

ISO 10303-210

Product data representation and exchange: Application protocol: Electronic assembly, interconnect, and packaging design

COPYRIGHT NOTICE:

ABSTRACT:

This document specifies the use of ISO 10303 integrated resources that satisfy the information sharing requirements for design engineers, device design engineers, value added engineering data suppliers, design analysts, system engineers, and manufacturing process planning engineers. The information is shared to transform the detailed design of and requirements for either an electronic assembly or an interconnect substrate into either a manufacturable description or an analysable description. Device data is shared to assure adequate product design and for source control purposes.

KEYWORDS: Component Data, Electronic Assembly, Tolerance, Requirements, Interconnect Substrate.

COMMENTS TO READER:

This is an internal committee working draft. The ARM EXPRESS, mapping tables, and AIM structure have been tested. The documentation is incomplete and may not match the EXPRESS. The EXPRESS G for both the ARM and AIM is to be ignored. This work has been done under the sponsorship of PDES, Inc. by the Electrical/Electronics project.

Project Leader: Thomas R. Thurman
Address: Rockwell Collins Inc.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 3.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75% of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this International Standard may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

This International Standard is organized as a series of parts, each published separately. The parts of ISO 10303 fall into one of the following series: description methods, integrated resources, application interpreted constructs, application protocols, abstract test suites, implementation methods, and conformance testing. The series are described in ISO 10303-1.

A complete list of parts of ISO 10303 is available from the internet:

<<http://www.nist.gov/sc4/editing/step/titles/>>

International Standard ISO 10303-210 was prepared by Technical Committee ISO/TC 184, *Industrial automation systems and integration*, Subcommittee SC4, *Industrial data*.

Annexes A, B, C, D, E and F form a normative part of this International Standard. Annexes G, H, J, K, and L are for information only.

Introduction

ISO 10303 is an International Standard for the computer-interpretable representation and exchange of product data. The objective is to provide a neutral mechanism capable of describing product data throughout the life cycle of a product independent from any particular system. The nature of this description makes it suitable not only for neutral file exchange, but also as a basis for implementing and sharing product databases and archiving.

This International Standard is organized as a series of parts, each published separately. The parts of ISO 10303 fall into one of the following series: description methods, integrated resources, application protocols, abstract test suites, implementation methods, and conformance testing. The series are described in ISO 10303-1. This part of ISO 10303 is a member of the application protocol series.

This part of ISO 10303 specifies an application protocol (AP) for the representation of information needed for the requirements specification of, design of, and analysis of, electronic assemblies, interconnect, and packaging.

This AP includes information needed to support configuration management of the product data.

The detailed product data identify the functional and physical performance requirements for the product in its intended environment. The functional and physical interface requirements define the usage environment of the product. Configuration management information is part of the product data.

The detailed functional requirements data may be either functional parametric properties data or explicit detailed functional design data. The functional parametric properties data, used in conjunction with an externally defined analysis model, describe the behavior of the product. The detailed functional design data may be used to identify the usage of functional abstractions as components and the connections between those components.

The detailed device data identify the products used in the design and their critical functional and physical characteristics. The detailed device data are from the external or usage view of the device. The functional device characteristics may be represented as detailed functional design data, allowing the association of the detailed functional requirements data to available products.

The analysable description includes information, at a level of abstraction, for physically realizing the product design. The analysable description may include the functional interconnect of descriptions and analysis models. The analysable description may be detailed functional design data that identify connections between components or material features in a design. Sufficient information is included to support multi-level mixed functional or physical analysis of a system composed of the assembly or interconnect products.

The detailed manufacturing capabilities data identify the material properties used as a basis in the design.

The manufacturable description includes information for physically realizing either the electronic assembly or interconnect product design. An assembly or a design may be used as a component in a different design, with geometry providing shape information in a geometric context.

The electronic assembly description is technology independent and identifies the products used as components and provides their placement and geometric shape data. These data support a detailed analysis of the performance of a product in its intended environment.

The interconnect product design describes the materials composing the interconnect, their arrangement in the interconnect physical structure, and their shape. The interconnect describes the arrangement and shape of material features of the interconnect product design. The interconnect description is technology independent.

Figure 1 contains the data planning model that provides a high-level description of the requirements for this application protocol. This planning model was created from the in-scope activities data of the application activity model (AAM). This planning model was used as a guide in developing the application reference model (ARM).

Figure 1 – Data planning model

This application protocol defines the context, scope, and information requirements for information shared between device, system, design, and manufacturing process planning engineers for transforming detailed requirements data, detailed device data, detailed manufacturing capabilities data, and detailed functional design data into analysable and manufacturable descriptions and specifies the integrated resources necessary to satisfy these requirements.

Application protocols provide the basis for developing implementations of ISO 10303 and abstract test suites for the conformance testing of AP implementations.

Clause 1 defines the scope of the application protocol and summarizes the functionality and data covered by the AP. An application activity model that is the basis for the definition of the scope is provided in annex G. The information requirements for the application are specified in clause 4 using terminology appropriate to the application. A graphical representation of the information requirements, referred to as the application reference model, is given in annex H.

Resource constructs are interpreted to meet the information requirements. This interpretation produces the application interpreted model (AIM). This interpretation, given in clause 5.1 shows the correspondence between the information requirements and the AIM. The short listing of the AIM specifies the interface to the integrated resources and is given in 5.2. Note that the definitions and EXPRESS provided in the integrated resources for constructs used in the AIM may include select list items and subtypes which are not imported into the AIM. The expanded listing given in annex A contains the complete EXPRESS for the AIM without annotation. A graphical representation of the AIM is given in annex J. Additional requirements for specific implementation methods are given in annex C.

Industrial automation systems and integration — Product data representation and exchange — Part 210 : Application Protocol: Electronic assembly, interconnect, and packaging design

1 Scope

This part of ISO 10303 specifies the use of the integrated resources necessary for the scope and information requirements for the design of electronic assemblies, interconnect and packaging.

NOTE The application activity model (AAM) in Annex G provides a graphical representation of the processes and information flows that are the basis for the definition of the scope of this part of ISO 10303.

The following are within the scope of this part of ISO 10303:

- The hierarchical description of the functionality of the electronic assembly or interconnect or devices that are used in an electronic assembly or interconnect;
- The hierarchical description of the functional objects that are combinations of one or more functional objects;
- The configuration management of the functional objects that are being developed concurrently;
- The configuration management of analytical models that are being developed concurrently;
- The explicit interface to analytic models that are used to define the behaviour of a functional object, a device, a physical object, an electronic assembly, or an interconnect;
- The description of the connection among the functional objects;
- The description of the connection among the devices used in the electronic assembly or interconnect;
- The description of the requirements for physical interconnection;
- The physical layout of the electronic assembly, including a description of the placement of the physical objects in the electronic assembly;
- The description of the bare interconnect, including the conductive and non-conductive materials and patterns;

- The functional and physical description of devices or physical objects, including material characteristics and composition;
- The functional usage and physical usage description of devices or physical objects, including material characteristics and composition;
- The functional and physical description of devices or physical objects realized as part of the interconnect, including material characteristics and composition;
- The functional usage and physical usage description of devices or physical objects realized as part of the interconnect, including material characteristics and composition;
- The description of the requirements and constraints on the design of the electronic assembly that assure product performance, incorporate quality, and enhance manufacturing process capabilities;
- The description of the requirements and constraints on the design of the interconnect that assure product performance, incorporate quality, and enhance manufacturing process capabilities;
- The configuration management of electronic assembly design descriptions;
- The configuration management of interconnect design descriptions;
- The allocation of certain details of the interconnect design description to the usage description of a physical object;
- The allocation of certain details of the electronic assembly design description to the usage description of a physical object;
- The description of electronic assemblies to implement various functional domains including, but not limited to, analogue, digital, video, radio frequency, and microwave;
- The description of interconnect to implement various functional domains including, but not limited to, analogue, digital, video, radio frequency, and microwave;
- The configuration management of constituent parts that are electronic assemblies or interconnect and that are being concurrently developed;
- The configuration management of documents that contain requirements;
- The allocation of requirements to functional objects, physical objects, and the physical implementation;
- The allocation of requirements from functional objects to their physical implementation;
- The allocation of each specific connection among the devices used in the electronic assembly to the component or group of components that realizes that connection;

- The association of characteristics to functional objects, physical objects, and analytical models;
- The identification of planned parameters for functional objects, electronic assemblies, interconnect, components, and analytical models;
- The identification of actual parameters for functional objects, electronic assemblies, interconnect, components, and analytical models.

The following are outside the scope of this part of ISO 10303:

- The drawings of functional objects, physical objects, electronic assemblies and interconnect;
- The process plans for the assembly of the electronic assembly;
- The process plans for the fabrication of the interconnect;
- The classification and categorization of data element types;
- The definition and interpretation of external file formats for analytic models;
- The management of the process used to design an electronic assembly or interconnect;
- The management of the manufacture of the physical objects used in an electronic assembly;
- The administrative procurement and cost data used by an enterprise.

2 Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this part of ISO 10303. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. However, parties to agreements based on this part of ISO 10303 are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referred to applies. Members of ISO and IEC maintain registers of currently valid International Standards.

3 Terms, definitions, and abbreviations

3.1 Terms defined in IEC 60050-541

This part of ISO 10303 makes use of the following terms defined in IEC 60050-541:

- annular ring;
- blind via;
- buried via;
- cutout;
- double-sided board;
- fiducial;
- interfacial connection;
- land;
- non functional land;
- printed wiring;
- printed circuit;
- trace;
- via.

3.2 Terms defined in ISO 129

This part of ISO 10303 makes use of the following term defined in ISO 129:

- dimension.

3.3 Terms defined in ISO 1101

This part of ISO 10303 makes use of the following term defined in ISO 1101:

- tolerance zone.

3.4 Terms defined in ISO 2692

This part of ISO 10303 makes use of the following terms defined in ISO 2692:

- least material condition;
- maximum material condition;
- maximum material principle.

3.5 Terms defined in ISO 2692: Amendment 1

This part of ISO 10303 makes use of the following term defined in ISO 2692: Amendment 1:

- least material requirement.

3.6 Terms defined in ISO 5459

This part of ISO 10303 makes use of the following terms defined in ISO 5459:

- datum;
- datum system.

3.7 Terms defined in ISO 8015

This part of ISO 10303 makes use of the following terms defined in ISO 8015:

- geometric tolerance;
- tolerance.

3.8 Terms defined in ISO 10303-1

This part of ISO 10303 makes use of the following terms defined in ISO 10303-1:

- abstract test suite;
- application;
- application activity model (AAM);
- application interpreted model (AIM);
- application object;

ISO 10303-210

- application protocol (AP);
- application reference model (ARM);
- assembly;
- conformance testing;
- data;
- implementation method;
- integrated resource;
- model;
- PICS proforma;
- product;
- product data;
- unit of functionality (UoF).

3.9 Terms defined in ISO 10303-11

This part of ISO 10303 makes use of the following terms defined in ISO 10303-11:

- domain rule;
- informal proposition;
- list;
- LOGICAL;
- SELF;
- set;
- unique rule.

3.10 Terms defined in ISO 10303-44

This part of ISO 10303 makes use of the following terms defined in ISO 10303-44:

- directed acyclic graph;
- parent node.

3.11 Terms defined in ISO 10303-45

This part of ISO 10303 makes use of the following term defined in ISO 10303-45:

- data environment.

3.12 Terms defined in ISO 10303-46

This part of ISO 10303 makes use of the following terms defined in ISO 10303-46:

- font;
- tiling.

3.13 Other definitions

For the purpose of this part of ISO 10303, the following definitions apply:

3.13.1

component

an occurrence of a product used in an assembled product.

3.13.2

connected

joined; related or associated.

3.13.3

connection

the state of being connected.

3.13.4

connectivity

the state of being connected.

3.13.5

double-sided printed circuit board

a PCB with a conductive pattern on both of its sides.

3.13.6

flexible printed circuit board

a PCB that utilizes flexible insulating substrate materials with or without flexible insulating cover layers.

3.13.7

functional object

a type of product design representation described as an assembly of functions or implied function.

3.13.8

functionality

the degree to which an object is designed or adapted to a particular function or use.

3.13.9

hierarchy

a collection of related items and where the relationship between the items may be represented by a directed acyclic graph in which a node has only one parent node.

3.13.10

hierarchical decomposition

a collection of related items and where the relationship between the items may be represented by a directed acyclic graph in which a node may have one or more parent nodes.

3.13.11

insulating substrate materials

materials with a high resistance to the flow of electrical current that are used as a base for the formation of conductive patterns.

3.13.12

integrated circuit

a miniature die of substrate material that is etched or imprinted with a complex of electronic components and their interconnections.

3.13.13

interface

an access mechanism to the functionality of an object.

3.13.14

multi-layer printed circuit board

a PCB that consists of rigid or flexible insulation materials and with three or more alternate printed wiring or printed circuit layers that have been bonded together and electrically interconnected.

3.13.15

nomenclature

a list of unique string types.

3.13.16

part

a product with operational functionality that is expected to be used as a component of one or more assembled products.

EXAMPLE 1 The types of functionality are electrical, mechanical, electro-mechanical, magnetic, and optical.

3.13.17

port

an access mechanism.

3.13.18

printed circuit board layout

the geometric patterns and layered configurations of a bare printed circuit board.

3.13.19

printed component

a part manufactured during PCB fabrication.

3.13.20

rigid-flex printed circuit board

a PCB that utilizes both rigid and flexible insulating substrate materials.

3.13.21

rigid printed circuit board

a PCB that utilizes only rigid insulating substrate materials.

3.13.22

single-sided printed circuit board

a PCB with a conductive pattern on only one side.

3.13.23

structural domain

a domain in which each model explicitly states only one type of relationship between model elements.

3.14 Abbreviations

For the purposes of this part of ISO 10303, the following abbreviations apply:

2D	two-dimension
3D	three-dimension
AAM	application activity model
AIM	application interpreted model
AP	application protocol
ARM	application reference model

B-rep	boundary representation
CAD	computer-aided design
CSG	constructive solid geometry
EDA	electronic design automation
EE	electrical or electronics
EDIF	electronic design interchange format
EMI	electrical magnetic interference
IC	integrated circuit
IP	informal proposition
MCM	multi-chip module
PCA	printed circuit assembly
PCB	printed circuit board
PICS	Protocol information and conformance statement
RF	radio frequency
UoF	Units of Functionality
UR	unique rule
URL	uniform resource locator
VHDL	VHSIC hardware description language
VHSIC	very high speed integrated circuits
WR	domain rule

4 Information requirements

This clause specifies the information required for information shared between device, system, design, and manufacturing process planning engineers for transforming detailed requirements data, detailed device data, detailed manufacturing capabilities data, and detailed functional design data into analysable and manufacturable descriptions.

The information requirements are specified as a set of units of functionality, application objects, and application assertions. These assertions pertain to individual application objects and to relationships between application objects. The information requirements are defined using the terminology of the subject area of this application protocol.

NOTE 1 A graphical representation of the information requirements is given in annex H.

NOTE 2 The information requirements correspond to those of the activities identified as being within the scope of this application protocol in annex G.

NOTE 3 The mapping table specified in 5.1 shows how the integrated resources and application interpreted constructs are used to meet the information requirements of this application protocol.

4.1 Units of functionality

This subclause specifies the units of functionality for the Electronic assembly, interconnect and packaging design application protocol. This Part of ISO 10303 specifies the following units of functionality:

- `advanced_boundary_representation`;
- `altered_package`;
- `altered_part`;
- `analytical_model`;
- `analytical_representation`;
- `assembly_bill_of_material`;
- `assembly_component`;
- `assembly_component_grouping`;
- `assembly_component_placement_requirements`;
- `assembly_design_information_assignment_to_usage_view`;
- `assembly_functional_interface_requirement`;

- assembly_functional_requirement_allocation;
- assembly_interface_component;
- assembly_marking;
- assembly_module_design;
- assembly_module_usage_view;
- assembly_physical_interface_requirement;
- assembly_physical_requirement_allocation;
- assembly_shape;
- assembly_technology;
- authorization;
- bare_die;
- characteristic;
- connection_zone_to_analytical_model_port_mapping;
- constructive_solid_geometry;
- datum_based_characteristic;
- datum_difference_based_characteristic;
- datum_difference_based_model;
- design_activity_control;
- design_management;
- device_marking;
- document;
- end_item_identification;
- external_definition;

- fabrication_joint;
- form_features;
- functional_decomposition_to_assembly_design;
- functional_decomposition_to_interconnect_design;
- functional_decomposition_with_nodal_representation;
- functional_decomposition_with_nodal_representation_to_assembly_mapping;
- functional_decomposition_with_nodal_representation_to_interconnect_mapping;
- functional_definition_to_physical_unit_usage_view_mapping;
- functional_definition_to_printed_part_mapping;
- functional_design_elaboration;
- functional_requirement_allocation;
- functional_specification;
- functional_unit_analytical_representation;
- functional_usage_view;
- functional_usage_view_terminal_to_analytical_model_port_mapping;
- geometric_dimensioning_and_tolerance;
- geometrically_bounded_2d_wireframe;
- inter_stratum_feature_template;
- interconnect_bill_of_material;
- interconnect_component_grouping;
- interconnect_design_information_assignment_to_usage_view;
- interconnect_functional_requirement_allocation;
- interconnect_interface_component;

- interconnect_marking;
- interconnect_module_connection_routing;
- interconnect_module_design;
- interconnect_module_edge;
- interconnect_module_usage_view;
- interconnect_physical_requirement_allocation;
- interconnect_placement_requirements;
- interconnect_shape;
- laminate_assembly_design;
- land;
- library_item;
- manufacturing_technology;
- material_product;
- non_topological_surface;
- package;
- packaged_part_black_box_model;
- packaged_part_terminal_analytical_representation;
- packaged_part_white_box_model;
- part_feature;
- part_feature_to_analytical_model_port_mapping;
- part_template;
- part_template_shape;
- physical_network;

- physical_unit;
- physical_unit_analytical_representation;
- physical_unit_shape;
- planned_characteristic;
- planned_effectivity;
- printed_part_template;
- product_identification;
- product_requirement_allocation;
- product_rule;
- requirement_decomposition;
- sequential_laminate_assembly_design;
- shape;
- signal;
- solid_of_linear_extrusion;
- source_control;
- stratum;
- stratum_feature;
- stratum_position;
- styled_curve;
- styled_text;
- test_probe;
- wireframe_2d_model_with_topology;
- wireframe_with_topology.

The units of functionality and a description of the functions that each UoF supports are given below. The application objects included in the UoFs are defined in 4.2

4.1.1 advanced_boundary_representation

The `advanced_boundary_representation` UoF defines the information needed for a representation of a product using advanced boundary representation solids models. This representation allows for the definition of curves and surfaces and the topology that bounds them. Boundaries are explicitly defined only by topology. All of the geometry that defines the product's shape shall be associated with topology.

The following application objects are used by the `advanced_boundary_representation` UoF:

- `Advanced_b_rep`.

4.1.2 altered_package

The `altered_package` UoF defines the properties of a package that has had some preparation work done to it that modifies the form or fit or material properties of the package. The preparation work is necessary to facilitate installation or support alternate mounting arrangements. The `altered_package` UoF is included to support the exchange of package related information independently of the usage of the package.

The following application objects are used by the `altered_package` UoF:

- `Altered_package`;
- `Altered_package_terminal`.

4.1.3 altered_part

The `altered_part` UoF defines the properties of a component that has had some preparation work done to it that modifies the form or fit or function or material properties of the component and is usually installed in the product to be delivered to a customer. The preparation work may be necessary to facilitate the installation, or to support alternate mounting arrangements, or to support field programmability. The `altered_part` UoF does not distinguish between the properties of a component that has been altered prior to installation and the properties of a component that has been altered, installed and delivered to a customer as part of the assembly.

NOTE Enterprises typically do not document component shape changes that are minor that occur during production of the assembly (e.g., an operation that trimmed leads would be ignored.).

The following application objects are used by the `altered_part` UoF:

- `Altered_package`;
- `Altered_package_terminal`;
- `Altered_packaged_part`;

- Engineering_make_from;
- Part_feature_make_from_relationship.

4.1.4 analytical_model

The analytical_model UoF defines the information needed to properly interface to and exchange the source code contents of an externally defined computer-interpretable model of a particular behaviour. A model allows a behaviour to be described using a mathematical form (e.g., algorithm, table). A model is independent of any particular product.

The following application objects are used by the analytical_model UoF:

- Analytical_model;
- Analytical_model_definition;
- Analytical_model_make_from_relationship;
- Analytical_model_port;
- Analytical_model_port_make_from_relationship;
- Analytical_model_scalar_port;
- Analytical_model_vector_port;
- Digital_analytical_model_port;
- Language_reference_manual;
- Model_parameter;
- Terminal_pair_port_equivalence_relationship.

4.1.5 analytical_representation

The analytical_representation UoF defines the information needed to associate specific instance data with an analytical model to support computer-based experimentation. The models are associated with a network representation in order to form a complete system of equations for numerical or symbolic analysis. Each discipline may have a different analytical representation of a product design.

NOTE The network representation commonly used, a nodal representation is supported by the functional_decomposition_with_nodal_representation UoF.

The following application objects are used by the analytical_representation UoF:

- Analytical_representation.

4.1.6 assembly_bill_of_material

The assembly_bill_of_material UoF defines the information needed to describe the structured list of materials of components required for an assembly. The assembly_bill_of_material UoF includes the vendor supplying the product, all approved alternates and substitutes, and which product selection is dependent on the result of a test of the assembly.

The following application objects are used by the assembly_bill_of_material UoF:

- Alternate_product;
- Alternate_select_product;
- Assembly_alternate_product;
- Assembly_composition_relationship;
- Assembly_material_composition_relationship;
- Next_higher_assembly_relationship;
- Physical_component;
- Promissory_usage_in_product_model_relationship;
- Promissory_usage_relationship;
- Substitute_product;
- Test_select_product.

4.1.7 assembly_component

The assembly_component UoF defines the information needed to incorporate occurrences of the different types of physical units as components in an assembly. The assembly_component UoF defines the information needed to incorporate components that use the different types of part templates as definitions in an assembly. The assembly_component UoF defines auxiliary roles a component may assume in an assembly in support of other components in addition to the primary role of component. The assembly_component UoF functionality supports discrete and fabricated assemblies.

The following application objects are used by the `assembly_component` UoF:

- `Assembly_component`;
- `Assembly_module_component`;
- `Assembly_module_macro_component`;
- `Assembly_module_macro_component_join_terminal`;
- `Bare_die_component`;
- `Cable_component`;
- `Interconnect_module_component`;
- `Interconnect_module_macro_component`;
- `Interface_component`;
- `Packaged_component`;
- `Packaged_connector_component`;
- `Physical_component`;
- `Routed_interconnect_component`;
- `Shield`;
- `Thermal_component`.

4.1.8 `assembly_component_grouping`

The `assembly_component_grouping` UoF defines the information needed to describe the different ways of grouping assembly components in an assembly. The `assembly_component_grouping` UoF functionality supports discrete and fabricated assemblies. The `assembly_component_grouping` UoF functionality supports design reuse of complex design elements.

NOTE The `assembly_component_grouping` UoF is not intended to be the means to support hierarchical design, as that is the purpose of the `assembly_module_design` and `interconnect_module_design` UoFs.

The following application objects are used by the assembly_component_grouping UoF:

- Array_placement_group;
- Assembly_component_placement_link;
- Assembly_group_component;
- Interfaced_group_component;
- Linear_array_placement_group_component;
- Linear_array_placement_group_component_link;
- Physical_component;
- Rectangular_array_placement_group_component;
- Sub_assembly_relationship.

4.1.9 assembly_component_placement_requirements

The assembly_component_placement_requirements UoF defines the information needed to describe the constraints restricting where components are to be placed in an assembly. These restrictions may be component category to board feature category or component category to component category related. Application object attribute data population is restricted to that related to the discrete assembly view.

The following application objects are used by the assembly_component_placement_requirements UoF:

- Component_group_assignment;
- Component_placement_restriction_assignment;
- Interconnect_module_component_surface_feature;
- Item_restricted_requirement_occurrence;
- Layout_spacing_requirement_occurrence;
- Mounting_restriction_area;
- Mounting_restriction_volume;
- Placement_group;
- Placement_group_area_assignment;

- Placement_group_volume_assignment.

4.1.10 assembly_design_information_assignment_to_usage_view

The assembly_design_information_assignment_to_usage_view UoF defines the information that describes the association between product data necessary for a design view and product data necessary to define a usage view. A product engineer may choose to only release usage view information in order to allow other designers to incorporate the product into a higher level assembly. This information is developed and maintained by a design organization in order to control the accuracy and integrity of externally released data.

The following application objects are used by the assembly_design_information_assignment_to_usage_view UoF:

- Component_feature_to_physical_usage_view_assignment;
- Component_terminal_to_assembly_module_interface_terminal_assignment;
- Component_terminal_to_assembly_module_join_terminal_assignment;
- Component_terminal_to_pca_terminal_assignment.

4.1.11 assembly_functional_interface_requirement

The assembly_functional_interface_requirement UoF defines the information needed to describe the manner by which an electronic assembly shall electrically or functionally interface to the next higher assembly. Constraints on the signals associated with terminals of the mating connector may be specified. Identification of the mating terminals is supported.

The following application objects are used by the assembly_functional_interface_requirement UoF:

- Mating_connector_termination;
- Termination_constraint.

4.1.12 assembly_functional_requirement_allocation

The assembly_functional_requirement_allocation UoF describes the assignment of network based functional requirements to an assembly under design. These requirements are specific to the relationship between the functional connectivity definition and the component instances used in the assembly under design that implement that connectivity.

NOTE Refer to the functional_requirement_allocation UoF for information assigning textual requirements to a functional decomposition.

The following application objects are used by the `assembly_functional_requirement_allocation` UoF:

- `Physical_component_terminal`;
- `Physical_node_requirement_to_implementing_component_allocation`;
- `Test_requirement_allocation`.

4.1.13 `assembly_interface_component`

The `assembly_interface_component` UoF defines the information needed to describe the component that acts as a connector that provides external access to an assembly. The items' position in the assembly, and the specification that dictates the selection and placement are included.

The following application objects are used by the `assembly_interface_component` UoF:

- `Ee_specification`;
- `Interface_component`;
- `Packaged_connector_component`.

4.1.14 `assembly_marking`

The `assembly_marking` UoF defines the information needed to apply identification information, using material, to an assembly. The content of the information is under configuration control. The scope of this UoF is for assemblies.

The following application objects are used by the `assembly_marking` UoF:

- `Configuration_controlled_message`;
- `Ee_specification`;
- `Marking`.

4.1.15 `assembly_module_design`

The `assembly_module_design` UoF defines the information needed to describe the components in an assembly and the physical relationship between the components and the assembly. The `assembly_module_design` UoF defines the information needed to describe the different features of components and the relationship between component features in an assembly. The `assembly_module_design` UoF defines the information needed to describe the materials used in an assembly that physically support components. Analysis data extraction is supported to allow verification of physical connectivity implementation.

The following application objects are used by the assembly_module_design UoF:

- Assembled_with_bonding;
- Assembled_with_fasteners;
- Assembly_component;
- Assembly_composition_relationship;
- Assembly_joint;
- Assembly_material_composition_relationship;
- Assembly_module;
- Assembly_module_component_terminal;
- Assembly_module_macro_component;
- Assembly_module_macro_component_join_terminal;
- Bare_die_component_terminal;
- Component_feature;
- Component_feature_make_from_relationship;
- Component_feature_relationship;
- Component_interface_terminal;
- Component_make_from_relationship;
- Component_mating_constraint_condition;
- Component_mounting_clearance_relationship;
- Component_mounting_feature;
- Component_overlap_relationship;
- Component_terminal;
- Connection_zone_based_assembly_joint;

- Interconnect_component_interface_terminal;
- Interconnect_component_join_terminal;
- Interconnect_module_component_surface_feature;
- Interconnect_module_component_terminal;
- Interconnect_module_macro_component;
- Interface_mounted_join;
- Movable_packaged_component_join_terminal;
- Next_higher_assembly_relationship;
- Package_terminal_occurrence;
- Packaged_component_join_terminal;
- Packaged_connector_component_interface_terminal;
- Pca;
- Physical_component;
- Routed_physical_component.

4.1.16 assembly_module_usage_view

The assembly_module_usage_view UoF defines the information needed to describe the electronic assembly for use as a component at the next level of assembly. The level of information provided is for use of the electronic assembly and not manufacture.

The following application objects are used by the assembly_module_usage_view UoF:

- Assembly_module_interface_terminal;
- Assembly_module_join_terminal;
- Assembly_module_terminal;
- Assembly_module_usage_view;
- Assembly_module_usage_view_connector_relationship;

- Packaged_connector;
- Pca_terminal;
- Pca_usage_view.

4.1.17 assembly_physical_interface_requirement

The assembly_physical_interface_requirement UoF defines the information needed to describe the manner by which an electronic assembly shall mechanically interface to the next higher assembly. The type of mating connector and its location relative to the electronic assembly are provided as a design requirement, that must be satisfied in the design.

The following application objects are used by the assembly_physical_interface_requirement UoF:

- Component_placement_restriction_assignment;
- Interface_requirement_occurrence;
- Mating_connector_component;
- Mating_connector_placement_relationship;
- Next_higher_assembly_interface_requirement.

4.1.18 assembly_physical_requirement_allocation

The assembly_physical_requirement_allocation UoF describes the assignment of customer, regulatory agency, and enterprise requirements to an assembly under design. These requirements may be assigned to physical items or geometric features that are used in various phases of the design process.

The following application objects are used by the assembly_physical_requirement_allocation UoF:

- Assembly_requirement_allocation;
- Assembly_separation_requirement_allocation;
- Electromagnetic_compatibility_requirement_allocation;
- Interface_component_allocation;
- Requirement_allocation;
- Shield_allocation;
- Thermal_requirement_allocation.

4.1.19 assembly_shape

The assembly_shape UoF defines the information needed to describe explicit geometric models and transformations used in the design process for an electronic assembly. This UoF permits a different type of geometric representation for a component in a library and for an instance of the component in the design.

The following application objects are used by the assembly_shape UoF:

- Assembly_component_2d_shape;
- Assembly_component_3d_shape;
- Bond_assembly_position;
- Component_2d_edge_location;
- Component_2d_location;
- Component_2d_stacked_location;
- Component_2d_surface_location;
- Component_3d_location;
- Component_assembly_2d_position;
- Component_assembly_3d_position;
- Component_part_2d_geometric_representation_relationship;
- Component_part_3d_geometric_representation_relationship;
- Design_view_connection_zone_position_relationship;
- Design_view_terminal_component_shape_relationship.

4.1.20 assembly_technology

The assembly_technology UoF defines the information needed to describe the different aspects of how components are joined together to make an assembly. The assembly_technology UoF defines the information needed to describe the material used in making the physical connections and their typical shape.

The following application objects are used by the assembly_technology UoF:

- Assembly_bond_definition;
- Assembly_technology_specification;
- Default_assembly_bond_shape;
- Reference_packaged_part_assembly_implementation;
- Reference_packaged_part_interconnect_implementation.

4.1.21 authorization

The authorization UoF defines the information necessary to determine the acceptance of a piece of product data within an enterprise, on a specific date, at a particular level of status, by a group of people having roles that allow them to grant the authorization.

The following application objects are used by the authorization UoF:

- Contract;
- Date;
- Date_and_time;
- Ee_approval;
- Organization;
- Person;
- Person_and_organization;
- Security_classification.

4.1.22 bare_die

The bare_die UoF defines the information needed to describe a semiconductor material product that may reside inside an integrated circuit, or that may be a discrete active component, or that may be included as a component in an electronic assembly. Terminal information is supported, including explicit shape data.

The following application objects are used by the bare_die UoF:

- Bare_die;
- Bare_die_bottom_surface;
- Bare_die_edge_segment_surface;
- Bare_die_edge_surface;
- Bare_die_surface;
- Bare_die_terminal;
- Bare_die_terminal_surface_constituent_relationship;
- Bare_die_top_surface;
- Connection_zone_interface_plane_relationship;
- Guided_wave_bare_die_terminal;
- Minimally_defined_bare_die_terminal;
- Seating_plane.

4.1.23 characteristic

The characteristic UoF defines the information needed to describe parameters and tolerances for a physical unit, a template, a design, or a model. Explicit units, as well as exact and uncertain measures may be described.

The following application objects are used by the characteristic UoF:

- Absorbed_dose_data_element;
- Activity_data_element;
- Amount_of_substance_data_element;
- Angle_data_element;
- Area_data_element;
- Capacitance_data_element;

- Celsius_temperature_data_element;
- Characteristic;
- Characteristic_data_set;
- Characteristic_data_table;
- Compound_characteristic;
- Conductance_data_element;
- Coordinated_characteristic;
- Data_element;
- Dose_equivalent_data_element;
- Ee_colour;
- Electric_charge_data_element;
- Electric_current_data_element;
- Electromotive_force_data_element;
- Energy_data_element;
- Event_data_element;
- Expanded_uncertainty;
- Force_data_element;
- Frequency_data_element;
- Illuminance_data_element;
- Inductance_data_element;
- Length_data_element;
- Luminous_flux_data_element;
- Luminous_intensity_data_element;

- Magnetic_flux_data_element;
- Magnetic_flux_density_data_element;
- Mass_data_element;
- Maximum_tolerance_characteristic;
- Measure_qualification;
- Minimum_tolerance_characteristic;
- Model_parameter;
- Numeric_parameter;
- Parameter_assignment;
- Pitch_class;
- Plus_minus_tolerance_characteristic;
- Power_data_element;
- Precision_qualifier;
- Pressure_data_element;
- Qualitative_uncertainty;
- Range_characteristic;
- Ratio_data_element;
- Resistance_data_element;
- Scattering_parameter_data_element;
- Solid_angle_data_element;
- Standard_uncertainty;
- Statistical_tolerance_characteristic;
- Symmetrical_tolerance_characteristic;

- Thermodynamic_temperature_data_element;
- Time_data_element;
- Tolerance_characteristic;
- Type_qualifier;
- Uncertainty_qualifier;
- Volume_data_element.

