is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the material_designation entity:

- ee_material_constraint (See ??) ;
- ee_material_unique_constraint (See ??) ;
- printed_part_template_material_constraint (See ??) .

5.2.3.2.47 measure_qualification

The base definition of the measure_qualification entity is given in ISO 10303-45. The following modifications apply to this Part of ISO 10303.

The definition of measure_qualification is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the measure_qualification entity:

- dimension_qualifier_constraint (See ??) ;
- geometric_tolerance_qualifier_constraint (See ??) ;
- pre_defined_dimension_qualifier_constraint (See ??) ;
- pre_defined_geometric_tolerance_qualifier_constraint (See ??);
- user_defined_dimension_qualifier_constraint (See ??);
- user_defined_geometric_tolerance_qualifier_constraint (See ??).

5.2.3.2.48 modified_geometric_tolerance

The base definition of the modified_geometric_tolerance entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of modified_geometric_tolerance is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the modified_geometric_tolerance entity:

- geometric_tolerance_with_applied_material_condition_property_constraint (See ??) .

5.2.3.2.49 **named_unit**

The base definition of the `named_unit` entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of `named_unit` is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the `named_unit` entity:

- `dependent_instantiable_named_unit` (See ??) .

5.2.3.2.50 **next_assembly_usage_occurrence**

The base definition of the `next_assembly_usage_occurrence` entity is given in ISO 10303-44. The following modifications apply to this Part of ISO 10303.

The definition of `next_assembly_usage_occurrence` is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the `next_assembly_usage_occurrence` entity:

- `coordinated_assembly_and_shape` (See ??) ;
- `next_higher_assembly_relationship_constraint` (See ??) ;
- `next_higher_assembly_relationship_unique_constraint` (See ??) .

5.2.3.2.51 **organization_role**

The base definition of the `organization_role` entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of `organization_role` is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the organization_role entity:

- dependent_instantiable_organization_role (See ??) .

5.2.3.2.52 parametric_representation_context

The base definition of the parametric_representation_context entity is given in ISO 10303-43. The following modifications apply to this Part of ISO 10303.

The definition of parametric_representation_context is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the parametric_representation_context entity:

- dependent_instantiable_parametric_representation_context (See ??) .

5.2.3.2.53 person_and_organization_role

The base definition of the person_and_organization_role entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of person_and_organization_role is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the person_and_organization_role entity:

- dependent_instantiable_person_and_organization_role (See ??) .

5.2.3.2.54 plus_minus_tolerance

The base definition of the plus_minus_tolerance entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of plus_minus_tolerance is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the plus_minus_tolerance entity:

- plus_minus_tolerance_range_representation_constraint (See ??) .

5.2.3.2.55 pre_defined_item

The base definition of the pre_defined_item entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of pre_defined_item is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the pre_defined_item entity:

- subtype_mandatory_pre_defined_item (See ??) .

5.2.3.2.56 product

The base definition of the product entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of product is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the product entity:

- ee_product_constraint (See ??) ;
- ee_product_unique_constraint (See ??) ;
- mandatory_product_related_product_category_value (See ??) ;
- product_requires_person_organization (See ??);
- product_requires_product_definition_formation (See ??);
- substitute_product_constraint (See ??).

5.2.3.2.57 product_concept

The base definition of the product_concept entity is given in ISO 10303-44. The following modifications apply to this Part of ISO 10303.

The definition of product_concept is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the product_concept entity:

- ee_product_model_unique_constraint (See ??) ;
- product_concept_requires_configuration_item (See ??) .

5.2.3.2.58 product_definition

The base definition of the product_definition entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of product_definition is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the product_definition entity:

- part_feature_constraint (See ??) ;
- product_definition_requires_date_or_date_and_time (See ??) ;
- product_definition_requires_person_organization (See ??) ;
- subtype_exclusive_product_definition (See ??).

5.2.3.2.59 product_definition_formation

The base definition of the product_definition_formation entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of product_definition_formation is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the product_definition_formation entity:

- bus_structural_definition_unique_constraint (See 5.2.3.25) ;
- ee_product_version_constraint (See ??) ;
- ee_product_version_unique_constraint (See ??) ;
- pdf_requires_security_classification (See ??);
- product_definition_formation_requires_approval (See ??);
- product_definition_formation_requires_person_organization (See ??);
- product_requires_product_definition_formation (See ??).

5.2.3.2.60 product_definition_formation_relationship

The base definition of the product_definition_formation_relationship entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of product_definition_formation_relationship is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the product_definition_formation_relationship entity:

- product_association_constraint (See ??) .

5.2.3.2.61 product_definition_relationship

The base definition of the product_definition_relationship entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of product_definition_relationship is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the product_definition_relationship entity:

- aggregate_connectivity_requirement_unique_constraint (See 5.2.3.6) ;
- assembly_requirement_allocation_constraint (See 5.2.3.19) ;
- bus_element_relationship_constraint (See ??) ;
- bus_element_relationship_unique_constraint (See ??);
- connectivity_allocation_constraint (See ??);
- connectivity_allocation_unique_constraint (See ??);
- design_composition_path_constraint (See ??);
- design_functional_unit_allocation_to_assembly_component_constraint (See ??);
- design_functional_unit_allocation_to_assembly_component_unique_constraint (See ??);
- design_functional_unit_allocation_to_assembly_joint_constraint (See ??);
- design_functional_unit_allocation_to_assembly_joint_unique_constraint (See ??);
- design_functional_unit_allocation_to_fabrication_joint_constraint (See ??);
- design_functional_unit_allocation_to_fabrication_joint_unique_constraint (See ??);
- design_functional_unit_allocation_to_reference_functional_unit_constraint (See ??);
- design_object_management_relationship_constraint (See ??);
- equivalent_functional_unit_definition_assignment_constraint (See ??);
- functional_unit_requirement_allocation_constraint (See ??);
- interface_component_allocation_constraint (See ??);
- inter_stratum_extent_constraint (See ??);
- part_device_constraint (See ??);
- part_device_unique_constraint (See ??);

- physical_node_requirement_to_implementing_component_allocation_constraint (See ??);
- physical_unit_relationship_constraint (See ??);
- reference_composition_path_constraint (See ??);
- reference_functional_unit_assignment_to_part_constraint (See ??);
- shield_allocation_constraint (See ??);
- subtype_exclusive_product_definition_relationship (See ??);
- thermal_requirement_allocation_constraint (See ??);
- transmission_line_functional_unit_to_routed_printed_component_allocation_constraint (See ??).

5.2.3.2.62 product_definition_usage

The base definition of the product_definition_usage entity is given in ISO 10303-44. The following modifications apply to this Part of ISO 10303.

The definition of product_definition_usage is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the product_definition_usage entity:

- subtype_mandatory_product_definition_usage (See ??) .

5.2.3.2.63 product_definition_with_associated_documents

The base definition of the product_definition_with_associated_documents entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of product_definition_with_associated_documents is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the product_definition_with_-associated_documents entity:

- ee_product_definition_constraint (See ??) .

5.2.3.2.64 product_material_composition_relationship

The base definition of the product_material_composition_relationship entity is given in ISO 10303-45. The following modifications apply to this Part of ISO 10303.

The definition of product_material_composition_relationship is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the product_material_composition_relationship entity:

- material_composition_relationship_constraint (See ??) .

5.2.3.2.65 projected_zone_definition

The base definition of the projected_zone_definition entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of projected_zone_definition is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the projected_zone_definition entity:

- projected_tolerance_zone_definition_constraint (See ??) ;
- projected_zone_and_base_relationship_constraint (See ??) ;
- projected_zone_height_characteristic_constraint (See ??) .

5.2.3.2.66 promissory_usage_occurrence

The base definition of the promissory_usage_occurrence entity is given in ISO 10303-44. The following modifications apply to this Part of ISO 10303.

The definition of promissory_usage_occurrence is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the promissory_usage_occurrence entity:

- promissory_usage_relationship_constraint (See ??) ;
- promissory_usage_relationship_unique_constraint (See ??) .

5.2.3.2.67 property_definition

The base definition of the property_definition entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of property_definition is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the property_definition entity:

- boundary_zone_definition_with_specified_size_constraint (See 5.2.3.24) ;
- conical_tolerance_zone_boundary_definition_constraint (See 5.2.3.65) ;
- conical_tolerance_zone_boundary_diametrical_size_characteristic_constraint (See 5.2.3.66) ;
- datum_axis_related_orientation_constraint (See 5.2.3.77);
- datum_based_direction_vector_constraint (See 5.2.3.78);
- datum_based_vector_orientation_constraint (See 5.2.3.80);
- datum_feature_material_condition_property_constraint (See 5.2.3.81);
- datum_precedence_assignment_constraint (See 5.2.3.87);
- datum_precedence_assignment_unique_constraint (See 5.2.3.88);
- datum_system_defining_conditions_constraint (See 5.2.3.89);
- datum_system_defining_conditions_with_material_conditions_constraint (See 5.2.3.90);
- datum_system_defining_conditions_without_material_conditions_constraint (See 5.2.3.91);
- dimension_related_positional_boundary_definition_constraint (See ??);
- dimension_set_constraint (See ??);
- direction_element_constraint (See ??);
- composite_signal_property_constraint (See 5.2.3.58);
- positional_boundary_member_definition_constraint (See ??);
- positional_boundary_offset_constraint (See ??);
- profile_boundary_definition_constraint (See ??);
- profile_boundary_definition_with_offsets_constraint (See ??);
- profile_related_positional_boundary_definition_constraint (See ??);
- restraint_condition_constraint (See ??);

- signal_property_constraint (See ??);
- subtype_exclusive_property_definition (See ??);
- technology_constraint (See ??);
- tolerance_specific_restraint_condition_constraint (See ??);
- tolerance_zone_boundary_definition_constraint (See ??);
- tolerance_zone_boundary_member_offset_constraint (See ??);
- tolerance_zone_definition_with_specified_orientation_constraint (See ??);
- tolerance_zone_per_unit_size_specification_constraint (See ??);
- true_profile_constraint (See ??);
- viewing_plane_based_orientation_constraint (See ??);
- viewing_plane_definition_constraint (See ??).

5.2.3.2.68 property_definition_relationship

The base definition of the property_definition_relationship entity is given in ISO 10303-45. The following modifications apply to this Part of ISO 10303.

The definition of property_definition_relationship is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the property_definition_relationship entity:

- composite_signal_property_relationship_constraint (See ??) ;
- functional_unit_network_terminal_definition_bus_assignment_constraint (See ??) ;
- functional_unit_network_terminal_definition_node_assignment_constraint (See ??) ;
- functional_unit_terminal_bus_assignment_constraint (See ??);
- functional_unit_terminal_node_assignment_constraint (See ??);
- operational_requirement_occurrence_relationship_constraint (See ??);
- requirement_composition_constraint (See ??).

5.2.3.2.69 **property_definition_representation**

The base definition of the `property_definition_representation` entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of `property_definition_representation` is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the `property_definition_representation` entity:

- `analytical_model_vector_port_assignment_constraint` (See 5.2.3.8) ;
- `assembly_component_2d_shape_constraint` (See ??) ;
- `assembly_component_3d_shape_constraint` (See ??) ;
- `component_placement_restriction_assignment_constraint` (See 5.2.3.44);
- `functional_specification_to_requirement_occurrence_assignment_constraint` (See ??);
- `located_interconnect_module_thickness_requirement_unique_constraint` (See ??);
- `subtype_exclusive_property_definition_representation` (See ??).

5.2.3.2.70 **representation**

The base definition of the `representation` entity is given in ISO 10303-43. The following modifications apply to this Part of ISO 10303.

The definition of `representation` is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the representation entity:

- boundary_size_characteristic_constraint (See 5.2.3.23) ;
- component_external_reference_constraint (See 5.2.3.35) ;
- component_overlap_relationship_constraint (See 5.2.3.41) ;
- component_mounting_clearance_relationship_constraint (See 5.2.3.40);
- connection_zone_constraint (See 5.2.3.68);
- curve_style_unique_constraint (See 5.2.3.73);
- datum_based_length_measure_constraint (See 5.2.3.79);
- diametrical_boundary_size_characteristic_constraint (See ??);
- ee_rule_conclusion_definition_unique_constraint (See ??);
- ee_rule_definition_constraint (See ??);
- ee_rule_definition_unique_constraint (See ??);
- ee_rule_premise_definition_unique_constraint (See ??);
- functional_specification_constraint (See ??);
- marking_constraint (See ??);
- opposing_boundary_set_size_characteristic_constraint (See ??);
- package_external_reference_constraint (See ??);
- part_terminal_external_reference_unique_constraint (See ??);
- registered_style_constraint (See ??);
- rule_priority_constraint (See ??);
- shape_element_unique_constraint (See ??);
- signal_specification_constraint (See ??);
- stratum_technology_line_width_tolerance_assignment_constraint (See ??);

- subtype_exclusive_representation (See ??).

5.2.3.2.71 representation_context

The base definition of the representation_context entity is given in ISO 10303-43. The following modifications apply to this Part of ISO 10303.

The definition of representation_context is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the representation_context entity:

- subtype_exclusive_representation_context (See ??) .

5.2.3.2.72 representation_item

The base definition of the representation_item entity is given in ISO 10303-43. The following modifications apply to this Part of ISO 10303.

The definition of representation_item is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the representation_item entity:

- characteristic_constraint (See 5.2.3.33) ;
- characteristic_unique_constraint (See ??) ;
- dependent_instantiable_representation_item (See ??) ;
- shape_element_unique_constraint (See ??).

5.2.3.2.73 representation_relationship

The base definition of the representation_relationship entity is given in ISO 10303-43. The following modifications apply to this Part of ISO 10303.

The definition of representation_relationship is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the representation_relationship entity:

- evaluated_characteristic_constraint (See ??) ;
- stratum_feature_shape_stratum_average_surface_shape_relationship_constraint (See ??) ;
- stratum_feature_shape_stratum_surface_shape_relationship_constraint (See ??) ;
- terminal_pair_port_equivalence_relationship_constraint (See ??).

5.2.3.2.74 runout_zone_definition

The base definition of the runout_zone_definition entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of runout_zone_definition is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the runout_zone_definition entity:

- runout_tolerance_zone_definition_with_specified_angle_constraint (See ??) .

5.2.3.2.75 runout_zone_orientation

The base definition of the runout_zone_orientation entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of runout_zone_orientation is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the runout_zone_orientation entity:

- subtype_mandatory_runout_zone_orientation (See ??) .

5.2.3.2.76 runout_zone_orientation_reference_direction

The base definition of the runout_zone_orientation_reference_direction entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of runout_zone_orientation_reference_direction is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the runout_zone_orientation_-reference_direction entity:

- runout_zone_orientation_constraint (See ??) .

5.2.3.2.77 security_classification

The base definition of the security_classification entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of security_classification is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the security_classification entity:

- security_classification_constraint (See ??) .

5.2.3.2.78 security_classification_level

The base definition of the security_classification_level entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of security_classification_level is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the security_classification_level entity:

- dependent_instantiable_security_classification_level (See ??) .

5.2.3.2.79 shape_aspect

The base definition of the shape_aspect entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of shape_aspect is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the shape_aspect entity:

- component_termination_passage_template_terminal_constraint (See 5.2.3.55) ;
- component_termination_passage_template_terminal_unique_constraint (See 5.2.3.56) ;
- conductive_interconnect_element_with_pre_defined_transitions_constraint (See 5.2.3.60) ;
- conductive_interconnect_element_with_user_defined_single_transition_constraint (See 5.2.3.61);
- connection_zone_constraint (See 5.2.3.68);
- interconnect_module_surface_feature_constraint (See ??);
- mating_connector_termination_constraint (See ??);
- mating_connector_termination_unique_constraint (See ??);
- non_feature_shape_element_constraint (See ??);
- part_device_terminal_constraint (See ??);
- part_device_terminal_unique_constraint (See ??);
- part_feature_constraint (See ??);
- part_feature_unique_constraint (See ??);
- polarity_indication_feature_constraint (See ??);
- shape_element_constraint (See ??);
- subtype_combination_shape_aspect (See ??);
- tolerance_zone_boundary_member_constraint (See ??);
- topological_junction_constraint (See ??);
- topological_junction_unique_constraint (See ??);
- via_template_terminal_constraint (See ??);
- via_template_terminal_unique_constraint (See ??).

5.2.3.2.80 **shape_aspect_deriving_relationship**

The base definition of the shape_aspect_deriving_relationship entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of shape_aspect_deriving_relationship is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the shape_aspect_deriving_relationship entity:

- shape_element_deriving_relationship_constraint (See ??) ;
- shape_element_deriving_relationship_unique_constraint (See ??) .

5.2.3.2.81 **shape_aspect_relationship**

The base definition of the shape_aspect_relationship entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of shape_aspect_relationship is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the shape_aspect_relationship entity:

- adjacent_stratum_surface_definition_constraint (See 5.2.3.4) ;
- adjacent_stratum_surface_definition_unique_constraint (See 5.2.3.5) ;
- assembly_requirement_allocation_constraint (See 5.2.3.19) ;
- assembly_separation_requirement_allocation_constraint (See 5.2.3.20);
- component_feature_to_layout_feature_relationship_constraint (See 5.2.3.38);
- component_terminal_to_assembly_module_terminal_assignment_constraint (See ??);
- component_terminal_to_interconnect_module_terminal_assignment_constraint (See ??);
- component_terminal_to_interconnect_module_terminal_assignment_unique_constraint (See ??);
- component_terminal_to_pca_terminal_assignment_constraint (See 5.2.3.53);
- component_terminal_to_pca_terminal_assignment_unique_constraint (See 5.2.3.54);
- conical_tolerance_zone_boundary_and_surface_relationship_constraint (See 5.2.3.64);
- datum_axis_and_tolerance_zone_orienting_relationship_constraint (See 5.2.3.76);
- datum_feature_usage_in_common_datum_relationship_constraint (See 5.2.3.82);
- datum_feature_usage_in_datum_relationship_constraint (See 5.2.3.83);
- datum_feature_usage_in_datum_relationship_unique_constraint (See 5.2.3.84);
- datum_feature_usage_in_datum_system_relationship_constraint (See 5.2.3.85);
- datum_feature_usage_in_single_datum_relationship_constraint (See 5.2.3.86);
- datum_target_usage_in_datum_target_set_relationship_constraint (See 5.2.3.92);
- datum_target_usage_in_datum_target_set_relationship_unique_constraint (See 5.2.3.93);
- datum_usage_in_datum_system_relationship_constraint (See 5.2.3.94);
- datum_usage_in_datum_system_relationship_unique_constraint (See 5.2.3.95);

- design_intent_modification_sequence_constraint (See ??);
- design_intent_modification_sequence_unique_constraint (See ??);
- device_terminal_map_relationship_constraint (See ??);
- edge_segment_vertex_constraint (See ??);
- equivalent_functional_terminals_assignment_constraint (See ??);
- feature_group_relationship_constraint (See ??);
- functional_usage_view_to_part_terminal_assignment_constraint (See ??);
- functional_usage_view_to_part_terminal_assignment_unique_constraint (See ??);
- functional_usage_view_to_printed_part_template_terminal_assignment_constraint (See ??);
- functional_usage_view_to_printed_part_template_terminal_assignment_unique_constraint (See ??);
- internal_stratum_access_constraint (See ??);
- internal_stratum_access_unique_constraint (See ??);
- junction_vertex_allocation_constraint (See ??);
- junction_vertex_allocation_unique_constraint (See ??);
- layout_spacing_requirement_non_conforming_design_object_constraint (See ??);
- parallel_shape_element_relationship_constraint (See ??);
- perpendicular_shape_element_relationship_constraint (See ??);
- physical_connectivity_abstraction_map_unique_constraint (See ??);
- physical_connectivity_definition_relationship_constraint (See ??);
- placement_group_area_assignment_constraint (See ??);
- positional_boundary_and_profile_boundary_member_relationship_constraint (See ??);
- printed_part_template_terminal_relationship_constraint (See ??);
- runout_tolerance_zone_orienting_relationship_constraint (See ??);
- shape_element_boundary_relationship_constraint (See ??);

- shape_element_composing_relationship_constraint (See ??);
- shape_element_constituent_relationship_constraint (See ??);
- shape_element_constituent_relationship_unique_constraint (See ??);
- shape_element_relationship_constraint (See ??);
- stratum_concept_to_physical_usage_view_assignment_constraint (See ??);
- subtype_exclusive_shape_aspect_relationship (See ??);
- tolerance_zone_and_viewing_plane_orienting_relationship_constraint (See ??);
- transmission_line_functional_unit_terminal_allocation_constraint (See ??);
- transmission_line_functional_unit_terminal_allocation_unique_constraint (See ??).

5.2.3.2.82 shape_dimension_representation

The base definition of the shape_dimension_representation entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of shape_dimension_representation is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the shape_dimension_representation entity:

- limit_dimension_representation_constraint (See ??) ;
- plus_minus_tolerance_range_representation_constraint (See ??) ;
- shape_dimension_representation_constraint (See ??) ;
- singular_dimension_representation_constraint (See ??).

5.2.3.2.83 shape_representation

The base definition of the shape_representation entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of shape_representation is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the shape_representation entity:

- bevel_edge_feature_shape_constraint (See 5.2.3.22) ;
- default_assembly_bond_shape_constraint (See 5.2.3.96) ;
- dependent_instantiable_shape_representation (See ??) ;
- feature_shape_occurrence_constraint (See ??);
- mating_connector_placement_relationship_constraint (See ??);
- part_template_3d_shape_constraint (See ??);
- part_template_planar_shape_constraint (See ??);
- physical_unit_3d_shape_constraint (See ??);
- physical_unit_planar_shape_constraint (See ??);
- planar_curve_constraint (See ??);
- planar_projected_shape_constraint (See ??);
- radius_edge_feature_shape_constraint (See ??);
- shape_representation_requires_origin (See ??);
- step_edge_feature_shape_constraint (See ??);
- stratum_3d_shape_constraint (See ??);
- stratum_planar_shape_constraint (See ??);
- subtype_mandatory_shape_representation (See ??).

5.2.3.2.84 shape_representation_relationship

The base definition of the shape_representation_relationship entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of shape_representation_relationship is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the shape_representation_relationship entity:

- component_part_2d_geometric_representation_relationship_constraint (See 5.2.3.42) ;
- component_part_3d_geometric_representation_relationship_constraint (See 5.2.3.43) ;
- consistent_part_template_shape_projection_constraint (See ??) ;
- consistent_physical_unit_shape_projection_constraint (See ??);
- consistent_stratum_shape_projection_constraint (See ??).

5.2.3.2.85 specified_higher_usage_occurrence

The base definition of the specified_higher_usage_occurrence entity is given in ISO 10303-44. The following modifications apply to this Part of ISO 10303.

The definition of specified_higher_usage_occurrence is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the specified_higher_usage_occurrence entity:

- next_higher_assembly_interface_requirement_constraint (See ??) .

5.2.3.2.86 text_literal

The base definition of the text_literal entity is given in ISO 10303-46. The following modifications apply to this Part of ISO 10303.

The definition of text_literal is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the text_literal entity:

- subtype_mandatory_text_literal (See ??) .

5.2.3.2.87 tolerance_value

The base definition of the tolerance_value entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of tolerance_value is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the tolerance_value entity:

- dependent_instantiable_tolerance_value (See ??) .

5.2.3.2.88 tolerance_zone

The base definition of the tolerance_zone entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of tolerance_zone is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the tolerance_zone entity:

- tolerance_zone_constraint (See ??) .

5.2.3.2.89 tolerance_zone_definition

The base definition of the tolerance_zone_definition entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of tolerance_zone_definition is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the tolerance_zone_definition entity:

- conical_tolerance_zone_definition_constraint (See 5.2.3.67) ;
- tolerance_zone_definition_constraint (See ??) ;
- tolerance_zone_definition_with_per_unit_size_specification_constraint (See ??) .

5.2.3.2.90 tolerance_zone_form

The base definition of the tolerance_zone_form entity is given in ISO 10303-47. The following modifications apply to this Part of ISO 10303.

The definition of tolerance_zone_form is modified as follows:

Associated global rules:

The following global rule defined in this part of ISO 10303 applies to the tolerance_zone_form entity:

- tolerance_zone_form_constraint (See ??) .

5.2.3.2.91 versioned_action_request

The base definition of the versioned_action_request entity is given in ISO 10303-41. The following modifications apply to this Part of ISO 10303.

The definition of versioned_action_request is modified as follows:

Associated global rules:

The following global rules defined in this part of ISO 10303 apply to the versioned_action_request entity:

- change_request_unique_constraint (See 5.2.3.32) ;
- versioned_action_request_requires_approval (See ??) ;
- versioned_action_request_requires_date_or_date_and_time (See ??) ;
- versioned_action_request_requires_person_organization (See ??);
- versioned_action_request_requires_status (See ??);
- work_request_constraint (See ??);
- work_request_unique_constraint (See ??).

5.2.3.3 add_design_object_management_relationship_unique_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The add_design_object_management_relationship_unique_constraint rule constrains the add_design_object_assignment and add_design_object_request_assignment population members, that fill the role of ARM add_design_object_management_relationship, so that the combination of ARM current_design and ARM current_design_object attributes shall be unique within the population.

EXPRESS specification:

```

    END_REPEAT;
  END_REPEAT;
END_REPEAT;
WHERE

  WR1: pass;
END_RULE; -- angular_dimension_with_direction_vector__unique_constraint
(

```

Formal propositions:

WR1: Every instance of `angular_dimension_with_orientation` must have a unique `property_definition` entity with a name of 'datum based vector orientation' that is related to the `angular_dimension_with_orientation` by a `property_definition_relationship` with a name of 'measurement orientation'.

5.2.3.10 `angular_size_dimension_constraint`

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `angular_size_dimension_constraint` rule constrains the use of an `angular_size` when it is used as an angular size dimension.

EXPRESS specification:

```
* )
( *
RULE angular_size_dimension_constraint FOR
    (angular_size);
END_RULE; -- angular_size_dimension_constraint
* )
( *
```

Informal propositions:

IP1: Each `angular_size` shall be represented by exactly zero `shape_dimension_representation` that contain at least one `representation_item` that has a name that is neither 'full angle' nor 'half angle'.

IP2: Each `angular_size` shall be represented by exactly zero `shape_dimension_representation` that contains a `representation_item` with the name of 'full angle' and a `representation_item` with a name of 'half angle'.

IP3: Each `angular_size` shall have a name of 'angular'.

5.2.3.11 `application_context_requires_ap_definition`

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `application_context_requires_ap_definition` rule assures that each instance of `application_context` has an `application_protocol_definition` with name equal to 'electronic_assembly_interconnect_and_packaging_design'.

EXPRESS specification:

```

*)
RULE application_context_requires_ap_definition FOR
  (application_context, application_protocol_definition);
WHERE

  WR1: SIZEOF (QUERY (ac <* application_context |
    NOT (SIZEOF (QUERY (apd <* application_protocol_definition |
      (ac :=: apd\application_protocol_definition.application)
      AND
      (apd\application_protocol_definition.application_interpreted_model_schema_name =
        'electronic_assembly_interconnect_and_packaging_design'
      ))) = 1 ))) = 0;
END_RULE; --application_context_requires_ap_definition
( *

```

Formal propositions:

WR1: For each instance of application_context, there shall be exactly one instance of application_protocol_definition that references the instance of application_context as its application with a value of 'electronic_assembly_interconnect_and_packaging_design' as its application_interpreted_model_schema_name.

5.2.3.12 approval_requires_approval_date_time

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The approval_requires_approval_date_time rule assures that each instance of approval has an associated date or time.

EXPRESS specification:

```

*)
RULE approval_requires_approval_date_time FOR (approval,
  approval_date_time);
WHERE

  WR1: SIZEOF(QUERY ( app <* approval |
    NOT (SIZEOF (QUERY (adt <* approval_date_time |
      app :=: adt.dated_approval))) = 1))) = 0;
END_RULE; -- approval_requires_approval_date_time
( *

```

Formal propositions:

WR1: For each instance of approval, there shall be exactly one instance of approval_date_time.

5.2.3.13 approval_requires_approval_person_organization

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The approval_requires_approval_person_organization rule assures that for each instance of approval there is an organization or person that is responsible for that approval.

EXPRESS specification:

```
*)
RULE approval_requires_approval_person_organization FOR (approval,
    approval_person_organization);
WHERE

    WR1: SIZEOF (QUERY (app <* approval |
        NOT (SIZEOF (QUERY (apo <* approval_person_organization |
            app :=: apo.authorized_approval)) >= 1))) = 0;
END_RULE; -- approval_requires_approval_person_organization
(*
```

Formal propositions:

WR1: For each instance of approval, there shall be one or more instances of approval_person_organization.

5.2.3.14 approval_role_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The approval_role_constraint rule assures that each approval_role has a role that is 'authorizer'.

EXPRESS specification:

```
*)
RULE approval_role_constraint FOR
    (approval_role);
WHERE
```

```

WR1: SIZEOF (QUERY (apr <* approval_role |
    NOT (apr\approval_role.role = 'authorizer')
    )) = 0;
END_RULE; -- approval_role_constraint
(*)

```

Formal propositions:

WR1: For each instance of approval_role, the role shall be 'authorizer'.

5.2.3.15 approvals_are_assigned

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The approvals_are_assigned rule assures that each approval is referenced by at least one approval_assignment as assigned_approval.

EXPRESS specification:

```

*)
RULE approvals_are_assigned FOR
    (approval, approval_assignment);
WHERE

    WR1: SIZEOF (QUERY (app <* approval |
        NOT (SIZEOF (QUERY (aa <* approval_assignment |
            app := aa.assigned_approval )) >= 1 ))) = 0;
END_RULE; -- approvals_are_assigned
(*)

```

Formal propositions:

WR1: For each instance of approval, there shall be one or more instances of approval_assignment.

5.2.3.16 assembly_alternate_product_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The assembly_alternate_product_constraint rule constrains the base of alternate_product_relationship when it is used as an assembly alternate product.

EXPRESS specification:

```
* )
( *
RULE assembly_alternate_product_constraint FOR
(alternate_product_relationship);
END_RULE; --assembly_alternate_product_constraint
* )
( *
```

Informal propositions:

IP1: IF alternate_product_relationship.basis = 'assembly alternate product' THEN alternate_product_relationship.base shall be a product which is the related_product_definition of an assembly_component_usage whose relating_product_definition {is a physical_unit} {has a frame_of_reference of an application_context_element where application_context_element.name = 'physical design'}.

5.2.3.17 assembly_composition_relationship_unique_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The assembly_composition_relationship_unique_constraint rule constrains assembly_component_usage population members, that fill the role of ARM assembly_composition_relationship, so that the combination of ARM assembly and ARM component attributes shall be unique within the population.

EXPRESS specification:

```

*)
RULE assembly_composition_relationship_unique_constraint FOR
  ( assembly_component_usage );
LOCAL
  acr : BAG OF assembly_component_usage :=
  QUERY( acu <* assembly_component_usage |
(acu\product_definition_relationship.name = 'assembly composition') );
  pu_bag : BAG OF physical_unit := [];
  acu_bag : BAG OF assembly_component_usage;
  pass : BOOLEAN := TRUE;
  cd_bag : BAG OF component_definition;
END_LOCAL;

REPEAT i := 1 to SIZEOF(acr) by 1;
  IF EXISTS( acr[i].relating_product_definition ) THEN
    IF( (acr[i].relating_product_definition.frame_of_reference.name =
      'physical design')
  AND ( 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PHYSICAL_UNIT' IN TYPEOF(acr[i].relating_product_definition)) ) THEN
      IF ( NOT ( acr[i].relating_product_definition IN pu_bag ) ) THEN
        pu_bag := pu_bag + acr[i].relating_product_definition;
      END_IF;
    END_IF;
  END_IF;
END_REPEAT;

REPEAT i := 1 to SIZEOF(pu_bag) by 1;
  IF ( NOT pass ) THEN ESCAPE;
  END_IF;
  cd_bag := [];
  acu_bag := QUERY( acu <* acr | (acu.relating_product_definition :=:
    pu_bag[i]) );
  REPEAT j := 1 to SIZEOF(acu_bag) by 1;
    IF EXISTS( acu_bag[j].related_product_definition ) THEN
      IF ( 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
        'COMPONENT_DEFINITION' IN
        TYPEOF(acu_bag[j].related_product_definition) ) THEN
        IF ( acu_bag[j].related_product_definition IN cd_bag ) THEN
          pass := FALSE;
          ESCAPE;
        ELSE
          cd_bag := cd_bag + acu_bag[j].related_product_definition;
        END_IF;
      END_IF;
    END_IF;
  END_REPEAT;
END_REPEAT;
WHERE

```

```

    WR1: pass;
END_RULE; -- assembly_composition_relationship_unique_constraint
( *
```

Formal propositions:

WR1: Every instance of `assembly_component_usage` with a name of 'assembly composition' must have a unique combination of `related_product_definition` and `relating_product_definition` attributes.

5.2.3.18 assembly_module_usage_view_connector_relationship_unique_constraint

The `assembly_module_usage_view_connector_relationship_unique_constraint` rule constrains `assembly_module_usage_view_connector_relationship` population members, that fill the role of ARM `assembly_module_usage_view_connector_relationship`, so that the combination of ARM `externally_visible_partial_reference_designation` and ARM `associating_usage` attributes shall be unique within the population.

EXPRESS specification:

```

*)
RULE assembly_module_usage_view_connector_relationship_unique_constraint FOR
  ( assembly_module_usage_view_connector_relationship );

    END_REPEAT;
    WHERE

    WR1: pass;
END_RULE; -- assembly_module_usage_view_connector_relationship_-
-- unique_constraint
( *
```

Formal propositions:

WR1: Every instance of `assembly_module_usage_view_connector_relationship` must have a unique combination of `physical_unit` entity and `descriptive_representation_item` description attribute where the `physical_unit` is related to the `assembly_module_usage_view_connector_relationship` by a `property_definition_representation` and the `descriptive_representation_item` has a name of 'partial reference designation' and is related to the `assembly_module_usage_view_connector_relationship` by a `representation_relationship` with a name of 'reference designation assignment'.

5.2.3.19 assembly_requirement_allocation_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `assembly_requirement_allocation_constraint` rule constrains the related and relating `shape_aspect` or `product_definition` when the `shape_aspect_relationship` or the `product_definition_relationship` is being used as an assembly requirement.

EXPRESS specification:

```
* )
( *
RULE assembly_requirement_allocation_constraint FOR
( shape_aspect_relationship,
  product_definition_relationship );
END_RULE; -- assembly_requirement_allocation_constraint
* )
( *
```

Informal propositions:

IP1: IF `shape_aspect_relationship.name` = 'assembly requirement allocation' the `related_shape_aspect` must be a (`component_terminal`) (`component_interface_terminal`) (`component_shape_aspect` whose description is ('component feature') ('component termination passage interface terminal') ('land interface terminal') ('non functional land interface terminal') ('printed connector component interface terminal')) or it shall be an `assembly_joint`.

IP2: IF `shape_aspect_relationship.name` = 'assembly requirement allocation' the `relating_shape_aspect` shall have a {`of_shape` with a `property_definition` with a definition that is a `product_definition` with a `frame_of_reference` that is a `application_context_element` with a name of 'assembly requirement'} and a definition for a `property_definition` that is a `requirements_property`.

IP3: IF `product_definition_relationship.name` = 'assembly requirement allocation' the `related_product_definition` shall be a `component_definition`.

IP4: IF `product_definition_relationship.name = 'assembly requirement allocation'` the `relating_product_definition` shall have a `{frame_of_reference}` with a `that` is a `application_context_element` with a name of `'assembly requirement'` and a definition for a `property_definition` that is a `requirements_property`.

5.2.3.20 `assembly_separation_requirement_allocation_constraint`

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `assembly_separation_requirement_allocation_constraint` rule constrains the `related_shape_aspect` of a `shape_aspect_relationship` when it is being used as an assembly separation requirement.

EXPRESS specification:

```
*)
(*
RULE assembly_separation_requirement_allocation_constraint FOR
( shape_aspect_relationship );
END_RULE; -- assembly_separation_requirement_allocation_constraint
*)
(*
```

Informal propositions:

IP1: IF `shape_aspect_relationship.name = 'assembly separation requirement'` the `related_shape_aspect` shall be a `(component_terminal)` `(component_interface_terminal)` `(component_shape_aspect` whose description is `('component feature')` `('component termination passage interface terminal')` `('land interface terminal')` `('non functional land interface terminal')` `('printed connector component interface terminal')`) or the `related_shape_aspect` shall be an `assembly_joint`.