4.1.24 connection_zone_to_analytical_model_port_mapping

The connection_zone_to_analytical_model_port_mapping UoF defines the information needed to associate specific geometric founded data for a physical unit to an analytical model port to support computer-based experimentation on a specific product design. Each discipline may have a different connection zone to analytical model port mapping for a product design. Direct specification of the mapping to a connection area on the terminal of the product concepts under investigation is provided. This UoF provides additional level of detail over that found in the part_feature_to_analytical_model_port_mapping UoF.

The following application objects are used by the connection_zone_to_analytical_model_port_mapping UoF:

- Connection_zone_model_port_assignment.

4.1.25 constructive_solid_geometry

The constructive_solid_geometry UoF defines the information needed to describe the solid representation of an item by use of primitive solid construction elements. These primitive elements may be intersected, unioned, and differenced with each other in order, to form desired representation. The construction history of the solid is included by default.

The following application objects are used by the constructive_solid_geometry UoF:

- Block;
- Boolean_csg_result;
- Csg_primitive;
- Csg_solid;
- Right_angular_wedge;
- Right_circular_cylinder.

4.1.26 datum_based_characteristic

The datum_based_characteristic UoF defines the information needed to describe parameters for a physical unit, a template, a design, or a model, where the characteristic is based on a Datum.

The following application objects are used by the datum_based_characteristic UoF:

- Datum_based_length_measure.

4.1.27 datum_difference_based_characteristic

The datum_difference_based_characteristic UoF defines the information needed to describe parameters for a physical unit, a template, a design, or a model where the characteristic is based on a Datum_difference.

The following application objects are used by the datum_difference_based_characteristic UoF:

- Datum_difference;
- Datum_difference_based_characteristic.

4.1.28 datum_difference_based_model

The datum_difference_based_model UoF defines the information needed to properly interface to and exchange an externally defined computer-interpretable model of a particular product that includes interfaces based on Datums. A datum_difference_based_model allows a product's characteristics and performance parameters to be described analytically and referenced to a base or reference computer interpretable geometric model. A datum_difference_based_model is an extension of the Analytical_model UoF.

The following application objects are used by the datum_difference_based_model UoF:

- Analytical_model;
- Analytical_model_port;
- Analytical_model_scalar_port;
- Analytical_model_vector_port;
- Datum_difference;
- Datum_difference_analytical_model_port_assignment;
- Datum_difference_based_model_parameter;

- Datum_difference_functional_unit_usage_view_terminal_assignment;
- Digital_analytical_model_port;
- Language_reference_manual;
- Model_parameter;
- Terminal_pair_port_equivalence_relationship.

4.1.29 design_activity_control

The design_activity_control UoF defines the information necessary to describe the history of product versions. It identifies initial product design requests, as well as change requests for revised product versions. It provides the directive for work to proceed in the development of these initial or modified product versions.

The following application objects are used by the design_activity_control UoF:

- Change_order;
- Change_request;
- Start_order;
- Start_request;
- Work_order;
- Work_request.

4.1.30 design_management

The design_management UoF defines the information needed to describe the association between an original product definition and a planned product definition. The planned product definition is based upon the original definition.

The following application objects are used by the design_management UoF:

- Add_design_object_management_relationship;
- Change_design_object_management_relationship;
- Delete_design_object_management_relationship;

- Design_object_management_relationship;
- Frozen_design_object;
- Managed_design_object;
- Owned_design_object;
- Owner_assignment.

4.1.31 device_marking

The device_marking UoF defines the information needed to apply identification information, using material, to an item used in a design for identification of that item. The content of the information is under configuration control. The scope of this UoF is for library data.

The following application objects are used by the device_marking UoF:

- Configuration_controlled_message;
- Ee_specification;
- Marking.

4.1.32 document

The document UoF defines the information needed to describe a set of different types of information elements that are found in a document that are used to specify, in detail, a product or an aspect of a product or model. Support is provided for describing text that is a part of a document.

EXAMPLE 1 Source code for models or requirements is data which may be exchanged using the capabilities of this UoF.

The following application objects are used by the document UoF:

- Design_specification;
- Ee_document;
- Ee_document_identifier;
- Ee_specification;
- Ee_text;
- Fabrication_technology_specification;

- Interface_specification;
- Language_reference_manual;
- Lead_form_specification;
- Material_specification;
- Process_specification;
- Structured_text;
- Surface_finish_specification;
- Test_specification.

4.1.33 end_item_identification

The end_item_identification UoF defines the information needed to describe the version of the product that is being provided to satisfy the customer's requirements.

The following application objects are used by the end_item_identification UoF:

- Ee_product_configuration;
- Ee_product_model.

4.1.34 external_definition

The external_definition UoF defines the information needed to describe any definitions that are not predefined in this part of ISO 10303. The external definition requires a computer interpretable data dictionary for the most effective implementation.

The following application objects are used by the external_definition UoF:

- External_definition.

4.1.35 fabrication_joint

The fabrication_joint UoF defines the information needed to describe a joint created during the interconnect substrate manufacturing process. The joint purpose is to describe an intended connection between the interconnect substrate materials. The joint concept may be for strictly design or analysis purposes and may not be resolvable as a separate feature in the finished product.

The following application objects are used by the fabrication_joint UoF:

- Connection_zone_based_fabrication_joint;
- Fabrication_joint;
- Interconnect_module_product_assembly_view_fabrication_joint.

4.1.36 form_features

The form_features UoF defines the information needed to describe certain explicitly modeled parametrically defined geometric feature definitions provided by this part of ISO 10303.

The following application objects are used by the form_features UoF:

- Bevel_edge_feature_shape;
- Blind_passage_template;
- Counterbore_passage_template;
- Countersunk_passage_template;
- Datum;
- Edge_segment_cross_section;
- Edge_shape;
- Interconnect_module_edge_segment_surface;
- Interconnect_module_primary_surface;
- Interconnect_module_secondary_surface;
- Interconnect_module_surface_feature;
- Radius_edge_feature_shape;
- Step_edge_feature_shape.

4.1.37 functional_decomposition_to_assembly_design

The functional_decomposition_to_assembly_design UoF defines the information needed to describe the assignment of a functional unit in a network definition to an element in the assembly. Usually, this information is provided by a packaging application. This UoF defines the different means of describing swapping accomplished within a design. The types of swapping covered are the ones between gates in a single package instance, between gates in different package instances, and between terminals in a gate.

NOTE Constraints on swapping are not included in this UoF. The terminals swapped with this UoF are on the functional elements in the hierarchical design network listing and not the flattened network listing. Applications that perform swapping on flattened representations will need to map to the hierarchical representation.

The following application objects are used by the functional_decomposition_to_assembly_design UoF:

- Component_swap_specification;
- Design_composition_path;
- Design_functional_unit_allocation_to_assembly_component;
- Design_functional_unit_allocation_to_assembly_joint;
- Gate_path_swap_specification;
- Terminal_swap_specification.

4.1.38 functional_decomposition_to_interconnect_design

The functional_decomposition_to_interconnect_design UoF defines the information needed to describe the assignment of a functional unit in a network definition to an element in the Interconnect_module. The functional_decomposition_to_interconnect_design UoF defines the different means of performing swapping within a design. The types of swapping covered are the ones between gates in a single printed part, between identical gates in different instances of a printed part, and between terminals of identical type and behaviour in a gate.

The following application objects are used by the functional_decomposition_to_interconnect_design UoF:

- Component_swap_specification;
- Design_composition_path;
- Design_functional_unit_allocation_to_assembly_component;
- Design_functional_unit_allocation_to_fabrication_joint;

- Gate_path_swap_specification;
- Physical_component_terminal;
- Terminal_swap_specification;
- Transmission_line_functional_unit_terminal_allocation;
- Transmission_line_functional_unit_to_routed_printed_component_allocation.

4.1.39 functional_decomposition_with_nodal_representation

The functional_decomposition_with_nodal_representation UoF defines the information needed to describe how a set of functional units are connected together to form a network. The individual connections may either be discrete or may be part of a defined bus structure. The network may be specified as electrical, thermal, or unspecified (to be resolved by the simulation environment).

NOTE The analytical_representation and analytical_model UoFs are also needed to build a complete set of input data for a simulation experiment, as this UoF only provides the network structure.

The following application objects are used by the functional_decomposition_with_nodal_representation UoF:

- Bus_element_link;
- Bus_structural_definition;
- Electrical_network_definition;
- Functional_unit;
- Functional_unit_definition;
- Functional_unit_network_definition;
- Functional_unit_network_node_definition;
- Functional_unit_network_terminal_definition_bus_assignment;
- Functional_unit_network_terminal_definition_node_assignment;
- Functional_unit_terminal;
- Functional_unit_terminal_bus_assignment;
- Functional_unit_terminal_node_assignment;

- Functional_unit_usage_view;
- Functional_unit_usage_view_terminal_definition;
- Thermal_network_definition.

4.1.40 functional_decomposition_with_nodal_representation_to_assembly_mapping

The functional_decomposition_with_nodal_representation_to_assembly_mapping UoF defines the information necessary to describe the association between the multi-level hierarchical nodal representation and the single level nodal representation described by a physical_connectivity_definition. Multi-level hierarchy is represented in this part of ISO 10303 by a graph, and there are several graph instances involved in this UoF. The lowest level primitives in the design graph are also the lowest level primitives in the functional definition of a physical unit. A mapping is defined between paths contained in two graph instances in order to define equivalent functionality for a design element and a library element that contributes to the functionality of a physical_unit or part_template whose definition is in a library. Information is provided to exchange the constraints determined on the allowed alternatives that may be selected by a mapping activity. The constraints may be applied to individual elements and also to individual terminals.

EXAMPLE 1 A packaging application that used this mapping would assign element names "A,B,C" of a multi-element part to three path instances in the design. A second mapping is defined to allow the packaging application to associate the reference designator of the assembly_component to the three paths through the design graph that are implemented with that assembly_component. It may be determined by the design activity that element "A" is permitted to be exchanged with element "B" but not with element "C".

The following application objects are used by the functional_decomposition_with_nodal_representation_to_assembly_mapping UoF:

- Aggregate_connectivity_requirement;
- Connectivity_allocation;
- Design_composition_path;
- Design_functional_unit_allocation_to_assembly_component;
- Design_functional_unit_allocation_to_reference_functional_unit;
- Functional_usage_view_to_part_terminal_assignment;
- Minimally_defined_component_terminal;
- Package_external_reference;
- Package_terminal_external_reference;

- Part_terminal_external_reference;
- Physical_component_terminal;
- Reference_composition_path;
- Reference_functional_unit_assignment_to_part.

4.1.41 functional_decomposition_with_nodal_representation_to_interconnect_mapping

The functional_decomposition_with_nodal_representation_to_interconnect_mapping UoF defines the information necessary to describe the association between the multi-level hierarchical nodal representation and the single level nodal representation described by a physical_connectivity_definition that is in the design view of an interconnect. Multi-level hierarchy is represented in this part of ISO 10303 by a graph, and there are several graph instances involved in this UoF. The lowest level primitives in the design graph are also the lowest level primitives in the functional definition of a part template. A mapping is defined between paths contained in two graph instances in order to define equivalent functionality for a design element and a library element that contributes to the functionality of a part_template whose definition is in a library. Information is provided to exchange the constraints determined on the allowed alternatives that may be selected by a mapping activity. The constraints may be applied to individual elements and also to individual terminals.

EXAMPLE 1 A packaging application that used this mapping would assign element names "A,B,C" of a multi-element part to three path instances in the design. A second mapping is defined to allow the packaging application to associate the reference designator of the assembly_component to the three paths through the design graph that are implemented with that assembly_component. It may be determined by the design activity that element "A" is permitted to be exchanged with element "B" but not with element "C".

NOTE The population of assembly_component supported by this UoF is the types of laminate_component.

The following application objects are used by the functional_decomposition_with_nodal_representation_to_interconnect_mapping UoF:

- Aggregate_connectivity_requirement;
- Connectivity_allocation;
- Design_composition_path;
- Design_functional_unit_allocation_to_assembly_component;
- Design_functional_unit_allocation_to_reference_functional_unit;
- Functional_usage_view_to_part_terminal_assignment;
- Physical_component_terminal;

- Reference_composition_path;
- Reference_functional_unit_assignment_to_part.

4.1.42 functional_definition_to_physical_unit_usage_view_mapping

The functional_definition_to_physical_unit_usage_view_mapping UoF defines the association between functional elements and the physical units that exhibit the behaviour defined in the functional element. The functional_definition_to_physical_unit_usage_view_mapping UoF defines minimal information needed for classifying the association to support design alternative selection (e.g., swapping) during the detailed design activity.

The following application objects are used by the functional_definition_to_physical_unit_usage_view_mapping UoF:

- Functional_usage_view_to_part_terminal_assignment;
- Reference_composition_path;
- Reference_functional_unit_assignment_to_part.

4.1.43 functional_definition_to_printed_part_mapping

The functional_definition_to_printed_part_mapping UoF defines the association between a functional element and a printed part template that exhibits the behaviour defined in the functional definition. The functional_definition_to_printed_part_mapping UoF defines minimal information needed for classifying the association to support design alternative selection (e.g., swapping) during the detailed design activity.

The following application objects are used by the functional_definition_to_printed_part_mapping UoF:

- Functional_usage_view_to_printed_part_template_terminal_assignment;
- Reference_composition_path;
- Reference_functional_unit_assignment_to_part.

4.1.44 functional_design_elaboration

The functional_design_elaboration UoF defines the information needed to describe the structure of a network realization (flattened listing). It furthermore states the requirements which dictated the topological design of the realized network. It states constraints on exchange of terminal assignments to achieve the desired functionality.

EXAMPLE 1 A constraint may be a swapping constraint to ensure required fan-in capability.

The following application objects are used by the functional_design_elaboration UoF:

- Minimally_defined_component_terminal;
- Part_terminal_external_reference;
- Physical_component_terminal;
- Physical_connectivity_definition;
- Physical_connectivity_definition_relationship;
- Physical_connectivity_element;
- Physical_connectivity_make_from_relationship;
- Physical_connectivity_structure_definition;
- Physical_unit_network_definition;
- Topological_junction.

4.1.45 functional_requirement_allocation

The functional_requirement_allocation UoF describes the assignment of customer, regulatory agency, and enterprise requirements to a functional element in a network under design or to a functional specification. These requirements may be assigned for various purposes and phases of the design process.

The following application objects are used by the functional_requirement_allocation UoF:

- Functional_unit_requirement_allocation.

4.1.46 functional_specification

The functional_specification UoF defines the information needed to describe the measured behaviour of a functional element under a set of controlled conditions. It also defines the information needed to describe equivalents among different functional elements.

The following application objects are used by the functional_specification UoF:

- Equivalent_functional_unit_definition_assignment;
- Functional_specification;
- Functional_specification_definition;
- Signal_specification.

4.1.47 functional_unit_analytical_representation

The functional_unit_analytical_representation UoF defines the information needed to associate specific functional definitions with an analytical model to support computer-based experimentation. Each analysis model port is explicitly mapped to a terminal of the functional definition. Domain specific analysis is supported by a predefined type system and predefined units for simulation variables.

The following application objects are used by the functional_unit_analytical_representation UoF:

- Analytical_model_port_assignment;
- Analytical_representation.

4.1.48 functional_usage_view

The functional_usage_view UoF defines the information needed to describe the characterized behaviour and interface of a functional element. The terminals of the functional element may be assigned type information to facilitate a swapping application.

The following application objects are used by the functional_usage_view UoF:

- Equivalent_functional_terminals_assignment;
- Functional_terminal_group;
- Functional_terminal_group_assignment;
- Functional_unit_usage_view;
- Functional_unit_usage_view_terminal_definition;
- Functional_unit_usage_view_terminal_definition_make_from_relationship;
- Scalar_terminal_definition;
- Scalar_terminal_definition_link.

4.1.49 functional_usage_view_terminal_to_analytical_model_port_mapping

The functional_usage_view_terminal_to_analytical_model_port_mapping UoF defines the information needed to describe the assignment between a terminal of a functional element and a port of an analytical model. This is used in analysing a design. This UoF supports assigning explicit behaviour that is defined in a simulation model to a functional element.

NOTE The behavioural assignment is a consequence of the assignment of the terminals between the functional element and the simulation model.

The following application objects are used by the functional_usage_view_terminal_to_analytical_model_port_mapping UoF:

- Analytical_model_port_assignment.

4.1.50 geometric_dimensioning_and_tolerance

The geometric_dimensioning_and_tolerance UoF defines the information required to describe a behavioural model of a physical_unit and associated properties using geometric dimensioning and tolerancing principles in accordance with pre-existing standards.

The following application objects are used by the geometric_dimensioning_and_tolerance UoF:

- Angular_dimension_with_direction_vector;
- Angular_size_dimension;
- Angularity_tolerance;
- Apex;
- Axis_placement;
- Axis_placement_2d;
- Axis_placement_3d;
- Boundary_based_position_tolerance;
- Boundary_size_characteristic;
- Boundary_zone_definition_with_specified_size;
- Centre_axis;
- Centre_of_symmetry;
- Centre_plane;
- Centre_point;
- Circular_runout_tolerance;
- Circularity_tolerance;
- Common_datum;

- Composite_feature_locating_position_tolerance;
- Composite_feature_relating_position_tolerance;
- Composite_group_shape_element;
- Composite_linear_profile_locating_tolerance;
- Composite_linear_profile_refinement_tolerance;
- Composite_shape_element;
- Composite_surface_profile_locating_tolerance;
- Composite_surface_profile_refinement_tolerance;
- Composite_unit_shape_element;
- Concentricity_and_coaxiality_tolerance;
- Conical_tolerance_zone_boundary;
- Conical_tolerance_zone_boundary_and_surface_relationship;
- Conical_tolerance_zone_boundary_definition;
- Conical_tolerance_zone_boundary_diametrical_size_characteristic;
- Conical_tolerance_zone_definition;
- Curve_dimension;
- Cylindricity_tolerance;
- Datum;
- Datum_axis;
- Datum_axis_and_tolerance_zone_orienting_relationship;
- Datum_axis_related_orientation;
- Datum_based_direction_vector;
- Datum_based_vector_orientation;

- Datum_feature;
- Datum_feature_material_condition_property;
- Datum_feature_usage_in_common_datum_relationship;
- Datum_feature_usage_in_datum_relationship;
- Datum_feature_usage_in_datum_system_relationship;
- Datum_feature_usage_in_single_datum_relationship;
- Datum_plane;
- Datum_point;
- Datum_precedence_assignment;
- Datum_reference_frame;
- Datum_system;
- Datum_system_defining_conditions;
- Datum_system_defining_conditions_with_material_conditions;
- Datum_system_defining_conditions_without_material_conditions;
- Datum_target;
- Datum_target_set;
- Datum_target_usage_in_datum_target_set_relationship;
- Datum_usage_in_datum_system_relationship;

4.1.51 geometrically_bounded_2d_wireframe

The `geometrically_bounded_2d_wireframe` UoF defines the information needed to describe the representation of the shape of a product by 2 dimensional wireframes that are defined by geometry. This includes 2D curves.

The following application objects are used by the `geometrically_bounded_2d_wireframe` UoF:

- `geometrically_bounded_2d_wireframe`.

4.1.52 inter_stratum_feature_template

The `inter_stratum_feature_template` UoF defines the information needed to describe product data, including shape data and terminal definitions. Occurrences of this data are used to describe electrical connectivity, and other design relationships, between different layers of an interconnect substrate. This UoF is used in conjunction with `manufacturing_technology` UoF.

The following application objects are used by the `inter_stratum_feature_template` UoF:

- `Component_termination_passage_template`;
- `Component_termination_passage_template_interface_terminal`;
- `Component_termination_passage_template_join_terminal`;
- `Component_termination_passage_template_terminal`;
- `Counterbore_passage_template`;
- `Countersunk_passage_template`;
- `Inter_stratum_feature_template`;
- `Unsupported_passage_template`;
- `Via_template`;
- `Via_template_terminal`.

4.1.53 interconnect_bill_of_material

The `interconnect_bill_of_material` UoF defines the information needed to describe the structured list of materials of components required to make an interconnect. The `interconnect_bill_of_material` UoF includes the vendor supplying the product, all approved alternates and substitutes, and which product selection is dependent on the result of a test.

The following application objects are used by the `interconnect_bill_of_material` UoF:

- `Alternate_product`;
- `Alternate_select_product`;
- `Assembly_alternate_product`;
- `Assembly_composition_relationship`;

- Assembly_material_composition_relationship;
- Interconnect_module_stratum_assembly_relationship;
- Material_composition_relationship;
- Next_higher_assembly_relationship;
- Physical_component_terminal;
- Promissory_usage_in_product_model_relationship;
- Promissory_usage_relationship;
- Substitute_product;
- Test_select_product.

4.1.54 interconnect_component_grouping

The interconnect_component_grouping UoF defines the information needed to describe the different ways of grouping components in an interconnect substrate. The interconnect_component_grouping UoF functionality supports fabricated assemblies. The interconnect_component_grouping UoF functionality supports design reuse of complex design elements.

The following application objects are used by the interconnect_component_grouping UoF:

- Array_placement_group;
- Assembly_component_placement_link;
- Assembly_group_component;
- Interfaced_group_component;
- Linear_array_placement_group_component;
- Linear_array_placement_group_component_link;
- Physical_component_terminal;
- Rectangular_array_placement_group_component;
- Sub_assembly_relationship.

4.1.55 `interconnect_design_information_assignment_to_usage_view`

The `interconnect_design_information_assignment_to_usage_view` UoF defines the information that describes the association between product data necessary for interconnect design and product data necessary to define a usage view of the interconnect.

The following application objects are used by the `interconnect_design_information_assignment_to_usage_view` UoF:

- `Component_feature_to_physical_usage_view_assignment`;
- `Component_terminal_to_interconnect_module_interface_terminal_assignment`;
- `Component_terminal_to_interconnect_module_join_terminal_assignment`;
- `Physical_component_terminal`;
- `Stratum_concept_to_physical_usage_view_assignment`.

4.1.56 `interconnect_functional_requirement_allocation`

The `interconnect_functional_requirement_allocation` UoF describes the assignment of functional connectivity requirements to an interconnect product under design. The assembly or assemblies for which the interconnect is originally designed to help compose constitutes an optional part of the requirements for the interconnect. The `Part_connected_terminals_definition` constitutes a definition of the required connections as seen from the exterior of the interconnect. The `Physical_node_requirement_to_implementing_component_allocation` is for use with `Printed_components` wherein the total functionality of the interconnect includes complex functionality (e.g., printed filters).

The following application objects are used by the `interconnect_functional_requirement_allocation` UoF:

- `Assembly_module`;
- `Connectivity_allocation_to_physical_network`;
- `Interconnect_module`;
- `Part_connected_terminals_definition`;
- `Physical_component_terminal`;
- `Physical_node_requirement_to_implementing_component_allocation`;
- `Test_requirement_allocation`.

4.1.57 **interconnect_interface_component**

The `interconnect_interface_component` UoF defines the information needed to describe the component that acts as a connector that provides external electrical access to an interconnect. The items' position in the interconnect substrate, and the specification that dictates the selection and placement are included.

The following application objects are used by the `interconnect_interface_component` UoF:

- `Ee_specification`;
- `Physical_component_terminal`;
- `Printed_connector_component`.

4.1.58 **interconnect_marking**

The `interconnect_marking` UoF defines the information needed to apply identification information, using material, to an interconnect. The content of the information is under configuration control. The scope of this UoF is for interconnect definitions.

The following application objects are used by the `interconnect_marking` UoF:

- `Configuration_controlled_message`;
- `Ee_specification`;
- `Marking`.

4.1.59 **interconnect_module_connection_routing**

The `interconnect_module_connection_routing` UoF defines the information needed to describe the electrical design requirements for the conductive elements associated with an interconnect substrate. The information contains specific topological requirements data, and user defined property data related to elements associated with the topological requirements data. The information needed to describe the resulting design is included. The `Physical_connectivity_definition` is in the scope of the `Physical_unit_network_definition` so as to not require a dummy `Assembly_module`.

EXAMPLE 1 Geometric trace layout data arranged in ordered trees is this type of information. Note that the context for the tree data is the assembly context and not the internal layout. The mapping between the two is accomplished with the `Junction_vertex_allocation` AO.

The following application objects are used by the `interconnect_module_connection_routing` UoF:

- `Conductive_interconnect_element_terminal_link`;
- `Connection_zone_based_fabrication_joint`;
- `Dependently_located_layer_connection_point`;
- `Dielectric_crossover_area`;
- `Explicitly_located_layer_connection_point`;
- `Fabrication_joint`;
- `Inter_stratum_join_implementation`;
- `Inter_stratum_join_relationship`;
- `Intra_stratum_join_relationship`;
- `Join_relationship`;
- `Junction_vertex_allocation`;
- `Layer_connection_point`;
- `Layer_connection_point_link`;
- `Partially_routed_physical_network`;
- `Physical_component_terminal`;
- `Physical_connectivity_abstraction_map`;
- `Physical_connectivity_definition`;
- `Physical_connectivity_definition_relationship`;
- `Physical_connectivity_element`;
- `Physical_connectivity_structure_definition`;
- `Physical_network`;
- `Physical_network_supporting_inter_stratum_feature`;

- Physical_network_supporting_stratum_feature_conductive_join;
- Physical_unit_network_definition;
- Stratum_concept_relationship;
- Stratum_feature_conductive_join;
- Topological_junction;
- Unrouted_join_relationship.

4.1.60 interconnect_module_design

The interconnect_module_design UoF defines the information needed to describe the required physical design data for an interconnect substrate. The information includes stackup, conductive patterns, feature tolerances, design intent, interface feature design, plated and unplated passages, various forms of cutout and edge treatments, and traceability capability from design features back to design intent. Various design definitions may exist for the same interconnect module depending on the discipline and enterprise perspective.

The following application objects are used by the interconnect_module_design UoF:

- Adjacent_stratum_surface_definition;
- Adjacent_stratum_surface_embedded_component_surface_definition;
- Array_placement_group;
- Assembly_component;
- Assembly_composition_relationship;

- Via_terminal.

4.1.61 interconnect_module_edge

The interconnect_module_edge UoF defines the information needed to describe the outer edge of the interconnect substrate in a design view.

The following application objects are used by the interconnect_module_edge UoF:

- Edge_segment_vertex;
- Interconnect_module_edge;
- Interconnect_module_edge_segment;
- Partially_plated_interconnect_module_edge;
- Physical_component_terminal;
- Plated_interconnect_module_edge;
- Plated_interconnect_module_edge_segment.

4.1.62 interconnect_module_usage_view

The interconnect_module_usage_view UoF defines the information needed to describe the interface definition of the interconnect substrate. This view may be used for the purpose of simulation and verifying the mechanical fit of the interconnect substrate when installed in the next level of assembly.

The following application objects are used by the interconnect_module_usage_view UoF:

- Edge_segment_vertex;
- Interconnect_module_cavity_surface;

- Interconnect_module_cutout_segment_surface;
- Interconnect_module_cutout_surface;
- Interconnect_module_edge_segment_surface;
- Interconnect_module_edge_surface;
- Interconnect_module_interface_terminal;
- Interconnect_module_join_terminal;
- Interconnect_module_primary_surface;
- Interconnect_module_secondary_surface;
- Interconnect_module_stratum_based_terminal;
- Interconnect_module_surface_feature;
- Interconnect_module_terminal;
- Interconnect_module_terminal_surface_constituent_relationship;
- Interconnect_module_usage_view;
- Located_interconnect_module_thickness_requirement;
- Pcb_usage_view.

4.1.63 interconnect_physical_requirement_allocation

The interconnect_physical_requirement_allocation UoF describes the assignment of customer, regulatory agency, and enterprise requirements to an interconnect product under design. These requirements may be assigned to physical items, geometric features, or conceptual items that are used in various phases of the design process.

The following application objects are used by the interconnect_physical_requirement_allocation UoF:

- Assembly_requirement_allocation;
- Assembly_separation_requirement_allocation;
- Electromagnetic_compatibility_requirement_allocation;
- Layout_land_width_tolerance_requirement_occurrence;

- Layout_line_width_tolerance_requirement_occurrence;
- Physical_component_terminal;
- Requirement_allocation;
- Shield_allocation;
- Specification_allocation;
- Thermal_isolation_requirement_assignment;
- Thermal_requirement_allocation.

4.1.64 interconnect_placement_requirements

The interconnect_placement_requirements UoF defines the information needed to describe the constraints restricting where components are to be placed in an Interconnect_module. These restrictions may be component category to board feature category or component category to component category or board feature category to board feature category related. Data that refers to assembly is included in order to support embedded components only, where those components are assembled during the substrate fabrication process.

The following application objects are used by the interconnect_placement_requirements UoF:

- Component_external_reference;
- Component_feature_external_reference;
- Component_group_assignment;
- Component_placement_restriction_assignment;
- Interconnect_module_component_surface_feature;
- Interconnect_module_constraint_region;
- Item_restricted_requirement_occurrence;
- Layer_qualified_layout_spacing_requirement_occurrence;
- Layout_spacing_requirement_non_conforming_design_object;
- Layout_spacing_requirement_occurrence;
- Mounting_restriction_area;

- Mounting_restriction_volume;
- Physical_component_terminal;
- Placement_group;
- Placement_group_area_assignment;
- Placement_group_volume_assignment.

4.1.65 interconnect_shape

The interconnect_shape UoF defines the information needed to describe explicit geometric models used in the design process for an interconnect substrate. This UoF permits the type of geometric representation for a library item to be different than the type of geometric representation of an instance in the design.

The following application objects are used by the interconnect_shape UoF:

- Assembly_component_2d_shape;
- Assembly_component_3d_shape;
- Assembly_component_non_planar_shape;
- Bond_assembly_position;
- Component_2d_edge_location;
- Component_2d_embedded_location;
- Component_2d_location;
- Component_3d_location;
- Component_assembly_2d_position;
- Component_assembly_3d_position;
- Component_assembly_non_planar_position;
- Component_non_planar_location;
- Component_part_2d_geometric_representation_relationship;
- Component_part_2d_non_planar_geometric_representation_relationship;

- Component_part_3d_geometric_representation_relationship;
- Design_intent_modification_3d_position;
- Design_intent_modification_3d_shape;
- Design_intent_modification_non_planar_2d_shape;
- Design_intent_modification_planar_position;
- Design_intent_modification_planar_shape;
- Design_intent_modification_styled_area_representation;
- Design_view_connection_zone_position_relationship;
- Design_view_terminal_component_shape_relationship;
- Open_shell_based_surface;
- Physical_component_terminal;
- Stratum_3d_shape;
- Stratum_average_surface_shape;
- Stratum_feature_3d_shape;
- Stratum_feature_non_planar_2d_shape;
- Stratum_feature_planar_shape;
- Stratum_feature_shape_stratum_average_surface_shape_relationship;
- Stratum_feature_shape_stratum_surface_shape_relationship;
- Stratum_feature_styled_area_representation;
- Stratum_planar_shape;
- Stratum_surface_in_stratum_3d_position;
- Stratum_surface_shape.

4.1.66 laminate_assembly_design

The laminate_assembly_design UoF defines the information needed to describe the laminate product resulting from the adjacent surface to surface bonding between laminate components. The usage of Assembly_joint in this UoF is to allow specification of the sequential arrangement of materials.

EXAMPLE 1 This design data may be used during a concurrent engineering process where one side is viewing the design as an arrangement of Stratum in the entire interconnect design and the other side is viewing the design as an arrangement of laminates.

The following application objects are used by the laminate_assembly_design UoF:

- Assembly_joint;
- Component_mating_constraint_condition;
- Interconnect_module;
- Interconnect_module_component;
- Interconnect_module_component_surface_feature;
- Next_higher_assembly_relationship;
- Physical_component_terminal;
- Promissory_usage_in_product_model_relationship;
- Promissory_usage_relationship.

4.1.67 land

The land UoF defines the information required to partially specify certain interconnect substrate features. These items are defined to support attachments for mating components in the electronic assembly. The items are not necessarily themselves visually distinguishable in the material in the interconnect substrate.

The following application objects are used by the land UoF:

- Component_termination_passage_and_contact_size_dependent_land;
- Component_termination_passage_and_contact_size_dependent_non_functional_land;
- Component_termination_passage_dependent_land;
- Component_termination_passage_dependent_non_functional_land;

- Contact_size_dependent_land;
- Contact_size_dependent_non_functional_land;
- Land;
- Non_functional_land;
- Unsupported_passage_dependent_non_functional_land;
- Via_and_contact_size_dependent_land;
- Via_and_contact_size_dependent_non_functional_land;
- Via_dependent_land;
- Via_dependent_non_functional_land.

4.1.68 library_item

The library_item UoF defines the information needed to describe the generic items that may be configuration managed at a level appropriate for inclusion in a library. Items in a library are incorporated into many designs without actively tracking which designs incorporate the items. These items are readily available to any enterprise; however, the amount of descriptive information varies between enterprises. The property values may vary between enterprises.

The following application objects are used by the library_item UoF:

- Library_ee_product_definition.

4.1.69 manufacturing_technology

The manufacturing_technology UoF defines the information needed to describe the properties of the fabrication technology selected for the interconnect substrate being designed.

The following application objects are used by the manufacturing_technology UoF:

- Component_termination_passage_template;
- Counterbore_passage_template;
- Countersunk_passage_template;
- Default_attachment_size_and_component_termination_passage_based_land_physical_template;

- Default_attachment_size_and_via_based_land_physical_template;
- Default_attachment_size_based_land_physical_template;
- Default_component_termination_passage_based_land_physical_template;
- Default_component_termination_passage_definition;
- Default_land_physical_template;
- Default_passage_based_land_physical_template;
- Default_unsupported_passage_based_land_physical_template;
- Default_unsupported_passage_definition;
- Default_via_based_land_physical_template;
- Default_via_definition;
- Dependent_material_removal_feature_template;
- Design_layer_technology;
- Documentation_layer_technology;
- Fabrication_technology_specification;
- Inter_stratum_feature_template;
- Land_physical_template;
- Land_template_interface_terminal;
- Land_template_join_terminal;
- Land_template_terminal;
- Line_width_class;
- Passage_technology;
- Stratum_technology;
- Unsupported_passage_template;
- Via_template.

4.1.70 material_product

The material_product UoF defines the information needed to describe the materials that compose an item. The association between specific materials used during the manufacturing process of the interconnect substrate are also described, in addition to any components that are part of the interconnect substrate manufacturing process. Material product categories may be described in addition to material properties. Bulk material callout is supported, as well as generic callout on engineering design definitions.

NOTE To form a material assembly, this edition of the standard relies on Assembly_composition_relationship but since this UoF does not exclusively support a Conformance Class and Conformance Classes that reference this UoF already call out that Application Object, that Application Object is not included in this UoF.

The following application objects are used by the material_product UoF:

- Ee_material;
- Ee_product_category;
- Ee_product_category_relationship;
- Ee_product_related_product_category;
- Material_composition_relationship;
- Material_definition.

4.1.71 non_topological_surface

The non_topological_surface UoF describes the representation of the shape of a product using surface geometry without topology. These representations are formed only by the use of points, curves, and surfaces. The boundaries of the surfaces are defined by curves on the surfaces and by explicit association between curves and surfaces they bound. Surfaces and curves shall be explicitly trimmed unless they are closed.

The following application objects are used by the non_topological_surface UoF:

- Geometrically_bounded_surface.

4.1.72 package

The package UoF defines the information needed to describe the package of a component that is part of the assembly. The shape of the component both as purchased and as delivered to a customer are provided. A common identifier for the shape of the package and placement orientation alignment information between 2 dimensional and 3 dimensional models are also provided. The information needed to allow industry or enterprise groups to populate explicit models and define associated properties and associated categories for standard packages and their versions is provided.

The following application objects are used by the package UoF:

- Altered_package;
- Altered_package_terminal;
- Connection_zone_interface_plane_relationship;
- Fiducial_part_feature;
- Guided_wave_terminal;
- Length_trimmed_terminal;
- Package;
- Package_body;
- Package_body_bottom_surface;
- Package_body_edge_segment_surface;
- Package_body_edge_surface;
- Package_body_surface;
- Package_body_top_surface;
- Package_terminal;
- Package_terminal_surface_constituent_relationship;
- Part_tooling_feature;
- Polarity_indication_feature;
- Primary_orientation_feature;
- Primary_reference_terminal;
- Seating_plane;
- Secondary_orientation_feature;
- Shape_formed_terminal;

- Surface_prepped_terminal;
- Tertiary_orientation_feature;
- Test_point_part_feature;
- Wire_terminal.

4.1.73 packaged_part_black_box_model

The packaged_part_black_box_model UoF defines the information necessary to describe a product as a part for the next level of assembly. The inner structure of this part isn't visible by the electronic assembly designer. This UoF defines the information necessary to describe the product terminals that are directly connected for the purposes of normal usage.

EXAMPLE 1 All terminals that are to be connected to a certain power supply voltage may be specified by use of the information defined in this UoF.

NOTE When an enterprise designs a part specifically for use on an electronic assembly, this allows the designer of the electronic assembly to have just enough information to use that part, like any other part, in the design process of the electronic assembly.

The following application objects are used by the packaged_part_black_box_model UoF:

- Altered_packaged_part;
- Packaged_connector;
- Packaged_connector_terminal_relationship;
- Packaged_part;
- Packaged_part_interface_terminal;
- Packaged_part_join_terminal;
- Packaged_part_terminal;
- Part_connected_terminals_definition.

4.1.74 packaged_part_terminal_analytical_representation

The packaged_part_terminal_analytical_representation UoF defines the information needed to associate unique behavioural data for each specific terminal to support computer-based experimentation that explicitly includes terminal effects. The specific context of this UoF is that the individual terminal is treated as a separate model for analysis purposes. Each Application object type referenced in this UoF is allocating the analysis port to the external feature or is allocating the analysis port to the internal feature. Each discipline may have a different analytical representation of a product design. For higher fidelity, reference the connection_zone_to_analytical_model_port_mapping UoF or a datum_difference related UoF since those UoFs more detailed modeling capabilities.

NOTE This UoF is only appropriate in the context of a so-called white box model.

The following application objects are used by the packaged_part_terminal_analytical_representation UoF:

- Part_device_terminal_model_port_assignment;
- Part_feature_model_port_assignment.

4.1.75 packaged_part_white_box_model

The packaged_part_white_box_model UoF defines the information necessary to describe a product for use by analysts for evaluation of properties as part of the next level of assembly. Some portion of the inner structure of the part is visible by analysts. Users may define properties at a level of accuracy required to support enterprise or standard analysis requirements.

NOTE This capability is typically used where the packaged parts are complex and are also primary sources of assembly failures. This information is not a description of multi-level hierarchical design definitions. This information may be used where off-the-shelf products are used where only critical information is conveyed.

EXAMPLE 1 The use of this information for analyzing purchased MCMs is typical.

The following application objects are used by the packaged_part_white_box_model UoF:

- Connection_zone_interface_plane_relationship;
- Connection_zone_model_port_assignment;
- Device_2d_position;
- Device_3d_position;
- Device_terminal_map;
- Device_terminal_map_relationship;

- Packaged_connector_terminal_relationship;
- Packaged_part;
- Packaged_part_interface_terminal;
- Packaged_part_join_terminal;
- Part_connected_terminals_definition;
- Part_device;
- Part_device_terminal;
- Part_device_terminal_model_port_assignment;
- Part_feature_model_port_assignment;
- Usage_view_connection_zone_terminal_shape_relationship.

4.1.76 part_feature

The part_feature UoF defines the information needed to describe the distinctive aspects of separately manufactured products included in the design. Explicit models of the aspects may be combined in the explicit model for the products. Classification of feature functionality is supported, with several predefined functions provided.

The following application objects are used by the part_feature UoF:

- Edge_segment_vertex;
- Feature_group_relationship;
- Fiducial_part_feature;
- Interconnect_module_cavity_surface;
- Interconnect_module_cutout_segment_surface;
- Interconnect_module_cutout_surface;
- Interconnect_module_edge_segment_surface;
- Interconnect_module_edge_surface;
- Interconnect_module_primary_surface;

- Interconnect_module_secondary_surface;
- Interconnect_module_surface_feature;
- Interconnect_module_terminal_surface_constituent_relationship;
- Part_array_feature;
- Part_feature;
- Part_feature_placement_link;
- Part_group_feature;
- Part_interface_access_feature;
- Part_linear_array_feature;
- Part_linear_array_feature_link;
- Part_mating_feature;
- Part_mounting_feature;
- Part_rectangular_array_feature;
- Part_terminal;
- Part_tooling_feature;
- Polarity_indication_feature;
- Primary_orientation_feature;
- Primary_reference_terminal;
- Secondary_orientation_feature;
- Tertiary_orientation_feature;
- Test_point_part_feature;
- Thermal_feature;
- Usage_concept_usage_relationship;
- Usage_view_connection_zone_terminal_shape_relationship.

4.1.77 **part_feature_to_analytical_model_port_mapping**

The `part_feature_to_analytical_model_port_assignment` UoF defines the information needed to associate a specific feature of a physical unit with an analytical model port to support computer-based experimentation. The consequence is that the UoF defines the information needed to associated a physical unit with a specific behaviour.

The following application objects are used by the `part_feature_to_analytical_model_port_mapping` UoF:

- `Analytical_representation`;
- `Part_feature_model_port_assignment`.

4.1.78 **part_template**

The `part_template` UoF defines the information necessary to describe the different types of templates. These templates provide the shape and other property information for the feature to be used in the design of the interconnect substrate. These templates reference a `Template_definition` for the purposes of identification.

The following application objects are used by the `part_template` UoF:

- `Connection_zone_map_identification`;
- `Default_trace_template`;
- `Design_layer_type_specific_padstack_definition`;
- `Electrical_isolation_removal_template`;
- `Footprint_definition`;
- `Layout_macro_definition_terminal_to_usage_terminal_assignment`;
- `Layout_macro_floor_plan_template`;
- `Material_addition_feature_template`;
- `Material_removal_feature_template`;
- `Padstack_definition`;
- `Padstack_location_in_footprint_definition`;
- `Part_template`;

- Part_template_location_in_padstack_definition;
- Part_text_template;
- Special_symbol_part_template;
- Stratum_feature_template;
- Stratum_occurrence_specific_padstack_definition;
- Stratum_type_independent_padstack_definition;
- Template_definition;
- Template_stratum_assignment;
- Thermal_isolation_removal_template;
- Trace_template;
- Usage_concept_usage_relationship.

4.1.79 part_template_shape

The part_template_shape UoF defines the information needed to describe explicit geometric models used as templates in the design process for an electronic assembly or for an interconnect substrate. This UoF defines the information needed to associate the 2 dimensional and 3 dimensional geometric representation of the layout templates in order to state that they are consistent.

The following application objects are used by the part_template_shape UoF:

- Footprint_definition_shape;
- Padstack_definition_shape;
- Padstack_location_in_footprint_definition_transform;
- Part_template_3d_keepout_shape;
- Part_template_3d_shape;
- Part_template_location_in_padstack_definition_transform;
- Part_template_non_planar_2d_shape;
- Part_template_or_physical_unit_2d_shape_representation_relationship;

- Part_template_or_physical_unit_3d_shape_representation_relationship;
- Part_template_planar_keepout_shape;
- Part_template_planar_shape.

4.1.80 physical_network

The physical_network UoF defines the information needed to describe the internal topological definition used as an explicit requirement in the design of the interconnect substrate. This internal topological definition is a result of mapping the external connection requirements defined in the interconnect_functional_requirement_allocation UoF to the interconnect design view.

The following application objects are used by the physical_network UoF:

- Partially_routed_physical_network;
- Physical_component_terminal;
- Physical_network.

4.1.81 physical_unit

The physical_unit UoF defines the information necessary to describe a product that may be an electronic assembly, or be used in an electronic assembly, or be used in the design of an electronic assembly. The physical_unit UoF defines the information necessary to describe a product that may be an interconnect product, or be used in an interconnect product, or be used in the design of an interconnect product. The information shall at least describe how the product may be used as a component but, may also encompass all the information required to reproduce the item. The information may also include information necessary to categorize the product or product versions for part selection activities. The information may also include information for parts that are purely mechanical in function.

The following application objects are used by the physical_unit UoF:

- Ee_product_category;
- Ee_product_category_relationship;
- Ee_product_related_product_category;
- Ee_product_specific_parameter_value_assignment;
- Physical_unit;
- Physical_unit_design_view;

- Physical_unit_relationship;
- Physical_unit_usage_view;
- Technology;
- Usage_concept_usage_relationship.

4.1.82 physical_unit_analytical_representation

The physical_unit_analytical_representation UoF defines the information needed to associate specific data for a physical unit with an analytical model to support computer-based experimentation. Each discipline may have a different physical unit analytical representation. Direct specification of the mapping to a connection area on the terminal of the product concepts under investigation is provided.

The following application objects are used by the physical_unit_analytical_representation UoF:

- Analytical_representation;
- Connection_zone_model_port_assignment;
- Part_feature_model_port_assignment.

4.1.83 physical_unit_shape

The physical_unit_shape UoF defines the information needed to describe explicit geometric models used in the design process for an electronic assembly or for an interconnect substrate. This UoF permits different types of geometric representation for the shape of the physical units and synchronization of the shapes with different dimensionality.

The following application objects are used by the physical_unit_shape UoF:

- Part_template_or_physical_unit_2d_shape_representation_relationship;
- Part_template_or_physical_unit_3d_shape_representation_relationship;
- Physical_unit_3d_keepout_shape;
- Physical_unit_3d_shape;
- Physical_unit_planar_keepout_shape;
- Physical_unit_planar_shape.

4.1.84 **planned_characteristic**

The `planned_characteristic` UoF defines the information that captures design intent properties. This design intent is based upon the manufacturing capabilities, product design structure, and component characteristics. This UoF defines the information that captures properties that are the result of experimental evaluation of the product definition in the product's intended use or in a manufacturing environment.

The following application objects are used by the `planned_characteristic` UoF:

- `Evaluated_characteristic`;
- `Evaluation_ee_product_definition`;
- `Planned_characteristic`;
- `Rule_based_evaluated_characteristic`.

4.1.85 **planned_effectivity**

The `planned_effectivity` UoF defines the information needed to describe under what circumstances a configuration change is to occur. The effectivity may be based on either the manufacturing cycle, or a time period, or a given quantity, or a range of individual products.

EXAMPLE 1 A planned-effectivity would be the time period between two dates.

The following application objects are used by the `planned_effectivity` UoF:

- `Planned_date_effectivity`;
- `Planned_effectivity`;
- `Planned_lot_effectivity`;
- `Planned_serial_number_effectivity`.

4.1.86 **printed_part_template**

The `printed_part_template` UoF defines the information needed to describe the definition of a printed component. Support is provided for both microwave and non-microwave design. Functionality is assigned in the definition. This UoF defines the information needed to describe the terminals that are directly connected internally in the printed component.

The following application objects are used by the printed_part_template UoF:

- Non_conductive_cross_section_template;
- Physical_component_terminal;
- Printed_connector_template;
- Printed_connector_template_terminal_relationship;
- Printed_part_cross_section_template;
- Printed_part_cross_section_template_terminal;
- Printed_part_template;
- Printed_part_template_connected_terminals_definition;
- Printed_part_template_interface_terminal;
- Printed_part_template_join_terminal;
- Printed_part_template_link;
- Printed_part_template_material;
- Printed_part_template_material_link;
- Printed_part_template_terminal;
- Printed_part_template_terminal_relationship;
- Stratum_technology_link;
- Template_material_cross_section_boundary;
- Usage_concept_usage_relationship.

4.1.87 product_identification

The product_identification UoF describes the structure through which a product, product categories, unique versions of a product, and different design discipline views of a product may be defined. This part of ISO 10303 does not rely solely on the relationship between design discipline view of a product and the product version to establish relationships between design discipline views but provides explicit models of the desired relationships in order to meet domain requirements(e.g., one functional product model may define the functionality of many physical products).

The following application objects are used by the product_identification UoF:

- Ee_product;
- Ee_product_category;
- Ee_product_category_relationship;
- Ee_product_definition;
- Ee_product_related_product_category;
- Ee_product_specific_parameter_value_assignment;
- Ee_product_version;
- Ee_product_version_supersedence;
- Externally_defined_ee_product_definition;
- Product_association.

4.1.88 product_requirement_allocation

The product_requirement_allocation UoF describes the assignment of customer, regulatory agency, and enterprise requirements to a product. These requirements may be assigned to products or configuration items or product versions in various phases of the design process.

The following application objects are used by the product_requirement_allocation UoF:

- Requirement_allocation.

4.1.89 product_rule

The product_rule UoF defines the information needed to describe design constraints, commonly referred to as rules. The information describes the rule's relationship to product characteristics, formal description of the functions that embody the rule, in addition to the configuration management aspects applied to the rule. The configuration management information supports rule version control and supports a formal process to making changes to an existing rule. A rule is an Ee_product.

The following application objects are used by the product_rule UoF:

- Ee_product;
- Ee_rule_complex_clause;

- Ee_rule_conclusion_definition;
- Ee_rule_definition;
- Ee_rule_function;
- Ee_rule_premise_definition;
- Ee_rule_simple_clause;
- Ee_rule_version;
- Participant_date_and_time_assignment;
- Rule_action;
- Rule_adoption;
- Rule_change_request;
- Rule_creation;
- Rule_expiration;
- Rule_justification;
- Rule_modification;
- Rule_priority;
- Rule_rejection;
- Rule_request;
- Rule_set;
- Rule_set_group;
- Rule_submission;
- Rule_supersedence.

4.1.90 requirement_decomposition

The requirement_decomposition UoF defines the information needed to describe the structure of a requirement, including any explicit combinatorial relationship between requirements helping to compose a requirement, and any dependencies upon other requirements.

The following application objects are used by the requirement_decomposition UoF:

- Constraint_occurrence;
- Design_characteristic_occurrence;
- Design_requirement_occurrence;
- Ee_product_definition_based_constraint_occurrence;
- Ee_requirement_occurrence;
- Electrical_requirement_occurrence;
- Electromagnetic_requirement_occurrence;
- Fabrication_thickness_requirement_occurrence;
- Inspection_requirement_occurrence;
- Layout_land_width_tolerance_requirement_occurrence;
- Layout_line_width_tolerance_requirement_occurrence;
- Material_electrical_conductivity_requirement_occurrence;
- Mechanical_requirement_occurrence;
- Operational_requirement_occurrence_relationship;
- Purpose_occurrence;
- Requirement_composition;
- Requirement_definition;
- Requirement_group_occurrence;
- Rule_based_constraint_occurrence;

- Shape_and_ee_product_definition_based_constraint_occurrence;
- Test_requirement_occurrence;
- Thermal_requirement_occurrence.

4.1.91 sequential_laminate_assembly_design

The sequential_laminate_assembly_design UoF defines the information needed to describe the laminate product resulting from the adjacent surface to surface bonding between laminate components. The sequential_laminate_assembly_design UoF also defines the information needed to describe a multi-layer connection in the laminate assembly where the layers are not adjacent. This description uses Interconnect_module, Interconnect_module_component_stratum_based_terminal, and Interconnect_module_product_assembly_view_fabrication_joint.

EXAMPLE 1 This design data may be used during a concurrent engineering process where one side is viewing the design as an arrangement of Stratum in the entire interconnect design and the other side is viewing the design as an arrangement of laminates.

EXAMPLE 2 This design data may be used during a concurrent engineering process where one side is viewing the design as the entire interconnect substrate, and the other side is viewing only the data required to determine the connections at one level of laminate assembly. Since the bonds in the laminate assembly are associated with occurrences of Interconnect_module_stratum_based_terminal, the enterprise responsible for the entire design may populate Part_connected_terminals_definition from the functional_specification UoF to define to the lower level design team the required connectivity for the laminate assembly at the lower level.

NOTE Fabrication technology capability will limit the number of lower level bonds actually associated to each Interconnect_module_product_assembly_view_fabrication_joint, but this part of ISO 10303 does not preclude any specific fabrication technology. Cutout and other Inter_stratum_feature are not within the scope of the sequential_laminate_assembly_design UoF as they directly depend on Stratum which is not included in this UoF.

The following application objects are used by the sequential_laminate_assembly_design UoF:

- Assembly_material_composition_relationship;
- Interconnect_module;
- Interconnect_module_component;
- Interconnect_module_component_stratum_based_terminal;
- Interconnect_module_component_surface_feature;
- Interconnect_module_product_assembly_view_fabrication_joint;
- Interconnect_module_stratum_based_terminal;

- Next_higher_assembly_relationship;
- Physical_component_terminal;
- Promissory_usage_in_product_model_relationship;
- Promissory_usage_relationship.

4.1.92 shape

The shape UoF defines the information needed to describe explicit geometric models used in the design process for an electronic assembly or for an interconnect substrate.

The following application objects are used by the shape UoF:

- Axis_placement;
- Axis_placement_2d;
- Axis_placement_3d;
- Boolean_csg_result;
- Bound_volume_shape;
- Bounding_curve;
- Cartesian_coordinate_system;
- Cartesian_point;
- Cartesian_transformation_operator_2d;
- Circular_area;
- Closed_curve;
- Composite_curve;
- Composite_curve_segment;
- Connection_zone;
- Csg_2d_shape;
- Curve;

- Direction;
- Elliptic_area;
- Externally_defined_hatch_style;
- Externally_defined_tile;
- Externally_defined_tile_style;
- Feature_shape_definition;
- Fill_area;
- Fill_area_occurrence;
- Fill_area_style;
- Fill_area_style_hatching;
- Fill_area_style_tile;
- Fill_area_style_tile_curve_with_style;
- Fill_area_style_tile_solid_region;
- Fill_area_style_tile_symbol_with_style;
- Geometric_representation_relationship;
- Manifold_subsurface_shape;
- Non_feature_shape_definition;
- Planar_projected_shape;
- Planar_shape;
- Polygonal_area;
- Pre_defined_datum_axis_3d_symbol;
- Pre_defined_datum_plane_3d_symbol;
- Pre_defined_parallel_datum_axis_2d_symbol;

- Pre_defined_parallel_datum_axis_symbol_3d_2d_relationship;
- Pre_defined_perpendicular_datum_axis_2d_symbol;
- Pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship;
- Pre_defined_perpendicular_datum_plane_2d_symbol;
- Pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship;
- Primitive_2d;
- Rectangular_area;
- Shape_composition_relationship;
- Shape_definition;
- Shape_item;
- Solid_fill_style;
- Trimmed_line;
- Vector;
- View_level_non_feature_shape_definition;
- Volume_shape_intersection;
- Volume_shape_plane_projection;
- Volume_shape_point_projection.

4.1.93 signal

The signal UoF defines the information needed to describe properties of an electrical physical phenomenon. This physical phenomenon property may be a simple instance or a composition of many simple instances.

The following application objects are used by the signal UoF:

- Characteristic_data_set;
- Characteristic_data_table;

- Composite_signal_property;
- Composite_signal_property_relationship;
- Signal;
- Signal_property.

4.1.94 solid_of_linear_extrusion

The solid_of_linear_extrusion UoF defines the information needed to describe a volumetric shape defined through the process of sweeping a planar surface over a specified distance.

The following application objects are used by the solid_of_linear_extrusion UoF:

- Solid_of_linear_extrusion.

4.1.95 source_control

The source_control UoF defines the information needed to describe an organization that is qualified to produce a particular product.

The following application objects are used by the source_control UoF:

- Certification;
- Organization;
- Supplied_product_version.

4.1.96 stratum

The stratum UoF defines the information needed to describe the individual layers of the interconnect substrate as they occur in the design definition. Various design definitions may exist for the same interconnect substrate, depending on the discipline and enterprise perspective.

The following application objects are used by the stratum UoF:

- Design_layer_stratum;
- Documentation_layer_stratum;
- Layer;
- Stratum;

- Stratum_average_surface;
- Stratum_surface;
- Stratum_technology.

4.1.97 stratum_feature

The stratum_feature UoF defines the information needed to describe the geometric shape of material features used to compose each stratum in an interconnect substrate. Location information is included in the description, in addition to the association to constraints placed upon the design. The stratum feature UoF defines the information needed to describe the sequentially ordered changes from an original or base-line feature design intent to a present feature design. Changes in feature material, either removal or addition, may be described, in addition to the nature of the requirement for the feature modification, either for electrical or thermal isolation. Design intent priority may be assigned to stratum features to constrain the extent of changes.

The following application objects are used by the stratum_feature UoF:

- Design_intent_modification;
- Design_intent_modification_3d_position;
- Design_intent_modification_planar_position;
- Design_intent_modification_sequence;
- Electrical_isolation_removal_structure;
- Filled_area_material_removal_structure;
- Material_addition_feature;
- Material_removal_feature;
- Material_shape_modification;
- Physical_component_terminal;
- Stratum_feature;
- Stratum_feature_in_stratum_3d_position;
- Stratum_feature_in_stratum_planar_position;
- Thermal_isolation_removal_structure.

4.1.98 stratum_position

The stratum_position UoF defines the information needed to describe where the stratum is located and its orientation with respect to the coordinate system of the interconnect substrate. The position supports either a three-dimensional coordinate system or a two-dimensional coordinate system.

The following application objects are used by the stratum_position UoF:

- Adjacent_stratum_surface_definition;
- Adjacent_stratum_surface_embedded_component_surface_definition;
- Interconnect_module_stratum_assembly_relationship;
- Stratum_interconnect_module_3d_position;
- Stratum_interconnect_module_planar_position.

4.1.99 styled_curve

The styled_curve UoF defines the information needed to describe the geometric properties of material as constrained by a shape. The shape information included is parametric, and path based, rather than an explicit closed curve model.

The following application objects are used by the styled_curve UoF:

- Curve_style;
- Curve_style_font;
- Curve_style_font_and_scaling;
- Externally_defined_curve_font;
- Solid_curve;
- Styled_curve_occurrence.

4.1.100 styled_text

The styled_text UoF defines the information needed to describe the appearance of material included in an interconnect substrate for conveying textual information to the reader.

The following application objects are used by the styled_text UoF:

- Font_definition;
- Registered_font;
- Styled_text.

4.1.101 test_probe

The test_probe UoF defines the information needed to describe the shape and location of a feature that is used to facilitate functional testing and analysis of an electronic assembly, or an interconnect substrate.

The following application objects are used by the test_probe UoF:

- Internal_probe_access_area;
- Probe_access_area.

4.1.102 wireframe_2d_model_with_topology

The wireframe_2d_model_with_topology UoF defines the information needed to describe the representation of the shape of a product by wireframes in 2 dimensions that are defined by edge or shell topology. This includes 2D curves and topology.

The following application objects are used by the wireframe_2d_model_with_topology UoF:

- Edge_based_2d_wireframe;
- Shell_based_2d_wireframe.

4.1.103 wireframe_with_topology

The wireframe_with_topology UoF defines the information needed to describe the representation of the shape of a product by wireframes that are defined by edge or shell topology. This includes 3D curves and topology.

The following application objects are used by the wireframe_with_topology UoF:

- Edge_based_wireframe;
- Shell_based_wireframe.

4.2 Application objects

This subclause specifies the application objects for the electronic assembly, interconnect, and packaging design application protocol. Each application object is an atomic element that embodies a unique application concept and contains attributes specifying the data elements of the object. The application objects and their definitions are given below.

NOTE 1 This part of ISO 10303 describes the constraints on an application object in this clause in a form meant for domain users. Some of the constraints on an application objects are restated in clause 4.3 in a form meant for application developers.

NOTE 2 The syntax "application_object.name" represents the identifier for the attribute of the specified application object.

NOTE 3 The application objects may be related to other application objects by type relations, under constraints defined in the application object. If the relationships to other application objects exist, the application object should be treated a part of an instance network where the rest of the network constrains the application object being considered.

4.2.1 Absorbed_dose_data_element

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Absorbed_dose_data_element is a

The data associated with an Absorbed_dose_data_element are the following:

— additional_data.

4.2.1.1 additional_data

Constraints:

UR1:

WR1: NOTE EXPRESS specification:

```
*)
ENTITY absorbed_dose_data_element
  SUBTYPE OF (data_element);
END_ENTITY; -- absorbed_dose_data_element

( *
```

4.2.2 Activity_data_element

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Activity_data_element is a

The data associated with an Activity_data_element are the following:

— additional_data.

4.2.2.1 additional_data

Constraints:

UR1:

WR1: NOTE EXPRESS specification:

```
*)
ENTITY activity_data_element
  SUBTYPE OF (data_element);
END_ENTITY; -- activity_data_element

( *
```

4.2.3 Add_design_object_management_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Add_design_object_management_relationship is a type of Design_object_management_relationship (see 4.2.278).

NOTE Together with Change_design_object_management_relationship and Delete_design_object_management_relationship, Add_design_object_management_relationship supports the exchange of changes to a design by the use of a data set containing only (1) the information necessary to identify the design (e.g., an Ee_product_definition or an Ee_product_version), which is assumed to be already known to the receiving system, and (2) the design objects that have been added, changed, or deleted. Note that all the quality and structural requirements defined in this part of ISO 10303 may also apply to the resultant new design iteration.

The data associated with an Add_design_object_management_relationship are the following:

— current_design_object.

4.2.3.1 current_design_object

The current_design_object specifies the role of the Managed_design_object (see 4.2.524) for the Add_design_object_management_relationship.

Constraints:

UR1: The combination of the current_design inherited from the supertype Design_object_management_relationship and the current_design_object shall be unique within a population of Add_design_object_management_relationship.

NOTE EXPRESS specification:

```
*)
ENTITY add_design_object_management_relationship
  SUBTYPE OF (design_object_management_relationship);
  current_design_object : managed_design_object;
  UNIQUE
    UR1 : current_design_object, current_design;
END_ENTITY; -- add_design_object_management_relationship

(*
```

4.2.4 Adjacent_stratum_surface_embedded_component_surface_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Adjacent_stratum_surface_embedded_component_surface_definition is a type of Managed_design_object (see 4.2.524). An Adjacent_stratum_surface_embedded_component_surface_definition is a link in a sequence of stratum surfaces that result in the completed design. This link is not to another Stratum_surface but is instead to a surface of an Embedded_component. There may be multiple Adjacent_stratum_surface_embedded_component_surface_definition that reference the same stratum surface in the case where Stratum (see 4.2.845) are laterally adjacent. The use of Adjacent_stratum_surface_embedded_component_surface_definition in combination with the position in 2D space of the Embedded_component within the interconnect is sufficient to uniquely identify the 3D location of the Embedded_component.

The data associated with an Adjacent_stratum_surface_embedded_component_surface_definition are the following:

- name;
- precedent_item;
- subsequent_item.

4.2.4.1 name

The name specifies the string for the human-interpretable identifier for the Adjacent_stratum_surface_embedded_component_surface_definition.

4.2.4.2 precedent_item

The precedent_item specifies the previous Stratum_surface (see 4.2.868) or the Component_feature (see 4.2.118) for the Adjacent_stratum_surface_embedded_component_surface_definition.

4.2.4.3 subsequent_item

The subsequent_item specifies the previous Stratum_surface (see 4.2.868) or the Component_feature (see 4.2.118) for the Adjacent_stratum_surface_embedded_component_surface_definition.

Constraints:

UR1: The name shall be unique with a population of Adjacent_stratum_surface_embedded_component_surface_definition.

UR2: The combination of the precedent_item and the subsequent_item shall be unique within a population of Adjacent_stratum_surface_embedded_component_surface_definition.

WR1: The precedent_item shall be a secondary surface of a Stratum if the item is a Stratum_surface.

WR2: The subsequent_item shall be a primary surface of a Stratum if the item is a Stratum_surface.