5.2.3.21 `bare_die_unique_constraint`

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `bare_die_unique_constraint` rule constrains the `bare_die`, `externally_defined_bare_die` and `library_defined_bare_die` population members, that fill the role of ARM `bare_die`, so the combination of ARM `implemented_function` and ARM `used_package` shall be unique within the population.

EXPRESS specification:

```

*)
RULE bare_die_unique_constraint FOR
  ( bare_die, externally_defined_bare_die, library_defined_bare_die );
LOCAL
  bd : BAG OF physical_unit := QUERY( r <* bare_die |
(r.frame_of_reference.name = 'physical design usage' ) );

'PRODUCT_DEFINITION_RELATIONSHIP.RELATED_PRODUCT_DEFINITION' ) |
( (pdr\product_definition_relationship.name = 'implemented function') AND
(pdr.relating_product_definition.frame_of_reference.name =
'functional design usage')
AND ( 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
'FUNCTIONAL_UNIT' IN TYPEOF(pdr.relating_product_definition)) ) );
  REPEAT j := 1 to SIZEOF(pdr_bag) by 1;
    IF EXISTS( pdr_bag[j].relating_product_definition ) THEN
      IF( NOT( pdr_bag[j].relating_product_definition IN fu_bag ) ) THEN
        fu_bag := fu_bag + pdr_bag[j].relating_product_definition;
      END_IF;
    END_IF;
  END_REPEAT;
END_REPEAT;

REPEAT i := 1 to SIZEOF(fu_bag) by 1;
  IF ( NOT pass ) THEN ESCAPE;
  END_IF;
  pu_bag := QUERY( r <* pu | (SIZEOF(QUERY(pdr <* USEDIN( fu_bag[i],
'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
'PRODUCT_DEFINITION_RELATIONSHIP.RELATING_PRODUCT_DEFINITION' ) |
((pdr\product_definition_relationship.name = 'implemented function')AND
(pdr.related_product_definition :=: r)) ))>0 ) );
  pd_bag := [];
  REPEAT j := 1 to SIZEOF(pu_bag) by 1;
    IF ( NOT pass ) THEN ESCAPE;

```

```

    END_IF;
    ut_bag := QUERY( pd <* USEDIN( pu_bag[j],
'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
'PROPERTY_DEFINITION.DEFINITION' ) | (pd\property_definition.name = 'unit technology') );
    REPEAT k := 1 to SIZEOF(ut_bag) by 1;
        IF EXISTS( ut_bag[k] ) THEN
            IF ( ut_bag[k] IN pd_bag ) THEN
                pass := FALSE;
                ESCAPE;
            ELSE
                pd_bag := pd_bag + ut_bag[k];
            END_IF;
        END_IF;
    END_REPEAT;
END_REPEAT;
END_REPEAT;
WHERE

    WR1: pass;
END_RULE; -- bare_die_unique_constraint
( *
```

Formal propositions:

WR1: Every instance of bare_die, externally_defined_bare_die and library_defined_bare_die must have a unique combination of functional_unit entity related by an 'implemented function' product_definition_relationship and a property_definition entity with a name of 'unit technology' whose definition attribute points to the bare_die, externally_defined_bare_die and library_defined_bare_die.

5.2.3.22 bevel_edge_feature_shape_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The bevel_edge_feature_shape_constraint rule requires maximum and minimum bevel width and bevel angles to be assigned to a shape_representation when it is being used as a bevel edge feature shape.

EXPRESS specification:

```

*)
( *
RULE bevel_edge_feature_shape_constraint FOR ( shape_representation );
END_RULE; -- bevel_edge_feature_shape_constraint
*)
( *
```

Informal propositions:

IP1: For each shape_representation representation.name = 'bevel edge feature shape' there shall be exactly one representation_item that is a length_measure_with_unit where representation_item.name = 'maximum bevel width' assigned to representation.items.

IP2: For each shape_representation representation.name = 'bevel edge feature shape' there shall be exactly one representation_item which is a length_measure_with_unit where representation_item.name = 'minimum bevel width' assigned to representation.items.

IP3: For each shape_representation representation.name = 'bevel edge feature shape' there shall be exactly one representation_item which is a plane_angle_measure_with_unit where representation_item.name = 'maximum bevel angle' assigned to representation.items.

IP4: For each shape_representation representation.name = 'bevel edge feature shape' there shall be exactly one representation_item which is a plane_angle_measure_with_unit where representation_item.name = 'minimum bevel angle' assigned to representation.items.

IP5: This representation shall only be a representation of the shape of an edge segment of the interconnect product.

5.2.3.23 boundary_size_characteristic_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The boundary_size_characteristic_constraint rule constrains the use of a representation when it is used as a boundary size characteristic.

EXPRESS specification:

```

*)
RULE boundary_size_characteristic_constraint FOR
  (representation);
WHERE

  WR1: SIZEOF(QUERY(rep <* representation |
    ((rep\representation.name = 'diametrical boundary size')
    OR (rep\representation.name = 'opposing boundary set size'))
    AND (NOT(SIZEOF(QUERY(lmwu <* rep.items |
      (lmwu\representation_item.name = 'tolerance value')) = 1)))) = 0;
END_RULE; -- boundary_size_characteristic_constraint
(

```

Formal propositions:

WR1: Each representation with a name of either 'diametrical boundary size' or 'opposing boundary set size' shall contain exactly one length_measure_with_unit that has a name of 'tolerance value'.

Informal propositions:

IP1: Each representation with a name of either 'diametrical boundary size' or 'opposing boundary set size' shall contain exactly one `length_measure_with_unit` that has a name of 'tolerance value', and that instance of `length_measure_with_unit` shall be the same instance of `length_measure_with_unit` as specified as the magnitude by the `physical_unit_geometric_tolerance` that is specified as the defining tolerance by the `tolerance_zone` that is specified as the zone by the `tolerance_zone_definition` that specifies the `tolerance_zone_boundary` as its boundaries and the `property_definition` of which has a description of 'boundary zone definition with specified size' and is represented by the instance of representation with a name of either 'diametrical boundary size' or 'opposing boundary set size'.

5.2.3.24 boundary_zone_definition_with_specified_size_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `boundary_zone_definition_with_specified_size_constraint` rule constrains the use of a `property_definition` when it is used as a boundary zone definition with specified size.

EXPRESS specification:

```

*)
( *
RULE boundary_zone_definition_with_specified_size_constraint FOR
  (property_definition);
END_RULE; -- boundary_zone_definition_with_specified_size_constraint
*)
( *

```

Informal propositions:

IP1: Each instance of `property_definition` that has a description of 'boundary zone definition with specified size' shall be a `property_definition` of a `tolerance_zone_boundary`.

IP2: Each instance of `property_definition` that has a description of 'boundary zone definition with specified size' shall have exactly one representation with a name of either 'diametrical boundary size' or 'opposing boundary set size'.

5.2.3.25 bus_structural_definition_unique_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `bus_structural_definition_unique_constraint` rule constrains the `product.name` population members to satisfy the uniqueness requirement of the ARM application object `Bus_structural_definition`.

EXPRESS specification:

```

*)

RULE bus_structural_definition_unique_constraint FOR
(bus_structural_definition, product_definition_formation, product);

LOCAL
    pass : BOOLEAN := TRUE;
    name_bag : BAG OF STRING := [];
END_LOCAL;

REPEAT i := 1 to SIZEOF(bus_structural_definition) by 1;
    IF EXISTS( bus_structural_definition[i].formation.of_product.name ) THEN
        IF (bus_structural_definition[i].formation.of_product.name IN
            name_bag) THEN

            pass := FALSE;
            ESCAPE;

    )) = 0;
END_RULE; -- cartesian_coordinate_system_constraint
(*

```

Formal propositions:

WR1: For each instance of `global_unit_assigned_context` implementing the arm `Cartesian_coordinate_system`, the set of units shall contain a maximum of 3 elements.

WR2: For each instance of `global_unit_assigned_context` implementing the arm `Cartesian_coordinate_system`, exactly one element of the set of units shall be a `length_unit`, exactly one element of the set of units shall be a `plane_angle_unit` where the unit is either radian or degree, and no more than one element of the set of units shall be a `solid_angle_unit`.

WR3: Each `geometric_representation_context` implementing the arm `Cartesian_coordinate_system`, the `coordinate_space_dimension` shall have a value of 2 or 3.

WR4: For each `global_uncertainty_assigned_context` implementing the arm `Cartesian_coordinate_system`, exactly one element of the set of uncertainty shall be a `length_measure_with_unit`.

5.2.3.27 cartesian_transformation_operator_2d_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `cartesian_transformation_operator_2d_constraint` rule requires the units of a `global_unit_assigned_context` to at least include a `length_unit` and a `plane_angle_unit` and a scale greater than zero.

EXPRESS specification:

```
*)  
RULE cartesian_transformation_operator_2d_constraint FOR  
      (cartesian_transformation_operator_2d);  
WHERE  
  
      WR1: SIZEOF(QUERY ( cto2 <* cartesian_transformation_operator_2d | NOT(  
        EXISTS(cto2.axis1) AND EXISTS(cto2.axis2)  
        AND (cto2.scale > 0.0 )))) = 0;  
END_RULE; -- cartesian_transformation_operator_2d_constraint  
(*
```

Formal propositions:

WR1: Axis1 and axis2 shall exist and the scale value shall be greater than 0.0.

5.2.3.28 centre_of_symmetry_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The centre_of_symmetry_constraint rule constrains the use of a centre_of_symmetry when it is used as a centre of symmetry.

EXPRESS specification:

```
*)  
(*  
RULE centre_of_symmetry_constraint FOR  
      (centre_of_symmetry);  
END_RULE; -- centre_of_symmetry_constraint  
*)  
(*
```

Informal propositions:

IP1: Each centre_of_symmetry shall have description of either 'axis', 'plane', or 'point'.

5.2.3.29 certification_requires_date_or_date_and_time

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The certification_requires_date_or_date_and_time rule assures that each certification has an associated applied_date_assignment or an applied_date_and_time_assignment.

EXPRESS specification:

```

*)
RULE certification_requires_date_or_date_and_time FOR
  (certification, applied_date_and_time_assignment,
   applied_date_assignment);
WHERE

  WR1: SIZEOF (QUERY (cert <* certification |
    NOT ((SIZEOF (QUERY (adata <* applied_date_and_time_assignment |
      cert IN adata.items )) = 1 ) OR
      (SIZEOF (QUERY (ada <* applied_date_assignment |
        cert IN ada.items )) = 1 )))) = 0;
END_RULE; -- certification_requires_date_or_date_and_time
( *

```

Formal propositions:

WR1: For each instance of certification, exactly one instance of applied_date_and_time_assignment or exactly one instance of applied_date_assignment shall contain the instance of certification in its set of items.

5.2.3.30 certification_unique_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The certification_unique_constraint rule constrains the certification.name population members to satisfy the uniqueness requirement of the ARM application object Certification.

EXPRESS specification:

```

*)

RULE certification_unique_constraint FOR (certification);

LOCAL
  r : BAG OF certification := QUERY (r <* certification | TRUE);
  pass : BOOLEAN := TRUE;
  name_bag : BAG OF string := [];
END_LOCAL;

    THEN pass := FALSE;
    END_IF;

```

```

END_REPEAT;

WHERE

    WR1: pass;
END_RULE; -- via_template_terminal_unique_constraint
( *

```

Formal propositions:

WR1: No more than one instance of `characterized_product_category` shall relate a specific `product_category.name` to a specific document through `applied_document_reference`.

NOTE The same label may be used for different `characterized_product_category` when different documents are referenced. This is the mechanism that permits category names to be isolated in the different contexts established by different dictionaries.

5.2.3.35 `component_external_reference_constraint`

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `component_external_reference_constraint` rule constrains the use of a representation when it is used as a component external reference.

EXPRESS specification:

```

*)
RULE component_external_reference_constraint FOR
    (representation);
WHERE

    WR1: SIZEOF( QUERY( rep <* representation | (rep\representation.name =
        'component external reference') AND
        (SIZEOF( QUERY( dri <* rep.items | NOT(
            ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
            'DESCRIPTIVE_REPRESENTATION_ITEM' IN TYPEOF(dri)) AND
            (dri\representation_item.name = 'design owner')))) = 1)))=0;

    WR2: SIZEOF(QUERY (rep <* representation |
        (rep\representation.name = 'component external reference') AND
        (SIZEOF (QUERY (dri <* rep.items |
            NOT(('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
            'DESCRIPTIVE_REPRESENTATION_ITEM' IN TYPEOF(dri)) AND
            (dri\representation_item.name = 'part number')))) = 1)))=0;

```

```

WR3: sizeof(query (rep <* representation |
  (rep\representation.name = 'component external reference') AND
  (sizeof (query (dri <* rep.items |
    NOT(('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'DESCRIPTIVE_REPRESENTATION_ITEM' IN typeof(dri)) AND
    (dri\representation_item.name = 'revision code'))))) = 1)))=0;

WR4: sizeof(query (rep <* representation |
  (rep\representation.name = 'component external reference') AND
  (sizeof (query (dri <* rep.items |
    NOT(('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'DESCRIPTIVE_REPRESENTATION_ITEM' IN typeof(dri)) AND
    (dri\representation_item.name = 'product definition id'))))) = 1)))=0;

WR5: sizeof(query (rep <* representation |
  (rep\representation.name = 'component external reference') AND
  (sizeof (query (dri <* rep.items |
    NOT(('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'DESCRIPTIVE_REPRESENTATION_ITEM' IN typeof(dri)) AND
    (dri\representation_item.name = 'reference designation'))))) = 1)))=0;
END_RULE; -- component_external_reference_constraint
( *

```

Formal propositions:

WR1: Each representation with a name of 'component external reference' shall contain a descriptive_representation_item with a name of 'design owner'.

WR2: Each representation with a name of 'component external reference' shall contain a descriptive_representation_item with a name of 'part number'.

WR3: Each representation with a name of 'component external reference' shall contain a descriptive_representation_item with a name of 'revision code'.

WR4: Each representation with a name of 'component external reference' shall contain a descriptive_representation_item with a name of 'product definition id'.

WR5: Each representation with a name of 'component external reference' shall contain a descriptive_representation_item with a name of 'reference designation'.

5.2.3.36 component_feature_external_reference_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The component_feature_external_reference_constraint rule constrains the use of a descriptive_representation_item when it is used as a component feature external reference.

EXPRESS specification:

```

*)
( *
RULE component_feature_external_reference_constraint FOR
  (descriptive_representation_item);
END_RULE; -- component_feature_external_reference_constraint
*)
( *

```

Informal propositions:

IP1: Each descriptive_representation_item with a name of 'component feature external reference' shall be a member of items for a representation with a name of 'component external reference'.

IP2: For each descriptive_representation_item with a name of 'component feature external reference' the combination of the its description and the representation with a name of 'component external reference' of which it is a member of items shall be unique.

5.2.3.37 component_feature_external_reference_unique_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The component_feature_external_reference_unique_constraint rule constrains the property_definition_-representation population members, that fill the role of ARM component_feature_external_reference, so that the combination of ARM name and ARM associated_component attributes shall be unique within the population.

EXPRESS specification:

```

*)
RULE component_feature_external_reference_unique_constraint FOR
  ( descriptive_representation_item );
LOCAL
  cfer : BAG OF descriptive_representation_item :=
    QUERY( dri <* descriptive_representation_item
| (dri\representation_item.name = 'component feature external reference') );
  desc_bag : BAG OF STRING := [];
  dri_bag : BAG OF descriptive_representation_item;
  rep_bag : BAG OF representation;
  pass : BOOLEAN := TRUE;
  r_bag : BAG OF representation;
END_LOCAL;

REPEAT i := 1 to SIZEOF(cfer) by 1;
  IF EXISTS( cfer[i]\descriptive_representation_item.description ) THEN
    IF ( NOT ( cfer[i]\descriptive_representation_item.description IN desc_bag )) THEN
      desc_bag := desc_bag + cfer[i]\descriptive_representation_item.description;
    END_IF;
  END_IF;
END_REPEAT;

REPEAT i := 1 to SIZEOF(desc_bag) by 1;
  IF ( NOT pass ) THEN ESCAPE;
  END_IF;
  r_bag := [];
  dri_bag := QUERY( dri <* cfer | (dri\descriptive_representation_item.description = desc_
REPEAT j := 1 to SIZEOF(dri_bag) by 1;
  IF ( NOT pass ) THEN ESCAPE;
  END_IF;
  rep_bag := QUERY( r <* USEDIN( dri_bag[j],
'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
'REPRESENTATION.ITEMS' ) | (r\representation.name = 'component external reference' ) );
  REPEAT k := 1 to SIZEOF(rep_bag) by 1;
    IF EXISTS( rep_bag[k] ) THEN
      IF ( rep_bag[k] IN r_bag ) THEN
        pass := FALSE;
        ESCAPE;
      ELSE
        r_bag := r_bag + rep_bag[k];
      END_IF;
    END_IF;
  END_REPEAT;
END_REPEAT;
END_REPEAT;
WHERE

```

```

    WR1: pass;
END_RULE; -- component_feature_external_reference_unique_constraint
( *

```

Formal propositions:

WR1: Every instance of `descriptive_representation_item` with a name of 'component feature external reference' must have a unique combination of description attributes and representation entities where the representations have the `descriptive_representation_items` in their `items` attribute and the representations have a name of 'component external reference'.

5.2.3.38 **component_feature_to_layout_feature_relationship_constraint**

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `component_feature_to_layout_feature_relationship_constraint` rule constrains the related and relating `shape_aspect` of a `shape_aspect_relationship` that is used as a component feature to layout feature.