NOTE EXPRESS specification:

```

*)
ENTITY adjacent_stratum_surface_embedded_component_surface_definition
SUBTYPE OF (managed_design_object);
    name : STRING;
    precedent_item : component_feature_or_stratum_surface;

4.2.5 Adjacent_stratum_surface_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Adjacent_stratum_surface_definition is a type of Managed_design_object (see 4.2.524). An Adjacent_stratum_surface_definition is a link in a sequence of stratum surfaces that result in the completed design. There may be multiple Adjacent_stratum_surface_definition that reference the same stratum surface in the case where Stratum (see 4.2.845) are laterally adjacent. The use of Adjacent_stratum_surface_definition in combination with the position in 2D space of the Stratum within the interconnect is sufficient to uniquely identify the 3D location of the Stratum.

The data associated with an Adjacent_stratum_surface_definition are the following:

- name;
- precedent_surface;
- subsequent_surface.

4.2.5.1 name

The name specifies the string for the human-interpretable identifier for the Adjacent_stratum_surface_definition.

4.2.5.2 precedent_surface

The precedent_surface specifies the previous Stratum_surface (see 4.2.868) for the Adjacent_stratum_surface_definition.

4.2.5.3 subsequent_surface

The subsequent_surface specifies the subsequent Stratum_surface (see 4.2.868) for the Adjacent_stratum_surface_definition.

Constraints:

UR1: The name shall be unique with a population of Adjacent_stratum_surface_definition.

UR2: The combination of the precedent_surface and the subsequent_surface shall be unique within a population of Adjacent_stratum_surface_definition.

WR1: The precedent_surface shall be a secondary surface of a Stratum.

WR2: The subsequent_surface shall be a primary surface of a Stratum.

NOTE EXPRESS specification:

```

*)
ENTITY adjacent_stratum_surface_definition
  SUBTYPE OF (managed_design_object);
    name          : STRING;
    precedent_surface : stratum_surface;
    subsequent_surface : stratum_surface;
  UNIQUE
    UR1 : name;
    UR2 : precedent_surface, subsequent_surface;
END_ENTITY; -- adjacent_stratum_surface_definition

( *
```

4.2.6 Advanced_b_rep

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Advanced_b_rep` is a type of `Bound_volume_shape` (see 4.2.76) that represents the shape of a part or an aspect of the shape of a part by an advanced boundary representation solid model. This representation allows for the curves and surfaces and the topology that binds them. Boundaries are explicitly defined only by topology. All of the geometry that defines the shape of a part or an aspect of the shape of a part must be associated with topology.

NOTE EXPRESS specification:

```
*)
ENTITY advanced_b_rep
  SUBTYPE OF (bound_volume_shape);
END_ENTITY; -- advanced_b_rep

( *
```

4.2.7 Aggregate_connectivity_requirement

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Aggregate_connectivity_requirement` is a type of `Managed_design_object` (see 4.2.524). An `Aggregate_connectivity_requirement` is the association between a set of one or more `Functional_unit_network_node_definition` (see 4.2.403) and one `Design_composition_path` (see 4.2.262) that ensures that the requirement for connectivity is maintained between the functional and the physical designs.

The data associated with an `Aggregate_connectivity_requirement` are the following:

- `connectivity_requirement`;
- `design_definition_path`.

4.2.7.1 connectivity_requirement

The `connectivity_requirement` specifies the role of the `Functional_unit_network_node_definition` (see 4.2.403) for the `Aggregate_connectivity_requirement`.

4.2.7.2 design_definition_path

The `design_definition_path` specifies the role of the `Design_composition_path` (see 4.2.262) for the `Aggregate_connectivity_requirement`.

Constraints:

UR1: The `design_definition_path` shall be unique within a population of `Aggregate_connectivity_requirement`s.

WR1: Each of the terminals that participate in a connectivity_requirement shall be reachable from any other terminal in the design_definition_path that is specified by the same connectivity_requirement.

NOTE Since the hierarchical product structure is represented in this part of ISO 10303 as a directed acyclic graph, the closure requirement is evaluated by traversing the combined graph including both product structure and nodal representation. There is an individual nodal representation for each node or level of the product structure.

NOTE EXPRESS specification:

```

*)
ENTITY aggregate_connectivity_requirement
  SUBTYPE OF (managed_design_object);
    connectivity_requirement : functional_unit_network_node_definition;
    design_definition_path   : design_composition_path_or_root;
  UNIQUE
    UR1 : design_definition_path, connectivity_requirement;
  WHERE
    WR1: NOT ('AP210_ARM.FUNCTIONAL_UNIT_NETWORK_DEFINITION' IN
              TYPEOF(design_definition_path)) OR
          (connectivity_requirement.associated_functional_unit_definition =
           design_definition_path);
    WR2: NOT ('AP210_ARM.DESIGN_COMPOSITION_PATH' IN
              TYPEOF(design_definition_path)) OR
          (connectivity_requirement.associated_functional_unit_definition =
           design_definition_path.design_functional_unit.definition);
--tt tc1 wd12 modified
(*)
WHERE
  should not allocate this to both a physical_connectivity_definition
and to a physical_network for the same revision of the physical
product.
*)
END_ENTITY; -- aggregate_connectivity_requirement

(*)

```

4.2.8 Altered_package

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Altered_package is a type of Package (see 4.2.573). An Altered_package describes a Package that has been modified in some manner from a reference Package. The material or shape properties of the Altered_package are different from the reference Package.

EXAMPLE 1 Examples of alteration include trimming of the terminals, prebending of the terminals, tinning of the terminals for solderability, or more than one of these.

EXAMPLE 2 Figure 2 illustrates some of the different forms a package may take when it is installed into an assembly. The original form on the left is in the role of to_be_altered for the forms on the right. The altered forms are identified and tracked by an enterprise.

NOTE Most Altered_packages are a result of terminal alteration.

The data associated with an Altered_package are the following:

— package_to_be_altered.

Figure 2 – Altered_package

4.2.8.1 package_to_be_altered

The package_to_be_altered specifies the Package (see 4.2.573) that is a reference for the Altered_package.

Constraints:

WR1: A Package shall not be in the role of package_to_be_altered for itself.

NOTE EXPRESS specification:

```

*)
ENTITY altered_package
  SUBTYPE OF (package);
    of_geometric_status : geometric_status;
    modified_terminal_separation : OPTIONAL length_data_element;
    package_to_be_altered : package;
END_ENTITY; -- altered_package
( *

```

4.2.9 Altered_package_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Altered_package_terminal is a type of Package_terminal (see 4.2.581). An Altered_package_terminal is one or more of a Length_trimmed_terminal (see 4.2.512), a Shape_formed_terminal (see 4.2.817), or a Surface_prepped_terminal (see 4.2.881). An Altered_package_terminal describes a Package_terminal that is the result of a modification process. Material or shape properties are different from the reference terminal.

EXAMPLE 1 The modification process may be performed prior to installing the occurrence of the Packaged_part (see 4.2.591) onto a Printed circuit board.

The data associated with an Altered_package_terminal are the following:

- associated_definition;
- terminal_to_be_altered.

4.2.9.1 associated_definition

The associated_definition specifies the role of the Altered_package (see 4.2.8) for the Altered_package_terminal.

4.2.9.2 terminal_to_be_altered

The terminal_to_be_altered specifies the Package_terminal (see 4.2.581) that will be modified for the Altered_package_terminal.

Constraints:

WR1: A Package_terminal shall not be in the role of terminal_to_be_altered for itself either directly or indirectly.

NOTE EXPRESS specification:

```

*)
ENTITY altered_package_terminal
  ABSTRACT SUPERTYPE OF ((shape_formed_terminal ANDOR
    surface_prepped_terminal) ANDOR length_trimmed_terminal)
  SUBTYPE OF (package_terminal);
    terminal_to_be_altered : package_terminal;
    SELF\part_feature.associated_definition : altered_package;
END_ENTITY; -- altered_package_terminal

( *

```

4.2.10 Altered_packaged_part

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Altered_packaged_part is a type of Packaged_part (see 4.2.591) whose used_package is an Altered_package (see 4.2.8). The material or shape properties are different from the reference Packaged_part.

NOTE For packaged parts that may have several alternate configurations (e.g., different lead configurations), an "unaltered" configuration can be designated using the base_packaged_part attribute. This base_packaged_part is then referenced by each Altered_packaged_part, along with the used_package, which references the Altered_package for that Altered_packaged_part. This relationship supports the traceability of altered parts, as well as the capability to readily identify potential replacement parts if a specific, altered part is out of stock, for example.

The data associated with an Altered_packaged_part are the following:

- base_packaged_part;
- used_package.

4.2.10.1 base_packaged_part

The base_packaged_part specifies the original, unmodified, Packaged_part (see 4.2.591) for the Altered_packaged_part.

4.2.10.2 used_package

The used_package specifies the Altered_package (see 4.2.8) that is the result of preparing the Package (see 4.2.573) by the enterprise for the Altered_packaged_part.

Constraints:

WR1: The Package in the role of used_package for the Packaged_part in the role of base_packaged_part shall be the same Package as the Package in the role of package_to_be_prepared for the Altered_package in the role of used_package.

WR2: A Packaged_part shall not be a base_packaged_part for itself, either directly or indirectly.

NOTE 1 This is a conceptual description only. It is understood that an enterprise does not disassemble a packaged part to accomplish its preparation. The view taken is that the package is the only item modified.

NOTE 2 It is recommended to use Engineering_make_from (see 4.2.353) For functional modifications (e.g., re-programming).

NOTE EXPRESS specification:

```

*)
ENTITY altered_packaged_part
  SUBTYPE OF (packaged_part);
    SELF\packaged_part.used_package : altered_package;
    base_packaged_part                : packaged_part;
END_ENTITY; -- altered_packaged_part

( *
```

4.2.11 Alternate_product

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Alternate_product is a type of Alternate_select_product (see 4.2.12) that is completely interchangeable with a specified Ee_product (see 4.2.319) with respect to form, fit, and function for an enterprise.

The data associated with an Alternate_product are the following:

— defined_alternate_product.

4.2.11.1 defined_alternate_product

The defined_alternate_product specifies the role of the Ee_product (see 4.2.319) for the Alternate_product.

NOTE EXPRESS specification:

```

*)
ENTITY alternate_product
  SUBTYPE OF (alternate_select_product);
  SELF\alternate_select_product.defined_alternate_product : SET [1:1] OF
  ee_product;
END_ENTITY; -- alternate_product

( *
```

4.2.12 Alternate_select_product

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Alternate_select_product is a type of Managed_design_object (see 4.2.524). An Alternate_select_product is one of an Alternate_product (see 4.2.11), an Assembly_alternate_product (see 4.2.32), or a Test_select_product (see 4.2.897). An Alternate_select_product specifies interchangeability relations at the product level. Form, fit and function evaluation by an enterprise is used to inform the decision to establish the relationship.

The data associated with an Alternate_select_product are the following:

- authorizing_agreement;
- defined_alternate_product;
- defining_base_product.

4.2.12.1 authorizing_agreement

The authorizing_agreement specifies the Contract (see 4.2.196) under which the Ee_product (see 4.2.319) was designed and procured for the Alternate_select_product. The authorizing_agreement need not be specified for a particular Alternate_select_product.

4.2.12.2 defined_alternate_product

The defined_alternate_product specifies one role of the Ee_product (see 4.2.319) for the Alternate_select_product. There shall be one or more Ee_product for the Alternate_select_product.

4.2.12.3 defining_base_product

The defining_base_product specifies one role of the Ee_product (see 4.2.319) for the Alternate_select_product. The defining_base_product is the reference with respect to form, fit, and function.

NOTE EXPRESS specification:

```

*)
ENTITY alternate_select_product
  ABSTRACT SUPERTYPE OF (ONEOF (assembly_alternate_product,
    test_select_product, alternate_product))
  SUBTYPE OF (managed_design_object);
  defined_alternate_product : SET [1:?] OF ee_product;
  defining_base_product    : ee_product;
  authorizing_agreement    : OPTIONAL contract;
END_ENTITY; -- alternate_select_product

```

(*

4.2.14 Analytical_model

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Analytical_model` is a type of `Managed_design_object` (see 4.2.524) that provides a mathematical description of the properties of a system.

NOTE 1 In this part of ISO 10303 an `Analytical_model` includes the variable declarations of the mathematical description but may not include the assignment of actual values for the variables declared. Assignment of actual values is accomplished in `Analytical_representation` (see 4.2.22)

NOTE 2 This part of ISO 10303 provides support for computer systems to verify type consistency between product data defined in this part of ISO 10303 and product data captured by `Analytical_models`.

NOTE 3 This part of ISO 10303 describes the interfaces (ports) to an `Analytical_model` and provides support for type checking of the units used for the parameters that may be assigned values for an `Analytical_model`.

EXAMPLE 1 Figure 3 is an example of the case where actual values are not included: the `Analytical_model` for a resistor that is coded in pseudocode.

When the `Analytical_model` is referenced by an `Analytical_representation` (see 4.2.22), literals will be supplied for items declared in the interface; both connections and their parameters, and the simulator must ensure that types are compatible.

NOTE 4 Usually the system is exercised in experiments to evaluate the usefulness of the system in the intended application.

NOTE 5 The language, syntax, and internal semantics of an `Analytical_model` are not specified by this part of ISO 10303.

NOTE 6 This part of ISO 10303 provides complete support for exchange of units, including SI units, derived units, and user declared units.

NOTE 7 This part of ISO 10303 provides complete support for prefixes of units.

The data associated with an `Analytical_model` are the following:

- `access_mechanism`;
- `name`;
- `parameter`;
- `reference_document`;
- `representation_language`;
- `source_code`.

```

Begin Interface declaration:
name := resistor;
ports{ } := (port 1, port 2);
parameter 1 name := resistance;
parameter 1 units := ohms;
End Interface declaration
-----
representation_language := "a simulation language definition document"
reference_document := some external definition

(* the following literals would be defined in the representation_language
current,
voltage,
units,
prefix,
:=
:=:
*
-
*

Ohms may be predefined or not, as required by the users of the language
In any case, it will be defined in the representation_language
or in the reference_document. *)

Model behavior declaration

I(input) := -I(output) {constraint based on conservation law}
V := V(input) - V(output) {constraint based on conservation law}
R := resistance {name mapping}
V := I(input) * R {statement of Ohm's Law, the constitutive equation for
this analytical_model}

```

Figure 3 – Analytical_model of a resistor

4.2.14.1 access_mechanism

The access_mechanism is an inverse relationship that specifies that the existence of the Analytical_model is dependent on the existence of the Analytical_model_port (see 4.2.17) that specifies the Analytical_model as its accessed_analytical_model. There shall be one or more Analytical_model_port for an Analytical_model.

4.2.14.2 name

The name specifies the string that is the identifier for the Analytical_model.

4.2.14.3 parameter

The parameter specifies the role of the Model_parameter (see 4.2.549) for the Analytical_model. There shall be one or more Model_parameter for a particular Analytical_model. Figure 3 illustrates the use of parameters.

4.2.14.4 reference_document

The reference_document specifies the role of the Ee_document (see 4.2.316) for the Analytical_model. The reference_document includes interface specifications for Analytical_models of interest to the enterprise.

4.2.14.5 representation_language

The representation_language specifies the Language_reference_manual (see 4.2.497) that defines the semantics and syntax of the computer interpretable strings in which the Analytical_model will be encoded. Figure 3 illustrates how the representation_language is specified and coded.

NOTE Only representation_languages that use characters from the ASCII code are supported by this part of ISO 10303.

4.2.14.6 source_code

The source_code specifies the role of the Ee_specification (see 4.2.338) for an Analytical_model. The source_code contains the source code for the Analytical_model. Figure3 illustrates how a source_code is specified and coded.

Constraints:

UR1: The name shall be unique within a population of Analytical_model.

NOTE EXPRESS specification:

```

*)
ENTITY analytical_model
  SUBTYPE OF (managed_design_object);
    name : ee_name;
    representation_language : language_reference_manual;

      accessed_analytical_model;

  UNIQUE
    UR1 : name;
END_ENTITY; -- analytical_model

( *
```

4.2.15 Analytical_model_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Analytical_model_definition is a type of Ee_product_definition (see 4.2.323).

The data associated with an Analytical_model_definition are the following:

— associated_requirement_occurrence.

4.2.15.1 associated_requirement_occurrence

The associated_model_occurrence is an inverse relationship that specifies that the existence of the Analytical_model_definition is dependent on the existence of an Analytical_model to reference the Analytical_model_definition.

NOTE EXPRESS specification:

```

*)
ENTITY analytical_model_definition
  SUBTYPE OF (ee_product_definition);
  INVERSE
    associated_model_occurrence :
      analytical_model FOR associated_definition;
END_ENTITY; -- analytical_model_definition

( *
```

4.2.16 Analytical_model_make_from_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Analytical_model_make_from_relationship is a type of Managed_design_object (see 4.2.524).

The data associated with an Analytical_model_make_from_relationship are the following:

- reusable_model;
- resultant_model.

4.2.16.1 reusable_model

The reusable_model specifies an Analytical_model (see 4.2.14) for the Analytical_model_make_from_relationship.

4.2.16.2 resultant_model

The resultant_model specifies an Analytical_model (see 4.2.14) for the Analytical_model_make_from_relationship.

Constraints:

UR1: The combination of reusable_model and resultant_model shall be unique within a population of Analytical_model_make_from_relationship.

WR1: The reusable_model shall not be the resultant_model within a population of Analytical_model_make_from_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY analytical_model_make_from_relationship

WHERE
  WR1: reusable_model:~::~ resultant_model;
END_ENTITY; -- analytical_model_make_from_relationship

( *
```

4.2.17 Analytical_model_port

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Analytical_model_port is a type of Managed_design_object (see 4.2.524). An Analytical_model_port may be an Analytical_model_vector_port (see 4.2.21), or additionally may be a Digital_analytical_model_port (see 4.2.290). An Analytical_model_port describes an interface point for an Analytical_model (see 4.2.14).

NOTE These points are the points at which a simulator allows a user to stimulate an instance of an Analytical_model or to evaluate the response of an instance of an Analytical_model to a stimulus in an experiment. In this context, instance includes the reference to the Analytical_model and the literals required for the parameters. A simulator that enforces conservative laws enforces that the energy entering an instance of an Analytical_model must be the same as that leaving the instance of the Analytical_model. The structure of the port is not visible merely by accessing this information. The subtypes of this object provide more visibility into the underlying structure as appropriate. Members of the subtype tree of this object are populated as needed by an application in order to disclose the appropriate level of detail. The specialization in the subtypes of this object occur as a result of being more specific about certain properties of the port.

The data associated with an Analytical_model_port are the following:

- accessed_analytical_model;
- distributed_properties;
- nominal_signal_flow_direction;
- port_name;
- port_type;
- unit_of_measure.

4.2.17.1 accessed_analytical_model

The accessed_analytical_model specifies the Analytical_model (see 4.2.14) that contains this Analytical_model_port.

NOTE 1 Containment in this case explicitly states that if a member of Analytical_model is deleted from the information base then the members of Analytical_model_port that are contained in that member of Analytical_model are also deleted.

NOTE 2 Containment in this case also explicitly states that the visibility of the name of an Analytical_model_port is limited to the Analytical_model that is the accessed_analytical_model.

4.2.17.2 distributed_properties

The distributed_properties specifies that the properties are either a distributed or a lumped element approximation for the Analytical_model_port. A value of TRUE means that the properties are distributed for the Analytical_model_port. A value of FALSE means that the properties are not distributed.

NOTE Multiple modes should be handled by assigning each mode a different port.

4.2.17.3 nominal_signal_flow_direction

The nominal_signal_flow_direction specifies either BIDIRECTIONAL, INPUT_DIRECTION, NOT_APPLICABLE, OUTPUT_DIRECTION, or UNKNOWN_DIRECTION for the Analytical_model_port. The nominal_signal_flow_direction need not be specified for a particular Analytical_model_port.

4.2.17.4 port_name

The port_name specifies the string that represents an identifier, understandable by the end user, for this Analytical_model_port.

NOTE The port_name is documented in the reference_document for the Analytical_model (see 4.2.14).

4.2.17.5 port_type

The port_type specifies one of a boolean_property_type, a logical_property_type, a physical_property_type, a numeric_property_type, or a string_property_type for this Analytical_model_port.

4.2.17.6 unit_of_measure

The unit_of_measure specifies the string for the descriptive label for the unit of measure of the value of a property associated with the simulated physical phenomenon exchanged through a member of the Analytical_model_port. The unit_of_measure need not be specified for a particular Analytical_model_port. The representation of the unit_of_measure is in accordance with ISO 10303-41.

Constraints:

UR1: The combination of the port_name and the accessed_analytical_model shall be unique within a population of Analytical_model_port.

NOTE EXPRESS specification:

```

*)
ENTITY analytical_model_port
  SUPERTYPE OF (analytical_model_vector_port ANDOR digital_analytical_model_port)
  SUBTYPE OF (managed_design_object);
  accessed_analytical_model      : analytical_model;
  port_name                     : ee_name;
  unit_of_measure                : OPTIONAL STRING;
  port_type                     : model_parameter_type;
  distributed_properties         : BOOLEAN;
  nominal_signal_flow_direction : OPTIONAL signal_flow_direction;
  UNIQUE
  UR1 : port_name, accessed_analytical_model;
END_ENTITY; -- analytical_model_port

( *

```

4.2.18 Analytical_model_port_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Analytical_model_port_assignment is a type of Managed_design_object (see 4.2.524). An Analytical_model_port_assignment is the relationship between a Functional_unit_usage_view_terminal_definition (see 4.2.411) and an Analytical_model_port (see 4.2.17) for the purpose of conducting analyses of the design. An Analytical_model_port_assignment binds or associates a behavioural representation to a structural representation. The cardinality or size of the Analytical_model_port shall be consistent with the cardinality or size of the terminal in the structural representation.

NOTE This mechanism allows model ports and functional terminal definitions to be associated regardless of their individual names.

The data associated with an Analytical_model_port_assignment are the following:

- assigned_analytical_model_port;
- assigned_functional_unit_terminal.

4.2.18.1 assigned_analytical_model_port

The assigned_analytical_model_port specifies the role of the Analytical_model_port (see 4.2.17) for the Analytical_model_port_assignment.

4.2.18.2 assigned_functional_unit_terminal

The assigned_functional_unit_terminal specifies the role of the Functional_unit_usage_view_terminal_definition (see 4.2.411) for the Analytical_model_port_assignment.

NOTE Usually, only one Analytical_model is bound to a Functional_unit_definition at a time.

NOTE EXPRESS specification:

```

*)
ENTITY analytical_model_port_assignment
  SUBTYPE OF (managed_design_object);
    assigned_functional_unit_terminal : functional_unit_usage_view_terminal_definition;
    assigned_analytical_model_port    : analytical_model_port;
WHERE
  WR1: NOT (('AP210_ARM.ANALYTICAL_MODEL_SCALAR_PORT' IN TYPEOF(assigned_analytical_model_po
    XOR ('AP210_ARM.SCALAR_TERMINAL_DEFINITION' IN TYPEOF(assigned_functional_unit_termi
END_ENTITY; -- analytical_model_port_assignment

( *

```

4.2.19 Analytical_model_port_make_from_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Analytical_model_port_make_from_relationship is a type of Managed_design_object (see 4.2.524).

The data associated with an Analytical_model_port_make_from_relationship are the following:

- associated_make_from;
- reusable_feature;
- resultant_feature.

4.2.19.1 associated_make_from

The associated_make_from specifies an Analytical_model_make_from_relationship (see 4.2.16) for the Analytical_model_port_make_from_relationship.

4.2.19.2 reusable_feature

The reusable_feature specifies an Analytical_model_port (see 4.2.17) for the Analytical_model_port_make_from_relationship.

4.2.19.3 resultant_feature

The resultant_feature specifies an Analytical_model_port (see 4.2.17) for the Analytical_model_port_make_from_relationship.

Constraints:

UR1: The combination of reusable_feature and resultant_feature shall be unique within a population of Analytical_model_port_make_from_relationship.

WR1: The reusable_feature shall not be the resultant_feature within a population of Analytical_model_port_make_from_relationship.

WR2: The Analytical_model referenced by the reusable_feature shall not be the Analytical_model referenced by the resultant_feature within a population of Analytical_model_port_make_from_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY analytical_model_port_make_from_relationship
  SUBTYPE OF (managed_design_object);
    associated_make_from : analytical_model_make_from_relationship;
    reusable_feature      : analytical_model_port;
    resultant_feature     : analytical_model_port;
UNIQUE
  UR1: reusable_feature, resultant_feature;
WHERE
  WR1: reusable_feature :&#60;&#62;; resultant_feature;
  WR2: reusable_feature.accessed_analytical_model :&#60;&#62;;
      resultant_feature.accessed_analytical_model;
END_ENTITY; -- analytical_model_port_make_from_relationship

( *
```

4.2.20 Analytical_model_scalar_port

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Analytical_model_scalar_port is a type of Analytical_model_vector_port (see 4.2.21) that has a size of exactly one. The Analytical_model_scalar_port is used if there is a requirement to specify the cardinality of the ports associated by a relationship entity.

EXAMPLE 1 Some examples are in the allocation to a functional unit terminal definition for analysis, or in mapping between a distributed model and a lumped equivalent circuit model, or in mapping to a vector port specified in an external syntax.

NOTE EXPRESS specification:

```

*)
ENTITY analytical_model_scalar_port
  SUBTYPE OF (analytical_model_vector_port);
WHERE
  WR1: SELF\analytical_model_vector_port.size = 1;
END_ENTITY; -- analytical_model_scalar_port

( *

```

4.2.21 Analytical_model_vector_port

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Analytical_model_vector_port is a type of Analytical_model_port (see 4.2.17) that has a size greater than one. An Analytical_model_vector_port may be an Analytical_model_scalar_port (see 4.2.20). The Analytical_model_vector_port is used in the converse case to the Analytical_model_scalar_port. This part of ISO 10303 does not predefine the elements of a vector port.

NOTE The cardinality of the structured port is known and a list of names is specified for it. Examples are bus ports, multi-degrees-of-freedom connections, microwave domain modes, and address and data bus definitions.

The data associated with an Analytical_model_vector_port are the following:

— size.

4.2.21.1 size

The size specifies the integer greater than one for the cardinality of the Analytical_model_vector_port.

Constraints:

WR1: The size shall be greater than one.

NOTE EXPRESS specification:

```

*)
ENTITY analytical_model_vector_port
  SUPERTYPE OF (analytical_model_scalar_port)
  SUBTYPE OF (analytical_model_port);
  size : positive_integer;
END_ENTITY; -- analytical_model_vector_port

( *

```

4.2.22 Analytical_representation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Analytical_representation is a type of Managed_design_object (see 4.2.524). An Analytical_representation is the association of specific data to properties of an Analytical_model (see 4.2.14) in order to unambiguously characterize some behaviour of a real or imaginary object. The characterization may be considered to describe the behaviour exhibited by the model in a specific environment or for a range of environments for a specific experiment.

NOTE 1 This entity accomplishes a function similar to the parameter assignment part of a statement in a Spice netlist, or a function or subroutine call in a computer program. This capability is useful where the parts in the library have many parameters, not all of which apply to each simulation model that could be used for the part. This entity matches up the correct parameter values with the correct model.

NOTE 2 The properties specified should be in accordance with the capabilities and limitations of the Analytical_model. That is, the mathematical formulations in the Analytical_model apply over limited ranges of real product characteristics and environmental characteristics.

NOTE 3 This part of ISO 10303 does not standardize qualification of Analytical_representations for an intended usage.

The data associated with an Analytical_representation are the following:

- analytical_representation_name;
- model_parameter_assignment;
- model_representation.

4.2.22.1 analytical_representation_name

The analytical_representation_name specifies the string for the human-interpretable identifier for this Analytical_representation.

4.2.22.2 model_parameter_assignment

The model_parameter_assignment specifies the role of the Parameter_assignment (see 4.2.603) for the Analytical_representation. The model_parameter_assignment binds instance data to data slots in the Analytical_model. There shall be one or more Parameter_assignment for the Analytical_representation.

NOTE For each parameter declared in a model definition, an actual value must be assigned when that model is referenced, unless there is a default assignment included in the source code for the model.

4.2.22.3 model_representation

The model_representation specifies the Analytical_model (see 4.2.14) as the basis model for the Analytical_representation.

Constraints:

UR1: The analytical_representation_name shall be unique within a population of Analytical_representation.

WR1: Each member of model_parameter_assignment.assigned_parameter shall be a member of model_representation.model_parameters.

NOTE Only parameters declared in the model_representation are assigned values.

NOTE EXPRESS specification:

```
*)
ENTITY analytical_representation
  SUBTYPE OF (managed_design_object);
  model_parameter_assignment : SET [1:?] OF parameter_assignment;
  model_representation       : analytical_model;
  analytical_representation_name : ee_name;
  UNIQUE
  UR1 : analytical_representation_name;
END_ENTITY; -- analytical_representation

( *
```

4.2.23 Angle_data_element

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Angle_data_element is a type of Data_element (see 4.2.211) where the requisite unit type is that of angular displacement. An Angle_data_element may be combined with a Qualified_data_element (see ??) in a complex instance to include uncertainty in an angle.

NOTE EXPRESS specification:

```
*)
ENTITY angle_data_element
  SUBTYPE OF (data_element);
END_ENTITY; -- angle_data_element

( *
```

4.2.24 Angular_dimension_with_direction_vector

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Angular_dimension_with_direction_vector` is a type of `Dimensional_location` (see 4.2.300) that defines the relationship between two `Shape_element` (see 4.2.810) in terms of the angle between them and a vector that provides an orientation to that angle. The angle is measured in the plane normal to the specified direction vector and in a clockwise direction as viewed in the direction specified by the vector. The measurement is from the `Shape_element` specified as the `locating_shape_element` to the `Shape_element` specified as the `located_shape_element` by the characterized `Shape_element_locating_relationship` (see 4.2.815).

The data associated with an `Angular_dimension_with_direction_vector` are the following:

— `measurement_orientation`.

4.2.24.1 `measurement_orientation`

The `measurement_orientation` specifies either the `Datum_based_vector_orientation` (see 4.2.220) or an `Axis_placement` (see 4.2.56). If the `Datum_based_vector_orientation` is specified as the `measurement_orientation`, the specified `Datum_based_vector_orientation` provides the orientation by which the angle is measured relative to Datum (see 4.2.214). If an `Axis_placement` is specified, the orientation is specified in the context of the representation of the `Shape_elements` the relationship of which is characterized by the `Angular_dimension_with_direction_vector`.

Constraints:

UR1: The combination of `located_elements` inherited from `Dimensional_location` and `measurement_orientation` shall be unique within a population of `Angular_dimension_with_direction_vector`.

WR1: The `dimension_type` of the `Angular_dimension_with_direction_vector` shall be "angular".

NOTE The attribute `dimension_type` is declared in the `Dimensional_characteristic` entity of which this entity is a subtype.

WR2: The boolean value specified as `directed` shall be TRUE.

NOTE The attribute `directed` is declared in the `Dimensional_location` entity of which this entity is a subtype.

IP1: If the `measurement_orientation` specifies an `Axis_placement`, the `Axis_placement` shall be in the same context as the representations of the two `Shape_elements` that are located relative to each other by the `Angular_dimension_with_direction_vector`.

NOTE EXPRESS specification:

```

*)
ENTITY angular_dimension_with_direction_vector
  SUBTYPE OF (dimensional_location);
    measurement_orientation :
axis_placement_or_datum_based_vector_orientation_select;
  UNIQUE
    UR1 : SELF\dimensional_location.located_elements, measurement_orientation;
END_ENTITY; -- angular_dimension_with_direction_vector

( *

```

4.2.25 Angular_size_dimension

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Angular_size_dimension is a type of Dimensional_size (see 4.2.301) that characterizes the angularity of a Shape_element (see 4.2.810). If the Angular_size_dimension is a Single_boundary_dimension (see 4.2.827), the Angular_size_dimension specifies the angle formed by the characterized Shape_element. If the Angular_size_dimension is a Dimensional_size_based_on_opposing_boundaries (see 4.2.302), the Angular_size_dimension specifies the angle formed by two Shape_elements that make up the characterized Shape_element.

The data associated with an Angular_size_dimension are the following:

- half_angle;
- major_angle.

4.2.25.1 half_angle

The half_angle specifies the boolean value that indicates whether the full angle is being characterized by the Angular_size_dimension, or whether the angle that is being characterized is the angle between the characterized Shape_element (see 4.2.810) and a centre line or centre plane of the characterized Shape_element. A value of TRUE indicates that the angle between the Shape_element and a centre line or centre plane is being characterized. A value of FALSE indicates that the full angle is being characterized.

4.2.25.2 major_angle

The major_angle specifies the angle to which the Angular_size_dimension is applied. A value of LARGE indicates that it is the larger of the angles formed by the characterized Shape_element (see 4.2.810). A value of SMALL indicates that it is the smaller of the angles formed by the characterized Shape_element. A value of EQUAL indicates that it may be either of the angles formed by the characterized Shape_element, since they are defined to be equal.

Constraints:

WR1: The dimension_type shall be "angular".

NOTE The attribute dimension_type is declared in the Dimensional_characteristic entity of which this entity is a subtype.

NOTE EXPRESS specification:

```

*)
ENTITY angular_size_dimension
  SUBTYPE OF (dimensional_size);
    half_angle : BOOLEAN;
    major_angle : angle_relator;
END_ENTITY; -- angular_size_dimension

( *
```

4.2.26 Angularity_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Angularity_tolerance is a type of Geometric_tolerance_with_referenced_datum_system (see 4.2.422) that specifies or partially specifies the requirement on the angularity of a Shape_element (see 4.2.810) in relation to one or two Datum (see 4.2.214).

NOTE Angularity_tolerance is defined in terms of tolerance zone definitions in 14.9 of ISO 1101.

Constraints:

WR1: The Shape_element specified as the toleranced_shape_element shall be a Centre_axis, Centre_plane, Physical_feature_or_part_template, or Tangent_plane.

NOTE The attribute toleranced_shape_element is declared in the Geometric_tolerance entity of which this entity is a subtype.

WR2: There shall be at most two Datum in the Datum_system, the definition of which is specified as the datum_system_definition.

NOTE The attribute datum_system_definition is declared in the Geometric_tolerance_with_referenced_datum_system entity of which this entity is a subtype.

WR3: At least one Datum_plane or Datum_axis shall be in the Datum_system, the definition of which is specified as the datum_system_definition.

WR4: If the `toleranced_shape_element` is a `Centre_plane`, `Physical_feature_or_part_template`, or `Tangent_plane`, the `Angularity_tolerance` shall specify a `Tolerance_zone_definition` as its `tolerance_zone_or_boundary_definition`; and that `Tolerance_zone_definition` shall specify a `Tolerance_zone_boundary_definition_with_specified_size` as its `boundary_definition`; and that `Tolerance_zone_boundary_definition_with_specified_size` shall specify an `Opposing_boundary_set_size_characteristic` as its `specified_boundary_size`.

IP1: A `Parallelism_tolerance` as opposed to an `Angularity_tolerance` shall be applied if the requirement is on the angularity of a `Shape_element` in relation to a `Datum_axis` or `Datum_plane` and the theoretically exact value of the angle is 0 or is an integral multiple of 180 degrees (π radians).

IP2: A `Perpendicularity_tolerance` as opposed to an `Angularity_tolerance` shall be applied if the requirement is on the angularity of a `Shape_element` in relation to a `Datum_axis` or `Datum_plane` and the theoretically exact value of the angle is an odd multiple of 90 degrees ($\pi/2$ radians).

IP3: The form of the `toleranced_shape_element` shall be consistent with the form of a shape element for which the application of an `angularity_tolerance` is sensible.

NOTE EXPRESS specification:

```
* )
ENTITY angularity_tolerance
  SUBTYPE OF (geometric_tolerance_with_referenced_datum_system);
END_ENTITY; -- angularity_tolerance

( *
```

4.2.27 Apex

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Apex` is a type of `Derived_shape_element` (see 4.2.260) that is either a point that is derived by projecting a conical surface or the common point that is derived by projecting two or more conical surfaces. The `Shape_element` (see 4.2.810) from which the `Apex` is derived are associated with the `Apex` by the `Shape_element_deriving_relationship` (see 4.2.814) that are specified as the `deriving_relationships`.

NOTE The attribute `deriving_relationships` is declared in the `Derived_shape_element` entity of which this entity is a subtype.

Constraints:

IP1: The common intersection of three or more planes or two curves shall be treated as a `Geometric_intersection` rather than as an `Apex`.

IP2: The form of the `Shape_elements` from which the `Apex` is derived shall be consistent with conical surfaces from which an `Apex` can be derived.

NOTE EXPRESS specification:

4.2.29 Array_placement_group

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Array_placement_group is a type of Assembly_group_component (see 4.2.40) that is a group of Assembly_component (see 4.2.34) placed in an linear or rectangular regular pattern in the assembly. An Array_placement_group may be a Laminate_text_string_component (see 4.2.489). The position tolerance specification of an Assembly_component that is included in an array is different from an Assembly_component that is randomly placed. Text support in this part of ISO 10303 is limited to a linear pattern defined by the character to character spacing defined in the font definition. Spacing properties for items other than text is supported by applying Geometric Dimensioning and Tolerancing methods.

NOTE This part of ISO 10303 provides support for multi-line messages with one instance of the Laminate_text_string_component for each line of the multi-line message.

EXAMPLE 1 Examples of components placed as arrays include: test points, thermal vias, integrated circuit memory devices, light emitting diodes, spare land areas, component terminal mating features where the component itself has terminals arranged in a grid, and text.

EXAMPLE 2 Figure 4 is an example layout for a component array. The Axis_placement (see 4.2.56) that is in the role of origin for the Package (see 4.2.573) definition in this example is placed at the centroid of the Package and consequently at the centroid of the Package_body (see 4.2.574). The illustration is typical of a drawing presentation of the design information conveyed by this part of ISO 10303. Each rectangle in the illustration is a representation of an instance of a Package_body.

NOTE EXPRESS specification:

```

4.2.30 Assembled_with_bonding

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembled_with_bonding is a type of Assembly_joint (see 4.2.41) that establishes the joint by bonding. Bonding requires use of material that may change state during the bonding process to form a permanent or semi-permanent joint. In this context, a permanent or semi-permanent joint means that repair of the affected part of the assembly would require destruction and replacement of the bond material.

Figure 4 – Array_placement_group

NOTE The `Assembled_with_bonding` object relates two assembly features that are bonded and the `Assembly_bond_definition` that specifies the category of the bond, its shape, its material, and its name.