EXPRESS specification:

```

*)
RULE component_feature_to_layout_feature_relationship_constraint FOR
( shape_aspect_relationship );
WHERE

    WR1: SIZEOF(QUERY(sar <* shape_aspect_relationship |
        (sar\shape_aspect_relationship.name = 'component feature to layout feature')
        AND NOT(SIZEOF(
            [ 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.'
            + 'COMPONENT_SHAPE_ASPECT',
            'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.'
            + 'COMPONENT_INTERFACE_TERMINAL',
            'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.'
            + 'COMPONENT_TERMINAL' ]
            * TYPEOF(sar.relying_shape_aspect))) > 0)
        )) = 0;

```

```

WR2: SIZEOF(QUERY(sar <* shape_aspect_relationship |
    (sar\shape_aspect_relationship.name = 'component feature to layout feature')
    AND NOT(SIZEOF(
        [ 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.'
        + 'COMPONENT_SHAPE_ASPECT',
        'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.'
        + 'STRATUM_FEATURE']
        * TYPEOF(sar.related_shape_aspect))) > 0)
    )) = 0;
END_RULE; -- component_feature_to_layout_feature_relationship_constraint
(*

```

Formal propositions:

WR1: IF shape_aspect_relationship.name = 'component feature to layout feature' the shape_aspect_relationship.relate_shape_aspect is a (component_shape_aspect) (component_interface_terminal) (component_terminal).

WR2: IF shape_aspect_relationship.name = 'component feature to layout feature' the shape_aspect_relationship.related_shape_aspect is a (component_shape_aspect) (stratum_feature).

5.2.3.39 component_feature_unique_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The component_feature_unique_constraint rule constrains the component_terminal and component_interface_terminal population members, that fill the role of ARM component_feature, so that the combination of ARM definition and ARM associated_component attributes shall be unique within the population.

EXPRESS specification:

```

*)
RULE component_feature_unique_constraint FOR
  ( component_terminal, component_interface_terminal );
LOCAL
  ct : BAG OF shape_aspect :=
    QUERY( ct <* component_terminal | (ct\shape_aspect.description IN
['assembly module component terminal',

    END_IF;
  END_IF;
END_REPEAT;
END_REPEAT;
END_REPEAT;
WHERE

  WR1: pass;
END_RULE; -- component_feature_unique_constraint
(*)

```

Formal propositions:

WR1: Every instance of component_terminal with a name of 'assembly module component terminal', 'bare die component terminal', 'interconnect component join terminal', 'interconnect module component terminal', 'interconnect module component stratum based terminal', 'minimally defined component terminal' or 'packaged component join terminal' and component_interface_terminal with a name of either 'interconnect component interface terminal' or 'packaged connector component interface terminal' must have a unique combination of of_shape.definition attributes and shape_aspect entities where the shape_aspects are related to the component_terminals and component_interface_terminals by a shape_aspect_relationship with a name of 'instantiated feature'.

5.2.3.40 component_mounting_clearance_relationship_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The component_mounting_clearance_relationship_constraint rule constrain the items of a representation and constrain the usage of that representation when it is used as a component mounting clearance.

EXPRESS specification:

```

*)
RULE component_mounting_clearance_relationship_constraint FOR
( representation );
WHERE

```

```

WR1: SIZEOF(QUERY(rep <* representation |
  (rep\representation.name = 'mounting clearance')
  AND (SIZEOF(QUERY(lmwu <* rep.items |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.'
    + 'LENGTH_MEASURE_WITH_UNIT' IN TYPEOF(lmwu))
    AND (lmwu\representation_item.name = 'minimum height')
  )) = 0))) = 0;
END_RULE; -- component_mounting_clearance_relationship_constraint
( *

```

Formal propositions:

WR1: IF the representation name = 'mounting clearance' it shall contain one item that is a length_measure_with_unit that has a name = 'minimum height'.

Informal propositions:

IP1: IF the representation name = 'mounting clearance' there shall be one property_definition_representation for which the representation is the used_representation and the definition for the property_definition_representation is a property_definition with a name equal to 'component mounting property', and the shape_aspect for the property_definition is a component_feature_relationship.

5.2.3.41 component_overlap_relationship_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The component_overlap_relationship_constraint rule constrain the items of a representation and constrain the usage of that representation when it is used as a component overlap clearance.

EXPRESS specification:

```

*)
RULE component_overlap_relationship_constraint FOR
( representation );
WHERE

WR1: SIZEOF(QUERY(rep <* representation |
  (rep\representation.name = 'overlap clearance')
  AND (SIZEOF(QUERY(lmwu <* rep.items |
    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.'
    + 'LENGTH_MEASURE_WITH_UNIT' IN TYPEOF(lmwu))
    AND (lmwu\representation_item.name = 'minimum clearance')
  )) = 0))) = 0;
END_RULE; -- component_overlap_relationship_constraint
( *

```

Formal propositions:

WR1: IF the representation name = 'overlap clearance' it shall contain one item that is a length_measure_with_unit that has a name = 'minimum clearance'.

Informal propositions:

IP1: IF the representation name = 'overlap clearance' there shall be two property_definition_representations for which the representation is the used_representation and the definition for the property_definition_representations is a property_definition with a name equal to 'component mounting property' and one of the property_definitions has a description = 'current component' and the second property_definition has a description = 'previously placed component'.

IP2: IF the representation name = 'overlap clearance' the two property_definition_representations for which the representation is the used_representation must have two product_definition_relationships which point to one product_definition.

5.2.3.42 component_part_2d_geometric_representation_relationship_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The component_part_2d_geometric_representation_relationship_constraint rule constrains the rep_1 and rep_2 attributes of a shape_representation_relationship when it is used to relate a component planar shape and the defining part planar shape.

EXPRESS specification:

```

*)
RULE component_part_2d_geometric_representation_relationship_constraint FOR
( shape_representation_relationship );
LOCAL
  rr: SET OF representation_relationship :=
    QUERY ( srr <* shape_representation_relationship |
            srr\representation_relationship.name =
              'component part planar shape' );
  pass: BOOLEAN := TRUE;
END_LOCAL;
REPEAT i := 1 to SIZEOF(rr) by 1;
IF ((rr[i].rep_1.context_of_items.coordinate_space_dimension) <>
    (rr[i].rep_2.context_of_items.coordinate_space_dimension))
THEN
  pass := FALSE;
END_IF;
END_REPEAT;
WHERE

```

```

WR1: pass;
END_RULE; -- component_part_2d_geometric_-
          -- representation_relationship_constraint
( *

```

Formal propositions:

WR1: IF shape_representation_relationship\representation_relationship.name = 'component part planar shape' the representation_relationship.rep_1 shall have the same dimensionality as representation_relationship.rep_2.

Informal propositions:

IP1: IF shape_representation_relationship\representation_relationship.name = 'component part planar shape' the representation_relationship.rep_1 shall be a shape_representation with name = 'planar projected shape' that is the used_representation of a property_definition_representation where property_definition_representation references an instance through the definition attribute that (is a physical_unit) (is a part_template_definition whose shape is defined by a characterized_object).

IP2: IF shape_representation_relationship\representation_relationship.name = 'component part planar shape' the representation_relationship.rep_2 shall be a shape_representation with name = 'planar projected shape' that is the used_representation of a property_definition_representation where ({property_definition_representation definition is a product_definition_shape} {property_definition_representation references a product_definition that is a component_definition}) (property_definition_representation references a shape_aspect that is a component_shape_aspect).

IP3: The combination of representation_relationship.rep_1, representation_relationship.rep_2 shall be unique within a population of representation_relationship with a representation_relationship name = 'component part planar shape'.

5.2.3.43 component_part_3d_geometric_representation_relationship_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The component_part_3d_geometric_representation_relationship_constraint rule constrains the rep_1 and rep_2 attributes of a shape_representation_relationship when it is used to relate a component 3d shape and the defining part 3d shape.

EXPRESS specification:

```

*)
RULE component_part_3d_geometric_representation_relationship_constraint FOR
( shape_representation_relationship );
LOCAL
  rr: SET OF representation_relationship :=
    QUERY ( srr <* shape_representation_relationship |
      srr\representation_relationship.name = 'component part 3d shape' );
  pass: BOOLEAN := TRUE;
END_LOCAL;
REPEAT i := 1 to SIZEOF(rr) by 1;
IF ((rr[i].rep_1.context_of_items.coordinate_space_dimension) <>
    (rr[i].rep_2.context_of_items.coordinate_space_dimension))
THEN
  pass := FALSE;
END_IF;
END_REPEAT;
WHERE

  WR1: pass;
END_RULE; -- component_part_3d_geometric_representation_-
          -- relationship_constraint
( *

```

Formal propositions:

WR1: IF shape_representation_relationship\representation_relationship.name = 'component part 3d shape' the representation_relationship.rep_1 shall have the same context dimensionality as representation_relationship.rep_2.

Informal propositions:

IP1: IF shape_representation_relationship\representation_relationship.name = 'component part 3d shape' the representation_relationship.rep_1 shall be a shape_representation with name = '3d bound volume shape' or 'part template non planar 2d shape' that is the used_representation of a property_definition_representation where property_definition_representation.definition.definition (is a physical_unit) (is a part_template_definition whose shape is defined by a characterized_object).

IP2: IF shape_representation_relationship\representation_relationship.name = 'component part 3d shape' the representation_relationship.rep_2 shall be a shape_representation with name = '3d bound volume shape' that is the used_representation of a property_definition_representation where ({property_definition_representation definition is a product_definition_shape} {property_definition_representation definition references a component_definition}) (property_definition_representation definition references a component_shape_aspect).

IP3: The combination of representation_relationship.rep1 and representation_relationship.rep2 shall be unique.

5.2.3.44 component_placement_restriction_assignment_constraint

The component_placement_restriction_assignment_constraint rule constrains a representation that is used as a component placement restriction assignment. This rule implements WR1 of the Application object.

EXPRESS specification:

```

*)
RULE component_placement_restriction_assignment_constraint FOR
( representation );
LOCAL
  cpra : SET OF representation := QUERY( cpra <* representation |
    cpra.name = 'component placement restriction assignment');

    )
    ) = 1 ) THEN pass2 := FALSE;
    END_IF;
END_REPEAT;
WHERE

    WR1: pass1;

    WR2: pass2;
END_RULE; -- component_placement_restriction_assignment_constraint
( *
```

Formal propositions:

WR1: IF representation_relationship.name = 'component placement restriction assignment area' the shape_aspect at the end of the path starting with rep_2 through used_representation of a property_definition_representation and ending with property_definition_representation.definition.definition shall be a mounting_restriction_area.

IF representation_relationship.name = 'component placement restriction assignment volume' the shape_aspect at the end of the path starting with rep_2 through used_representation of a property_definition_representation and ending with property_definition_representation.definition.definition shall be a mounting_restriction_volume.

At least one of area or volume shall exist.

WR2: IF representation.name = 'component placement restriction assignment' the representation shall be referenced as a used_representation by a property_definition_representation that shall have a definition that shall be a grouped_requirements_property which has a name = 'item restricted requirements property'.

5.2.3.45**component_terminal_to_assembly_module_interface_terminal_assignment_constraint**

The component_terminal_to_assembly_module_interface_terminal_assignment_constraint rule constrains the related_shape_aspect of a shape_aspect_relationship when it is used as a component terminal to assembly module terminal assignment.

EXPRESS specification:

```
* )
( *
RULE component_terminal_to_assembly_module_interface_terminal_assignment_constraint
  FOR ( shape_aspect_relationship );
END_RULE; -- component_terminal_to_assembly_module_interface_terminal_
          -- assignment_constraint
* )
( *
```

Informal propositions:

IP1: IF {shape_aspect_relationship.name = 'component feature to physical usage view assignment'} {shape_aspect_relationship.relate_shape_aspect is an assembly_module_interface_terminal where the product_definition referenced through the path assembly_module_interface_terminal to it's supertype shape_aspect.of_shape.definition.name = 'assembly module'} the shape_aspect_relationship.related_shape_aspect shall be a (component_terminal where component_terminal\shape_aspect.description = ('assembly module component terminal') ('interconnect module component terminal')) (component_interface_terminal)

5.2.3.46 component_terminal_to_assembly_module_interface_terminal_assignment_unique_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The component_terminal_to_assembly_module_interface_terminal_assignment_unique_constraint rule constrains the shape_aspect_relationship population members, that fill the role of ARM component_terminal_to_assembly_module_interface_terminal_assignment, so that the ARM usage_view_terminal attribute shall be unique within the population.

EXPRESS specification:

```

*)
RULE
component_terminal_to_assembly_module_interface_terminal_assignment_unique_constraint
FOR

Informal propositions:

IP1: Each shape_aspect with {name = 'conductive interconnect element with user defined single transition'} {of_shape.definition is a component_definition} shall be the relating_shape_aspect of one shape_aspect_relationship where {shape_aspect_relationship.name = 'end terminus'} {shape_aspect_relationship.related_shape_aspect is a layer_connection_point}.

IP2: Each shape_aspect with {name = 'conductive interconnect element with user defined single transition'} {of_shape.definition is a component_definition} shall be the relating_shape_aspect of one shape_aspect_relationship where {shape_aspect_relationship.name = 'start terminus'} {shape_aspect_relationship.related_shape_aspect is a layer_connection_point}.

IP3: Each shape_aspect with {name = 'conductive interconnect element with user defined single transition'} {of_shape.definition is a component_definition} shall participate as a definition of exactly two property_definition_representations whose used_representation is a shape_representation and one shape_representation.items is a curve.

IP4: Each shape_aspect with {name = 'conductive interconnect element with user defined single transition'} {of_shape.definition is a component_definition} shall be the related_shape_aspect of one shape_aspect_relationship where {shape_aspect_relationship.name = 'instantiated feature'} {shape_aspect_relationship.description = 'end feature'} {shape_aspect_relationship.relying_shape_aspect is a part_template_definition whose description = 'trace template'}.

IP5: Each shape_aspect with {name = 'conductive interconnect element with user defined single transition'} {of_shape.definition is a component_definition} shall be the related_shape_aspect of one shape_aspect_relationship where {shape_aspect_relationship.name = 'instantiated feature'} {shape_aspect_relationship.description = 'start feature'} {shape_aspect_relationship.relying_shape_aspect is a part_template_definition whose description = 'trace template'}.

5.2.3.62 configuration_controlled_message_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The configuration_controlled_message_constraint rule constrains the value of the description of a descriptive_representation_item when it is used as an approval date, manufacturers code, part number, or revision identifier.

EXPRESS specification:

```
* )
( *
RULE configuration_controlled_message_constraint FOR
( descriptive_representation_item );
END_RULE; -- configuration_controlled_message_constraint
* )
( *
```

Informal propositions:

IP1: IF descriptive_representation_item\representation_item.name = 'approval date' the descriptive_representation_item shall be an item in a representation that is referenced in an approval_assignment and the value of SELF.description shall be the concatenation of the value of date.year_component + ',' + the value of calendar_date.month_component + ',' + the value of calendar_date.day_component + ',' + the value of local_time.hour_component + ',' + the value of local_time.minute_component + ',' + the value of local_time.second_component + ',' + the value of coordinated_universal_time_offset.hour_offset + ',' + the value of coordinated_universal_time_offset.minute_offset + ',' + the value of coordinated_universal_time_offset.sense.

IP2: IF descriptive_representation_item\representative_item.name = 'manufacturers code' the descriptive_representation_item shall be an item in a representation that is referenced in an organization_assignment and the value of SELF.description shall be identical to that of organization.id.

IP3: IF descriptive_representative_item\representative_item.name = 'part number' the descriptive_representation_item shall be an item in a representation that is referenced in a property_definition_representation which has a definition.definition.formation that is a product_definition_formation and the value of SELF.description shall be identical to that of product_definition_formation.of_product.id.

IP4: IF descriptive_representative_item\representative_item.name = 'revision identifier' the descriptive_representation_item shall be an item in a representation which is referenced in a property_definition_representation that has a definition.definition.formation that is a product_definition_formation and the value of SELF.description shall be identical to that of product_definition_formation.id.

5.2.3.63 configuration_item_requires_person_organization

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The configuration_item_requires_person_organization rule assures that each configuration_item has an applied_person_and_organization_assignment or an applied_organization_assignment.

EXPRESS specification:

```
*)
RULE configuration_item_requires_person_organization FOR
  (configuration_item,
   applied_person_and_organization_assignment,
   applied_organization_assignment);
WHERE

  WR1: SIZEOF (QUERY (ci <* configuration_item |
    NOT ((SIZEOF (QUERY (apaoa <*
      applied_person_and_organization_assignment |
      ci IN apaoa.items )) = 1 ) OR
      (SIZEOF (QUERY (aoa <*
        applied_organization_assignment |
        ci IN aoa.items )) = 1 )))) = 0;
END_RULE; -- configuration_item_requires_person_organization
(*
```

Formal propositions:

WR1: For each instance of configuration_item, there shall be exactly one instance of applied_person_and_organization_assignment that contains the instance of configuration_item in its set of items.

5.2.3.64 conical_tolerance_zone_boundary_and_surface_relationship_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `conical_tolerance_zone_boundary_and_surface_relationship_constraint` rule constrains the use of a `shape_aspect_relationship` when it is used as a conical tolerance zone boundary and surface relationship.

EXPRESS specification:

```

*)
( *
RULE conical_tolerance_zone_boundary_and_surface_relationship_constraint FOR
  (shape_aspect_relationship);
END_RULE; -- conical_tolerance_zone_boundary_and_surface_relationship -
          -- constraint
*)
( *

```

Informal propositions:

IP1: Each `shape_aspect_relationship` with a name of 'conical tolerance zone boundary and surface' shall have a `related_shape_aspect` that is either a `part_template_definition` or is on the boundary of the shape of the product.

IP2: Each `shape_aspect_relationship` with a name of 'conical tolerance zone boundary and surface' shall have a `relating_shape_aspect` that is a `tolerance_zone_boundary` with a description of 'conical'.

IP3: Each `shape_aspect_relationship` with a name of 'conical tolerance zone boundary and surface' shall have exactly one `property_definition` with a description of 'conical tolerance zone boundary size'.

5.2.3.65 `conical_tolerance_zone_boundary_definition_constraint`

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `conical_tolerance_zone_boundary_definition_constraint` rule constrains the use of a `property_definition` when it is used as a conical tolerance zone boundary definition.

EXPRESS specification:

```

*)
( *
RULE conical_tolerance_zone_boundary_definition_constraint FOR
  (property_definition);
END_RULE; -- conical_tolerance_zone_boundary_definition_constraint
*)
( *

```

Informal propositions:

IP1: Each instance of `property_definition` that has a description of 'conical tolerance zone boundary' shall be a `property_definition` of a `tolerance_zone_boundary` that has a description of 'conical'.

IP2: Each instance of `property_definition` that has a description of 'conical tolerance zone boundary' shall relate to exactly two `property_definition` that have a description of 'conical tolerance zone boundary size' to specify its 'boundary size'.

IP3: Each instance of `property_definition` that has a description of 'conical tolerance zone boundary' shall relate to exactly two `property_definition` that have a description of 'conical tolerance zone boundary size' to specify its 'boundary size' and each of the `property_definition` that have a description of 'conical tolerance zone boundary size' shall be related as a 'defined boundary' to exactly one `physical_unit_geometric_tolerance`, and each of these `physical_unit_geometric_tolerance` shall have the same name.

IP4: Each instance of `property_definition` that has a description of 'conical tolerance zone boundary' shall relate to exactly two `property_definition` that have a description of 'conical tolerance zone boundary size' to specify its 'boundary size' and each of the `property_definition` that have a description of 'conical tolerance zone boundary size' shall be related as a 'defined boundary' to exactly one `physical_unit_geometric_tolerance`, and each of these `physical_unit_geometric_tolerance` shall relate to the same `property_definition` with a description of either 'datum system property with material conditions' or 'datum system property without material conditions' to specify their 'referenced datum system definition'.

IP5: Each instance of `property_definition` that has a description of 'conical tolerance zone boundary' shall relate to exactly two `property_definition` that have a description of 'conical tolerance zone boundary size' to specify its 'boundary size' and each of the `property_definition` that have a description of 'conical tolerance zone boundary size' shall be related as a 'defined boundary' to exactly one `physical_unit_geometric_tolerance`, and each of these `physical_unit_geometric_tolerance` either shall not be modified_`geometric_tolerance` or shall have the same modifier.

IP6: Each instance of `property_definition` that has a description of 'conical tolerance zone boundary' shall relate to exactly two `property_definition` that have a description of 'conical tolerance zone boundary size' to specify its 'boundary size' and each of the `property_definition` that have a description of 'conical tolerance zone boundary size' shall be related as a 'defined boundary' to exactly one `physical_unit_geometric_tolerance`, and each of these `physical_unit_geometric_tolerance` shall specify the same instance of `shape_aspect` as their `toleranced_shape_aspect`, and that `shape_aspect` shall either be a `centre_of_symmetry` with a description of 'axis', or a `composite_shape_aspect` in which all the 'composing' `shape_aspects` are of type `centre_of_symmetry` and have a description of 'axis'.

IP7: Each instance of `property_definition` that has a description of 'conical tolerance zone boundary' shall be a `property_definition` of a `tolerance_zone_boundary` that has a description of 'conical' and that `tolerance_zone_boundary` shall be specified as the first of the boundaries of a `tolerance_zone_definition` that specifies as its zone a `tolerance_zone` that has a description of 'conical'.

5.2.3.66 conical_tolerance_zone_boundary_diametrical_size_characteristic_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `conical_tolerance_zone_boundary_diametrical_size_characteristic_constraint` rule constrains the use of a `property_definition` when it is used as a conical tolerance zone boundary diametrical size characteristic.

EXPRESS specification:

```

*)
( *
RULE
conical_tolerance_zone_boundary_diametrical_size_characteristic_constraint
FOR (property_definition);
END_RULE; -- conical_tolerance_zone_boundary_diametrical_size_-
          -- characteristic_constraint
*)
( *

```

Informal propositions:

IP1: Each instance of `property_definition` that has a description of 'conical tolerance zone boundary size' shall be a `property_definition` of a `shape_aspect_relationship` that has a name of 'conical tolerance zone boundary and surface'.

IP2: Each instance of `property_definition` that has a description of 'conical tolerance zone boundary size' shall be related as a 'boundary size' to exactly one `property_definition` that has a description of 'conical tolerance zone boundary'.

IP3: Each instance of `property_definition` that has a description of 'conical tolerance zone boundary size' shall have a representation that contains exactly one `length_measure_with_unit` that has a name of 'conical tolerance zone boundary value', and that instance of `length_measure_with_unit` shall be the same instance of `length_measure_with_unit` as specified as the magnitude by the `physical_unit_geometric_tolerance` that relates to the instance of `property_definition` that has a description of 'conical tolerance zone boundary size' to specify its 'defined boundary'.

IP4: Each instance of `property_definition` that has a description of 'conical tolerance zone boundary size' shall be related as a 'defined boundary' to exactly one `physical_unit_geometric_tolerance`, and that `physical_unit_geometric_tolerance` shall be either a `position_tolerance`, a `parallelism_tolerance`, a `perpendicularity_tolerance`, or an `angularity_tolerance`.

IP5: Each instance of `property_definition` that has a description of 'conical tolerance zone boundary size' shall be related as a 'boundary size' to exactly one `property_definition` that has a description of 'conical tolerance zone boundary' and that `property_definition` shall be applied to the same instance of `tolerance_zone_boundary` as specified as the `relating_shape_aspect` by the `shape_aspect_relationship` that has a name of 'conical tolerance zone boundary and surface' and to which the instance of `property_definition` is applied.

5.2.3.67 conical_tolerance_zone_definition_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `conical_tolerance_zone_definition_constraint` rule constrains the use of a `tolerance_zone_definition` when it is used as a conical tolerance zone definition.

EXPRESS specification:

```
* )
( *
RULE conical_tolerance_zone_definition_constraint FOR
  (tolerance_zone_definition);
END_RULE; -- conical_tolerance_zone_definition_constraint
* )
( *
```

Informal propositions:

IP1: Each `tolerance_zone_definition` that specifies a `tolerance_zone` with a description of 'conical' shall have exactly one boundary that is a `tolerance_zone_boundary` with a description of 'conical' and that `tolerance_zone_boundary` shall have exactly one `property_definition` that has a description of 'conical tolerance zone boundary'.

IP2: Each `tolerance_zone_definition` that specifies a `tolerance_zone` with a description of 'conical' as its zone, shall have that `tolerance_zone` specify exactly two `physical_unit_geometric_tolerance`, as its defining tolerance, and these `physical_unit_geometric_tolerance` shall be the same `physical_unit_geometric_tolerance` that relate to the `property_definitions` with a description of 'conical tolerance zone boundary size' that are applied to `shape_aspect_relationships` with names of 'conical tolerance zone boundary' and 'surface' that specify the `tolerance_zone_boundary`, as the `relating_shape_aspect`, that is specified as the boundaries of the `tolerance_zone_definition`.

5.2.3.68 connection_zone_constraint

The `connection_zone_constraint` rule constrains the use of `shape_aspect` and `shape_representation` when implementing the ARM concepts of `Connection_zone` and the associated colour.

EXPRESS specification:

```
* )
RULE connection_zone_constraint FOR ( shape_aspect, representation );
WHERE
```

```

WR1: sizeof( query( sa <* shape_aspect |
    (sa\shape_aspect.description = 'connection zone') AND NOT
    (sizeof (usedin (sa, '')) >= 1))) = 0;

WR2: sizeof( query( sa <* shape_aspect |
    (sa\shape_aspect.description = 'connection zone') AND
    NOT(sizeof( query( sar <* usedin(sa,
    'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'SHAPE_ASPECT_RELATIONSHIP.RELATED_SHAPE_ASPECT') |
    (sar\shape_aspect_relationship.name IN [
    'connection',
    'minimum attachment region size',
    'maximum attachment region size',
    'external connection area',
    'external connection zone',
    'internal connection zone',
    'mounting area',
    'terminal connection zone'
    ]))) >= 1))) = 0;
END_RULE; -- connection_zone_constraint
( *

```

Formal propositions:

WR1: Each instance of shape_aspect with a description of 'connection zone' shall be referenced at least once.

WR2: Each instance of shape_aspect with a description of 'connection zone' shall be referenced by at least one shape_aspect_relationship with a name of 'connection', 'minimum attachment region size', 'maximum attachment region size', 'external connection area', 'external connection zone', 'internal connection zone', 'mounting area', or 'terminal connection zone'.

Informal propositions:

IP1: Each instance of shape_aspect with a description of 'connection zone' that is represented by a shape_representation that is capable of representing topological information shall be represented by a shape_representation that describes the connection zone as being a set of connected points.

EXAMPLE 1 If a manifold_surface_shape_representation were to represent a connection zone, there would only be one shell in the representation.

5.2.3.69 contract_unique_constraint

The contract_unique_constraint rule constrains the contract.name population members to satisfy the uniqueness requirement of the ARM application object Contract.

EXPRESS specification:

```
*)  
  
RULE contract_unique_constraint FOR (contract);  
  
LOCAL  
  r : BAG OF contract := QUERY (r <* contract | TRUE);  
  pass : BOOLEAN := TRUE;  
  name_bag : BAG OF string := [];  
END_LOCAL;  
  
REPEAT i := 1 to SIZEOF (r) by 1;  
  IF EXISTS( r[i]\contract.name ) THEN  
    IF (r[i]\contract.name IN name_bag) THEN  
      pass := FALSE;  
      ESCAPE;  
    ELSE  
      name_bag := name_bag + r[i]\contract.name;  
    END_IF;  
  END_IF;  
END_REPEAT;  
  
WHERE  
  WR1 : pass;  
  
END_RULE; -- contract_unique_constraint  
  
(*
```

Formal propositions:

WR1: The name shall be unique within a population of contract.

5.2.3.70 curve_extension_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The curve_extension_constraint rule limits the values that the extension for curve_style_with_extension shall be.

EXPRESS specification:

```

*)
( *
RULE curve_extension_constraint for ( curve_style_with_extension );
END_RULE; -- curve_extension_constraint
*)
( *

```

Informal propositions:

IP1: The allowed values for extension are: $+ 0.5 \cdot \text{width} \pm \text{delta}$, $0 \pm \text{delta}$, $- 0.5 \cdot \text{width} \pm \text{delta}$.
 where delta is uncertainty_measure_with_unit, assigned by user.

5.2.3.71 curve_style_font_and_scaling_unique_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The curve_style_font_and_scaling_unique_constraint rule constrains the curve_style_font_and_scaling name attribute in a population to satisfy the uniqueness requirement of the ARM application object Curve_style_font_and_scaling.

EXPRESS specification:

*)

```

RULE curve_style_font_and_scaling_unique_constraint
  FOR (curve_style_font_and_scaling);

LOCAL
  r : BAG OF curve_style_font_and_scaling :=
    QUERY (r <* curve_style_font_and_scaling | TRUE);
  pass : BOOLEAN := TRUE;
  name_bag : BAG OF string := [];
END_LOCAL;

REPEAT i := 1 to SIZEOF (r) by 1;
  IF EXISTS( r[i]\curve_style_font_and_scaling.name ) THEN
    IF (r[i]\curve_style_font_and_scaling.name IN name_bag) THEN
      pass := FALSE;
      ESCAPE;
    ELSE
      name_bag := name_bag + r[i]\curve_style_font_and_scaling.name;
    END_IF;
  END_IF;
END_REPEAT;

WHERE
WR1 : pass;

END_RULE; -- curve_style_font_and_scaling_unique_constraint

( *
```

Formal propositions:

WR1: The name shall be unique within a population of curve_style_font_and_scaling.

5.2.3.72 curve_style_requires_length_measure_with_unit

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The curve_style_requires_length_measure_with_unit rule constrains the entity pointed to by the curve_width attribute of a curve_style.

EXPRESS specification:

```

*)
RULE curve_style_requires_length_measure_with_unit FOR ( curve_style );
WHERE

    WR1: SIZEOF(QUERY(cs <* curve_style |
        NOT('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.'
            + 'LENGTH_MEASURE_WITH_UNIT' IN TYPEOF(cs))
        )) = 0;
END_RULE; -- curve_style_requires_length_measure_with_unit
( *

```

Formal propositions:

WR1: A curve_style.curve_width shall be a length_measure_with_unit.

5.2.3.73 curve_style_unique_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The curve_style_unique_constraint rule constrains the representation population members, that fill the role of ARM curve_style, so that the ARM name shall be unique within the population.

EXPRESS specification:

```

*)
RULE curve_style_unique_constraint FOR
  ( representation );
LOCAL
  cs : BAG OF representation := QUERY( r <* representation |
  ((r\representation.name = 'curve style parameters') AND (r.context_of_items\representation.
  'curve style parametric context')) );
  pass : BOOLEAN := TRUE;
  desc_bag : BAG OF STRING := [];
END_LOCAL;

REPEAT i := 1 to SIZEOF(cs) by 1;
  IF ( NOT pass ) THEN ESCAPE;
  END_IF;
  REPEAT j := 1 to SIZEOF(cs[i].items) by 1;
    IF ( ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'DESCRIPTIVE_REPRESENTATION_ITEM' IN TYPEOF(cs[i].items[j])) AND
    (cs[i].items[j]\representation_item.name = 'curve style name') ) THEN
      IF EXISTS( cs[i].items[j]\descriptive_representation_item.description ) THEN
        IF ( cs[i].items[j]\descriptive_representation_item.description IN desc_bag ) THEN
          pass := FALSE;
          ESCAPE;
        ELSE
          desc_bag := desc_bag + cs[i].items[j]\descriptive_representation_item.description;
        END_IF;
      END_IF;
    END_IF;
  END_REPEAT;
END_REPEAT;
WHERE

  WR1: pass;
END_RULE; -- curve_style_unique_constraint
(

```

Formal propositions:

WR1: Every instance of representation with a name of 'curve style parameters' must have a unique descriptive_representation_item.description attribute where the descriptive_representation_item has a name of 'curve style name' and is a member of the representation's set of items.

5.2.3.74 date_and_time_require_minute_and_second

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `date_and_time_require_minute_and_second` rule constrains `date_and_time` to include a minute and second component.

EXPRESS specification:

```
*)
RULE date_and_time_require_minute_and_second FOR ( date_and_time );
WHERE

    WR1: SIZEOF(QUERY(dat <* date_and_time |
                      NOT(Exists(dat.time_component.minute_component)))) = 0;

    WR2: SIZEOF(QUERY(dat <* date_and_time |
                      NOT(Exists(dat.time_component.second_component)))) = 0;
END_RULE; -- date_and_time_require_minute_and_second
(*
```

Formal propositions:

WR1: A `date_and_time` shall have a `time_component.minute_component`.

WR2: A `date_and_time` shall have a `time_component.second_component`.

5.2.3.75 **date_constraint**

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `date_constraint` rule specifies that all instances of `date` shall have a `year_number` that has 4 digits.

EXPRESS specification:

```
*)
RULE date_constraint FOR (date);
WHERE

    WR1: SIZEOF (QUERY (d <* date |
                       d.year_component < 1856)) = 0;
END_RULE; -- date_constraint
(*
```

Formal propositions:

WR1: For each instance of `date`, the `year_component` shall be greater than or equal to 1856.

5.2.3.76 datum_axis_and_tolerance_zone_orienting_relationship_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The datum_axis_and_tolerance_zone_orienting_relationship_constraint rule constrains the use of a shape_aspect_relationship when it is used as a datum axis and tolerance zone orienting relationship.

EXPRESS specification:

```
*)
(*
RULE datum_axis_and_tolerance_zone_orienting_relationship_constraint FOR
  (shape_aspect_relationship);
END_RULE; -- datum_axis_and_tolerance_zone_orienting_relationship_constraint
*)
(*
```

Informal propositions:

IP1: Each shape_aspect_relationship with a name of 'datum axis and tolerance zone' shall have a related_shape_aspect that is a physical_unit_datum with a description of 'axis'.

IP2: Each shape_aspect_relationship with a name of 'datum axis and tolerance zone' shall have a relating_shape_aspect that is a tolerance_zone.

IP3: Each shape_aspect_relationship with a name of 'datum axis and tolerance zone' shall have exactly one property_definition with a description of 'datum axis related orientation'.

5.2.3.77 datum_axis_related_orientation_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The datum_axis_related_orientation_constraint rule constrains the use of a property_definition when it is used as a datum axis related orientation.

EXPRESS specification:

```
*)
(*
RULE datum_axis_related_orientation_constraint FOR
  (property_definition);
END_RULE; -- datum_axis_related_orientation_constraint
*)
(*
```

Informal propositions:

IP1: Each instance of property_definition that has a description of 'datum axis related orientation' shall be a property_definition of a shape_aspect_relationship that has a name of 'datum axis and tolerance zone'.

IP2: Each instance of property_definition that has a description of 'datum axis related orientation' shall have a name of either 'centred on arc' or 'centred on radial'.

IP3: Each instance of property_definition that has a description of 'datum axis related orientation' shall be related as a 'zone orientation' to exactly one property_definition that has a description of 'tolerance zone orientation'.

5.2.3.78 datum_based_direction_vector_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The datum_based_direction_vector_constraint rule constrains the use of a property_definition when it is used as a datum based direction vector.

EXPRESS specification:

```
*)
(*
RULE datum_based_direction_vector_constraint FOR
  (property_definition);
END_RULE; -- datum_based_direction_vector_constraint
*)
(*
```

Informal propositions:

IP1: Each instance of property_definition that has a description of 'datum direction property' shall be a property_definition of a physical_unit_datum that has a description of 'plane'.

IP2: Each instance of property_definition that has a description of 'datum direction property' shall have a representation that contains exactly one axis1_placement that has a name of 'orientation'.

IP3: Each instance of property_definition that has a description of 'datum direction property' shall have a name of either 'positive direction vector' or 'negative direction vector'.

IP4: Each instance of property_definition that has a description of 'datum direction property' shall be related as a 'element direction vector' to at least one property_definition that has a description of 'direction element'.

5.2.3.79 datum_based_length_measure_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The datum_based_length_measure_constraint rule constrain the usage of a representation and the items of a representation when it is used as maximum component height or clearance.

EXPRESS specification:

```
*)
(*
RULE datum_based_length_measure_constraint FOR ( representation );
END_RULE; -- datum_based_length_measure_constraint
*)
(*
```

Informal propositions:

IP1: Each representation with a name = ('maximum positive component height') ('maximum negative component height') ('maximum mounting clearance') ('minimum mounting clearance') shall have one items that is a length_measure_with_unit.name = 'measure'.

IP2: Each representation with a name = ('maximum positive component height') ('maximum negative component height') ('maximum mounting clearance') ('minimum mounting clearance') shall have one items that is a direction.name = 'measure orientation' or that is a descriptive_representation_item.name = 'measure orientation'.

IP3: Each representation with a name = ('maximum positive component height') ('maximum negative component height') ('maximum mounting clearance') ('minimum mounting clearance') shall be the used_representation of one property_definition_representation that has a definition.definition that is a datum.

5.2.3.80 datum_based_vector_orientation_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The datum_based_vector_orientation_constraint rule constrains the use of a property_definition when it is used as a datum based vector orientation.

EXPRESS specification:

```

*)
( *
RULE datum_based_vector_orientation_constraint FOR
  (property_definition);
END_RULE; -- datum_based_vector_orientation_constraint
*)
( *

```

Informal propositions:

IP1: Each instance of property_definition that has a description of 'datum based vector orientation' shall be a property_definition of a shape_aspect that has a description of 'vector'.

IP2: Each instance of property_definition that has a description of 'datum based vector orientation' shall relate to exactly two property_definition that have a description of 'direction element' to specify its 'direction component'.

IP3: Each instance of property_definition that has a description of 'datum based vector orientation' either shall be related as a 'zone orientation' to at least one property_definition that has a description of 'tolerance zone orientation', shall be related as a 'measurement orientation' to at least one property_definition that has a description of 'dimensional location property' and that is a property_definition of a dimensional_location_with_direction, or shall be related as a 'measurement orientation' to at least one property_definition that has a description of 'dimensional location property' and that is a property_definition of an angular_dimension_with_orientation.

IP4: Each instance of property_definition that has a description of 'datum based vector orientation' shall relate to exactly two property_definition that have a description of 'direction element' to specify its 'direction component' and each of these shall be a property_definition of instances of shape_aspect_relationship that have a name of 'datum plane and half plane relationship' and each of these shape_aspect_relationship shall specify a different physical_unit_datum that has a description of 'plane' as their related_shape_aspect.

IP5: Each instance of property_definition that has a description of 'datum based vector orientation' shall relate to exactly two property_definition that have a description of 'direction element' to specify its 'direction component' and each of these shall be a property_definition of instances of shape_aspect_relationship that have a name of 'datum plane and half plane relationship' and each of these shape_aspect_relationship shall specify a different physical_unit_datum that has a description of 'plane' as their related_shape_aspect and these physical_unit_datum shall be related to the same datum_reference_frame as 'reference plane'.

IP6: Each instance of `property_definition` that has a description of 'direction element' shall relate to exactly one `property_definition` that has a description of 'datum direction property' to specify its 'half datum plane direction vector', and this `property_definition` shall be applied to a `physical_unit_datum` that has a description of 'plane'.

Additionally, each instance of `property_definition` that has a description of 'direction element' shall relate to exactly one `property_definition` that has a description of 'datum direction property' to specify its 'element direction vector', and this `property_definition` shall be applied to a `physical_unit_datum` that has a description of 'plane'.

Finally, each instance of `property_definition` that has a description of 'direction element' shall be a `property_definition` of a `shape_aspect_relationship` that has a name of 'datum plane and half plane relationship' and that `shape_aspect_relationship` shall have a `related_shape_aspect` that is of type `physical_unit_datum` and has a description of 'plane'.

None of these `physical_unit_datum` shall be the same.

IP7: Each instance of `property_definition` that has a description of 'direction element' shall relate to exactly one `property_definition` that has a description of 'datum direction property' to specify its 'half datum plane direction vector', this `property_definition` shall be a `property_definition` of a `physical_unit_datum` that has a description of 'plane'.

Additionally, each instance of `property_definition` that has a description of 'direction element' shall relate to exactly one `property_definition` that has a description of 'datum direction property' to specify its 'element direction vector', this `property_definition` shall be a `property_definition` of a `physical_unit_datum` that has a description of 'plane'.

Finally, each instance of `property_definition` that has a description of 'direction element' shall be a `property_definition` of a `shape_aspect_relationship` that has a name of 'datum plane and half plane relationship' and that `shape_aspect_relationship` shall have a `related_shape_aspect` of type `physical_unit_datum` that has a description of 'plane'.

These `physical_unit_datum` shall be related to the same `datum_reference_frame` as 'reference plane'.

5.2.3.81 datum_feature_material_condition_property_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `datum_feature_material_condition_property_constraint` rule constrains the use of a `property_definition` when it is used as a datum feature material condition property.

EXPRESS specification:

```

*)
( *
RULE datum_feature_material_condition_property_constraint FOR
  (property_definition);
END_RULE; -- datum_feature_material_condition_property_constraint
*)
( *

```

Informal propositions:

IP1: Each instance of `property_definition` that has a description of 'datum feature material condition property' shall be a `property_definition` of a `shape_aspect_relationship` that has a name of 'datum feature usage in datum system'.

IP2: Each instance of `property_definition` that has a description of 'datum feature material condition property' shall be related as a 'applied material condition property' to exactly one `property_definition` that has a description of 'datum system property with material conditions'.

IP3: Each instance of `property_definition` that has a description of 'datum feature material condition property' shall have a name of either 'least material requirement' or 'maximum material principle'.

IP4: Each instance of `property_definition` that has a description of 'datum feature material condition property' shall be related as an 'applied material condition property' to exactly one `property_definition` that has a description of 'datum system property with material conditions' and that `property_definition` shall be applied to the same instance of `datum_system` as specified as the `relating_shape_aspect` by the `shape_aspect_relationship` that has a name of 'datum feature usage in datum system' and to which the instance of `property_definition` is applied.

5.2.3.82 datum_feature_usage_in_common_datum_relationship_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `datum_feature_usage_in_common_datum_relationship_constraint` rule constrains the use of a `shape_aspect_relationship` when it is used as a datum feature usage in common datum relationship.

EXPRESS specification:

```

*)
( *
RULE datum_feature_usage_in_common_datum_relationship_constraint FOR
  (shape_aspect_relationship);
END_RULE; -- datum_feature_usage_in_common_datum_relationship_constraint
*)
( *

```

Informal propositions:

IP1: Each `shape_aspect_relationship` with a name of 'datum feature usage in common datum' shall have a relating `shape_aspect` that is a `physical_unit_datum` that has a name of 'common datum'.

5.2.3.83 datum_feature_usage_in_datum_relationship_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `datum_feature_usage_in_datum_relationship_constraint` rule constrains the use of a `shape_aspect_relationship` when it is used as a datum feature usage in datum relationship.

EXPRESS specification:

```

*)
( *
RULE datum_feature_usage_in_datum_relationship_constraint FOR
  (shape_aspect_relationship);
END_RULE; -- datum_feature_usage_in_datum_relationship_constraint
*)
( *
```

Informal propositions:

IP1: Each `shape_aspect_relationship` with a name of either 'datum feature usage in common datum' or 'datum feature usage in single datum' shall have a related `shape_aspect` that is a `physical_unit_datum_feature`.

IP2: Each `shape_aspect_relationship` with a name of either 'datum feature usage in common datum' or 'datum feature usage in single datum' shall have a relating `shape_aspect` that is a `physical_unit_datum`.

IP3: Each `shape_aspect_relationship` with a name of either 'datum feature usage in common datum' or 'datum feature usage in single datum' shall specify a unique combination of relating `shape_aspect` and related `shape_aspect`.

5.2.3.84 datum_feature_usage_in_datum_relationship_unique_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `datum_feature_usage_in_datum_relationship_unique_constraint` rule constrains `shape_aspect_relationship` population members, that fill the role of ARM `datum_feature_usage_in_datum_relationship`, so that the combination of ARM relating `shape_element` and ARM related `shape_element` attributes shall be unique within the population.

EXPRESS specification:

```

*)
RULE datum_feature_usage_in_datum_relationship_unique_constraint FOR
  ( shape_aspect_relationship );
LOCAL
  dfuidr : BAG OF shape_aspect_relationship :=
    QUERY( sar <* shape_aspect_relationship |
      ((sar\shape_aspect_relationship.name = 'datum feature usage in common datum') OR
      (sar\shape_aspect_relationship.name = 'datum feature usage in single datum')) );
  pudf_bag : BAG OF physical_unit_datum_feature := [];
  sar_bag : BAG OF shape_aspect_relationship;
  pass : BOOLEAN := TRUE;
  pud_bag : BAG OF physical_unit_datum;
END_LOCAL;

REPEAT i := 1 to SIZEOF(dfuidr) by 1;
  IF EXISTS( dfuidr[i].relating_shape_aspect ) THEN
    IF( 'ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PHYSICAL_UNIT_DATUM' IN TYPEOF(dfuidr[i].relating_shape_aspect) ) THEN
      IF ( NOT ( dfuidr[i].relating_shape_aspect IN pud_bag ) ) THEN
        pud_bag := pud_bag + dfuidr[i].relating_shape_aspect;
      END_IF;
    END_IF;
  END_IF;
END_REPEAT;

REPEAT i := 1 to SIZEOF(pud_bag) by 1;
  IF ( NOT pass ) THEN ESCAPE;
  END_IF;
  pudf_bag := [];
  sar_bag :=

    ('ELECTRONIC_ASSEMBLY_INTERCONNECT_AND_PACKAGING_DESIGN.' +
    'PHYSICAL_UNIT_DATUM_FEATURE' IN TYPEOF(sar.related_shape_aspect))) );
  REPEAT j := 1 to SIZEOF(sar_bag) by 1;
    IF EXISTS( sar_bag[j].related_shape_aspect ) THEN
      IF ( sar_bag[j].related_shape_aspect IN pudf_bag ) THEN
        pass := FALSE;
        ESCAPE;
      ELSE
        pudf_bag := pudf_bag + sar_bag[j].related_shape_aspect;
      END_IF;
    END_IF;
  END_REPEAT;
END_REPEAT;
WHERE

  WR1: pass;
END_RULE; -- datum_feature_usage_in_datum_relationship_unique_constraint
( *

```

Formal propositions:

WR1: Every instance of `shape_aspect_relationship` with a description of either 'datum feature usage in common datum' or 'datum feature usage in single datum' must have a unique combination of `relating_shape_aspect` and `related_shape_aspect` attributes.

5.2.3.85 datum_feature_usage_in_datum_system_relationship_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `datum_feature_usage_in_datum_system_relationship_constraint` rule constrains the use of a `shape_aspect_relationship` when it is used as a datum feature usage in datum system relationship.

EXPRESS specification:

```

*)
( *
RULE datum_feature_usage_in_datum_system_relationship_constraint FOR
  (shape_aspect_relationship);
END_RULE; -- datum_feature_usage_in_datum_system_relationship_constraint
*)
( *
```

Informal propositions:

IP1: Each `shape_aspect_relationship` with a name of 'datum feature usage in datum system' shall have a `related_shape_aspect` that is a `physical_unit_datum_feature`.

IP2: Each `shape_aspect_relationship` with a name of 'datum feature usage in datum system' shall have a `relating_shape_aspect` that is a `datum_system`.

IP3: Each `shape_aspect_relationship` with a name of 'datum feature usage in datum system' shall have exactly one `property_definition` with a description of 'datum feature material condition property'.

IP4: Each `shape_aspect_relationship` with a name of 'datum feature usage in datum system' shall have a `related_shape_aspect` that is a `physical_unit_datum_feature` that is in the set of `physical_unit_datum_feature` that are related as either 'datum feature usage in common datum' or 'datum feature usage in single datum' to the `physical_unit_datum` that are related as the 'datum usage in datum system' to the `datum_system` that is the `relating_shape_aspect`.

5.2.3.86 datum_feature_usage_in_single_datum_relationship_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `datum_feature_usage_in_single_datum_relationship_constraint` rule constrains the use of a `shape_aspect_relationship` when it is used as a datum feature usage in single datum relationship.

EXPRESS specification:

```

*)
( *
RULE datum_feature_usage_in_single_datum_relationship_constraint FOR
  (shape_aspect_relationship);
END_RULE; -- datum_feature_usage_in_single_datum_relationship_constraint
*)
( *

```

Informal propositions:

IP1: Each shape_aspect_relationship with a name of 'datum feature usage in single datum' shall have a relating_shape_aspect that is a physical_unit_datum that has a name of 'single datum'.

5.2.3.87 datum_precedence_assignment_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The datum_precedence_assignment_constraint rule constrains the use of a property_definition when it is used as a datum precedence assignment.

EXPRESS specification:

```

*)
( *
RULE datum_precedence_assignment_constraint FOR
  (property_definition);
END_RULE; -- datum_precedence_assignment_constraint
*)
( *

```

Informal propositions:

IP1: Each instance of property_definition that has a description of 'datum precedence assignment' shall be a property_definition of a shape_aspect_relationship that has a name of 'datum usage in datum system'.

IP2: Each instance of property_definition that has a description of 'datum precedence assignment' shall be related as a 'assigned datum precedence' to exactly one property_definition that has a description of either 'datum system property with material conditions' or 'datum system property without material conditions'.

IP3: Each instance of `property_definition` that has a description of 'datum precedence assignment' shall have a name of either 'primary', 'secondary', or 'tertiary'.

IP4: Each instance of `property_definition` that has a description of 'datum precedence assignment' shall be related as an 'assigned datum precedence' to exactly one `property_definition` that has a description of either 'datum system property with material conditions' or 'datum system property without material conditions' and that `property_definition` shall be applied to the same instance of `datum_system` as specified as the `relating_shape_aspect` by the `shape_aspect_relationship` that has a name of 'datum usage in datum system' and to which the instance of `property_definition` is applied.

5.2.3.88 datum_precedence_assignment_unique_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `datum_precedence_assignment_unique_constraint` rule constrains `property_definition` population members, that fill the role of ARM `datum_precedence_assignment`, so that the combination of ARM name and ARM `datum_system_conditions_definition` shall be unique within the population.

EXPRESS specification:

```

*)
RULE datum_precedence_assignment_unique_constraint FOR

        ELSE
          pds := pds + pdr_bag[k].relating_property_definition;
        END_IF;
      END_IF;
    END_REPEAT;
  END_REPEAT;
END_REPEAT;
WHERE

```

```

    WR1: pass;
END_RULE; -- datum_precedence_assignment_unique_constraint
( *

```

Formal propositions:

WR1: Every instance of `property_definition` with a description of 'datum precedence assignment' must have a unique combination of name attribute and `property_definition` entity with a description of either 'datum system property with material conditions' or 'datum system property without material conditions' where the `property_definitions` are related by a `property_definition_relationship` with a name of 'assigned datum precedence'.

5.2.3.89 datum_system_defining_conditions_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `datum_system_defining_conditions_constraint` rule constrains the use of a `property_definition` when it is used as a datum system defining conditions.

EXPRESS specification:

```

*)
( *
RULE datum_system_defining_conditions_constraint FOR
    (property_definition);
END_RULE; -- datum_system_defining_conditions_constraint
*)
( *

```

Informal propositions:

IP1: Each instance of `property_definition` that has a description of either 'datum system property with material conditions' or 'datum system property without material conditions' shall be a `property_definition` of a `datum_system`.

IP2: Each instance of `property_definition` that has a description of either 'datum system property with material conditions' or 'datum system property without material conditions' shall relate to exactly one, two, or three `property_definition` that have a description of 'datum precedence assignment' to specify its 'assigned datum precedence'.

IP3: Each instance of `property_definition` that has a description of either 'datum system property with material conditions' or 'datum system property without material conditions' that relates, as 'assigned datum precedence', to a `property_definition` that has a description of 'datum precedence assignment' and has a name of 'tertiary' shall also relate, as 'assigned datum precedence', to a `property_definition` that has a description of 'datum precedence assignment' and has a name of 'secondary'.

IP4: Each instance of `property_definition` that has a description of either 'datum system property with material conditions' or 'datum system property without material conditions' that relates, as 'assigned datum precedence', to a `property_definition` that has a description of 'datum precedence assignment' and has a name of 'secondary' shall also relate, as 'assigned datum precedence', to a `property_definition` that has a description of 'datum precedence assignment' and has a name of 'primary'.

IP5: Each instance of `property_definition` that has a description of 'datum system property with material conditions' shall be related as a 'referenced datum system definition' to at least one `geometric_tolerance_with_specified_datum_system`.

IP6: Each instance of `property_definition` that has a description of 'datum system property without material conditions' either shall be related as a 'referenced datum system definition' to at least one `geometric_tolerance_with_specified_datum_system` or shall be related as a 'referenced datum system property' to at least one `property_definition` that has a description of 'dimensional location property' and that is a `property_definition` for a `datum_system_based_dimensional_location`.

IP7: Each instance of `property_definition` that has a description of either 'datum system property with material conditions' or 'datum system property without material conditions' shall relate to exactly one, two, or three `property_definition` that have a description of 'datum precedence assignment' to specify its 'assigned datum precedence' and those `property_definition` shall have unique names.

5.2.3.90 datum_system_defining_conditions_with_material_conditions_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `datum_system_defining_conditions_with_material_conditions_constraint` rule constrains the use of a `property_definition` when it is used as a datum system defining conditions with material conditions.

EXPRESS specification:

```
* )
( *
RULE datum_system_defining_conditions_with_material_conditions_constraint
FOR (property_definition);
END_RULE; -- datum_system_defining_conditions_with_material_-
          -- conditions_constraint
* )
( *
```

Informal propositions:

IP1: Each instance of `property_definition` that has a description of 'datum system property with material conditions' shall relate to at least one `property_definition` that has a description of 'datum feature material condition property' to specify its 'applied material condition property'.

5.2.3.91 datum_system_defining_conditions_without_material_conditions_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `datum_system_defining_conditions_without_material_conditions_constraint` rule constrains the use of a `property_definition` when it is used as a datum system defining conditions without material conditions.

EXPRESS specification:

```
* )
( *
RULE
datum_system_defining_conditions_without_material_conditions_constraint FOR
    (property_definition);
END_RULE; -- datum_system_defining_conditions_without_material_
           -- conditions_constraint
* )
( *
```

Informal propositions:

IP1: Each instance of `property_definition` that has a description of 'datum system property without material conditions' shall relate to exactly zero `property_definition` that have a description of 'datum feature material condition property' to specify its 'applied material condition property'.

5.2.3.92 datum_target_usage_in_datum_target_set_relationship_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `datum_target_usage_in_datum_target_set_relationship_constraint` rule constrains the use of a `shape_aspect_relationship` when it is used as a datum target usage in datum target set relationship.

EXPRESS specification:

```

*)
( *
RULE datum_target_usage_in_datum_target_set_relationship_constraint FOR
  (shape_aspect_relationship);
END_RULE; -- datum_target_usage_in_datum_target_set_relationship_constraint
*)
( *

```

Informal propositions:

IP1: Each shape_aspect_relationship with a name of 'datum target usage' shall have a related_shape_aspect that is a physical_unit_datum_target.

IP2: Each shape_aspect_relationship with a name of 'datum target usage' shall have a relating_shape_aspect that is a physical_unit_datum_target_set.

IP3: Each shape_aspect_relationship with a name of 'datum target usage' shall have a description that is expressed only by digits and represents a positive integer.

IP4: Each shape_aspect_relationship with a name of 'datum target usage' shall specify a unique combination of relating_shape_aspect and related_shape_aspect.

IP5: Each shape_aspect_relationship with a name of 'datum target usage' shall specify a unique combination of relating_shape_aspect and description.

5.2.3.93 datum_target_usage_in_datum_target_set_relationship_unique_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The datum_target_usage_in_datum_target_set_relationship_unique_constraint rule constrains shape_aspect_relationship population members, that fill the role of ARM datum_target_usage_in_datum_target_set_relationship, so that the combination of ARM used_datum_target and ARM defined_datum_target attributes and that the combination of ARM datum_target_number and ARM defined_datum_target attributes shall be unique within the population.

EXPRESS specification:

Informal propositions:

IP1: Each `shape_aspect_relationship` with a name of 'datum usage in datum system' shall have a `related_shape_aspect` that is a `physical_unit_datum`, and the name of `physical_unit_datum` shall be either 'common datum' or 'single datum'

IP2: Each `shape_aspect_relationship` with a name of 'datum usage in datum system' shall have a `relating_shape_aspect` that is a `datum_system`.

IP3: Each `shape_aspect_relationship` with a name of 'datum usage in datum system' shall have exactly one `property_definition` with a description of 'datum precedence assignment'.

IP4: Each `shape_aspect_relationship` with a name of 'datum usage in datum system' shall specify a unique combination of `relating_shape_aspect` and `related_shape_aspect`.

5.2.3.95 datum_usage_in_datum_system_relationship_unique_constraint

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `datum_usage_in_datum_system_relationship_unique_constraint` rule constrains `shape_aspect_relationship` population members, that fill the role of ARM `datum_usage_in_datum_system_relationship`, so that the combination of ARM `established_datum_system` and ARM `used_datum` attributes shall be unique within the population.

EXPRESS specification:

```

*)
RULE datum_usage_in_datum_system_relationship_unique_constraint FOR
  ( shape_aspect_relationship );
LOCAL

5.2.3.99 **dependent_instantiable_action_directive**

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The `dependent_instantiable_action_directive` rule specifies that all instances of `action_directive` are dependent on the usage to define another entity.