EXAMPLE 1 Figure 5 illustrates the concept of the joint category described herein and the roles of the related application objects.

The data associated with an `Assembled_with_bonding` are the following:

- `bond_assembly_position`;
- `default_bond_definition`.

4.2.30.1 bond_assembly_position

The `bond_assembly_position` is an inverse relationship that specifies that the `Assembled_with_bonding` shall be referenced by no more than one `Bond_assembly_position` as its bond. The `bond_assembly_position` need not be specified for a particular `Assembled_with_bonding`. The position is provided to identify shape placement for analysis.

Figure 5 – Assembled_with_bonding

4.2.30.2 default_bond_definition

The default_bond_definition specifies the Assembly_bond_definition (see 4.2.33) used by the Assembled_with_bonding process to form a join.

EXAMPLE 1 A type of bond material is solder. A type of component feature is a component terminal.

Constraints:

WR1: The members of Part_feature utilized by Assembled_with_bonding that are inherited from Assembly_joint shall be the same members of Part_feature specified inclusively by Assembly_bond_definition bonded_feature_1 and bonded_feature_2.

NOTE EXPRESS specification:

```

*)
ENTITY assembled_with_bonding

  WR2: SELF\assembly_joint.assembly_features_2.definition :=:
                                default_bond_definition.bonded_feature_2;
END_ENTITY; -- assembled_with_bonding

( *

```

4.2.31 Assembled_with_fasteners

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembled_with_fasteners is a type of Assembly_joint (see 4.2.41) that establishes the assembly by using fasteners to mechanically position a component so that its component mounting features are connected to component mounting features of another component in the assembly. The fasteners are associated with the base component using Product_association (see 4.2.741).

EXAMPLE 1 The usual case for this is the mounting hardware associated with a power device mounted to the Interconnect_module_component (see 4.2.442). Figure 6 illustrates the concept of the joint category described herein and the roles of the related Application Objects.

The data associated with an Assembled_with_fasteners are the following:

— associated_assembly.

4.2.31.1 associated_assembly

The associated_assembly specifies the Assembly_group_component (see 4.2.40) that identifies the components required to be considered together in the assembly process for the Assembled_with_fasteners. The associated_assembly does not describe a formal product structure hierarchy.

Figure 6 – Assembled_with_fasteners

4.2.32 Assembly_alternate_product

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An *Assembly_alternate_product* is a type of *Alternate_select_product* (see 4.2.12) where the alternate is valid only for a particular design. The alternate is valid for all instances of the *defining_base_product* inherited from *Alternate_select_product* within that design.

NOTE In specifying the components to be used in an assembly, it is a fairly common practice to stipulate that any usage of a given component (as referenced by a part number, for example) in that assembly may be replaced by some other specified component. Each of those other components is then an *Assembly_alternate_product* for the specified component (*defining_base_product*) for that assembly. The *Assembly_alternate_product* supports only this assembly-level alternate: i.e., it only refers to components that can serve as alternates for any usage of the specified component (the *defining_base_product*) in that assembly.

The data associated with an *Assembly_alternate_product* are the following:

— *basis_context*.

4.2.32.1 basis_context

The *basis_context* specifies the role of the *Physical_unit_design_view* (see 4.2.667) for the *Assembly_alternate_product*.

NOTE EXPRESS specification:

```

*)
ENTITY assembly_alternate_product
  SUBTYPE OF (alternate_select_product);
    basis_context : physical_unit_design_view;
END_ENTITY; -- assembly_alternate_product

( *
```

4.2.33 Assembly_bond_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_bond_definition is a type of Managed_design_object (see 4.2.524). An Assembly_bond_definition is the definition of the joint that uses bulk material to bond together portions of the assembly.

NOTE This part of ISO 10303 provides the ability to define the typical shape of the bond through the use of Default_assembly_bond_shape (see 4.2.244).

The data associated with an Assembly_bond_definition are the following:

- analytical_assembly_bond_representation;
- associated_definition;
- bond_category;
- bond_material;
- bonded_feature_1;
- bonded_feature_2;
- default_shape;
- name.

4.2.33.1 analytical_assembly_bond_representation

The analytical_assembly_bond_representation specifies the role of Analytical_representation for the Assembly_bond_definition. There may be one or more analytical_assembly_bond_representation for Assembly_bond_definition. The analytical_assembly_bond_representation need not be specified for a particular Assembly_bond_definition.

4.2.33.2 associated_definition

The associated_definition specifies the role of the Externally_defined_product_definition (see ??) for the Assembly_bond_definition. The associated_definition is only provided to support identification of the product classification.

4.2.33.3 bond_category

The bond_category specifies the role of the External_definition (see 4.2.361) for the Assembly_bond_definition.

NOTE This part of ISO 10303 does not predefine the classification of bonds for assembly.

EXAMPLE 1 Some typical types are wire bond, solder, and conductive adhesive.

4.2.33.4 bond_material

The bond_material specifies the role of the Ee_material (see 4.2.318) for the Assembly_bond_definition. The bond material may be a composition.

4.2.33.5 bonded_feature_1

The bonded_feature_1 specifies one role of Part_feature for Assembly_bond_definition. The bonded_feature_1 defines one of the Part_feature that will be utilized by Assembled_with_bonding.

4.2.33.6 bonded_feature_2

The bonded_feature_2 specifies one role of Part_feature for Assembly_bond_definition. The bonded_feature_2 defines the second Part_feature that will be utilized by Assembled_with_bonding.

4.2.33.7 default_shape

The default_shape is an inverse relationship that specifies that there shall be no more than one Default_assembly_bond_shape (see 4.2.244) that specifies the Assembly_bond_definition as its characterized_bond_definition. The default_shape need not be specified for a particular Assembly_bond_definition.

4.2.33.8 name

The name specifies the string identifying the Assembly_bond_definition.

Constraints:

UR1: The name shall be unique within a population of Assembly_bond_definitions.

UR2: The item that is bonded_feature_1 shall not be bonded_feature_2.

WR1: There shall be a product category of 'technology specific model' assigned to the product this assembly_bond_definition is associated with.

WR2: The associated_definition shall not be another subtype of Ee_product_definition.

NOTE EXPRESS specification:

4.2.34 Assembly_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_component is a type of Managed_design_object (see 4.2.524). An Assembly_component may be one of an Assembly_module_component (see 4.2.44), a Bare_die_component (see 4.2.61), an Interconnect_module_component (see 4.2.442), a Laminate_component (see 4.2.483), a Packaged_component (see 4.2.585), or a Printed_component (see 4.2.721), or additionally may be an Assembly_group_component (see 4.2.40), or additionally may be a Shield (see 4.2.821), or additionally may be a Thermal_component (see 4.2.900), or additionally may be a Routed_interconnect_component (see 4.2.777), or additionally may be an Interface_component (see 4.2.468). An Assembly_component is the occurrence of a Physical_unit (see 4.2.664) or Part_template (see 4.2.620) in an assembly. An Assembly_component may include additional product data over that defined in Physical_unit or Part_template. An Assembly_component that is no other type is intended to be an instance of a Physical_unit and not of a Part_template.

EXAMPLE 1 Figure 7 illustrates a detail of an assembly drawing that shows the Assembly_component in relation to a cross-sectional view of the Interconnect_module_component. Figure ?? illustrates a complete assembly showing multiple Assembly_component.

NOTE 1 An Assembly_component may be assembled onto an Interconnect_module_component in the realization of an Assembly_module (see 4.2.43). An Assembly_component may be an occurrence of an Assembly_module_usage_view (see 4.2.51). An Assembly_component may be an occurrence of an Interconnect_module_usage_view (see 4.2.465). For the purposes of this model, the current interpretation is to treat an embedded component as a Packaged_component. The Interconnect_module_component_terminal (see 4.2.445) that mates with the Packaged_component_join_terminal (see 4.2.586) of the embedded component is not visible when the Assembly_module is assembled, but the Interconnect_module_component_terminal is still logically the interface to the Interconnect_module_component for the embedded component.

The manufacturing view supports the fact that the embedded component is installed during part of the sequential manufacturing process for the Interconnect_module (see 4.2.440).

NOTE 2 An Assembly_component may be a floor-planning symbol if the definition is an Assembly_module or an Interconnect_module. If the Assembly_component is used in this manner, then the actual components will be inclusion_definitioned in the design in a later iteration that results from inclusion_definitioning the detailed components from the Assembly_module or Interconnect_module using a computer processor. The processor may choose to support traceability by using the Component_make_from_relationship (see 4.2.126) to specify what component of the Assembly_module or Interconnect_module corresponds to the component in the design.

NOTE 3 Parameters may be assigned to Assembly_component by the Planned_characteristic object through the Assembly_requirements_allocation.

The data associated with an Assembly_component are the following:

- assembly;
- component_2d_shape;
- component_3d_shape;
- usage_definition.

4.2.34.1 assembly

The assembly is an inverse relationship that specifies that the existence of the Assembly_component is dependent on the existence of the Assembly_composition_relationship (see 4.2.39) that specifies the Assembly_component as its component. There shall be one or more Assembly_composition_relationship for an Assembly_component.

NOTE This cardinality supports multiple versions of the design, with the same member of Assembly_component.

Figure 7 – Assembly_component

4.2.34.2 component_2d_shape

The component_2d_shape is an inverse relationship that specifies that there shall be no more than one Assembly_component_2d_shape (see 4.2.35) that specifies the Assembly_component as its shape_characterized_component. The component_2d_shape need not be supplied for a particular Assembly_component.

4.2.34.3 component_3d_shape

The component_3d_shape is an inverse relationship that specifies that there shall be no more than one Assembly_component_3d_shape (see 4.2.36) that specifies the Assembly_component as its shape_characterized_component. The component_3d_shape need not be supplied for a particular Assembly_component.

4.2.34.4 usage_definition

The usage_definition specifies either a Part_template (see 4.2.620) or a Physical_unit (see 4.2.664) for the Assembly_component. The usage_definition need not be supplied for an Assembly_component. The usage_definition is optional because some types of Assembly_component are defined through another mechanism. The types of Assembly_component for which usage_definition is required include the explicit statement of that requirement in their definition.

Constraints:

WR1: If the usage_definition exists, then only a Footprint_occurrence shall reference a Footprint_definition and only a Padstack_occurrence shall reference a Padstack_definition.

WR2: All members of assembly shall be for the same product.

WR3: No more than one member of assembly shall be for a version of the product.

WR4: An Assembly_component shall not be both a Laminate_component and an Interface_component.

NOTE EXPRESS specification:

4.2.35 Assembly_component_2d_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_component_2d_shape is a type of Planar_projected_shape (see 4.2.677). An Assembly_component_2d_shape is the two-dimensional shape of an Assembly_component (see 4.2.34).

NOTE The shape is defined by the `Physical_unit_planar_shape` (see 4.2.670), or by the equivalent for `Part_template` (see 4.2.620), referenced by the location transformation in `Component_assembly_2d_position` (see 4.2.112).

The data associated with an `Assembly_component_2d_shape` are the following:

— `shape_characterized_component`.

4.2.35.1 `shape_characterized_component`

The `shape_characterized_component` specifies the role of the `Assembly_component` (see 4.2.34) for the `Assembly_component_2d_shape`.

NOTE EXPRESS specification:

```
*)
ENTITY assembly_component_2d_shape
  SUBTYPE OF (planar_projected_shape);
  shape_characterized_component : SET [1:?] OF assembly_component;
END_ENTITY; -- assembly_component_2d_shape

(*
```

4.2.36 `Assembly_component_3d_shape`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Assembly_component_3d_shape` is a type of `Feature_shape_definition` (see 4.2.372). An `Assembly_component_3d_shape` is the three-dimensional shape of an `Assembly_component` (see 4.2.34).

The data associated with an `Assembly_component_3d_shape` are the following:

— `shape_characterized_component`.

4.2.36.1 `shape_characterized_component`

The `shape_characterized_component` specifies the role of the `Assembly_component` (see 4.2.34) for the `Assembly_component_3d_shape`.

NOTE EXPRESS specification:

```
*)
ENTITY assembly_component_3d_shape
  SUBTYPE OF (feature_shape_definition);
  shape_characterized_component : SET [1:?] OF assembly_component;
END_ENTITY; -- assembly_component_3d_shape

( *
```

4.2.37 Assembly_component_non_planar_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_component_non_planar_shape is a type of Manifold_subsurface_shape (see 4.2.525), and a Feature_shape_definition (see 4.2.372). An Assembly_component_non_planar_shape is the shape of a Assembly_component (see 4.2.34) that is represented in the form of a surface.

NOTE EXPRESS specification:

```
*)
ENTITY assembly_component_non_planar_shape
  SUBTYPE OF (manifold_subsurface_shape, feature_shape_definition);
  shape_characterized_component : SET [1:?] OF assembly_component;
END_ENTITY; -- assembly_component_non_planar_shape

( *
```

4.2.38 Assembly_component_placement_link

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_component_placement_link is a type of Managed_design_object (see 4.2.524).

The data associated with an Assembly_component_placement_link are the following:

- precedent_element;
- referenced_by;
- subsequent_element.

4.2.38.1 precedent_element

The precedent_element specifies an Assembly_component (see 4.2.34) for the Assembly_component_placement_link.

4.2.38.2 referenced_by

The `referenced_by` is an inverse relationship that specifies that the existence of the `Assembly_component_placement_link` is dependent on the existence of the `Linear_array_placement_group_component` (see 4.2.516) that specifies the `Assembly_component_placement_link` as its element.

4.2.38.3 subsequent_element

The `subsequent_element` specifies an `Assembly_component` (see 4.2.34) for the `Assembly_component_placement_link`.

NOTE EXPRESS specification:

```
*)
ENTITY assembly_component_placement_link
  SUBTYPE OF (managed_design_object);
    precedent_element : assembly_component;
    subsequent_element : assembly_component;
INVERSE
  referenced_by : linear_array_placement_group_component FOR
                  element;
END_ENTITY; -- assembly_component_placement_link

( *
```

4.2.39 Assembly_composition_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Assembly_composition_relationship` is a type of `Managed_design_object` (see 4.2.524). An `Assembly_composition_relationship` may be a `Next_higher_assembly_relationship` (see 4.2.556). An `Assembly_composition_relationship` relates an `Assembly_component` (see 4.2.34) to the assembly that it helps to compose.

The data associated with an `Assembly_composition_relationship` are the following:

- `assembly`;
- `assembly_bonding_agent`;
- `component`;
- `security_code`.

4.2.39.1 assembly

The assembly specifies the Physical_unit_design_view (see 4.2.667) for the product realized by this Assembly_composition_relationship.

4.2.39.2 assembly_bonding_agent

The assembly_bonding_agent specifies the role of the Ee_material (see 4.2.318) for the Assembly_composition_relationship. There may be more than one Ee_material for the Assembly_composition_relationship. The assembly_bonding_agent need not be specified for a particular Assembly_composition_relationship.

NOTE 1 The use of this attribute is appropriate where no feature shape data is available.

NOTE 2 To identify quantity of bulk material, this part of ISO 10303 predefines Assembly_material_composition_relationship (see 4.2.42).

4.2.39.3 component

The component specifies the role of the Assembly_component (see 4.2.34) for the Assembly_composition_relationship.

4.2.39.4 security_code

The security_code specifies the role of the Security_classification (see 4.2.804) for the Assembly_composition_relationship. The security_code is optional and need not be supplied.

Constraints:

UR1: The combination of the assembly and the component shall be unique within a population of Assembly_composition_relationship.

WR1: At least one member of Assembly_composition_relationship shall specify a member of Assembly_component that is also a member of Interface_component.

NOTE This part of ISO 10303 requires the interface to the next level of assembly to exist. This is because this part of ISO 10303 supports design and archival of designs that may be used in higher levels of assembly.

NOTE EXPRESS specification:

```

*)
ENTITY assembly_composition_relationship
  SUPERTYPE OF (ONEOF (next_higher_assembly_relationship))
  SUBTYPE OF (managed_design_object);
  assembly          : physical_unit_design_view;
  component          : assembly_component;
  security_code      : OPTIONAL security_classification;
  assembly_bonding_agent : OPTIONAL SET [1:?] OF ee_material;
  UNIQUE
    UR1 : assembly, component;
END_ENTITY; -- assembly_composition_relationship

( *

```

4.2.40 Assembly_group_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_group_component is a type of Assembly_component (see 4.2.34). An Assembly_group_component may be either one or both of an Array_placement_group (see 4.2.29) or an Interfaced_group_component (see 4.2.473). Each component that is part of a group is in the same design view as that group.

EXAMPLE 1 This application object is provided to support, for instance, the hardware items required for power device mounting.

NOTE 1 This application object is not included to support process plans.

NOTE 2 The intent is for all members of Assembly_component that are also in the role of related_components for Sub_assembly_relationship to be placed as a group in a placement activity using a CAD tool. However, each member of the group is placed individually in this standard. A receiving system should treat the relative placement of members of the group as derived data.

EXAMPLE 2 This application object supports paired-line layout by making each individual conductive_interconnect_element associated by the sub_assembly_relationship entity to this application object one of the lines to be paired. Extensions to higher number of lines is obvious.

The data associated with an Assembly_group_component are the following:

— components.

4.2.40.1 components

The components is an inverse relationship that specifies that the existence of the Assembly_group_component is dependent on the existence of the Sub_assembly_relationship (see 4.2.877) that specifies the Assembly_group_component as its relating_component. There shall be one or more Sub_assembly_relationship for an Assembly_group_component.

NOTE The usual case is for one member of Sub_assembly_relationship to associate all relating components, but more than one is permitted. There is no semantic difference in this part of ISO 10303 between all the components being related with one member of Sub_assembly_relationship or each of the component being related having its own Sub_assembly_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY assembly_group_component
  SUPERTYPE OF (interfaced_group_component ANDOR array_placement_group ANDOR
    (ONEOF(footprint_occurrence, padstack_occurrence)))
  SUBTYPE OF (assembly_component);
  INVERSE
    components : SET [1:?] OF sub_assembly_relationship FOR relating_component;
END_ENTITY; -- assembly_group_component
( *
```

4.2.41 Assembly_joint

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_joint is a type of Managed_design_object (see 4.2.524). An Assembly_joint may be either one of or both of an Assembled_with_bonding (see 4.2.30) or an Assembled_with_fasteners (see 4.2.31) or additionally may be a Connection_zone_based_assembly_joint (see 4.2.186). An Assembly_joint is the result of the process that establishes physical connectivity between component features of two components in an assembly.

EXAMPLE 1 Figure 8 illustrates the roles assigned to items in an assembly by a designer in constructing a member of Assembly_joint.

NOTE 1 Assembly_joint is a central concept in this part of ISO 10303 that provides information necessary to extract a network description of a design from the assembly model. Once extracted, the description may be compared to the original requirements.

NOTE 2 Assembly_joint provides critical information necessary to evaluate the appropriateness of the two features related by Assembly_joint to their use in the assembly, given the process used for the joint.

NOTE 3 Assembly_joint provides critical information necessary to evaluate the appropriateness of the relative position of the two features related by Assembly_joint, given the process used for the joint, and the technology used for each of the associated components, including related tolerances.

NOTE 4 One of these components may be an Interconnect_module_component (see 4.2.442).

The data associated with an Assembly_joint are the following:

- assembly_features;
- associated_assembly;
- description;
- name.

Note - the insulated wires are each an Assembly_component that is a Routed_interconnect_component and is also an Interface_component

Figure 8 – Assembly_joint

4.2.41.1 assembly_features

The assembly_features specify exactly two members of any of the following: Assembly_module_component_terminal (see 4.2.45), Bare_die_component_terminal (see 4.2.62), Interconnect_component_interface_terminal (see 4.2.438), Interconnect_component_join_terminal (see 4.2.439), Interconnect_module_component_terminal (see 4.2.445), Package_terminal_occurrence (see 4.2.583), Packaged_component_join_terminal (see 4.2.586), or Packaged_connector_component_interface_terminal (see 4.2.589), for the Assembly_joint.

4.2.41.2 associated_assembly

The associated_assembly specifies the Assembly_module (see 4.2.43) or the Assembly_group_component (see 4.2.40) that contains the Assembly_joint.

4.2.41.3 description

The description specifies the text that in human-interpretable form describes the Assembly_joint. The description need not be specified for a particular Assembly_joint.

4.2.41.4 name

The name specifies the string of text that identifies the Assembly_joint.

Constraints:

WR1: A feature shall not be assembled to itself either directly or indirectly.

WR2: Assembly_features_1 shall be in the associated_assembly.

WR3: Assembly_features_2 shall be in the associated_assembly.

NOTE EXPRESS specification:

```

( *

```

4.2.42 Assembly_material_composition_relationship

An Assembly_material_composition_relationship is a type of Managed_design_object (see 4.2.524). An Assembly_material_composition_relationship is the association between a Physical_unit_design_view (see 4.2.667) and Ee_material (see 4.2.318) for the purpose of bulk material callout.

NOTE This application object is intended solely to support raw material callout whose shape is not explicitly modeled in the product model.

EXAMPLE 1 Solder identified as a bonding agent may be aggregated for the assembly using this Application Object.

The data associated with an `Assembly_material_composition_relationship` are the following:

- `as_required`;
- `assembly`;
- `component_material`;
- `quantity`;
- `security_code`.

4.2.42.1 `as_required`

The `as_required` specifies the LOGICAL type for the `Assembly_material_composition_relationship`. This type permits a user to specify that the amount of material to be supplied with the product may be determined at assembly on an item by item basis, where the item referred to is a real product delivered to a customer.

EXAMPLE 1 Adhesives, insulation and wire may all be cases where the value of the attribute is TRUE.

4.2.42.2 `assembly`

The `assembly` specifies the role of the `Physical_unit_design_view` (see 4.2.667) for the `Assembly_material_composition_relationship`.

4.2.42.3 `component_material`

The `component_material` specifies the role of the `Material_definition` (see 4.2.531) for the `Assembly_material_composition_relationship`.

4.2.42.4 `quantity`

The `quantity` specifies the role of the `Data_element` (see 4.2.211) for the `Assembly_material_composition_relationship`. The quantity need not be specified for the `Assembly_material_composition_relationship`.

4.2.42.5 `security_code`

The `security_code` specifies the role of the `Security_classification` (see 4.2.804) for the `Assembly_material_composition_relationship`. The `security_code` is optional and need not be supplied.

Constraints:

WR1: For an occurrence of a bulk material product, units shall be specified as one of the following: length_unit; amount_of_substance_unit; mass_unit; volume_unit; area_unit.

IP1: Wire used for jumpers that are explicitly defined shall be specified as a member of Interconnect_component.

NOTE EXPRESS specification:

```
*)
ENTITY assembly_material_composition_relationship

    quantity          : OPTIONAL data_element;
    assembly           : physical_unit_design_view;
    component_material : material_definition;
    security_code      : OPTIONAL security_classification;
    as_required        : LOGICAL;
END_ENTITY; -- assembly_material_composition_relationship
(*
```

4.2.43 Assembly_module

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_module is a type of Physical_unit_design_view (see 4.2.667). An Assembly_module may be a Pca (see 4.2.639). An Assembly_module is an assembly design view of a product. This application object supports design reuse, modular product definitions, component libraries, and related technologies. There may be discipline views that further specialize this view.

EXAMPLE 1 Figure 80 is an illustration of an Assembly_module.

NOTE 1 An Assembly_module could be a ball grid array design, an MCM design, a disk drive design, a line card or plug-in module in a telecommunications rack, or a line replaceable unit in an airframe or spacecraft. Incomplete designs that have some specified functionality as defined by a functional definition may be included in a component library application, for example. The designs may be included in an active design by reference. At the appropriate time in the design phase, the single reference is replaced with individual references to the elements that compose the Assembly_module. Support is provided for maintaining the information necessary to trace back to the original Assembly_module from the released Assembly_component (see 4.2.34) through the Component_make_from_relationship (see 4.2.126).

NOTE 2 Product categories other than Pca, such as MCM-L (Multichip Module, Laminated), MCM-D (Multichip Module, Deposited) and MCM-C (Multichip Module, Ceramic) may be included through the use of this application object, and population of the Technology (see 4.2.886) and Ee_product_category (see 4.2.320) application objects.

EXAMPLE 2 In this example (based on the previous notes), assembly technology is the process that bonds two products together (e.g., soldering, welding) by joining individual features of one product to individual features of the other product. The Assembly_module would have two components: A Packaged_part (see 4.2.591) and an Interconnect_module. The Interconnect_module would include a Land (see 4.2.490) pattern designed to optimize the assembly process yield for the Packaged_part and the Stratum (see 4.2.845) stackup of the Interconnect_module combination. Full knowledge of the Interconnect_module technology is available through the complete definition of the Passage_technology (see 4.2.638) and Stratum_technology (see 4.2.871) supported in this part of ISO 10303. The assembly technology characteristics assigned by an enterprise may be exchanged through population of the Ee_product_category and Ee_product_related_product_category (see 4.2.326) application objects. Technology classification may be exchanged using the Technology application object. If desired, Analytical_representation (see 4.2.22) may be populated to support process simulation. Package (see 4.2.573) may be used instead of Packaged_part in the Assembly_module if there is no interest in electrical characteristics.

Constraints:

WR1: A Laminate_component shall not be in the role of component for the Assembly_composition_-relationship that references an Assembly_module in the role of assembly

NOTE EXPRESS specification:

```
*)
ENTITY assembly_module
    SUPERTYPE OF (ONEOF(pca,
                        reference_packaged_part_assembly_implementation))
    SUBTYPE OF (physical_unit_design_view);
END_ENTITY; -- assembly_module

( *
```

4.2.44 Assembly_module_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_module_component is a type of Assembly_component (see 4.2.34). This application object is an occurrence of the usage view of an Assembly_module (see 4.2.43), and could be either a design reuse item or an occurrence of the usage view of a real item.

NOTE Assembly_module_component represents an occurrence of a part concept for usage in one or more design views for the same product, where each design view is for a different version of the product. This is useful in a vertically integrated concurrent engineering environment, where full data sharing is allowed, as it permits visibility into the fact that there is a design definition of the component that is an Assembly_module.

EXAMPLE 1 It is useful to consider a daughter board instance as an Assembly_module_component rather than as an instance of Packaged_part (see 4.2.591) in this part of ISO 10303 for traceability to the design view for archival purposes for the design organization.

The data associated with an `Assembly_module_component` are the following:

- `access_mechanisms`;
- `usage_definition`.

4.2.44.1 `access_mechanisms`

The `access_mechanisms` is an inverse relationship that specifies that the existence of the `Assembly_module_component` is dependent on the existence of the `Assembly_module_component_terminal` (see 4.2.45) that specifies the `Assembly_module_component` as its `associated_component`. There shall be two or more `Assembly_module_component_terminals` for an `Assembly_module_component`.

4.2.44.2 `usage_definition`

The `usage_definition` specifies the role of the `Assembly_module_usage_view` (see 4.2.51) for the `Assembly_module_component`.

NOTE EXPRESS specification:

```

*)
ENTITY assembly_module_component
--tt tc1 wd9 modified
    SUPERTYPE OF(assembly_module_macro_component)
--tt tc1 wd11 modified
    SUBTYPE OF (physical_component);

    INVERSE
        access_mechanisms : SET [2:?] OF assembly_module_component_terminal FOR
                                associated_component;
END_ENTITY; -- assembly_module_component

( *
```

4.2.45 `Assembly_module_component_terminal`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Assembly_module_component_terminal` is a type of `Component_terminal` (see 4.2.137). The `Assembly_module_component_terminal` is included with the `Assembly_module_component` to assure the data integrity of references to the terminals of the `Assembly_module_component`.

The data associated with an `Assembly_module_component_terminal` are the following:

- `associated_component`;
- `definition`.

4.2.45.1 associated_component

The associated_component specifies the role of the Assembly_module_component (see 4.2.44) for the Assembly_module_component_terminal.

4.2.45.2 definition

The definition specifies the role of the Assembly_module_terminal (see 4.2.50) for the Assembly_module_component_terminal.

NOTE EXPRESS specification:

```
*)
ENTITY assembly_module_component_terminal
  SUBTYPE OF (physical_component_terminal);
    SELF\component_feature.definition          : assembly_module_terminal;
    SELF\component_feature.associated_component : assembly_module_component;
END_ENTITY; -- assembly_module_component_terminal

--tt tc1 wd9 added
(*
```

4.2.46 Assembly_module_interface_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_module_interface_terminal is a type of Assembly_module_terminal (see 4.2.50).

NOTE EXPRESS specification:

```
*)
ENTITY assembly_module_interface_terminal
  SUBTYPE OF (assembly_module_terminal);
END_ENTITY; -- assembly_module_interface_terminal

--tt tc1 wd9 added
(*
```

4.2.47 Assembly_module_join_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_module_join_terminal is a type of Assembly_module_terminal (see 4.2.50).

NOTE EXPRESS specification:

```

*)
ENTITY assembly_module_join_terminal
  SUBTYPE OF (assembly_module_terminal);
INVERSE
--tt tc1 wd9 modified
defining_terminal : component_feature_to_physical_usage_view_assignment for
  defined_part_feature;
WHERE
  WR1: 'AP210_ARM.INTERCONNECT_MODULE_JOIN_TERMINAL' IN TYPEOF(defining_terminal.assigned_
  WR2: 'AP210_ARM.COMPONENT_TERMINAL_TO_ASSEMBLY_MODULE_JOIN_TERMINAL_ASSIGNMENT' IN TYPEOF
END_ENTITY; -- assembly_module_join_terminal

--tt tc1 wd8 added
(*

```

4.2.48 Assembly_module_macro_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_module_macro_component is a type of Assembly_component (see 4.2.34).

The data associated with an Assembly_module_macro_component are the following:

- access_mechanisms;
- usage_definition;
- usage_view_definition.

4.2.48.1 access_mechanisms

The access_mechanisms is an inverse relationship that specifies that the existence of the Assembly_module_macro_component is dependent on the existence of the Assembly_module_component_terminal (see 4.2.45) that specifies the Assembly_module_macro_component as its associated_component. There shall be two or more Assembly_module_component_terminal for an Assembly_module_macro_component.

4.2.48.2 usage_definition

The usage_definition specifies the role of an Assembly_module (see 4.2.43) for the Assembly_module_macro_component.

4.2.48.3 usage_view_definition

The usage_view_definition is a derived role of an Assembly_module_usage_view (see 4.2.51) which specifies the Assembly_module_usage_view that is identified via the path SELF\assembly_component.usage_definition\physical_unit_design_view.usage_view.

Constraints:

WR1: The Assembly_module_usage_view (see 4.2.51) referenced by the usage_view_definition shall be the same Assembly_module_usage_view referenced by the associated_definition which is referenced by the definition which is referenced by the access_mechanisms.

NOTE EXPRESS specification:

```

*)
ENTITY assembly_module_macro_component
--tt tc1 wd9 modified
    SUBTYPE OF (assembly_module_component);
--tt tc1 wd9 modified
    design_definition : assembly_module;

```

4.2.49 Assembly_module_macro_component_join_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_module_macro_component_join_terminal is a type of Assembly_module_component_terminal (see 4.2.45).

NOTE EXPRESS specification:

```

*)
ENTITY assembly_module_macro_component_join_terminal
  SUBTYPE OF (assembly_module_component_terminal);
    SELF\component_feature.definition      : assembly_module_join_terminal;
    SELF\component_feature.associated_component : assembly_module_macro_component;
END_ENTITY; -- assembly_module_macro_component_join_terminal

( *

```

4.2.50 Assembly_module_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_module_terminal is a type of Part_terminal (see 4.2.630). An Assembly_module_terminal may be a Pca_terminal (see 4.2.640). An Assembly_module_terminal may be associated with an instance of Assembly_module_usage_view_connector_relationship (see 4.2.52) to specify connector level interface definition for an assembly. This association is maintained in the usage view. If available, the terminal_connection_zone shall be supplied.

NOTE The Assembly_module_terminal supports multi-level design, analysis, and verification in a multi-discipline environment. Explicit description of assembly_module_terminals allows connectivity requirements to be explicitly stated and interference requirements to be identified early in the design and development cycle.

The data associated with an Assembly_module_terminal are the following:

- associated_definition;
- feature_shape;
- reference_terminal;
- related_connector;
- terminal_connection_zone.

4.2.50.1 associated_definition

The associated_definition specifies the role of the Assembly_module_usage_view (see 4.2.51) for the Assembly_module_terminal.

4.2.50.2 feature_shape

The feature_shape specifies the role of the Feature_shape_occurrence (see ??) for the Assembly_module_terminal. There shall be one or more Feature_shape_occurrence for an Assembly_module_terminal.

4.2.50.3 reference_terminal

The reference_terminal specifies a Packaged_part_interface_terminal (see 4.2.592) for the Assembly_module_terminal. A reference_terminal need not be specified for a Package_part_interface_terminal.

4.2.50.4 related_connector

The related_connector specifies an Assembly_module_usage_view_connector_relationship (see 4.2.52) for the Assembly_module_terminal. A related_connector need not be specified for a Package_part_interface_terminal.

4.2.50.5 terminal_connection_zone

The terminal_connection_zone specifies the role of the Connection_zone (see 4.2.185) for the Assembly_module_terminal. There may be more than one Connection_zone for an Assembly_module_terminal. The terminal_connection_zone is optional and need not be supplied. If the data is available in the source system, it shall be supplied.

NOTE The Feature_shape_occurrence (see ??) specified by the terminal or mounting feature may be the same Feature_shape_occurrence that is specified by the associated Connection_zone (see 4.2.185). In this case the whole terminal is the Connection_zone.

Constraints:

IP1: If a related_connector is specified, the position, shape, and orientation of the Assembly_module_terminal shall be overridden by the reference_terminal position, shape, and orientation.

NOTE EXPRESS specification:

```

*)
ENTITY assembly_module_terminal
  SUPERTYPE OF ((ONEOF(
    assembly_module_interface_terminal,
    assembly_module_join_terminal))
    ANDOR (pca_terminal))
  SUBTYPE OF (part_terminal);
  SELF\part_feature.associated_definition : assembly_module_usage_view;
  reference_terminal :
OPTIONAL packaged_part_interface_terminal;
  related_connector :
OPTIONAL assembly_module_usage_view_connector_relationship;
  terminal_connection_zone : OPTIONAL SET [1:?] OF connection_zone;
INVERSE
  SELF\part_feature.feature_shape : SET [1:?] OF usage_concept_usage_relationship;
  associated_usage;
END_ENTITY; -- assembly_module_terminal
( *

```

4.2.51 Assembly_module_usage_view

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_module_usage_view is a type of Physical_unit_usage_view (see 4.2.672). An Assembly_module_usage_view may be a Pca_usage_view (see 4.2.641). An Assembly_module_usage_view provides additional domain knowledge for the design organization.

NOTE 1 The Assembly_module_usage_view supports intellectual property protection. A design organization can control the amount of data they provide to a licensee or purchaser by including only a specifically tailored set of data in a usage view.

NOTE 2 Shape information is provided by Physical_unit_3d_shape (see 4.2.666) or by Physical_unit_planar_shape (see 4.2.670).

EXAMPLE 1 This data can include the information currently included in an interface control drawing (ICD).

EXAMPLE 2 Figure 9 illustrates that the information in an Assembly_module_usage_view can be different from the information in a design view. The information in this illustration is sufficient to analyse airflow characteristics and interference characteristics, as well as information related to the connectors in the design.

The data associated with an `Assembly_module_usage_view` are the following:

- `access_mechanisms`;
- `implemented_function`;
- `maximum_negative_component_height`;
- `maximum_positive_component_height`.

4.2.51.1 access_mechanisms

The `access_mechanisms` is an inverse relationship that specifies that the existence of the `Assembly_module_usage_view` is dependent on the existence of the `Assembly_module_terminal` (see 4.2.50) that specifies the `Assembly_module_usage_view` as its `associated_definition`. There shall be two or more `Assembly_module_terminals` for an `Assembly_module_usage_view`.

4.2.51.2 implemented_function

The `implemented_function` specifies the role of the `Functional_unit_usage_view` (see 4.2.410) for the `Assembly_module_usage_view`.

4.2.51.3 maximum_negative_component_height

The `maximum_negative_component_height` specifies the largest `Datum_based_length_measure` (see 4.2.219) in the negative direction from the `Datum` (see 4.2.214) for the `Assembly_module_usage_view`. The `maximum_negative_component_height` need not be specified for a particular `Assembly_module_usage_view`.

EXAMPLE 1 An example of the `maximum_negative_component_height` attribute is for a printed circuit assembly with through-hole components, where the maximum lead protrusion dimension is given. That dimension is the `maximum_negative_component_height`. Figure 9 illustrates this example. Another example of the `maximum_negative_component_height` attribute is for a printed circuit assembly with surface mounted components on both sides. The `maximum_negative_component_height` attribute is for the distance between the established datum and the maximum material condition of the vertical dimension of the highest surface mount component on the secondary side of the printed circuit assembly.

4.2.51.4 maximum_positive_component_height

The `maximum_positive_component_height` specifies the largest `Datum_based_length_measure` (see 4.2.219) in the positive direction from the `Datum` (see 4.2.214) for the `Assembly_module_usage_view`. The `maximum_positive_component_height` need not be specified for a particular `Assembly_module_usage_view`.

EXAMPLE 1 An example of the `maximum_positive_component_height` attribute is for a printed circuit assembly where the maximum component height in the positive direction relative to a datum is given. This dimension pertains to the fit of the printed circuit assembly in its next assembly. That dimension is the `maximum_positive_component_height`. Figure 9 illustrates this example.

Figure 9 – Assembly_module_usage_view

Constraints:

WR1: The direction from the Datum for the maximum_negative_component_height shall be negative in the Z axis direction.

WR2: The direction from the Datum for the maximum_positive_component_height shall be positive in the Z axis direction.

WR3: The function implemented shall be the function whose terminals are mapped to the terminals of this assembly module usage view.

IP1: The Datum orientation vector direction shall be considered to be positive when it is parallel to the normal of the top side of the interconnect substrate instance.

NOTE EXPRESS specification:

```

*)
ENTITY assembly_module_usage_view
  SUPERTYPE OF (pca_usage_view)
  SUBTYPE OF (physical_unit_usage_view);
  implemented_function          : functional_unit_usage_view;
  maximum_negative_component_height : OPTIONAL datum_based_length_measure;
  maximum_positive_component_height : OPTIONAL datum_based_length_measure;
INVERSE
  access_mechanisms : SET [2:?] OF assembly_module_terminal FOR
                        associated_definition;
END_ENTITY; -- assembly_module_usage_view

( *
```

4.2.52 Assembly_module_usage_view_connector_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_module_usage_view_connector_relationship is a type of Usage_concept_usage_relationship (see 4.2.942) that associates the placement and orientation of a Packaged_connector (see 4.2.587) with an Assembly_module_usage_view (see 4.2.51). An Assembly_module_usage_view_connector_relationship supports the identification of connector placement data, when the design details are not available.

The data associated with an Assembly_module_usage_view_connector_relationship are the following:

— externally_visible_partial_reference_designation.

4.2.52.1 externally_visible_partial_reference_designation

An externally_visible_partial_reference_designation specifies an Ee_name for an Assembly_module_usage_view_connector_relationship (see 4.2.52). An externally_visible_partial_reference_designation supports the identification of a connector as a partial reference designation independent of the internal reference designation assigned by the designer of the product. This independence is required when the connector is actually designed as part of a complete lower level assembly.

Constraints:

UR1: The combination of externally_visible_partial_reference_designation and associating_usage inherited from Usage_concept_usage_relationship shall be unique in a population of Assembly_module_usage_view_connector_relationship.

IP1: The associating_usage inherited from Usage_concept_usage_relationship shall be an Assembly_module_usage_view.

IP2: The associated_usage inherited from Usage_concept_usage_relationship shall be a Packaged_connector.

NOTE EXPRESS specification:

```

*)
ENTITY assembly_module_usage_view_connector_relationship
  SUBTYPE OF (usage_concept_usage_relationship);
    associating_usage : assembly_module_usage_view;
    SELF\usage_concept_usage_relationship.associated_usage : packaged_connector;
    externally_visible_partial_reference_designation : ee_name;
UNIQUE
  UR1 : externally_visible_partial_reference_designation,
  associating_usage;
END_ENTITY; -- assembly_module_usage_view_connector_relationship

( *
```

4.2.53 Assembly_requirement_allocation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_requirement_allocation is a type of Managed_design_object (see 4.2.524). An Assembly_requirement_allocation may be one or more of an Assembly_separation_requirement_allocation (see 4.2.54), an Electromagnetic_compatibility_requirement_allocation (see 4.2.347), or a Thermal_requirement_allocation (see 4.2.907). An Assembly_requirement_allocation is the relationship between the Ee_requirement_occurrence (see 4.2.330) and either an Assembly_component (see 4.2.34) or a Component_feature (see 4.2.118) that satisfies that Ee_requirement_occurrence.

The data associated with an Assembly_requirement_allocation are the following:

- assembly_assignment;
- requirement.

4.2.53.1 assembly_assignment

The assembly_assignment specifies either an Assembly_component (see 4.2.34) or a Component_feature (see 4.2.118) for the Assembly_requirement_allocation.

4.2.53.2 requirement

The requirement specifies the role of the Ee_requirement_occurrence (see 4.2.330) for the Assembly_requirement_allocation.

NOTE EXPRESS specification:

```

*)
ENTITY assembly_requirement_allocation
  SUPERTYPE OF ((thermal_requirement_allocation ANDOR
    electromagnetic_compatibility_requirement_allocation) ANDOR
    assembly_separation_requirement_allocation)
  SUBTYPE OF (managed_design_object);
  assembly_assignment : component_or_feature;
  requirement         : ee_requirement_occurrence;
END_ENTITY; -- assembly_requirement_allocation

( *
```

4.2.54 Assembly_separation_requirement_allocation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Assembly_separation_requirement_allocation is a type of Assembly_requirement_allocation (see 4.2.53). An Assembly_separation_requirement_allocation provides for the physical spacing required among components of the assembly. The Assembly_separation_requirement_allocation is for the purpose of specifying separation between items based on the Ee_requirement_occurrence (see 4.2.330).

NOTE Multiple members of this entity may be populated in order to specify all the sets with which a given set will be disjoint, either thermally or electromagnetically.

EXAMPLE 1 A typical usage of this AO is to reference a member of Layout_spacing_requirement_occurrence (see 4.2.509) as the requirement inherited from Assembly_requirement_allocation.

The data associated with an `Assembly_separation_requirement_allocation` are the following:

— `disjoint_assignment`.

4.2.54.1 `disjoint_assignment`

The `disjoint_assignment` specifies either an `Assembly_component` (see 4.2.34) or a `Component_feature` (see 4.2.118) for the `Assembly_separation_requirement_allocation`. There shall be one or more `Assembly_component` or `Component_feature` for the `Assembly_separation_requirement_allocation`. The `disjoint_assignment` shall be applied pairwise.

Constraints:

IP1: The value of `Length_data_element` (see 4.2.511) shall be specified as a characteristic of the `Ee_requirement_occurrence` (see 4.2.330) from `Assembly_requirement_allocation`.

NOTE EXPRESS specification:

```
*)
ENTITY assembly_separation_requirement_allocation
  SUBTYPE OF (assembly_requirement_allocation);
    disjoint_assignment : SET [1:?] OF component_or_feature;
END_ENTITY; -- assembly_separation_requirement_allocation
( *
```

4.2.55 `Assembly_technology_specification`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Assembly_technology_specification` is a type of `Process_specification` (see 4.2.740) that identifies and describes an activity to be performed on an `Ee_product` (see 4.2.319) or `Ee_material` (see 4.2.318) in order to produce an assembly.

NOTE EXPRESS specification:

```
*)
ENTITY assembly_technology_specification
  SUBTYPE OF (process_specification);
END_ENTITY; -- assembly_technology_specification
( *
```

4.2.56 `Axis_placement`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Axis_placement` is a type of `Shape_item` (see 4.2.818). An `Axis_placement` may be an `Axis_placement_2d` (see 4.2.57) or an `Axis_placement_3d` (see 4.2.58). An `Axis_placement` is the transformation and orientation of one `Cartesian_coordinate_system` (see 4.2.86) relative to a referenced coordinate system. An `Axis_placement` is the rigid body transformation that transforms the geometry of the object being placed from its coordinate system to the `Cartesian_coordinate_system` in which the object is being placed. The dimensionality of `Axis_placement` is determined by the dimensionality of the object being placed. The interpretation of this Application Object shall be to an `axis2_placement_3d` or to an `axis2_placement_2d`.

The data associated with an `Axis_placement` are the following:

- `reference_direction`;
- `translation`.

4.2.56.1 `reference_direction`

The `reference_direction` specifies a `Direction` (see 4.2.304) as a reference for an occurrence of a physical device in an `Axis_placement`.

4.2.56.2 `translation`

The `translation` specifies the `Cartesian_point` (see 4.2.87) that is the origin of a `Cartesian_coordinate_system` (see 4.2.86) relative to the origin of a reference `Cartesian_coordinate_system` while maintaining the angular relationship among the axes of the two coordinate systems in the `Axis_placement`.

NOTE EXPRESS specification:

```
*)
ENTITY axis_placement
  SUPERTYPE OF (ONEOF (axis_placement_3d,axis_placement_2d))
  SUBTYPE OF (shape_item);
    reference_direction : direction;
    translation         : cartesian_point;
END_ENTITY; -- axis_placement
(*
```

4.2.57 `Axis_placement_2d`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Axis_placement_2d` is a type of `Axis_placement` (see 4.2.56) that has two dimensions of translation.

NOTE EXPRESS specification:

```
*)
ENTITY axis_placement_2d
  SUBTYPE OF (axis_placement);
END_ENTITY; -- axis_placement_2d
```

(*

4.2.58 Axis_placement_3d

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Axis_placement_3d is a type of Axis_placement (see 4.2.56) that has three dimensions of translation.

NOTE EXPRESS specification:

```
*)
ENTITY axis_placement_3d
  SUBTYPE OF (axis_placement);
END_ENTITY; -- axis_placement_3d
```

--tt tc1 wd9 modified

(*

4.2.59 Bare_die

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Bare_die is a type of a Physical_unit_usage_view (see 4.2.672). A Bare_die is used to describe the physical shape and function of a semiconductor device.

NOTE 1 In the PCA domain an occurrence of a Bare_die may be installed into an occurrence of a Package (see 4.2.573) to realize a Packaged_part (see 4.2.591), an occurrence of which is then mounted in the assembly. In this role of performing a function, a Bare_die has terminals.

NOTE 2 In the PCB domain an occurrence of a Bare_die may be installed into the design of an Interconnect_module (see 4.2.440) to realize an embedded component. In this role, the external surfaces of the Bare_die will be important as they form part of the location information for the occurrence.

NOTE 3 A Bare_die implements electrical functionality. It is not necessary to exchange Bare_die information for parts such as molded or ceramic resistors where there is not a separately identifiable and common industry understanding of a die.

NOTE 4 In the PCA domain an occurrence of a Bare_die may be mounted directly onto the occurrence of a usage view of a PCB.

NOTE 5 The existence of oxide or other thin contaminate protection is considered normal for a Bare_die.

The data associated with a Bare_die are the following:

- access_mechanisms;
- implemented_function;
- least_material_condition_centroid_location;
- maximum_height_above_die_seating_plane;
- maximum_material_condition_centroid_location;
- die_seating_plane;
- unit_technology.

EXAMPLE 1 A semiconductor die is a familiar example used in packaged components on PCAs.

4.2.59.1 access_mechanisms

The access_mechanisms is an inverse relationship that specifies that the existence of the Bare_die is dependent on the existence of the Minimally_defined_bare_die_terminal (see 4.2.545) that specifies the Bare_die as its associated_definition. There shall be two or more Minimally_defined_bare_die_terminal for a Bare_die.

4.2.59.2 implemented_function

The implemented_function specifies the role of the Functional_unit_usage_view (see 4.2.410) for the Bare_die.

4.2.59.3 least_material_condition_centroid_location

The least_material_condition_centroid_location specifies one role of the Cartesian_point (see 4.2.87) for the Bare_die. The least_material_condition_centroid_location is the center of mass for a bare die in the minimum material state. The least_material_condition_centroid_location need not be specified for a particular Bare_die.

4.2.59.4 maximum_height_above_die_seating_plane

The maximum_height_above_die_seating_plane specifies the role of the Length_data_element (see 4.2.511) for the Bare_die. The maximum_height_above_die_seating_plane is the largest extent of the Bare_die above the die_seating_plane. The maximum_height_above_die_seating_plane need not be specified for a particular Bare_die.

4.2.59.5 maximum_material_condition_centroid_location

The maximum_material_condition_centroid_location specifies one role of the Cartesian_point (see 4.2.87) for the Bare_die. The maximum_material_condition_centroid_location is the center of mass for a bare die in the state that contains the most material. The maximum_material_condition_centroid_location need not be specified for a particular Bare_die.

4.2.59.6 die_seating_plane

The die_seating_plane is an inverse relationship that specifies that the existence of the Bare_die is dependent on the existence of the Seating_plane (see 4.2.802) that is also a standard orientation reference for assembly purposes for the Bare_die. The seating_plane is simulating a mounting surface.

4.2.59.7 unit_technology

The unit_technology specifies the role of the Technology (see 4.2.886) for the Bare_die. This part of ISO 10303 does not predefined unit_technology classification.

EXAMPLE 1 Examples include a classification for process and material such as CMOS, BICMOS, ECL, etc.

NOTE 1 Additional categorization is supported with this part of ISO 10303 by using Ee_product_category (see 4.2.320) and related application objects.

NOTE 2 The Bare_die is a monolithic (silicon, germanium, gallium arsenide, etc.) component before encapsulation in a package. It has generally been passivated (e.g., with an oxide layer) to protect it from contamination. Packaging is not required in order for a Bare_die description to be exchanged in conformance to this standard.

Constraints:

WR1: The function implemented shall be the function whose terminals are mapped to the terminals of the bare die.

NOTE This is a test of express in a note

EXPRESS specification:

```

*)
ENTITY bare_die

4.2.60 Bare_die_bottom_surface

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Bare_die_bottom_surface is a type of Part_mounting_feature (see 4.2.618).

The data associated with a Bare_die_bottom_surface are the following:

— associated_definition.

4.2.60.1 associated_definition

The associated_definition specifies the role of the Bare_die (see 4.2.59) for the Bare_die_bottom_surface.

NOTE EXPRESS specification:

```
*)
ENTITY bare_die_bottom_surface
  SUBTYPE OF (bare_die_surface);
  SELF\part_feature.associated_definition : bare_die;
END_ENTITY; -- bare_die_bottom_surface

( *
```

4.2.61 Bare_die_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Bare_die_component is a type of Assembly_component (see 4.2.34) that is defined by a Bare_die (see 4.2.59).

The data associated with a Bare_die_component are the following:

— usage_definition.

4.2.61.1 usage_definition

The usage_definition specifies the role of the Bare_die for the Bare_die_component.

NOTE EXPRESS specification:

```
*)
ENTITY bare_die_component
--tt tc1 wd11 modified
  SUBTYPE OF (physical_component);
  SELF\assembly_component.usage_definition : bare_die;
END_ENTITY; -- bare_die_component

( *
```

4.2.62 Bare_die_component_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Bare_die_component_terminal is a type of Component_terminal (see 4.2.137) that is an instance of a Bare_die_terminal (see 4.2.66). The Bare_die_component_terminal is the area on the bare die instance onto which an enterprise will place bond wires, joining the active areas on the die instance to the next level of assembly. It is not necessarily the shape of the land itself on the die.

The data associated with a Bare_die_component_terminal are the following:

- associated_component;
- definition.

4.2.62.1 associated_component

The associated_component specifies the Bare_die_component (see 4.2.61) to which the Bare_die_component_terminal provides electrical access.

4.2.62.2 definition

The definition specifies the role of the Bare_die_terminal for the Bare_die_component_terminal.

NOTE EXPRESS specification:

```
*)
ENTITY bare_die_component_terminal
  SUBTYPE OF (physical_component_terminal);
    SELF\component_feature.definition          : bare_die_terminal;

END_ENTITY; -- bare_die_surface

( *
```

4.2.66 Bare_die_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Bare_die_terminal is a type of Minimally_defined_bare_die_terminal (see 4.2.545). A Bare_die_terminal is the surface area on a Bare_die (see 4.2.59) that corresponds to the functional terminal on that Bare_die.

EXAMPLE 1 A device_terminal_map in combination with a part_device_terminal are populated to map the functionality of a Bare_die to the functionality of the packaged_part for the occurrence of the Bare_die in the Packaged_part.

The data associated with a Bare_die_terminal are the following:

- external_connection_area;
- material.

4.2.66.1 external_connection_area

The external_connection_area specifies the Connection_zone (see 4.2.185) of the Bare_die_terminal. The external_connection_area is the area on the surface of a Bare_die (see 4.2.59) to which an electrically conducting material shall be attached to access the electrical functionality of the Bare_die. There may be more than one Connection_zone for a Bare_die_terminal. The external_connection_area is optional and need not be supplied if the data is unavailable in the source system. If the data is available in the source system, it shall be supplied.

NOTE The Feature_shape_occurrence (see ??) inherited by the terminal may be the same Feature_shape_occurrence that is specified by the associated Connection_zone (see 4.2.185). In this case the whole terminal is the Connection_zone.

4.2.66.2 material

The material specifies the role of the Ee_material (see 4.2.318) for the Bare_die_terminal.

Constraints:

WR1: The points comprising the external_connection_area shall reside in the shape of the Bare_die being accessed.

WR2: The points comprising the external_connection_area shall be defined in the coordinate system of the device being accessed via the external_connection_area.

NOTE EXPRESS specification:

```

*)
ENTITY bare_die_terminal
  SUBTYPE OF (minimally_defined_bare_die_terminal);
  material          : ee_material;
  external_connection_area : OPTIONAL SET [1:?] OF connection_zone;
  seating_plane_zone : OPTIONAL connection_zone_interface_plane_relationship;
END_ENTITY; -- bare_die_terminal
( *
```

4.2.67 Bare_die_terminal_surface_constituent_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Bare_die_terminal_surface_constituent_relationship is a type of Shape_element_constituent_relationship (see 4.2.813).

NOTE EXPRESS specification:

```

*)
ENTITY bare_die_terminal_surface_constituent_relationship
  SUBTYPE OF (shape_element_constituent_relationship);
  SELF\shape_element_relationship.relate_shape_element : bare_die_surface;
  SELF\shape_element_relationship.related_shape_element : bare_die_terminal;
END_ENTITY; -- bare_die_terminal_surface_constituent_relationship

--tt tc1 wd8 add
( *
```

4.2.68 Bare_die_top_surface

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Bare_die_top_surface is a type of Part_mounting_feature (see 4.2.618).

The data associated with a Bare_die_top_surface are the following:

— associated_definition.

4.2.68.1 associated_definition

The associated_definition specifies the role of the Bare_die (see 4.2.59) for the Bare_die_top_surface.

NOTE EXPRESS specification:

```
*)
ENTITY bare_die_top_surface
  SUBTYPE OF (bare_die_surface);
  SELF\part_feature.associated_definition : bare_die;
END_ENTITY; -- bare_die_top_surface

```

4.2.69 Bevel_edge_feature_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Bevel_edge_feature_shape is a type of Edge_shape (see 4.2.313) that describes a bevelled edge of a feature with a two-dimensional shape.

EXAMPLE 1 Figure 10 illustrates a detail of a fabrication drawing that presents some of the information provided by Bevel_edge_feature_shape. The figure illustrates the measurement conditions (including orientation) for generic width and angle attributes.

The data associated with a Bevel_edge_feature_shape are the following:

- maximum_bevel_angle;
- maximum_bevel_width;
- minimum_bevel_angle;
- minimum_bevel_width.

Figure 10 – Bevel_edge_feature_shape

4.2.69.1 maximum_bevel_angle

The `maximum_bevel_angle` specifies the largest positive value of an `Angle_data_element` (see 4.2.23) measured in the plane of the `Volume_shape_projection` (see ??) relative to the edge surface being beveled (Datum B in figure 10). If the `maximum_bevel_angle` is zero, no material shall be removed. If the `maximum_bevel_angle` is between zero and 90 degrees material shall be removed from the surface closest to the Stratum (see 4.2.845) whose attribute `primary_design_layer_stratum` is TRUE. If the `maximum_bevel_angle` is 90 degrees, no material shall be removed. If the `maximum_bevel_angle` is between 90 and 180 degrees, material shall be removed from the surface furthest from the Stratum whose attribute `primary_design_layer_stratum` is TRUE. `Maximum_bevel_angles` greater than 180 shall not result in material removal.

4.2.69.2 maximum_bevel_width

The `maximum_bevel_width` specifies the largest positive value of the `Length_data_element` (see 4.2.511) that is the width of the bevel relative to the edge surface that is beveled for the `Bevel_edge_feature_shape`.

4.2.69.3 minimum_bevel_angle

The `minimum_bevel_angle` specifies the smallest positive value of an `Angle_data_element` (see 4.2.23) measured in the plane of the `Volume_shape_projection` (see ??) relative to the edge surface being beveled (Datum B in figure 10). If the `minimum_bevel_angle` is zero, no material shall be removed. If the `minimum_bevel_angle` is between zero and 90 degrees material shall be removed from the surface closest to the `Stratum` (see 4.2.845) whose attribute `primary_design_layer_stratum` is TRUE. If the bevel angle is 90 degrees, no material shall be removed. If `minimum_bevel_angle` is between 90 and 180 degrees, material shall be removed from the surface furthest from `Stratum` whose attribute `primary_design_layer_stratum` is TRUE. Bevel_angles greater than 180 shall not result in material removal.

4.2.69.4 minimum_bevel_width

The `minimum_bevel_width` specifies the smallest positive value for the `Length_data_element` (see 4.2.511) that is the width of the bevel relative to the edge surface that is beveled for the `Bevel_edge_feature_shape`.

Constraints:

WR1: The `Planar_projected_shape` and `Volume_shape_projection` application objects shall be populated when this application object is populated, and shall be provided in the geometric model associated with this application object. Two members of `Datum` shall be populated when this application object is populated; one member shall be `Datum A` and the other member shall be `Datum B`.

NOTE EXPRESS specification:

```
*)
ENTITY bevel_edge_feature_shape
  SUBTYPE OF (edge_shape);
    minimum_bevel_width : length_data_element;
    minimum_bevel_angle : angle_data_element;
    maximum_bevel_width : length_data_element;
    maximum_bevel_angle : angle_data_element;
END_ENTITY; -- bevel_edge_feature_shape
```

(*

4.2.70 Blind_passage_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Blind_passage_template` is a type of `Unsupported_passage_template` (see 4.2.941). The `Blind_passage_template` includes sufficient data to determine feature properties for passages that do not penetrate the complete substrate.

The data associated with a `Blind_passage_template` are the following:

- `bottom_distance_from_datum_reference`;
- `datum_reference`;
- `of_measure_orientation`.

4.2.70.1 `bottom_distance_from_datum_reference`

The `bottom_distance_from_datum_reference` specifies the role of the `Shape_dimension_representation` (see 4.2.809) for the `Blind_passage_template`.

4.2.70.2 `datum_reference`

The `datum_reference` specifies the role of the `Stratum_surface` (see 4.2.868) for the `Blind_passage_template`.

4.2.70.3 `of_measure_orientation`

The `of_measure_orientation` specifies normal or reversed as the measure orientation for the `Blind_passage_template`. Normal specifies that the orientation is parallel to the normal of the reference surface. Reversed specifies that the orientation is anti-parallel to the normal of the reference surface.

Constraints:

IP1: A `datum_reference` shall not be a `Stratum_average_surface` (see 4.2.847).

NOTE EXPRESS specification:

```
*)
ENTITY blind_passage_template
  SUBTYPE OF (unsupported_passage_template);
    of_measure_orientation      : measure_orientation;
    datum_reference             : stratum_surface;
    bottom_distance_from_datum_reference : shape_dimension_representation;
END_ENTITY; -- blind_passage_template

( *
```

4.2.71 `Blind_via`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Blind_via is a type of Via (see 4.2.947). Each Blind_via is either a Bonded_conductive_base_blind_via (see 4.2.74), a Non_conductive_base_blind_via (see 4.2.557), or a Plated_conductive_base_blind_via (see 4.2.684) . Blind_via is defined in IEC 60050-541.

EXAMPLE 1 Figure 11 illustrates an idealized cross-section of an interconnect substrate, showing the depth of penetration of a Blind_via into the substrate.

Figure 11 – Blind_via

Constraints:

WR1: Only one end of a Blind_via shall be at a surface of the Interconnect_module.

NOTE EXPRESS specification:

```

*)
ENTITY blind_via
  ABSTRACT SUPERTYPE OF (ONEOF (bonded_conductive_base_blind_via,
    non_conductive_base_blind_via, plated_conductive_base_blind_via))
  SUBTYPE OF (via);
END_ENTITY; -- blind_via

```

(*

4.2.72 Block

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Block is a type of Csg_primitive (see 4.2.201) which is used in forming a "CSG" solid model.

NOTE EXPRESS specification:

```

*)
ENTITY block
  SUBTYPE OF (csg_primitive);
END_ENTITY; -- block

( *
```

4.2.73 Bond_assembly_position

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Bond_assembly_position is a type of Managed_design_object (see 4.2.524). A Bond_assembly_position is the placement of an Assembled_with_bonding (see 4.2.30) within the Physical_unit_3d_shape (see 4.2.666) of an assembly. The Bond_assembly_position is an approximation to the actual position since it uses a default shape for the bond. There may be considerable variation between the default shape and actual shapes in the "as delivered" product.

The data associated with a Bond_assembly_position are the following:

- assembly_model;
- bond;
- bond_definition_placement;
- bond_model.

4.2.73.1 assembly_model

The assembly_model specifies the Physical_unit_3d_shape (see 4.2.666) of the assembly for the Bond_assembly_position.

4.2.73.2 bond

The bond specifies the role of the Assembled_with_bonding (see 4.2.30) for the Bond_assembly_position.

4.2.73.3 bond_definition_placement

The bond_definition_placement specifies the role of the Axis_placement_3d (see 4.2.58) for the Bond_assembly_position. The placement specifies the transformation applied to the bond model to bring it into the assembly model.

4.2.73.4 bond_model

The bond_model specifies the Default_assembly_bond_shape (see 4.2.244) of the assembly bond for the Bond_assembly_position.

NOTE EXPRESS specification:

```

*)
ENTITY bond_assembly_position
  SUBTYPE OF (managed_design_object);
    bond : assembled_with_bonding;
    assembly_model : physical_unit_3d_shape;
    bond_model : default_assembly_bond_shape;
    bond_definition_placement : axis_placement_3d;
END_ENTITY; -- bond_assembly_position

( *
```

4.2.74 Bonded_conductive_base_blind_via

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Bonded_conductive_base_blind_via is a type of Blind_via (see 4.2.71) in which the material that composes the base of the Via (see 4.2.947) is conductive, and in which the base material has been implemented by conductively bonding the Land (see 4.2.490) at the base of the Via to a Stratum_feature (see 4.2.851) of an adjacent conducting Stratum (see 4.2.845).

The data associated with a Bonded_conductive_base_blind_via are the following:

— features_join.

4.2.74.1 features_join

The features_join specifies the Stratum_feature_conductive_join (see 4.2.853) that joins the Land (see 4.2.490) on the interior facing surface of the Stratum (see 4.2.845) that is one end of the extent of the Blind_via (see 4.2.71) to the Land or other Stratum_feature (see 4.2.851) on the interior facing surface of the Stratum immediately adjacent to the first Stratum. The surfaces identified need be adjacent only through the extent of the intersection of these two joined features.

Constraints:

WR1: The Land at the base of the Bonded_conducted_base_blind_via shall be bonded to the Land on the adjacent Stratum.

NOTE A conductive bonding agent may be used to form the bond identified by features_join.

NOTE EXPRESS specification:

```

*)
ENTITY bonded_conductive_base_blind_via
  SUBTYPE OF (blind_via);
  features_join : stratum_feature_conductive_join;
END_ENTITY; -- bonded_conductive_base_blind_via

( *

```

4.2.75 Boolean_csg_result

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Boolean_csg_result is a type of Shape_item (see 4.2.818). A Boolean_csg_result is a Bound_volume_shape (see 4.2.76), or a Csg_primitive (see 4.2.201), which is the result of using a boolean operator. The Boolean_csg_result allows for the composition or decomposition of a Bound_volume_shape, or a Csg_primitive.

The data associated with a Boolean_csg_result are the following:

- csg_operator;
- operand_1;
- operand_2.

4.2.75.1 csg_operator

The csg_operator specifies the difference, the intersection, or the union that determines the Boolean_csg_result.

4.2.75.2 operand_1

The operand_1 specifies the Bound_volume_shape (see 4.2.76), or a Csg_primitive (see 4.2.201) which is the first operand for the Boolean_csg_result.

4.2.75.3 operand_2

The operand_2 specifies the Bound_volume_shape (see 4.2.76), or a Csg_primitive (see 4.2.201) which is the second operand for the Boolean_csg_result.

NOTE EXPRESS specification:

```

*)
ENTITY boolean_csg_result
  SUBTYPE OF (shape_item);
    operand_1      : boolean_csg_operand;
    operand_2      : boolean_csg_operand;
    csg_operator    : boolean_operator;
END_ENTITY; -- boolean_csg_result

--tt tc1 wd9 modified
( *
```

4.2.76 Bound_volume_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Bound_volume_shape is a type of Shape_definition (see 4.2.808). A Bound_volume_shape is one of an Advanced_b_rep (see 4.2.6), a Csg_solid (see 4.2.202), an Edge_based_wireframe (see 4.2.310), a Geometrically_bounded_surface (see 4.2.425), a Shell_based_wireframe (see 4.2.820), or a Solid_of_linear_extrusion (see 4.2.833). A Bound_volume_shape is a three-dimensional geometric representation of a volume.

NOTE EXPRESS specification:

```

*)
ENTITY bound_volume_shape
  ABSTRACT SUPERTYPE OF (ONEOF (
    advanced_b_rep,
    csg_solid,
    edge_based_wireframe,

  SUBTYPE OF (shape_definition);
END_ENTITY; -- bound_volume_shape

( *
```

4.2.77 Boundary_based_position_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Boundary_based_position_tolerance` is a type of `Position_tolerance_with_referenced_datum_system` (see 4.2.696) and a type of `Geometric_tolerance_with_applied_material_condition_property` (see 4.2.421). The `Boundary_based_position_tolerance` defines a `Tolerance_zone_boundary` (see 4.2.915) that is offset from either the least material condition boundary or the maximum material condition boundary depending on the value of the `applied_material_condition_property_name`.

NOTE The attribute `applied_material_condition_property_name` is declared in the `Geometric_tolerance_with_applied_material_condition_property` entity of which this entity is a subtype.

The least material condition boundary and the maximum material condition boundary are established either by one or more `Dimensional_characteristic` (see 4.2.298) or by a `Profile_of_any_surface_tolerance` (see 4.2.747). If the `Boundary_based_position_tolerance` specifies an `applied_material_condition_property_name` of "maximum_material_principle", the `Tolerance_zone_boundary` is offset from the maximum material condition boundary by half of the offset value and in the direction away from the least material condition boundary. If the `Boundary_based_position_tolerance` specifies an `applied_material_condition_property_name` of "least_material_requirement", then the `Tolerance_zone_boundary` is offset from the least material condition boundary by half of the offset value and in the direction away from the maximum material condition boundary.

NOTE Boundary based position tolerances are discussed in 5.10.1 and 6.5.5.1 of ASME Y14.5M.

The data associated with a `Boundary_based_position_tolerance` are the following:

— `profile_control`.

4.2.77.1 `profile_control`

The `profile_control` specifies a `Profile_of_any_surface_tolerance_with_referenced_datum_system` (see 4.2.748) that defines a `Tolerance_zone_boundary` (see 4.2.915) that establishes the least material condition boundary and the maximum material condition boundary from which the `Positional_boundary` (see 4.2.698) defined by the `Boundary_based_position_tolerance` is based. A `profile_control` need not be specified for a `Boundary_based_position_tolerance`.