EXPRESS specification:

```

*)
RULE dependent_instantiable_action_directive FOR (action_directive);
WHERE

  WR1: SIZEOF (QUERY (ad <* action_directive |
    NOT (SIZEOF (USEDIN (ad, '')) >= 1))) = 0;
END_RULE; -- dependent_instantiable_action_directive
(*)

```

Formal propositions:

WR1: For each instance of `action_directive`, there shall be a reference to the `action_directive` instance from an attribute of another entity.

5.2.3.100 dependent_instantiable_approval_status

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The dependent_instantiable_approval_status rule specifies that all instances of approval_status are dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_approval_status FOR (approval_status);
WHERE

WR1: SIZEOF (QUERY (ast <* approval_status |
    NOT (SIZEOF (USEDIN (ast, '')) >= 1))) = 0;
END_RULE; -- dependent_instantiable_approval_status
(*
```

Formal propositions:

WR1: For each instance of approval_status, there shall be a reference to the approval_status instance from an attribute of another entity.

5.2.3.101 dependent_instantiable_certification_type

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The dependent_instantiable_certification_type rule specifies that all instances of certification_type are dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_certification_type FOR (certification_type);
WHERE

WR1: SIZEOF (QUERY (ct <* certification_type |
    NOT (SIZEOF (USEDIN (ct, '')) >= 1))) = 0;
END_RULE; -- dependent_instantiable_certification_type
(*
```

Formal propositions:

WR1: For each instance of certification_type, there shall be a reference to the certification_type instance from an attribute of another entity.

5.2.3.102 dependent_instantiable_contract_type

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The dependent_instantiable_contract_type rule specifies that all instances of contract_type are dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_contract_type FOR (contract_type);
WHERE

    WR1: sizeof(QUERY ( ct <* contract_type |
        NOT (sizeof (USEDIN (ct, '')) >= 1))) = 0;
END_RULE; -- dependent_instantiable_contract_type
(*
```

Formal propositions:

WR1: For each instance of contract_type, there shall be a reference to the contract_type instance from an attribute of another entity.

5.2.3.103 dependent_instantiable_date

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The dependent_instantiable_date rule specifies that all instances of date are dependent on the usage to define another entity.

EXPRESS specification:

```
*)
RULE dependent_instantiable_date FOR (date);
WHERE
```

```

WR1: SIZEOF (QUERY (dt <* date |
    NOT (SIZEOF(USEDIN (dt, '')) >= 1))) = 0;
END_RULE; -- dependent_instantiable_date
( *

```

Formal propositions:

WR1: For each instance of date, there shall be a reference to the date instance from an attribute of another entity.

5.2.3.104 dependent_instantiable_date_role

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The dependent_instantiable_date_role rule specifies that all instances of date_role are dependent on the usage to define another entity.

EXPRESS specification:

```

*)
RULE dependent_instantiable_date_role FOR (date_role);
WHERE

```

```

WR1: SIZEOF (QUERY (dr <* date_role |
    NOT (SIZEOF (USEDIN (dr, '')) >= 1))) = 0;
END_RULE; -- dependent_instantiable_date_role
( *

```

Formal propositions:

WR1: For each instance of date_role, there shall be a reference to the date_role instance from an attribute of another entity.

5.2.3.105 dependent_instantiable_date_time_role

NOTE This rule may not have been updated to agree with the changes in clause 4.2.

The dependent_instantiable_date_time_role rule specifies that all instances of date_time_role are dependent on the usage to define another entity.

EXPRESS specification:

```
* )  
RULE dependent_instantiable_date_time_role FOR (date_time_role);  
WHERE  
  