Constraints:

WR1: The `Shape_element` specified as the `toleranced_shape_element` shall be a `Physical_feature_or_part_template`.

NOTE The attribute `toleranced_shape_element` is declared in the `Geometric_tolerance` entity of which this entity is a subtype.

WR2: If a `Profile_of_any_surface_tolerance_with_referenced_datum_system` is specified as the `profile_control`, both the `Profile_of_any_surface_tolerance_with_referenced_datum_system` and the `Boundary_based_position_tolerance` shall specify the same instance of `Physical_feature_or_part_template` as their `toleranced_shape_element`.

WR3: If a `Profile_of_any_surface_tolerance_with_referenced_datum_system` is specified as the `profile_control`, the `Datum` in the `Datum_system` of the `Profile_of_any_surface_tolerance_with_referenced_datum_system` shall be in the `Datum_system` of the `Boundary_based_position_tolerance` and shall be assigned the same datum precedence.

WR4: If the `Boundary_based_position_tolerance` specifies a `Profile_of_any_surface_tolerance` as the `profile_control`, the `Boundary_based_position_tolerance` shall specify a `Profile_related_positional_boundary_definition` as the `tolerance_zone_or_boundary_definition`; otherwise, the `Boundary_based_position_tolerance` shall specify a `Positional_boundary_member_definition` as the `tolerance_zone_or_boundary_definition`.

NOTE EXPRESS specification:

```

*)
ENTITY boundary_based_position_tolerance
  SUBTYPE OF (position_tolerance_with_referenced_datum_system,
    geometric_tolerance_with_applied_material_condition_property);
  profile_control :
OPTIONAL profile_of_any_surface_tolerance_with_referenced_datum_system;
END_ENTITY; -- boundary_based_position_tolerance

( *
```

4.2.78 Boundary_size_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Boundary_size_characteristic` is a type of `Managed_design_object` (see 4.2.524). A `Boundary_size_characteristic` is either a `Diametrical_boundary_size_characteristic` (see 4.2.287) or an `Opposing_boundary_set_size_characteristic` (see 4.2.568). A `Boundary_size_characteristic` is a definition that characterizes the size of the `Tolerance_zone_boundary` (see 4.2.915).

The data associated with a `Boundary_size_characteristic` are the following:

- `boundary_definition`;
- `maximum_tolerance_value`;
- `tolerance_value`.

4.2.78.1 boundary_definition

The `boundary_definition` is an inverse relationship that specifies that the existence of the `Boundary_size_characteristic` is dependent on the existence of the `Boundary_zone_definition_with_specified_size` (see 4.2.79) that specifies the `Boundary_size_characteristic` as its `specified_boundary_size`.

4.2.78.2 maximum_tolerance_value

The maximum_tolerance_value specifies the Length_data_element (see 4.2.511) that represents the maximum size of the Tolerance_zone_boundary (see 4.2.915). The maximum_tolerance_value need not be specified for the Boundary_size_characteristic.

NOTE Fig. 6-42 of ASME Y14.5M illustrates the application of a maximum value to a geometric tolerance.

4.2.78.3 tolerance_value

The tolerance_value specifies the Length_data_element (see 4.2.511) that represents the size of the Tolerance_zone_boundary (see 4.2.915) for the Boundary_size_characteristic.

NOTE EXPRESS specification:

```

*)
ENTITY boundary_size_characteristic
  ABSTRACT SUPERTYPE OF (ONEOF (diametrical_boundary_size_characteristic,
    opposing_boundary_set_size_characteristic))
  SUBTYPE OF (managed_design_object);

    maximum_tolerance_value : OPTIONAL length_data_element;
  INVERSE
    boundary_definition : boundary_zone_definition_with_specified_size FOR
      specified_boundary_size;
END_ENTITY; -- boundary_size_characteristic

( *
```

4.2.79 Boundary_zone_definition_with_specified_size

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Boundary_zone_definition_with_specified_size is a type of Tolerance_zone_boundary_definition (see 4.2.916) in which the size of the Tolerance_zone_boundary (see 4.2.915) is defined by a Boundary_size_characteristic (see 4.2.78). A Boundary_zone_definition_with_specified_size may be a Profile_boundary_definition (see 4.2.742).

The data associated with a Boundary_zone_definition_with_specified_size are the following:

— specified_boundary_size.

4.2.79.1 specified_boundary_size

The specified_boundary_size specifies the Boundary_size_characteristic (see 4.2.78) that defines the size of the Tolerance_zone_boundary (see 4.2.915) for the Boundary_zone_definition_with_specified_size.

NOTE EXPRESS specification:

```

*)
ENTITY boundary_zone_definition_with_specified_size
  SUPERTYPE OF (profile_boundary_definition)
  SUBTYPE OF (tolerance_zone_boundary_definition);
  specified_boundary_size : boundary_size_characteristic;
END_ENTITY; -- boundary_zone_definition_with_specified_size

( *

```

4.2.80 Bounding_curve

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Bounding_curve is a type of Curve . A Bounding_curve is provided in this part of ISO 10303 to describe the left side or the right side of a Conductive_interconnect_element_with_user_defined_single_transition (see 4.2.175) on an interconnect substrate.

EXAMPLE 1 Figure 12 illustrates a detail of a layout drawing that shows a transition on a trace. Figure 13 illustrate several alternative functions (only one of which is used in this example). A selected function describes the mapping from a constant to the shape of the top side of the trace segment identified as "I" in subfigure "C" in figure 12. The segment "I" is supported in this part of ISO 10303 through a member of Conductive_interconnect_element_with_user_defined_single_transition.

The data associated with a Bounding_curve are the following:

- basis_curve;
- mapping_function.

Figure 12 – Fabrication drawing detail

Figure 13 – Alternative functions for Bounding_Curve

4.2.80.1 basis_curve

The basis_curve specifies the role of the Trimmed_line (see 4.2.933) for the Bounding_curve. The basis_curve founds the Bounding_curve in the geometric context of the design.

4.2.80.2 mapping_function

The mapping_function specifies the role of the External_definition (see 4.2.361) for the Bounding_curve. The mapping_function maps the Trimmed_line onto the resultant curve which is the Bounding_curve.

NOTE This mechanism ensures that the geometry may be exchanged using this part of ISO 103030 even though the mapping function is an externally defined concept.

Constraints:

WR1: A Bounding_curve shall not specify itself through the basis_curve, either directly or indirectly.

WR2: The mapping_function shall have the property of being a one to one map.

NOTE EXPRESS specification:

```
*)
ENTITY bounding_curve
  SUBTYPE OF (curve);
    mapping_function : external_definition;
    basis_curve      : trimmed_line;
END_ENTITY; -- bounding_curve

( *
```

4.2.81 Buried_via

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Buried_via is a type of Via (see 4.2.947). Buried_via is defined in IEC 60050-541.

EXAMPLE 1 Figure 14 illustrates a Buried_via in a cross-section view of an interconnect substrate.

Constraints:

WR1: No end of the Buried_via shall be exposed in the Interconnect_module.

Figure 14 – Buried_via

NOTE EXPRESS specification:

```
*)
ENTITY buried_via
  SUBTYPE OF (via);
END_ENTITY; -- buried_via

--tt tc1 wd10 renamed
(*
```

4.2.82 Bus_element_link

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Bus_element_link is a type of Managed_design_object (see 4.2.524).

NOTE EXPRESS specification:

```
*)
ENTITY bus_element_link
  SUBTYPE OF (managed_design_object);
--tt tc1 wd2 change
  precedent_element      : bus_structural_definition_or_node;
  subsequent_element     : bus_structural_definition_or_node;
  UNIQUE
  UR1 : precedent_element, subsequent_element;
  WHERE
  WR1: precedent_element &#60;&#62; subsequent_element;
END_ENTITY; -- bus_element_link
(*
```

4.2.83 Bus_structural_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Bus_structural_definition` is a type of `Managed_design_object` (see 4.2.524). A `Bus_structural_definition` is the aggregate or composition of the mathematical or logical structure of the bus. If a bus were to be represented by a graph, the `Bus_structural_definition` would be a root node for the bus in that representation.

NOTE 1 A bus is a composition concept. Once defined, the bus definition can be used in various connectivity related aspects of the design. Several of the possible usages are conflicting and rules are provided to ensure unambiguous data. The structure of the reference model prohibits certain conflicting usages from occurring simultaneously.

NOTE 2 Ordered definition of buses is supported in this part of ISO 10303 by interpreting the name of the bus element as indicating the position in the sequence, using normal ASCII ordering for regular expressions. Spaces are not allowed in names.

The data associated with a `Bus_structural_definition` are the following:

- `bus_name`;
- `composition`;
- `external_bus_access`.

4.2.83.1 `bus_name`

The `bus_name` specifies the string identifying the `Bus_structural_definition`.

NOTE A project may establish project wide default names for buses. The identifier should then be globally unique within that project.

4.2.83.2 `composition`

The composition is an inverse relationship that specifies that the existence of the `Bus_structural_definition` is dependent on the existence of the `Bus_element_relationship` (see ??) that specifies the `Bus_structural_definition` as its `bus_definition`.

4.2.83.3 `external_bus_access`

The `external_bus_access` is an inverse relationship that specifies that there shall be no more than one `Functional_unit_network_terminal_definition_bus_assignment` (see 4.2.404) that specifies the `Bus_structural_definition` as its `connected_bus`. The `external_bus_access` need not be supplied for a particular `Bus_structural_definition`.

Constraints:

UR1: The bus_name shall be unique within a population of Bus_structural_definitions.

NOTE EXPRESS specification:

```

*)
ENTITY bus_structural_definition
  SUBTYPE OF (managed_design_object);
  bus_name : ee_name;

4.2.86 Cartesian_coordinate_system

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Cartesian_coordinate_system is a type of Managed_design_object (see 4.2.524). A Cartesian_coordinate_system is a system of two coordinates that locates a point on a plane and measures its distance from either of two intersecting straight-line axes along a line parallel to the other axis, or a system of three coordinates that locates a point in space and measures its distance from any of three intersecting coordinate planes measured parallel to that one of three straight-line axes that is the intersection of the other two planes.

The data associated with a Cartesian_coordinate_system are the following:

- angle_unit_of_measure;
- angular_uncertainty;
- dimensionality;
- length_unit_of_measure;
- length_uncertainty.

4.2.86.1 angle_unit_of_measure

The angle_unit_of_measure specifies either degree or radian as the measurement unit of the Cartesian_coordinate_system.

4.2.86.2 angular_uncertainty

The angular_uncertainty specifies the Angle_data_element (see 4.2.23) of the uncertainty of angularity for the Cartesian_coordinate_system.

NOTE This value is based on the precision of the processor that created the model.

4.2.86.3 dimensionality

The dimensionality specifies either the two-dimensional or three-dimensional nature of the Cartesian_coordinate_system.

4.2.86.4 length_unit_of_measure

The length_unit_of_measure specifies the string for the unit of measurement for the Cartesian_coordinate_system. This shall be interpreted as a length unit of measure.

4.2.86.5 length_uncertainty

The length_uncertainty specifies the Length_data_element (see 4.2.511) of the uncertainty of length for the Cartesian_coordinate_system.

NOTE This value is based on the precision of the processor that created the model.

NOTE EXPRESS specification:

```

*)
ENTITY cartesian_coordinate_system
  SUBTYPE OF (managed_design_object);
    length_unit          : STRING;
    length_unit_prefix   : OPTIONAL si_prefix;

4.2.87 Cartesian_point

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Cartesian_point is a type of Shape_item (see 4.2.818). A Cartesian_point is a geometric point in cartesian space. The requirements of the domain are for two-dimensional and three-dimensional geometry. Each usage of geometry in the domain will specify the required dimensionality.

NOTE EXPRESS specification:

```

*)
ENTITY cartesian_point
  SUBTYPE OF (shape_item);
END_ENTITY; -- cartesian_point
( *
```

4.2.88 Cartesian_transformation_operator_2d

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Cartesian_transformation_operator_2d` is a type of `Managed_design_object` (see 4.2.524). A `Cartesian_transformation_operator_2d` defines a geometric transformation in two-dimensional space composed of translation, rotation, mirroring and uniform scaling. A precise mathematical definition for `Cartesian_transformation_operator_2d` is provided in ISO 10303-42.

The data associated with a `Cartesian_transformation_operator_2d` are the following:

- `axis_1`;
- `axis_2`;
- `mirror`;
- `scale`;
- `translation`.

4.2.88.1 axis_1

The `axis_1` specifies one role of a `Direction` (see 4.2.304) for the `Cartesian_transformation_operator_2d`.

4.2.88.2 axis_2

The `axis_2` specifies one role of a `Direction` (see 4.2.304) for the `Cartesian_transformation_operator_2d`.

4.2.88.3 mirror

The `mirror` is a derived attribute that specifies the value of the determinant of the transformation matrix for the `Cartesian_transformation_operator_2d`.

4.2.88.4 scale

The `scale` specifies the role of the `Positive_ratio_measure` (see ??) for the `Cartesian_transformation_operator_2d`.

4.2.88.5 translation

The `translation` specifies the role of the `Cartesian_point` (see 4.2.87) for the `Cartesian_transformation_operator_2d`.

Constraints:

IP1: Mirroring shall be only about the local Y axis, which "local Y axis" is defined as a): being parallel to the Y axis of the current coordinate system and b): intersecting the Cartesian_point which is in the role of translation for this Cartesian_transformation_operator_2d.

EXAMPLE 1 A point at (X = 3, Y = 2) would be at (X = -3, Y = 2) after being transformed using the Cartesian_transformation_operator_2d if no rotation were applied and no translation were applied, but mirroring were applied.

NOTE Typically the transformation matrix is the result of applying the ordered sequence of "rotate, mirror, translate" operations to an identity matrix. Placing translate last in the sequence satisfies the requirement that mirroring shall be about a local axis.

IP2: The determinant of the transformation matrix shall have a value of -1.0 or +1.0.

NOTE In a received file the value of the determinant may not be exactly 1.0 or -1.0 due to roundoff error. Since these are the only two allowed values, standard techniques to deal with the error are easily applied.

IP3: The scale value for the transformation shall be one.

NOTE EXPRESS specification:

```

*)
ENTITY cartesian_transformation_operator_2d
  SUBTYPE OF (managed_design_object);
    axis_1          : direction;
    axis_2          : direction;

4.2.90 Centre_axis

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Centre_axis is a type of Centre_of_symmetry (see 4.2.91) that is axial in form. The Shape_element (see 4.2.810) from which the Centre_axis is derived are associated with the Centre_axis by the Shape_element_deriving_relationship (see 4.2.814) that are specified as the deriving_relationships.

NOTE 1 The attribute deriving_relationships is declared in the Derived_shape_element (see 4.2.260) entity of which this entity is a subtype.

NOTE 2 The precise interpretation of a Centre_axis is context dependent. That is, the distinction is not made between an axis of a feature and a derived median line of a feature as defined in 1.3 of ASME Y14.5M.

EXAMPLE 1 A Position_tolerance (see 4.2.695) and a Straightness_tolerance (see 4.2.844) may be applied to the same Centre_axis of a cylindrical Shape_element.

Constraints:

IP1: The form of the Shape_elements from which the Centre_axis is derived shall be consistent with the form of shape elements from which a centre axis can be derived.

NOTE EXPRESS specification:

```
*)
ENTITY centre_axis
  SUBTYPE OF (centre_of_symmetry);
END_ENTITY; -- centre_axis

( *
```

4.2.91 Centre_of_symmetry

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Centre_of_symmetry is a type of Derived_shape_element (see 4.2.260) that is derived by determining the geometric centre of one or more Shape_element (see 4.2.810). A Centre_of_symmetry is one of a Centre_axis (see 4.2.90), a Centre_plane (see 4.2.92), or a Centre_point (see 4.2.93).

NOTE EXPRESS specification:

4.2.94 Certification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Certification is a type of Managed_design_object (see 4.2.524). A Certification is a granting of approval for use of a Supplied_product_version (see 4.2.879).

The data associated with a Certification are the following:

- certification_approval;
- certification_date;
- certification_number;
- certified_product_version.

4.2.94.1 certification_approval

The certification_approval specifies the Ee_approval (see 4.2.314) of the Certification.

4.2.94.2 certification_date

The certification_date specifies either the Date (see 4.2.212) or the Date_and_time (see 4.2.213) for the Certification.

4.2.94.3 certification_number

The certification_number specifies the Ee_text (see 4.2.339) that identifies the Certification.

4.2.94.4 certified_product_version

The certified_product_version specifies the Supplied_product_version (see 4.2.879) for the subject of the Certification.

Constraints:

UR1: The certification_number shall be unique within a population of Certifications.

NOTE EXPRESS specification:

```

*)
ENTITY certification
  SUBTYPE OF (managed_design_object);
    certification_approval    : ee_approval;

4.2.95 Change_design_object_management_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Change_design_object_management_relationship` is a type of `Design_object_management_relationship` (see 4.2.278) that provides information about design changes, including the swapping changes among components, gates, or terminals. A `Change_design_object_management_relationship` may be a `Component_swap_specification` (see 4.2.136), a `Gate_path_swap_specification` (see 4.2.415), or a `Terminal_swap_specification` (see 4.2.891).

The data associated with a `Change_design_object_management_relationship` are the following:

- `current_design_object`;
- `previous_design_object`.

4.2.95.1 `current_design_object`

The `current_design_object` specifies the `Managed_design_object` (see 4.2.524), after the design change, for the `Change_design_object_management_relationship`. The `current_design_object` is in the scope of the `current_design`.

4.2.95.2 `previous_design_object`

The `previous_design_object` specifies the `Managed_design_object` (see 4.2.524), before the design change, for the `Change_design_object_management_relationship`. The `previous_design_object` is in the scope of the `previous_design`.

Constraints:

UR1: The combination of the `current_design_object` and the `current_design` inherited from `Design_object_management_relationship` shall be unique within a population of `Change_design_object_management_relationships`.

UR2: The combination of the `previous_design_object` and the `previous_design` inherited from `Design_object_management_relationship` shall be unique within a population of `Change_design_object_management_relationships`.

WR1: The `current_design_object` and the `previous_design_object` shall be of the same type of application object, as defined in this part of ISO 10303.

NOTE A design change may affect only the attributes of the object and not its identifier.

NOTE EXPRESS specification:

4.2.96 Change_order

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Change_order is a type of Work_order (see 4.2.964) that authorizes the development of a modified design of an Ee_product (see 4.2.319), resulting in a new Ee_product_version (see 4.2.328).

The data associated with a Change_order are the following:

— adopted_solution.

4.2.96.1 adopted_solution

The adopted_solution specifies the Design_object_management_relationship (see 4.2.278), or Ee_text (see 4.2.339) which is to be implemented by the Change_order.

NOTE EXPRESS specification:

```

*)
ENTITY change_order
  SUBTYPE OF (work_order);
  adopted_solution : design_object_management_relationship_or_description;

( *

```

4.2.97 Change_request

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Change_request is a type of Work_request (see 4.2.965) that identifies the proposed extent of work to be done to modify the design of a product.

The data associated with a Change_request are the following:

- consequence;
- recommended_solution;
- version.

4.2.97.1 consequence

The consequence specifies the Ee_text (see 4.2.339) that describes the impact that the Change_request will have on the product. There shall be one or more Ee_text for a Change_request.

4.2.97.2 recommended_solution

The recommended_solution specifies one or more Design_object_management_relationship (see 4.2.278), or Ee_text (see 4.2.339) of a potential solution which meets the requirements defined in the Change_request. A recommended_solution need not be specified for a Change_request.

4.2.97.3 version

The version specifies the string identifying a Change_request. The version shall be human interpretable.

Constraints:

UR1: The combination of the version and the work_request_id inherited from Work_request shall be unique within a population of Change_request.

NOTE EXPRESS specification:

```
*)
ENTITY change_request
  SUBTYPE OF (work_request);

    UR1 : version, SELF\work_request.work_request_id;
END_ENTITY; -- change_request

( *
```

4.2.98 Characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Characteristic is a type of Managed_design_object (see 4.2.524). A Characteristic may be one of a Compound_characteristic (see 4.2.154), or a Numeric_parameter (see 4.2.565). A Characteristic is a property of an item.

NOTE A Characteristic may describe either a physical item, like a realized part, or a description that is unrealizable, such as a simulation model.

The data associated with a Characteristic are the following:

- property_value;
- reference_document;
- type_name.

4.2.98.1 property_value

The property_value specifies either a Data_element (see 4.2.211), an External_definition (see 4.2.361), or one of a boolean type, a LOGICAL, or a string type, for the Characteristic.

4.2.98.2 reference_document

The reference_document specifies the Ee_document (see 4.2.316) or a string identifying this Characteristic.

NOTE This part of ISO 10303 explicitly supports the unambiguous exchange of properties whose names are registered by a registration authority and whose definitions are included in data dictionaries. This part of ISO 10303 includes facilities to unambiguously exchange a wide variety of units including SI, user named, and derived.

4.2.98.3 type_name

The type_name specifies the string for this Characteristic.

Constraints:

UR1: The string representing the type_name shall not appear more than once in the reference_document in the role of "type name for Characteristic".

NOTE EXPRESS specification:

```
*)
ENTITY characteristic
  SUPERTYPE OF (ONEOF(compound_characteristic,
    numeric_parameter))

4.2.99 Characteristic_data_set

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Characteristic_data_set is a type of Compound_characteristic (see ??). A Characteristic_data_set is a part of the data needed to compose a data table. The items included in the set are related by being in the set but there is no sequence specified. Specific functional relationships are beyond the scope of this Application object and should be addressed by the Analytical_model Application object.

NOTE EXPRESS specification:

```
*)
ENTITY characteristic_data_set
  SUBTYPE OF (compound_characteristic);
  SELF\characteristic.property_value : set_characteristic;
END_ENTITY; -- characteristic_data_set
(*
```

4.2.100 Characteristic_data_table

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Characteristic_data_table is a type of Compound_characteristic (see 4.2.154). A Characteristic_data_table describes data as a sequence of columns, where the elements in each successive column in the table are correlated according to the position of the column in the sequence of columns. The recursive construction shall terminate in a simple Characteristic Application object.

NOTE EXPRESS specification:

```

*)
ENTITY characteristic_data_table
  SUBTYPE OF (compound_characteristic);
  SELF\characteristic.property_value : list_characteristic;
END_ENTITY; -- characteristic_data_table
( *

```

4.2.101 Circular_area

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Circular_area is a type of Primitive_2d (see 4.2.720).

The data associated with a Circular_area are the following:

- centre;
- radius.

4.2.101.1 centre

The centre specifies a Cartesian_point (see 4.2.87) for the Circular_area.

4.2.101.2 radius

The radius specifies a Length_data_element (see 4.2.511) for the Circular_area.

NOTE EXPRESS specification:

```

*)
ENTITY circular_area
  SUBTYPE OF (primitive_2d);
  centre: cartesian_point;
  radius: length_data_element;
END_ENTITY; -- circular_area
( *

```

4.2.102 Circular_runout_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Circular_runout_tolerance` is a type of `Geometric_tolerance_with_referenced_datum_system` (see 4.2.422) that specifies or partially specifies the design requirement on the run-out of circular elements of a `Physical_feature_or_part_template` (see 4.2.658) in relation to a `Datum_axis` (see 4.2.215). Where run-out is the quality or state of having perfect form and axial alignment in relation to an axis. The `Physical_feature_or_part_template` may be coaxial or normal to the `Datum_axis`. If the `Circular_runout_tolerance` is applied at a specified angle the defined `Tolerance_zone_definition` (see 4.2.920) is a `Runout_tolerance_zone_definition_with_specified_angle` (see 4.2.796).

NOTE 1 A circular run-out tolerance is typically verified by placing a full movement indicator against the surface of the part at the desired orientation and location and then rotating the part one complete revolution about the datum axis. The value of the full indicator movement is then read. This process is repeated at each of the desired test locations. If any one of the full indicator movement readings is greater than the specified tolerance value the surface has exceeded one of the tolerance zones and the part fails the inspection. In theory, there are an infinite number of test locations. However, in practice, a finite number of test locations are measured.

NOTE 2 Circular run-out tolerance is defined in terms of tolerance zone definitions in 14.13 of ISO 1101.

Constraints:

WR1: The `Shape_element` specified as the `toleranced_shape_element` shall be a `Physical_feature_or_part_template`.

NOTE The attribute `toleranced_shape_element` is declared in the `Geometric_tolerance` entity of which this entity is a subtype.

WR2: The `Circular_runout_tolerance` shall not be a `Geometric_tolerance_with_applied_material_condition_property`.

WR3: There shall be at most two `Datum` in the `Datum_system` the definition of which is specified as the `datum_system_definition`.

NOTE The attribute `datum_system_definition` is declared in the `Geometric_tolerance_with_referenced_datum_system` entity of which this entity is a subtype.

WR4: There shall be a `Datum_axis` in the `Datum_system` the definition of which is specified as the `datum_system_definition`.

WR5: The `Datum_system_defining_conditions` that is specified as the `datum_system_definition` shall be a `Datum_system_defining_conditions_without_material_conditions`.

WR6: The `Circular_runout_tolerance` shall specify a `Tolerance_zone_definition` as its `tolerance_zone_or_boundary_definition`; and that `Tolerance_zone_definition` shall specify a `Tolerance_zone_boundary_definition_with_specified_size` as its `boundary_definition`; and that `Tolerance_zone_boundary_definition_with_specified_size` shall specify an `Opposing_boundary_set_size_characteristic` as its `specified_boundary_size`.

IP1: The form of the toleranced `Physical_feature_or_part_template` shall be consistent with the form of a physical feature for which the application of a circular run-out tolerance is sensible.

NOTE EXPRESS specification:

```

*)
ENTITY circular_runout_tolerance
  SUBTYPE OF (geometric_tolerance_with_referenced_datum_system);
END_ENTITY; -- circular_runout_tolerance

( *
```

4.2.103 Circularity_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Circularity_tolerance is a type of Geometric_tolerance_without_referenced_datum_system (see 4.2.423) that specifies or partially specifies the design requirement on the circularity, or roundness, of either a Shape_element (see 4.2.810)(if the Shape_element specified as the tolerated_shape_element is circular, essentially two-dimensional); or of the cross-sectional elements of the tolerated Shape_element (if it is either spherical or can be described as a surface of revolution). For a spherical Shape_element, the cross-sectional elements pass through the centre of the sphere. For a surface of revolution, the cross-sectional elements are taken normal to the axis of revolution. Each circular element must lie within its tolerance zone. The Tolerance_zone_boundary (see 4.2.915) consists of two concentric, coplanar circles. For a surface of revolution or spherical Shape_element the Circularity_tolerance defines a Tolerance_zone (see 4.2.913) that is representative of the tolerance zone for each of the cross-sectional elements.

NOTE 1 Circularity_tolerance is defined in terms of tolerance zone definitions in 14.3 of ISO 1101.

NOTE 2 The attribute tolerated_shape_element is declared in the Geometric_tolerance entity of which this entity is a subtype.

Constraints:

WR1: The Shape_element specified by the tolerated_shape_element shall be a Physical_feature_or_part_template.

WR2: The Circularity_tolerance shall not be a Geometric_tolerance_with_applied_material_condition_property.

WR3: The Circularity_tolerance shall specify a Tolerance_zone_definition as its tolerance_zone_or_boundary_definition; and that Tolerance_zone_definition shall specify a Tolerance_zone_boundary_definition_with_specified_size as its boundary_definition; and that Tolerance_zone_boundary_definition_with_specified_size shall specify an Opposing_boundary_set_size_characteristic as its specified_boundary_size.

IP1: The form of the tolerated Physical_feature_or_part_template shall be consistent with the form of a feature for which the application of a circularity tolerance is sensible.

NOTE EXPRESS specification:

```
*)  
ENTITY circularity_tolerance  
  SUBTYPE OF (geometric_tolerance_without_referenced_datum_system);  
END_ENTITY; -- circularity_tolerance  
  
(*
```

4.2.104 Closed_curve

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Closed_curve is a type of Curve (see 4.2.203) that is traced by a moving point that returns to an arbitrary starting Cartesian_point (see 4.2.87).

Constraints:

IP1: A Closed_curve shall not be self intersecting.

NOTE EXPRESS specification:

```
*)  
ENTITY closed_curve  
  SUBTYPE OF (curve);  
END_ENTITY; -- closed_curve  
  
(*
```

4.2.105 Common_datum

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Common_datum is a type of Datum (see 4.2.214) that is established by two or more Datum_feature (see 4.2.226).

NOTE Common datums are described in 6.2.2 of ISO 5459.

Constraints:

WR1: Each Common_datum shall participate in establishing at least one Datum_system.

WR2: Each Common_datum shall be specified as the relating_shape_element by two or more Datum_feature_usage_in_common_datum_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY common_datum
  SUBTYPE OF (datum);
END_ENTITY; -- common_datum

4.2.106 Component_2d_edge_location

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_2d_edge_location is a type of Component_2d_location (see 4.2.108). The Component_2d_edge_location places components on the edge of a substrate in order to maintain contact with both the top and bottom circuitry.

NOTE Connection_zone_interface_plane_relationship (see 4.2.188) and Connection_zone_based_assembly_joint (see 4.2.186) may be used to provide more details if needed by a receiving organization.

The data associated with a Component_2d_edge_location are the following:

— reference_terminal_assembly_joint.

4.2.106.1 reference_terminal_assembly_joint

The reference_terminal_assembly_joint specifies the Assembly_joint (see 4.2.41) that joins the Primary_reference_terminal (see 4.2.718) of the component being located to the associated mating component feature. The surface the mating component feature is associated with is part of the orientation description for the Component_2d_edge_location.

Constraints:

WR1: stuff to be added

NOTE EXPRESS specification:

```

*)
ENTITY component_2d_edge_location
  SUBTYPE OF (component_2d_location);
    reference_terminal_assembly_joint : assembly_joint;
--tt tc1 wd13 added
    mounting_surface_assembly_joint : assembly_joint;
--tt tc1 wd13 added

  WR1: reference_terminal_assembly_joint &#60;&#62; mounting_surface_assembly_joint;
  WR2: SELF\component_2d_location.substrate_location = FALSE;
  WR3: SIZEOF(['AP210_ARM.INTERCONNECT_MODULE_COMPONENT_TERMINAL',
    'AP210_ARM.INTERCONNECT_MODULE_COMPONENT_SURFACE_FEATURE']) *
    TYPEOF(mounting_surface_assembly_joint.assembly_features_1)) &#62;= 0;
END_ENTITY; -- component_2d_edge_location

--tt tc1 wd8 modified
(

```

4.2.107 Component_2d_embedded_location

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_2d_embedded_location is a type of Component_2d_location (see 4.2.108). The Component_2d_embedded_location places components in a substrate under the constraint that is is required to maintain contact with Stratum_surface on both the top and bottom of the component.

NOTE The Embedded_component_terminal referenced by the Fabrication_joint referenced by reference_joint should be a constituent of one of the surfaces referenced by precedent_surface or subsequent_surface.

The data associated with a Component_2d_embedded_location are the following:

- precedent_surface;
- subsequent_surface;
- reference_terminal.

4.2.107.1 precedent_surface

The precedent_surface specifies the Adjacent_stratum_surface_embedded_component_surface_definition (see 4.2.4) that joins the Component_feature (see 4.2.118) of the component being located to the associated stratum surface. The Adjacent_stratum_surface_embedded_component_surface_definition in this role is identifying the stratum surface that is closer to the primary stratum in the substrate than is the embedded component itself.

4.2.107.2 subsequent_surface

The subsequent_surface specifies the Adjacent_stratum_surface_embedded_component_surface_definition (see 4.2.4) that joins the Component_feature (see 4.2.118) of the component being located to the associated stratum surface. The Adjacent_stratum_surface_embedded_component_surface_definition in this role is identifying the stratum surface that is further away from the primary stratum in the substrate than is the embedded component itself.

4.2.107.3 reference_terminal

The reference_terminal specifies the Fabrication_joint (see 4.2.368) that joins the Primary_reference_terminal (see 4.2.718) of the component being located to the Land_join_terminal or Non_functional_land_join_terminal that implements the internal connection to the circuitry in the rest of the substrate.

Constraints:

WR1: The Embedded_component_terminal referenced by reference_joint shall reference the same component as that referenced by the Component_feature referenced by the Adjacent_stratum_surface_embedded_component_surface_definition referenced by either the precedent_surface or the subsequent_surface.

NOTE EXPRESS specification:

```

*)
ENTITY component_2d_embedded_location
  SUBTYPE OF (component_2d_location);
    precedent_surface      : adjacent_stratum_surface_embedded_component_surface_definition;
    subsequent_surface     : adjacent_stratum_surface_embedded_component_surface_definition;
    reference_terminal     : fabrication_joint;
UNIQUE
  UR1 : precedent_surface, reference_terminal, subsequent_surface;
WHERE
  WR1: precedent_surface &#60;&#62; subsequent_surface;
  WR2: SELF\component_2d_location.substrate_location = FALSE;
END_ENTITY; -- component_2d_embedded_location
( *
```

4.2.108 Component_2d_location

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Component_2d_location` is a type of `Managed_design_object` (see 4.2.524). A `Component_2d_location` may be a `Component_2d_edge_location` (see 4.2.106). The `Component_2d_location` is the placement location, including orientation and mirroring, specified by a combination of description characteristics, substrate surface identification, and two-dimensional transformation. This Application Object requires `Component_assembly_2d_position` (see 4.2.112) for completeness. Mirroring shall not be applied to the location of a base substrate. Mirroring applied to components other than a base substrate shall indicate that the components are mounted on the surface of the substrate opposite to the primary surface. When this application object is used in this manner, there shall be only one base substrate in the assembly.

NOTE Subtypes of this application object includes sufficient information to accurately determine machine parameters for reliable installation of a component on an interconnect substrate. The use of this application object should be reserved for locating base substrates that are not themselves mounted in the design, or where the only mating condition information is encoded in the transformation.

The data associated with a `Component_2d_location` are the following:

- `placement_fixed`;
- `transformation`.

4.2.108.1 `placement_fixed`

The `placement_fixed` specifies whether or not the `Component_2d_location` is fixed in the design. A value of `TRUE` indicates that the `Component_2d_location` is fixed; a value of `FALSE` indicates that the `Component_2d_location` is not fixed.

4.2.108.2 `transformation`

The transformation specifies the role of the `Cartesian_transformation_operator_2d` (see 4.2.88) for the `Component_2d_location`.

Constraints:

IP1: The transformation matrix value of +1.0 shall indicate primary surface mounted component (un-mirrored). The transformation matrix value of -1.0 shall indicate secondary surface mounted component (mirrored). A mirror requirement to mirror about the local Y axis indicates that values on the Y axis are invariant, while values on the X axis are assigned the negative of the original value.

EXAMPLE 1 A point at (X = 3, Y = 2) would be at (X = -3, Y = 2) after being mirrored.

NOTE This standard does not support a "mounting style" attribute. Components which are altered from their normal mounting arrangement (e.g., "upside down mounting style") are considered to be `Altered_packaged_part` (see 4.2.10) in the context of this standard if the normal mounting arrangement is available and a relationship to that normal mounting arrangement is desired.

IP2: The scale value for the transformation shall be one.

NOTE EXPRESS specification:

```

*)
ENTITY component_2d_location
  SUPERTYPE OF (ONEOF(component_2d_edge_location,
                        component_2d_embedded_location,

4.2.110 Component_2d_surface_location

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_2d_surface_location is a type of Component_2d_location (see 4.2.108). The Component_2d_surface_location places components on the external surface of a substrate.