    WR1: SIZEOF (QUERY (dtr <* date_time_role |

END_RULE; -- dependent_instantiable_date_time_role  
(*
```

Formal propositions:

WR1: For each instance of date_time_role, there shall be a reference to the date_time_role instance from an attribute of another entity.

6 Conformance requirements

Conformance to this part of ISO 10303 includes satisfying the requirements stated in this part, the requirements of the implementation method(s) supported, and the relevant requirements of the normative references.

An implementation shall support at least one of the following implementation methods:

- ISO 10303-21;
- ISO 10303-22.

Requirements with respect to implementation methods are specified in annex C.

The Protocol Information Conformance Statement (PICS) proforma lists the options or the combinations of options that may be included in the implementation. The PICS proforma is provided in annex D.

This Part of ISO 10303 provides for a number of options that may be supported by an implementation. These options have been grouped into the following conformance classes:

- Class 1 - Device Functional and Physical Characterization;
- Class 2 - Interconnect Technology Constraints;
- Class 3 - Assembly Technology Constraints;
- Class 4 - Assembly Functional Requirements;
- Class 5 - Assembly Physical Requirements;
- Class 6 - Interconnect Functional Requirements;
- Class 7 - Interconnect Physical Requirements;
- Class 8 - Assembly Physical Design;
- Class 9 - Interconnect Design;
- Class 10 - Interconnect Design (Microwave);
- Class 11 - Geometric Dimensioning and Tolerancing;
- Class 12 - Product Rule;
- Class 13 - Functional Decomposition;

- Class 14 - Package Functional and Physical Characterization;
- Class 15 - Geometrically Bounded Surface Model;
- Class 16 - Wireframe Model with Topology;
- Class 17 - Advanced Boundary Representation;
- Class 18 - Constructive Solid Geometry;
- Class 19 - Extruded Solid;
- Class 20 - Geometrically Bounded 2d Wireframe Model;
- Class 21 - Wireframe 2d Model with Topology;
- Class 22 - Curve 2d;
- Class 23 - Basic Curve 2d;
- Class 24 - Laminate Assembly Design ;
- Class 25 - Connection Zone Based Model Extraction;
- Class 26 - Functional Specification;
- Class 27 - Physical Unit Physical Characterization;
- Class 28 - Packaged Part White Box Model;
- Class 29 - Printed Part Functional and Physical Characterization;
- Class 30 - Open Shell Model ;
- Class 31 - Assembly Functional Interface Requirements;
- Class 32 - Assembly Physical Interface Requirements;
- Class 33 - Assembly Requirement Allocation;
- Class 34 - Interconnect Requirement Allocation;
- Class 35 - Functional Requirement Allocation;
- Class 36 - Product Requirement Allocation;

- Class 37 - Datum Difference Based Model Definition ;
- Class 38 - Datum Difference Based Characteristic;
- Class 39 - Design Management .

Conformance to this part of ISO 10303 requires conformance to one of the following:

- any combination of the conformance classes 1 through 7;
- conformance class 8;
- any combination of the conformance classes 9, 10, 24;
- conformance class 12 ;
- any combination of the conformance classes 13, 14;
- any combination of the conformance classes 24 through 29 ;
- any combination of the conformance classes 31 through 39 .

Conformance classes 15 through 23, and class 30, are shape representation conformance classes for this part of ISO 10303, and shall be used with other conformance classes of this part of ISO 10303. Conformance to a particular conformance class requires that all AIM entities, types, and associated constraints defined as part of that class be supported. Conformance to a particular conformance class requires conformance to each conformance class included in that class. All entities specified, either directly or indirectly, by required attributes of the required AIM entities shall be supported. Conformance to a particular conformance class requires that all ARM constraints for UoFs implemented by this class be supported.

Support for a particular conformance class requires support of all the options specified in this class.

NOTE The following information is provided as a list rather than table format.

6.1 Device Functional and Physical Characterization

Device Data includes following information: device black box model, package data, functional data, environmental constraints, performance data, simulation models. Formal encapsulation of external data type definitions is made for parametric data and analysis models. Pin mapping is provided to ensure consistency between device views. Shape, material, technology, tolerance on shape and on parameters, units are included. Shapes included may be categorized according to discipline (e.g. thermal analysis, vibration analysis), and analysis environment (e.g., design, assembly, end-user). Geometric Dimensioning and Tolerancing is included. The functional data includes two distinct data sets: hierarchical functional decomposition into behavioural elements embedded in a network represented at each level by a nodal formulation; collection of device terminals (e.g., connector terminals, printed circuit board interface areas, jumper ends) that implement the functionality of a network node. Configuration management information and design management information is provided. This data includes at least one geometric representation.

The class requires the implementation of the following Units of Functionality:

- altered_part;
- analytical_model;
- analytical_representation;
- assembly_module_usage_view;
- authorization;
- bare_die;
- characteristic;
- datum_based_characteristic;
- device_marking;
- document;
- end_item_identification;
- external_definition;
- functional_decomposition_with_nodal_representation;
- functional_definition_to_physical_unit_usage_view_mapping;
- functional_specification;

- functional_unit_analytical_representation;
- functional_usage_view;
- functional_usage_view_terminal_to_analytical_model_port_mapping;
- library_item;
- material_product;
- package;
- packaged_part_black_box_model;
- part_feature;
- part_feature_to_analytical_model_port_mapping;
- physical_unit;
- physical_unit_analytical_representation;
- physical_unit_shape;
- product_identification;
- shape;
- signal;
- source_control;
- styled_curve;
- styled_text.

The class requires the implementation of the following AIM entities:

- ERROR: Could not open schemas/classes/device_functional_and_physical_characterization_class.exp..

6.2 Interconnect Technology Constraints

This Data includes all information provided to the design team by fabrication vendors from which may be derived default land and passage definitions, based on the desired yield for fabrication and assembly processes. Typical Data includes minimum annular ring, maximum passage aspect ratio, minimum deposition thickness, maximum terminal size supported for through hole technology class, and other critical material processing properties. Configuration management information and design management information is provided. This data includes at least one geometric representation.

The class requires the implementation of the following Units of Functionality:

- analytical_model;
- analytical_representation;
- authorization;
- characteristic;
- document;
- end_item_identification;
- external_definition;

6.3 Assembly Technology Constraints

This Data includes all information provided to the design team by assembly vendors from which may be derived constraints on which packages may be selected, mounting arrangements to be specified, permitted mounting areas, clearances, etc. Typical bond shape for each unique assembly process is available. Extensive use of formal encapsulation of external data type definitions is made for parametric data. Configuration management information and design management information is provided. This data includes at least one geometric representation.

The class requires the implementation of the following Units of Functionality:

- analytical_model;
- analytical_representation;
- assembly_marking;
- assembly_physical_interface_requirement;

- assembly_technology;
- authorization;
- characteristic;

The class requires the implementation of the following AIM entities:

- ERROR: Could not open schemas/classes/assembly_technology_constraints_class.exp..

6.4 Assembly Functional Requirements

This Data includes all information required to specify the behaviour of the assembly, including interface definition. Explicit structural definition is provided for the functional network, including representations of usage view and design view, representations of folded and elaborated network hierarchy. This includes gate allocation information. Explicit allocation of each functional network node to the implementing component is included. Extensive use of formal encapsulation is provided for signal definition, mathematical models, etc. This data includes information required to support embedded components in an interconnect product. Configuration management information and design management information is provided.

The class requires the implementation of the following Units of Functionality:

- analytical_model;
- analytical_representation;

6.5 Assembly Physical Requirements

This Data includes all information provided to the design team that may be represented by shape data, including customer requirements, and technology selected to implement those requirements. Explicit allowed volumetric shape, external connection locations are included. Component grouping, keepout, keepin, etc is included. This data includes information required to support embedded components in an interconnect product. Configuration management information and design management information is provided. Preferred parts and packages may be specified by inclusion in design library. This data includes at least one geometric representation.

The class requires the implementation of the following Units of Functionality:

- analytical_model;
- analytical_representation;
- assembly_bill_of_material;
- assembly_component_placement_requirements;

- styled_text.

The class requires the implementation of the following AIM entities:

- ERROR: Could not open schemas/classes/assembly_physical_requirements_class.exp..

6.6 Interconnect Functional Requirements

This Data includes the device data from conformance class 1 (only the functional device information) specific to an interconnect product (e.g., pcb, substrate, flex board). The functional view of Devices which are fabricated as part of the interconnect product fabrication process (e.g., printed inductors, printed connectors, printed capacitors) are included in the functional definition. Devices which are embedded are considered to be external to the interconnect product since they are not fabricated as part of the product and their shape does not directly contribute to the shape definition of the interconnect product. Configuration management information and design management information is provided.

The class requires the implementation of the following Units of Functionality:

- analytical_model;
- analytical_representation;
- authorization;
- characteristic;
- document;
- end_item_identification;
- external_definition;
- functional_decomposition_to_interconnect_design;

6.7 Interconnect Physical Requirements

This Data includes all information related to shape and position requirements. Trace, via and other passage spacing, keepin, keepout, etc. is included. Explicit allowed volumetric shape, required connection locations, material specifications, etc. are included. Those layout items whose placement is driven by thermal considerations or electromagnetic interference may be specified. Configuration management information and design management information is provided. This data includes at least one geometric representation.

The class requires the implementation of the following Units of Functionality:

The class requires the implementation of the following AIM entities:

- ERROR: Could not open schemas/classes/interconnect_physical_requirements_class.exp..

6.8 Assembly Physical Design

This data includes all data that defines the physical relationships between the components in the assembly. This data includes all the components that exist in the assembly, and specifies those that provide physical interfaces to the next level of assembly. Several types of assembly joint may be specified. Design re-use is explicitly supported with traceability. Complete traceability back to requirements is provided. This data identifies those components that do not meet design requirements. Appropriate elements of Geometric Dimensioning and Tolerancing are provided. This data includes both design view and usage view of the assembly. Configuration management information and design management information is provided. This data includes at least one geometric representation.

The class requires the implementation of the following Units of Functionality:

- analytical_model;

6.9 Interconnect Design

This data provides functional and physical layout information sufficient to allow manufacture and test of an interconnect. Design re-use is explicitly supported with traceability. Complete traceability back to requirements is provided. Product connection requirements, shape requirements, product specifications, process specifications, material specifications including manufacturing view of stackup, Geometric Dimensioning and Tolerancing are provided. This data identifies those elements that do not meet design requirements. This data includes both design view and usage view of the interconnect product. Support for specification of signal prioritization is provided. Support for specifying the explicit network topology to be implemented is provided. Configuration management information and design management information is provided. This data includes at least one geometric representation.

The class requires the implementation of the following Units of Functionality:

- analytical_model;

6.10 Interconnect Design (Microwave)

This data is similar to Class 9, with the exception that the metallization may be considered to be microstrip or stripline, with a specified shape element of the cross-section(i.e., point, edge, cutting plane) acting as the terminal(pair, port) of the line or component. Use of formal external definitions is provided to link in models with the product definition data. Analytical model terminals may be typed as having distributed parameters. This data identifies those elements that do not meet design requirements. This data includes both design view and usage view of the interconnect product. Support for specification of signal prioritization is provided. Support for specifying the explicit network topology to be implemented is provided. Configuration management information and design management information is provided. This data includes at least one geometric representation.

The class requires the implementation of the following Units of Functionality:

- analytical_model;
- analytical_representation;
- authorization;
- characteristic;
- datum_based_characteristic;

6.11 Geometric Dimensioning and Tolerancing

This data includes the 14 geometric tolerances in ISO 1101. Angularity, circularity, circular run-out, concentricity, cylindricity, flatness, parallelism, perpendicularity, position, profile of any line, profile of any surface, straightness, symmetry, and total run-out. This data includes dimension, limits and fits. This data includes datum system definition. This data includes the tolerance zones in ISO 1101 and ASME Y14.5.(e.g., cylindrical, parallelepiped, projected, and conical). Configuration management information and design management information is provided.

The class requires the implementation of the following Units of Functionality:

- authorization;
- document;
- end_item_identification;
- geometric_dimensioning_and_tolerance;
- product_identification;
- shape.

The class requires the implementation of the following AIM entities:

- ERROR: Could not open schemas/classes/geometric_dimensioning_and_tolerancing_class.exp..

6.12 Product Rule

This data includes support for rule creation, management, assignment to product data or features, assignment to product or requirement parameters. Complete use of this capability requires use of external definition for the expressions. Configuration management information and design management information is provided.

The class requires the implementation of the following Units of Functionality:

- analytical_model;
- analytical_representation;
- authorization;
- characteristic;
- document;

- end_item_identification;
- external_definition;
- product_rule;
- source_control.

The class requires the implementation of the following AIM entities:

- absorbed_dose_measure_with_unit;
- activity_measure_with_unit;

6.13 Functional Decomposition

This data includes specification of the folded and unfolded (elaborated) hierarchical product definition in the functional view. Support is provided for a usage view and a design view. The ability to exchange data defining a functional test bench and functional specification based on signals is included. Signal definition relies on external definition, but signal properties may be represented. Support is provided for both lumped element and distributed port properties. Analysis models may be included in the exchange structure with close integration accomplished by pin mapping. Configuration management information and design management information is provided.

The class requires the implementation of the following Units of Functionality:

- analytical_model;
- analytical_representation;
- authorization;
- characteristic;
- document;
- end_item_identification;
- external_definition;
- functional_decomposition_with_nodal_representation;

6.14 Package Functional and Physical Characterization

Package Data includes following information: Case style, material identification, environmental constraints, performance data, simulation models. Formal encapsulation of external data type definitions is made for parametric data and analysis models. Terminal identification is provided to ensure consistency between 2D and 3D geometric models. Package body material is included. Terminals may have core and surface materials. Shape, material, technology, tolerance on shape and on parameters, units are included. Extensive support for orientation synchronization between enterprises is provided. Shapes included may be categorized according to discipline (e.g, thermal analysis, vibration analysis), and analysis environment (e.g., assembly, end-user). Geometric Dimensioning and Tolerancing is included. Complex packages may be treated by the design owner as an interconnect product and publish the information in package as the customer view. Formal Reference information to a defining document is provided. Configuration management information and design management information is provided. This data includes at least one geometric representation.

The class requires the implementation of the following Units of Functionality:

- altered_package;
- analytical_model;
- analytical_representation;
- authorization;
- characteristic;
- datum_based_characteristic;
- device_marking;
- document;
- end_item_identification;

- external_definition;
- library_item;

- package;
- part_feature;
- physical_unit_shape;
- planned_characteristic;
- product_identification;
- shape;
- source_control;
- styled_curve;
- styled_text.

The class requires the implementation of the following AIM entities:

- ERROR: Could not open schemas/classes/package_functional_and_physical_characterization_class.exp..

6.15 Geometrically Bounded Surface Model

This class shall not be implemented by itself.

The class requires the implementation of the following Units of Functionality:

- geometrically_bounded_2d_wireframe;
- non_topological_surface.

The class requires the implementation of the following AIM entities:

- plane_angle_measure_with_unit;
- geometric_representation_context;
- geometric_representation_item;

- geometrically_bounded_2d_wireframe_representation;
- geometrically_bounded_surface_shape_representation;
- global_uncertainty_assigned_context;
- global_unit_assigned_context;
- length_measure_with_unit;
- managed_design_object;
- measure_with_unit;
- shape_representation.

6.16 Wireframe Model With Topology

This class shall not be implemented by itself.

The class requires the implementation of the following Units of Functionality:

- wireframe_2d_model_with_topology;
- wireframe_with_topology.

The class requires the implementation of the following AIM entities:

- plane_angle_measure_with_unit;
- edge_based_2d_wireframe_shape_representation;
- edge_based_wireframe_shape_representation;
- geometric_representation_context;
- geometric_representation_item;
- global_uncertainty_assigned_context;
- global_unit_assigned_context;
- length_measure_with_unit;
- managed_design_object;

- measure_with_unit;
- shape_representation;
- shell_based_2d_wireframe_shape_representation;
- shell_based_wireframe_shape_representation.

6.17 Advanced Boundary Representation

This class shall not be implemented by itself.

The class requires the implementation of the following Units of Functionality:

- advanced_boundary_representation.

The class requires the implementation of the following AIM entities:

- advanced_brep_shape_representation;
- geometric_representation_context;
- geometric_representation_item;
- global_uncertainty_assigned_context;
- global_unit_assigned_context;
- length_measure_with_unit;
- managed_design_object;
- measure_with_unit;
- plane_angle_measure_with_unit;
- shape_representation.

6.18 Constructive Solid Geometry

This class shall not be implemented by itself.

The class requires the implementation of the following Units of Functionality:

- constructive_solid_geometry.

The class requires the implementation of the following AIM entities:

- plane_angle_measure_with_unit;
- block;
- boolean_result;
- csg_shape_representation;
- geometric_representation_context;
- geometric_representation_item;
- global_uncertainty_assigned_context;
- global_unit_assigned_context;
- length_measure_with_unit;
- managed_design_object;
- measure_with_unit;
- primitive_2d;
- right_angular_wedge;
- right_circular_cylinder;
- shape_representation.

6.19 Extruded Solid

This class shall not be implemented by itself.

The class requires the implementation of the following Units of Functionality:

- solid_of_linear_extrusion.

The class requires the implementation of the following AIM entities:

- plane_angle_measure_with_unit;
- extruded_area_solid;

- geometric_representation_context;
- geometric_representation_item;
- global_uncertainty_assigned_context;
- global_unit_assigned_context;
- length_measure_with_unit;
- managed_design_object;
- measure_with_unit;
- shape_representation.

6.20 Geometrically Bounded 2d Wireframe Model

This class shall not be implemented by itself.

The class requires the implementation of the following AIM entities:

- geometrically_bounded_2d_wireframe_representation.

6.21 Wireframe 2d Model With Topology

This class shall not be implemented by itself.

The class requires the implementation of the following AIM entities:

- edge_based_2d_wireframe_shape_representation;
- shell_based_2d_wireframe_shape_representation.

6.22 Curve 2d

This class shall not be implemented by itself.

The class requires the implementation of the following AIM entities:

- curve;
- polyline.

6.23 Basic Curve 2d

Includes Only Lines, Circle and Arc Subtype of Conic. This class shall not be implemented by itself.

The class requires the implementation of the following AIM entities:

- circle;
- composite_curve;
- line;
- polyline;
- trimmed_curve.

6.24 Laminate Assembly Design

This data provides physical assembly information sufficient to allow communication of the arrangement of laminates in an interconnect product, and required interconnections among the materials assembled. Configuration management information and design management information is provided.

The class requires the implementation of the following Units of Functionality:

- authorization;
- characteristic;
- datum_based_characteristic;
- end_item_identification;
- laminate_assembly_design;
- library_item;
- product_identification;
- sequential_laminate_assembly_design.

The class requires the implementation of the following AIM entities:

- absorbed_dose_measure_with_unit;
- activity_measure_with_unit;

- amount_of_substance_measure_with_unit;
- analytical_model;
- analytical_model_definition;
- analytical_representation;

6.25 Connection Zone Based Model Extraction

This data provides information sufficient to allow communication of more detailed connection points of analysis models than is available using feature assignment to analytical model ports. Configuration management information and design management information is provided.

The class requires the implementation of the following Units of Functionality:

- analytical_model;
- analytical_representation;
- characteristic;
- connection_zone_to_analytical_model_port_mapping;
- document;
- end_item_identification;
- external_definition.

The class requires the implementation of the following AIM entities:

- absorbed_dose_measure_with_unit;
- activity_measure_with_unit;
- amount_of_substance_measure_with_unit;

- analytical_model;
- analytical_model_definition;

6.26 Functional Specification

This data provides information sufficient to allow communication of the behavioural specification of product functions. Formal encapsulation of external data type definitions is made for parametric data and signal characterization. Configuration management information and design management information is provided.

The class requires the implementation of the following Units of Functionality:

- characteristic;
- document;
- end_item_identification;
- external_definition;
- functional_specification;
- functional_usage_view;
- product_identification;
- signal;
- source_control.

The class requires the implementation of the following AIM entities:

- absorbed_dose_measure_with_unit;
- activity_measure_with_unit;
- amount_of_substance_measure_with_unit;
- analytical_model;
- analytical_model_definition;
- analytical_representation;
- applied_group_assignment;

6.27 Physical Unit Physical Characterization

Physical Unit Physical Characterization data includes following information: Material identification, environmental constraints, performance data, simulation models. Formal encapsulation of external data type definitions is made for parametric data and analysis models. Shape, material, technology, tolerance on shape and on parameters, units are included. Shapes included may be categorized according to discipline (e.g, thermal analysis, vibration analysis), and analysis environment (e.g., assembly, end-user). Geometric Dimensioning and Tolerancing is included. A Formal Reference capability to the defining document is provided. Configuration management information and design management information is provided. This data includes at least one geometric representation.

The class requires the implementation of the following Units of Functionality:

- authorization;
- characteristic;
- datum_based_characteristic;
- device_marking;
- document;
- end_item_identification;
- external_definition;

- library_item;
- material_product;
- package;
- part_feature;
- physical_unit;
- physical_unit_shape;
- planned_characteristic;
- product_identification;
- shape;
- source_control;
- styled_curve;
- styled_text.

The class requires the implementation of the following AIM entities:

- ERROR: Could not open schemas/classes/physical_unit_physical_characterization_class.exp..

6.28 Packaged Part White Box Model

Packaged Part White Box Model Data includes following information: device model, package data, functional data, environmental constraints, performance data, simulation models. Assembly arrangement of devices included in the package to compose the packaged part is explicitly provided. Mapping of analysis model connection points to package terminals is provided. Formal encapsulation of external data type definitions is made for parametric data and analysis models. Pin mapping is provided to ensure consistency between device views. Shape, material, technology, tolerance on shape and on parameters, units are included. Shapes included may be categorized according to discipline (e.g. thermal analysis, vibration analysis), and analysis environment (e.g., design, assembly, end-user). Geometric Dimensioning and Tolerancing is included. The functional data includes two distinct data sets: hierarchical functional decomposition into behavioural elements embedded in a network represented at each level by a nodal formulation; collection of device terminals (e.g., connector terminals, printed circuit board interface areas, jumper ends) that implement the functionality of a network node. Configuration management information and design management information is provided. This data includes at least one geometric representation.

The class requires the implementation of the following Units of Functionality:

- altered_part;
- analytical_model;
- analytical_representation;
- authorization;
- characteristic;
- document;
- end_item_identification;
- external_definition;
- functional_decomposition_with_nodal_representation;
- functional_definition_to_physical_unit_usage_view_mapping;

- source_control.

The class requires the implementation of the following AIM entities:

- ERROR: Could not open schemas/classes/packaged_part_white_box_model_class.exp..

6.29 Printed Part Functional and Physical Characterization

Printed Part Data includes following information: device model, layout template data, functional data, environmental constraints, performance data, simulation models. Mapping of analysis model connection points to printed part terminals is provided. Formal encapsulation of external data type definitions is made for parametric data and analysis models. Pin mapping is provided to ensure consistency between device views. Shape, material, technology, tolerance on shape and on parameters, units are included. Shapes included may be categorized according to discipline (e.g. thermal analysis, vibration analysis), and analysis environment (e.g., design, assembly, end-user). Geometric Dimensioning and Tolerancing is included. The functional data includes two distinct data sets: hierarchical functional decomposition into behavioural elements embedded in a network represented at each level by a nodal formulation; collection of device terminals that implement the functionality of a network node. Configuration management information and design management information is provided. This data includes at least one geometric representation.

The class requires the implementation of the following Units of Functionality:

- analytical_model;
- analytical_representation;
- characteristic;
- document;
- end_item_identification;
- external_definition;
- functional_decomposition_with_nodal_representation;
- functional_definition_to_printed_part_mapping;

- styled_curve;
- styled_text.

The class requires the implementation of the following AIM entities:

- ERROR: Could not open schemas/classes/printed_part_functional_and_physical_characterization_class.exp..

6.30 Open Shell Model

This class shall not be implemented by itself.

The class requires the implementation of the following AIM entities:

- manifold_surface_shape_representation.

6.31 Assembly Functional Interface Requirements

Assembly Functional Interface Requirements includes the following information: functional interface model, signal constraints, external definition support, Product identification, functional usage view. Support for documentation is provided.

The class requires the implementation of the following Units of Functionality:

- assembly_functional_interface_requirement;
- authorization;
- characteristic;
- document;

- end_item_identification;
- external_definition;
- functional_usage_view.

The class requires the implementation of the following AIM entities:

- absorbed_dose_measure_with_unit;
- activity_measure_with_unit;
- amount_of_substance_measure_with_unit;
- analytical_model;
- analytical_model_definition;
- analytical_representation;

6.32 Assembly Physical Interface Requirements

Assembly Physical Interface Requirements includes the following information: critical component placement data, critical component placement or keepout or keepin requirements, connector placement data, mating connector placement data, geometric interface (fit) requirements to next level assembly. Supporting data including external definition, properties, product identification, documentation and authorization are included.

The class requires the implementation of the following Units of Functionality:

- assembly_component_placement_requirements;
- assembly_interface_component;
- assembly_physical_interface_requirement;
- authorization;
- characteristic;
- document;
- end_item_identification;
- external_definition.

The class requires the implementation of the following AIM entities:

- absorbed_dose_measure_with_unit;
- activity_measure_with_unit;
- amount_of_substance_measure_with_unit;
- analytical_model;
- analytical_model_definition;
- analytical_representation;
- approval;

6.33 Assembly Requirement Allocation

Assembly Requirement Allocation includes the following information: complete functional and physical interface requirements, complete capability to allocate enterprise or external agency requirements to assembly function or physical design, model based requirement description using simulation models and models with assigned parametric data. Supporting data including document, authorization, product identification, external definition, and authorization are included.

The class requires the implementation of the following Units of Functionality:

- analytical_model;
- analytical_representation;
- assembly_functional_interface_requirement;
- assembly_functional_requirement_allocation;
- assembly_physical_interface_requirement;
- assembly_physical_requirement_allocation;
- authorization;
- characteristic;
- document;
- end_item_identification;
- external_definition.

The class requires the implementation of the following AIM entities:

- absorbed_dose_measure_with_unit;
- activity_measure_with_unit;
- amount_of_substance_measure_with_unit;
- analytical_model;
- analytical_model_definition;
- analytical_model_make_from_relationship;

6.34 Interconnect Requirement Allocation

Interconnect Requirement Allocation includes the following information: complete functional and physical requirements, complete capability to allocate enterprise or external agency requirements to interconnect function or physical design, model based requirement description using simulation models and models with assigned parametric data. Capability to explicitly describe the required external connections for a printed wiring board or simple substrate. Capability to segregate the required external connections from the required functions other than simple interconnect for printed circuit boards (including printed components). Supporting data including document, authorization, product identification, external definition, and authorization are included.

The class requires the implementation of the following Units of Functionality:

- analytical_model;
- analytical_representation;
- authorization;
- characteristic;
- document;
- end_item_identification;
- external_definition;
- interconnect_functional_requirement_allocation;
- interconnect_physical_requirement_allocation.

The class requires the implementation of the following AIM entities:

- absorbed_dose_measure_with_unit;
- activity_measure_with_unit;
- amount_of_substance_measure_with_unit;
- analytical_model;
- analytical_model_definition;
- analytical_model_make_from_relationship;

6.35 Functional Requirement Allocation

Functional Requirement Allocation includes the following information: allocation of customer, regulatory agency, or enterprise requirements to a functional element or to a functional specification for various phases and purposes of a design process.

The class requires the implementation of the following Units of Functionality:

- functional_requirement_allocation.

The class requires the implementation of the following AIM entities:

- analytical_model;
- analytical_model_definition;
- analytical_representation;
- approval;
- bond_category;
- calendar_date;
- component_functional_terminal;
- component_functional_unit;
- compound_representation_item;
- contract;

- coordinated_representation_item;
- date_and_time;

- table_representation_item.

6.36 Product Requirement Allocation

Product Requirement Allocation includes the following information: allocation data describing the assignment of customer, regulatory agency, and enterprise requirements to a product. These requirements can be assigned to products or configuration items or product versions in various phases of the design process.

The class requires the implementation of the following Units of Functionality:

- product_requirement_allocation.

The class requires the implementation of the following AIM entities:

- analytical_model;
- analytical_model_definition;
- analytical_representation;
- approval;
- bond_category;
- calendar_date;
- component_functional_terminal;
- component_functional_unit;
- compound_representation_item;

6.37 Datum Difference Based Model Definition

Datum Difference Based Model Definition includes the following information: data that describes interfaces to simulation models where the interfaces are based on Datums. Base geometric models may be created that Datum system and baseline parameters, which are then fed to a simulator, along with instance data from the product model, which is also correlated with the base geometric model. A Functional usage view is supported, providing the capability to map the model onto the functional definition for simulation using circuit level simulation. This data includes at least one geometric representation.

The class requires the implementation of the following Units of Functionality:

- analytical_model;
- authorization;
- datum_difference_based_model;
- document;
- end_item_identification;
- external_definition;
- functional_usage_view.

The class requires the implementation of the following AIM entities:

- analytical_model;
- analytical_model_definition;
- analytical_model_make_from_relationship;
- analytical_model_port;
- analytical_representation;
- applied_group_assignment;
- approval;
- bond_category;

6.38 Datum Difference Based Characteristic

Datum Difference Based Characteristic includes the following information: data that describes parameters for a physical unit, a template, or a model, where the characteristic is based on a Datum, or where the parameter is based on the difference between two Datum. Supporting data including document, product identification, and external definition are included. This data includes at least one geometric representation.

The class requires the implementation of the following Units of Functionality:

- characteristic;
- datum_based_characteristic;
- datum_difference_based_characteristic;
- document;
- end_item_identification;
- external_definition.

The class requires the implementation of the following AIM entities:

- absorbed_dose_measure_with_unit;
- activity_measure_with_unit;
- amount_of_substance_measure_with_unit;
- approval;

- area_measure_with_unit;
- bond_category;

6.39 Design Management

This data includes configuration management and design activity control and includes change request and work request.

The class requires the implementation of the following Units of Functionality:

- design_activity_control;
- design_management.

The class requires the implementation of the following AIM entities:

- add_design_object_assignment;
- add_design_object_request_assignment;