NOTE Connection_zone_interface_plane_relationship (see 4.2.188) and Connection_zone_based_assembly_joint (see 4.2.186) may be used to provide more details if needed by a receiving organization.

The data associated with a Component_2d_surface_location are the following:

— mounting_surface_assembly_joint.

4.2.110.1 mounting_surface_assembly_joint

The mounting_surface_assembly_joint specifies the Assembly_joint (see 4.2.41) that joins the Component_mounting_feature (see 4.2.129) of the component being located to the associated mating component feature. The surface the mating component feature is associated with is part of the orientation description for the Component_2d_surface_location.

NOTE EXPRESS specification:

```

    TYPEOF(mounting_surface_assembly_joint.assembly_features_1)) &#62;= 0;
END_ENTITY; -- component_2d_surface_location

```

(*

4.2.111 Component_3d_location

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_3d_location is a type of Managed_design_object (see 4.2.524). A Component_3d_location is the translation and orientation in three dimensions for the positioning of the Assembly_component (see 4.2.34). This Application Object requires Component_assembly_3d_position (see 4.2.113) for completeness.

The data associated with a Component_3d_location are the following:

- transformation;
- placement_fixed.

4.2.111.1 transformation

The transformation specifies the role of the Axis_placement_3d (see 4.2.58) for the Component_3d_location.

4.2.111.2 placement_fixed

The placement_fixed specifies whether or not the Component_3d_location is fixed. A value of TRUE indicates that the Component_3d_location is fixed. A value of FALSE indicates that the Component_3d_location is not fixed.

NOTE EXPRESS specification:

```

*)
ENTITY component_3d_location
  SUBTYPE OF (managed_design_object);
    transformation : axis_placement_3d;
    placement_fixed : BOOLEAN;
END_ENTITY; -- component_3d_location

( *
```

4.2.112 Component_assembly_2d_position

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_assembly_2d_position is a type of Managed_design_object (see 4.2.524). A Component_assembly_2d_position is the placement and orientation for the positioning of the Assembly_component_2d_shape (see 4.2.35) in the Physical_unit_planar_shape (see 4.2.670) specified by the Next_higher_assembly_relationship (see 4.2.556).

The data associated with a Component_assembly_2d_position are the following:

- assembly_model;
- component;
- component_model;
- transformation.

4.2.112.1 assembly_model

The assembly_model specifies the role of the Physical_unit_planar_shape (see 4.2.670) for the Component_assembly_2d_position.

4.2.112.2 component

The component specifies the role of the Next_higher_assembly_relationship (see 4.2.556) for the Component_assembly_2d_position. The Next_higher_assembly_relationship specifies the actual component being placed.

4.2.112.3 component_model

The component_model specifies the role of the Assembly_component_2d_shape (see 4.2.35) for the Component_assembly_2d_position.

4.2.112.4 transformation

The transformation specifies the role of the Component_2d_location (see 4.2.108) for the Component_assembly_2d_position.

NOTE This application object is included to support exchange where a CAD geometric model is constrained to be two-dimensional models, and there is additional non-geometric characteristic information available.

NOTE EXPRESS specification:

```

*)
ENTITY component_assembly_2d_position
  SUBTYPE OF (managed_design_object);
    component_model : assembly_component_2d_shape;

```

4.2.113 Component_assembly_3d_position

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_assembly_3d_position is a type of Managed_design_object (see 4.2.524). A Component_assembly_3d_position is the placement location and orientation in three dimensions for the positioning of the Assembly_component_3d_shape (see 4.2.36) in the Physical_unit_3d_shape (see 4.2.666) specified by the Next_higher_assembly_relationship (see 4.2.556).

The data associated with a Component_assembly_3d_position are the following:

- assembly_model;
- component;
- component_model;
- transformation.

4.2.113.1 assembly_model

The assembly_model specifies the role of the Physical_unit_3d_shape (see 4.2.666) for the Component_assembly_3d_position.

4.2.113.2 component

The component specifies the role of the Next_higher_assembly_relationship (see 4.2.556) for the Component_assembly_3d_position. The Next_higher_assembly_relationship specifies the actual component being placed.

4.2.113.3 component_model

The component_model specifies the role of the Assembly_component_3d_shape (see 4.2.36) for the Component_assembly_3d_position.

4.2.113.4 transformation

The transformation specifies the role of the Component_3d_location (see 4.2.111) for the Component_assembly_3d_position.

NOTE EXPRESS specification:

```

*)
ENTITY component_assembly_3d_position
  SUBTYPE OF (managed_design_object);
    component_model : assembly_component_3d_shape;
    transformation  : component_3d_location;

    component       : next_higher_assembly_relationship;
END_ENTITY; -- component_assembly_3d_position

( *
```

4.2.114 Component_assembly_non_planar_position

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_assembly_non_planar_position is a type of Managed_design_object (see 4.2.524). A Component_assembly_non_planar_position is the placement location and orientation in three dimensions for the positioning of the Assembly_component_non_planar_shape (see 4.2.37) in the Physical_unit_3d_shape (see 4.2.666) specified by the Next_higher_assembly_relationship (see 4.2.556).

The data associated with a `Component_assembly_non_planar_position` are the following:

- `assembly_model`;
- `component`;
- `component_model`;
- `transformation`.

4.2.114.1 assembly_model

The `assembly_model` specifies the role of the `Physical_unit_3d_shape` (see 4.2.666) for the `Component_assembly_non_planar_position`.

4.2.114.2 component

The `component` specifies the role of the `Next_higher_assembly_relationship` (see 4.2.556) for the `Component_assembly_non_planar_position`. The `Next_higher_assembly_relationship` specifies the actual component being placed.

4.2.114.3 component_model

The `component_model` specifies the role of the `Assembly_component_non_planar_shape` (see 4.2.37) for the `Component_assembly_non_planar_position`.

4.2.114.4 transformation

The `transformation` specifies the role of the `Component_non_planar_location` (see 4.2.130) for the `Component_assembly_non_planar_position`.

NOTE EXPRESS specification:

```

*)
ENTITY component_assembly_non_planar_position
  SUBTYPE OF (managed_design_object);
    component_model : assembly_component_non_planar_shape;

```

4.2.115 Component_based_annotation_symbol_placement_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Component_based_annotation_symbol_placement_relationship` is a type of `Component_feature_to_layout_feature_relationship` (see 4.2.122). A `Component_based_annotation_symbol_placement_relationship` is the information that identifies a `Special_symbol_laminate_component` (see 4.2.834) and is to be placed in the context of the design. This information overrides any such information that may be provided in the library.

The data associated with a `Component_based_annotation_symbol_placement_relationship` are the following:

— `related_stratum_concept`.

NOTE This information is used to provide a means to reposition occurrences of polarization etch symbols, such as are used for polarized capacitors and diodes. The placement information is provided by the `Next_higher_assembly_relationship` for the occurrence of the etch symbol.

4.2.115.1 `related_stratum_concept`

The `related_stratum_concept` specifies the role of the `Special_symbol_laminate_component` (see 4.2.834) for the `Component_based_annotation_symbol_placement_relationship`.

NOTE EXPRESS specification:

```

4.2.116 `Component_based_annotation_text_relationship`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Component_based_annotation_text_relationship` is a type of `Component_feature_to_layout_feature_relationship` (see 4.2.122). A `Component_based_annotation_text_relationship` is the information that specifies an explicit text message based on the component, where the message content is either the value of the reference to the component's locator or the value of the terminal pin identifier.

NOTE This information permits product data stored in standard exchange files to serve as messages that are presented to the user in the medium of the Stratum (see 4.2.845), such as the text of the locator reference or the terminal pin name. This information is not intended to be populated for general etched characters on the board.

The data associated with a `Component_based_annotation_text_relationship` are the following:

- `message_type`;
- `related_stratum_concept`.

4.2.116.1 `message_type`

The `message_type` specifies either a component locator reference or a terminal locator for the `Component_based_annotation_text_relationship`. The `message_type` is a discriminator for determining which data to use from the attribute `relating_feature` that is inherited from the `Application Object Component_feature_to_layout_feature_relationship` (see 4.2.122). The useful options are either `Component_external_reference` (see 4.2.117) or `Component_feature_external_reference` (see 4.2.119). Either of these options will require a query based on the attribute `assembly_design_requirement` of the design which this `Component_feature_to_layout_feature_relationship` is helping to define. For the component locator reference option, two additional queries are required, one to determine the `Next_higher_assembly_relationship` (see 4.2.556) and the second to determine the `Assembly_component` (see 4.2.34). The component locator reference is the attribute `reference_designation` of the returned instance of `Next_higher_assembly_relationship`. The string content of that attribute shall be the string content of the message of the `related_stratum_concept`. For the terminal locator option, additional queries are necessary, continuing with the `Assembly_component` and terminating at the relevant `Part_terminal_external_reference` (see 4.2.631) with an intermediate query of `Component_feature` (see 4.2.118). The string content of the name attribute of `Part_terminal_external_reference` shall be the string content of the message of the `related_stratum_concept`.

NOTE 1 The attribute `message_type` is not a value of data. It is a declaration of the type of `Component_based_annotation_text_relationship`.

NOTE 2 The data contained in the `reference_designation` attribute in a member of `Next_higher_assembly_relationship` (see 4.2.556) is an instance of a message of one type.

NOTE 3 The data contained in the `name` attribute in a member of `Package_terminal` (see 4.2.581) is an instance of a message of the second type.

4.2.116.2 `related_stratum_concept`

The `related_stratum_concept` specifies the role of the `Laminate_text_string_component` (see 4.2.489) for the `Component_based_annotation_text_relationship`. There is no explicit geometric relationship defined in this part of ISO 10303 between the design element referenced by the message presented by the `related_stratum_concept` and the `related_stratum_concept` itself. Only the `related_stratum_concept` is positioned in the current design. The component or feature referenced by the message in the attribute `related_stratum_concept` is defined in a different design that is an `Assembly_module` (see 4.2.43).

NOTE This is the actual physical message, as realized by the fabrication process. The position of the corresponding elements in the two designs are usually defined by an end user using a layout tool which presents a view of the data from the assembly in the layout tool for design efficiency.

NOTE EXPRESS specification:

```

*)
ENTITY component_based_annotation_text_relationship
  SUBTYPE OF (component_feature_to_layout_feature_relationship);
  SELF\component_feature_to_layout_feature_relationship.related_stratum_concept :
  laminate_text_string_component;
  message_type :
  component_based_message_type;
END_ENTITY; -- component_based_annotation_text_relationship

( *
```

4.2.117 Component_external_reference

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_external_reference is a type of Managed_design_object (see 4.2.524). A Component_external_reference is an unambiguous reference to a Next_higher_assembly_relationship (see 4.2.556) in a different design.

EXAMPLE 1 Items in an Interconnect_module (see 4.2.440) design view may need to reference component to assembly relationships in the assembly in order to unambiguously identify source of layout requirements.

The data associated with a Component_external_reference are the following:

- design_owner;
- part_number;
- revision_code;
- product_definition_id;
- reference_designation.

4.2.117.1 design_owner

The design_owner specifies one role of a string for the Component_external_reference. The design_owner is the organization that maintains the registration document for the part_number for the reference assembly. Usually it is the design authority.

4.2.117.2 part_number

The part_number specifies one role of a string for the Component_external_reference. The part_number identifies the reference assembly in the context of the design_owner.

4.2.117.3 revision_code

The revision_code specifies one role of a string for the Component_external_reference. The revision_code identifies the version of the reference assembly.

NOTE Usually the revision_code and part number identify the original assembly for which an interconnect is designed.

4.2.117.4 product_definition_id

The product_definition_id specifies one role of a string for the Component_external_reference. The product_definition_id identifies the original Ee_product_definition for the assembly. If not available in the originating system, the string "UNKNOWN" shall be provided.

4.2.117.5 reference_designation

The reference_designation specifies one role of a string for the Component_external_reference. The reference_designation uniquely identifies the externally referenced component in the reference assembly.

NOTE EXPRESS specification:

```

*)
ENTITY component_external_reference
  SUBTYPE OF (managed_design_object);
    design_owner      : STRING;
    part_number       : STRING;
    revision_code     : STRING;
    product_definition_id : STRING;
    reference_designation : STRING;
END_ENTITY; -- component_external_reference

( *
```

4.2.118 Component_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_feature is a type of Managed_design_object (see 4.2.524). A Component_feature may be one of a Component_interface_terminal (see 4.2.125), a Component_terminal (see 4.2.137), a Component_termination_passage_interface_terminal (see 4.2.148), a Land_interface_terminal (see 4.2.491), a Non_functional_land_interface_terminal (see 4.2.563), or a Printed_connector_component_interface_terminal (see 4.2.725), and in addition may be a Physical_component_feature (see 4.2.649), and in addition may be an Interconnect_module_component_surface_feature (see 4.2.444). The location of the Component_feature in the assembly model is derived from the placement of the associated_component in the assembly model and the placement of the definition model in the usage_definition model of that associated_component.

The data associated with a `Component_feature` are the following:

- `associated_component`;
- `defined_product_feature`;
- `definition`.

4.2.118.1 associated_component

The `associated_component` specifies the role of the `Assembly_component` (see 4.2.34) for the `Component_feature`.

NOTE The subtypes of `Component_feature` specify specializations of `Assembly_component` that are consistent with the subtype of `definition`.

4.2.118.2 defined_product_feature

The `defined_product_feature` is an inverse relationship that specifies that there shall be no more than one `Component_feature_to_physical_usage_view_assignment` (see 4.2.123) that specifies the `Component_feature` as its `assigned_design_object`. The `defined_product_feature` need not be specified for a particular `Component_feature`.

4.2.118.3 definition

The `definition` specifies either a `Component_termination_passage_template_terminal` (see 4.2.153), a `Land_template_terminal` (see 4.2.496), a `Part_feature` (see 4.2.609), a `Part_terminal_external_reference` (see 4.2.631), a `Printed_part_template_terminal` (see 4.2.737), or a `Via_template_terminal` (see 4.2.953) for this `Component_feature`. The `definition` need not be specified for a particular `Component_feature`.

Constraints:

UR1: The combination of the `definition` and the `associated_component` shall be unique within a population of `Component_features`.

WR1: The `Physical_unit` or `Part_template` specified by the `associated_component` as its `usage_definition` shall be the same `Physical_unit` or `Part_template` specified by the `definition` as its `associated_definition`.

WR2: For each `Component_feature` there shall be no more than one `Assembly_joint` that specifies it as an `assembly_feature`.

NOTE Parameters may be assigned to `Component_feature` by the `Planned_characteristic` object through the `Assembly_requirements_allocation`.

NOTE EXPRESS specification:

```

*)
ENTITY component_feature
--tt tc1 wd12 modified
  SUPERTYPE OF (ONEOF (physical_component_feature,
    laminate_component_feature))
  SUBTYPE OF (managed_design_object);

  associated_component : assembly_component;
  INVERSE
    defined_product_feature :
SET [0:1] OF component_feature_to_physical_usage_view_assignment FOR
assigned_design_object;
  UNIQUE
    UR1 : definition, associated_component;
END_ENTITY; -- component_feature

--tt tc1 wd12 added
(

```

4.2.119 Component_feature_external_reference

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_feature_external_reference is a type of Managed_design_object (see 4.2.524). A Component_feature_external_reference is an unambiguous reference to a Component_feature (see 4.2.118) in a different design.

EXAMPLE 1 Items in an Interconnect_module (see 4.2.440) design view may need to reference component features in a reference assembly in order to unambiguously identify source of layout requirements.

The data associated with a Component_feature_external_reference are the following:

- associated_component;
- name.

4.2.119.1 associated_component

The associated_component specifies the role for a Component_external_reference (see 4.2.117) for the Component_feature_external_reference.

4.2.119.2 name

The name specifies the role of a string for the Component_feature_external_reference.

Constraints:

UR1: Each member of Component_feature_external_reference shall have a unique combination of attributes.

NOTE EXPRESS specification:

```

*)
ENTITY component_feature_external_reference
  SUBTYPE OF (managed_design_object);
    associated_component : component_external_reference;
    name                 : STRING;
UNIQUE
  UR1 : associated_component, name;
END_ENTITY; -- component_feature_external_reference

( *
```

4.2.120 Component_feature_make_from_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_feature_make_from_relationship is a type of Managed_design_object (see 4.2.524). A Component_feature_make_from_relationship is an association between two Component_feature (see 4.2.118), where one Component_feature is used as a basis for the development of another Component_feature.

The data associated with a Component_feature_make_from_relationship are the following:

- resultant_feature;
- reusable_feature.

4.2.120.1 resultant_feature

The resultant_feature specifies the Component_feature (see 4.2.118) that results from modifying or reusing the reusable_feature in the Component_feature_make_from_relationship.

4.2.120.2 reusable_feature

The reusable_feature specifies the Component_feature (see 4.2.118) that is modified or reused to become the resultant_feature in the Component_feature_make_from_relationship.

Constraints:

WR1: The resultant_feature shall not be the reusable_feature either directly or indirectly.

WR2: The type of the resultant_feature shall be the same as the type of the reusable_feature.

NOTE EXPRESS specification:

```

*)
ENTITY component_feature_make_from_relationship
  SUBTYPE OF (managed_design_object);
    reusable_feature : component_feature;
    resultant_feature : component_feature;
END_ENTITY; -- component_feature_make_from_relationship

( *
```

4.2.121 Component_feature_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_feature_relationship is a type of Managed_design_object (see 4.2.524). A Component_feature_relationship is the association between two Component_feature (see 4.2.118).

The data associated with a Component_feature_relationship are the following:

- related_component_feature;
- relating_component_feature.

4.2.121.1 related_component_feature

The related_component_feature specifies the dependent Component_feature (see 4.2.118) for the Component_feature_relationship.

4.2.121.2 relating_component_feature

The relating_component_feature specifies the independent Component_feature (see 4.2.118) for the Component_feature_relationship.

Constraints:

WR1: The related_component_feature shall not be the relating_component_feature either directly or indirectly.

NOTE EXPRESS specification:

```

*)
ENTITY component_feature_relationship
  SUBTYPE OF (managed_design_object);
    related_component_feature : component_feature;
    relating_component_feature : component_feature;
END_ENTITY; -- component_feature_relationship

( *
```

4.2.122 Component_feature_to_layout_feature_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_feature_to_layout_feature_relationship is a type of Managed_design_object (see 4.2.524). A Component_feature_to_layout_feature_relationship may be a Component_based_annotation_symbol_placement_relationship (see 4.2.115) or a Component_based_annotation_text_relationship (see 4.2.116). A Component_feature_to_layout_feature_relationship is the association between a component or feature of a component and a layout feature, based upon a requirement. All features related with this relationship shall be in the same design unless the reference is to a Component_external_reference (see 4.2.117) or to a Component_feature_external_reference (see 4.2.119).

The data associated with a Component_feature_to_layout_feature_relationship are the following:

- related_stratum_concept;
- relating_feature;
- requirement.

4.2.122.1 related_stratum_concept

The related_stratum_concept specifies either an Inter_stratum_feature (see 4.2.432), a Laminate_component (see 4.2.483), a Stratum (see 4.2.845), a Stratum_feature (see 4.2.851), or a Stratum_surface (see 4.2.868) to which the relating_feature is related for the Component_feature_to_layout_feature_relationship.

4.2.122.2 relating_feature

The relating_feature specifies an Assembly_component (see 4.2.34) or a Component_feature (see 4.2.118) or a Component_feature_external_reference or a Component_external_reference for the Component_feature_to_layout_feature_relationship.

4.2.122.3 requirement

The requirement specifies the `Ee_requirement_occurrence` (see 4.2.330) that causes this `Component_feature_to_layout_feature_relationship` to be needed. The requirement need not be specified for a particular `Component_feature_to_layout_feature_relationship`.

NOTE EXPRESS specification:

```

*)
ENTITY component_feature_to_layout_feature_relationship
  SUPERTYPE OF (ONEOF (component_based_annotation_text_relationship,
    component_based_annotation_symbol_placement_relationship))
  SUBTYPE OF (managed_design_object);
  related_stratum_concept : stratum_concept;
  relating_feature        : component_or_component_feature;
  requirement             : OPTIONAL ee_requirement_occurrence;
END_ENTITY; -- component_feature_to_layout_feature_relationship

--tt tc1 wd9 modified
( *
```

4.2.123 Component_feature_to_physical_usage_view_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Component_feature_to_physical_usage_view_assignment` is a type of `Managed_design_object` (see 4.2.524). A `Component_feature_to_physical_usage_view_assignment` is the association between the `Part_feature` (see 4.2.609) and the `Component_feature` (see 4.2.118). The purpose for this assignment is to link the product data in the design view to the product data in the usage view for traceability purposes.

NOTE 1 In an archive, both a design view and a usage view are archived together, with this relationship populated as necessary to provide linkages between the features in the usage view and the features in the design view. Without this linkage populated, there is no way to guarantee traceability between a design view and a usage view, without evaluating the design view and the usage view in detail.

NOTE 2 In the case where this part of ISO 10303 is used to exchange or store designs that may be used in higher level assemblies, the usage view is provided to the designers of those higher level assemblies, and this entity allows the interface definitions to the next level assemblies to be carefully controlled. Note that the usage view is an as-designed view. The requirements unit of functionality in this part of ISO 10303 supports the as-required view of the interface to the next higher assembly in a top-down design paradigm. This part of ISO 10303 supports explicitly exchanging those data separately so that traceability is provided from requirements to as-designed life-cycle states in the same exchange file.

NOTE 3 This information is provided for the case where a `Component_feature` is suitable directly as a feature of the assembly.

NOTE 4 Most `Component_feature` types will be interface types.

The data associated with a `Component_feature_to_physical_usage_view_assignment` are the following:

- `assigned_design_object`;
- `defined_part_feature`.

4.2.123.1 `assigned_design_object`

The `assigned_design_object` specifies the role of the `Component_feature` (see 4.2.118) for the `Component_feature_to_physical_usage_view_assignment`.

4.2.123.2 `defined_part_feature`

The `defined_part_feature` specifies the role of the `Part_feature` (see 4.2.609) for the `Component_feature_to_physical_usage_view_assignment`.

NOTE EXPRESS specification:

```

*)
ENTITY component_feature_to_physical_usage_view_assignment
  SUPERTYPE OF (ONEOF (
    component_terminal_to_assembly_module_join_terminal_assignment,
    component_terminal_to_assembly_module_interface_terminal_assignment,
    component_terminal_to_interconnect_module_join_terminal_assignment,
    component_terminal_to_interconnect_module_interface_terminal_assignment,
    component_terminal_to_pca_terminal_assignment))
  SUBTYPE OF (managed_design_object);
    defined_part_feature : part_feature;
    assigned_design_object : component_feature;
END_ENTITY; -- component_feature_to_physical_usage_view_assignment

( *
```

4.2.124 `Component_group_assignment`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Component_group_assignment` is a type of `Managed_design_object` (see 4.2.524). A `Component_group_assignment` is the relationship between an `Assembly_component` (see 4.2.34) and the `Placement_group` (see 4.2.674) to which it is assigned. A `Component_group_assignment` is an incomplete concept by itself and is intended for use with a `Placement_group_area_assignment` (see 4.2.675) or a `Component_placement_restriction_assignment` (see 4.2.135).

The data associated with a `Component_group_assignment` are the following:

- `assigned_component`;
- `associated_group`.

4.2.124.1 `assigned_component`

The `assigned_component` specifies the `Assembly_component` (see 4.2.34) in the `Component_group_assignment`.

4.2.124.2 `associated_group`

The `associated_group` specifies the `Placement_group` (see 4.2.674) in the `Component_group_assignment`.

NOTE EXPRESS specification:

```

*)
ENTITY component_group_assignment
  SUBTYPE OF (managed_design_object);
    associated_group    : placement_group;
    assigned_component : assembly_component;
END_ENTITY; -- component_group_assignment

( *
```

4.2.125 `Component_interface_terminal`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Component_interface_terminal` is a type of `Component_feature` (see 4.2.118). A `Component_interface_terminal` is one of an `Interconnect_component_interface_terminal` (see 4.2.438) or a `Packaged_connector_component_interface_terminal` (see 4.2.589). A `Component_interface_terminal` is one termination of an interface component.

EXAMPLE 1 An example of this is one terminal on a socket or connector, available for mating to a terminal of an external connector or to a terminal of a component installed in the socket.

The data associated with a `Component_interface_terminal` are the following:

- `associated_component`.

4.2.125.1 `associated_component`

The `associated_component` specifies the role of the `Interface_component` (see 4.2.468) for the `Component_interface_terminal`.

NOTE EXPRESS specification:

```

*)
ENTITY component_interface_terminal
  ABSTRACT SUPERTYPE OF (ONEOF (
    packaged_connector_component_interface_terminal,
    interconnect_component_interface_terminal))
  SUBTYPE OF (physical_component_feature);
--tt tc1 wd12 modified
--tt tc1 wd9 modified
  SELF\component_feature.associated_component : interface_component;
END_ENTITY; -- component_interface_terminal

```

(*

4.2.126 Component_make_from_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_make_from_relationship is a type of Managed_design_object (see 4.2.524). A Component_make_from_relationship is the association between one Assembly_composition_relationship (see 4.2.39) and another Assembly_composition_relationship, where one Assembly_composition_relationship results from full or partial reuse of the other. A Component_make_from_relationship may be a Laminate_group_component_make_from_relationship.

NOTE The main use of this concept is design reuse where the modification consists of the fact that the Assembly_composition_relationship is in a different assembly from the original design, or where the original design is a reference design.

The data associated with a Component_make_from_relationship are the following:

- resultant_component;
- reusable_component.

4.2.126.1 resultant_component

The resultant_component specifies the Assembly_composition_relationship (see 4.2.39) for the Assembly_component (see 4.2.34) that results from the reuse of the reusable_component in the Component_make_from_relationship.

4.2.126.2 reusable_component

The reusable_component specifies the Assembly_composition_relationship (see 4.2.39) for the Assembly_component (see 4.2.34) that is reused to create the resultant_component in the Component_make_from_relationship.

Constraints:

WR1: The reusable_component shall not be an ancestor, either directly or indirectly of the resultant_component. The inverse shall also be true.

WR2: The reusable_component shall not be the resultant_component.

NOTE EXPRESS specification:

```

*)
ENTITY component_make_from_relationship
  SUPERTYPE OF(laminate_group_component_make_from_relationship)
  SUBTYPE OF (managed_design_object);
  reusable_component : assembly_component;
  resultant_component : assembly_component;
WHERE
  WR1: resultant_component &#60;&#62; reusable_component;
END_ENTITY; -- component_make_from_relationship

( *
```

4.2.127 Component_mating_constraint_condition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_mating_constraint_condition is a type of Managed_design_object (see 4.2.524). A Component_mating_constraint_condition identifies the degrees of freedom that have been constrained by a set of members of Assembly_joint (see 4.2.41). A Component_mating_constraint_condition provides "x","y","z" as the set of axes, and "u","v","w" as the set of rotations about those axes. If an axis is included in the set, then translation along that axis is constrained. If a rotation is included in the set, then rotation about the corresponding axis is constrained. The pairs of axis,rotation are: x,u; y,v;z,w. The axes are referenced in the local coordinate system of the component referenced by the related attribute of the members of Assembly_joint referenced by constraining_joints. Exactly one member of Assembly_component shall be referenced by the related attribute of members of Assembly_joint referenced by constraining_joints.

The data associated with a Component_mating_constraint_condition are the following:

- constraining_joint;
- constrained_degrees_of_freedom;
- context;
- name.

4.2.127.1 constraining_joint

The `constraining_joint` specifies the `Assembly_joint` for the `Component_mating_constraint_condition`. There shall be at least one member of `constraining_joint` and there shall be no more than three members of `constraining_joint`.

4.2.127.2 constrained_degrees_of_freedom

The `constrained_degrees_of_freedom` specifies the identifier of the degrees of freedom that are constrained. There shall be at least one and there shall be no more than five degrees of freedom specified.

4.2.127.3 context

The `of_context` specifies the role of the `Physical_unit_design_view` (see 4.2.667) for the `Component_mating_constraint_condition`.

4.2.127.4 name

The `name` specifies the identifier of the `Component_mating_constraint_condition` in the context of the `Physical_unit_design_view`.

NOTE EXPRESS specification:

```

*)
ENTITY component_mating_constraint_condition
  SUBTYPE OF (managed_design_object);
  constraining_joint : SET[1:3] OF assembly_joint;
  constrained_degree_of_freedom : SET[1:5] OF degree_of_freedom;
  of_context : physical_unit_design_view;
  name : ee_name;
UNIQUE
  UR1: name, of_context;
END_ENTITY; -- component_mating_constraint_condition
( *
```

4.2.128 Component_mounting_clearance_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Component_mounting_clearance_relationship` is a type of `Managed_design_object` (see 4.2.524). A `Component_mounting_clearance_relationship` is the relationship between the features of one component and another in their next assembly, with respect to the clearance between them.

NOTE 1 This clearance is required when a specific component requires a minimum distance from the printed circuit board or another specific component.

NOTE 2 This clearance is often derived from the mechanism requirements of the factory equipment that assembles the components to their next assembly. The mechanical handling fingers that grasp and place a component require clearance from previously placed components in order to place the second component and release it from the mechanism.

The data associated with a `Component_mounting_clearance_relationship` are the following:

- `feature_relationship`;
- `maximum_mounting_clearance`;
- `minimum_mounting_clearance`.

4.2.128.1 `feature_relationship`

The `current_component` specifies the `Component_feature_relationship` (see 4.2.121) of the features of the components to be placed for the `Component_mounting_clearance_relationship`.

4.2.128.2 `maximum_mounting_clearance`

The `maximum_mounting_clearance` specifies the `Length_data_element` (see 4.2.511), of the maximum distance between the `current_component` and the `previously_placed_component`, for the `Component_mounting_clearance_relationship`. The `maximum_mounting_clearance` need not be specified for a particular `Component_mounting_clearance_relationship`. The value shall be interpreted as the specification to be satisfied by the assembly process.

4.2.128.3 `minimum_mounting_clearance`

The `minimum_mounting_clearance` specifies the `Length_data_element` (see 4.2.511), of the minimum distance between the `current_component` and the `previously_placed_component`, for the `Component_mounting_clearance_relationship`. The value shall be interpreted as the specification to be satisfied by the assembly process.

Constraints:

WR1: The `feature_relationship` shall relate two features in the same design but not of the same component.

WR2: A `Datum_plane` shall be defined for each of the `current_component` and of the `previously_placed_component`.

WR3: The length shall be measured between the two `Datum_planes`.

WR4: Both components shall be in the same version of the product.

WR5: Each Datum_plane shall be based on physical features referenced by the feature_relationship.

NOTE EXPRESS specification:

```

4.2.129 Component_mounting_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_mounting_feature is a type of Physical_component_feature (see 4.2.649).

The data associated with a Component_mounting_feature are the following:

— definition.

4.2.129.1 definition

The definition specifies the role of the Part_mounting_feature (see 4.2.618) for the Component_mounting_feature.

NOTE EXPRESS specification:

```

*)
ENTITY component_mounting_feature
  SUBTYPE OF (physical_component_feature);
    SELF\component_feature.definition : part_mounting_feature;
END_ENTITY; -- component_mounting_feature

( *
```

4.2.130 Component_non_planar_location

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Component_non_planar_location` is a type of `Managed_design_object` (see 4.2.524). A `Component_non_planar_location` is the translation and orientation in three dimensions for the positioning of the `Assembly_component` (see 4.2.34). This Application Object requires `Component_assembly_3d_position` (see 4.2.113) for completeness.

The data associated with a `Component_non_planar_location` are the following:

- `transformation`;
- `placement_fixed`.

4.2.130.1 transformation

The `transformation` specifies the role of the `Axis_placement_3d` (see 4.2.58) for the `Component_non_planar_location`.

4.2.130.2 placement_fixed

The `placement_fixed` specifies whether or not the `Component_non_planar_location` is fixed. A value of `TRUE` indicates that the `Component_non_planar_location` is fixed. A value of `FALSE` indicates that the `Component_non_planar_location` is not fixed.

NOTE EXPRESS specification:

```
*)
ENTITY component_non_planar_location
  SUBTYPE OF (managed_design_object);
    transformation : axis_placement_3d;
    placement_fixed : BOOLEAN;
END_ENTITY; -- component_non_planar_location
(*
```

4.2.131 Component_overlap_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Component_overlap_relationship` is a type of `Managed_design_object` (see 4.2.524). A `Component_overlap_relationship` is the relationship between one component and another in their next assembly, with respect to the physical overlap between them. This overlap is often derived from the mechanism requirements of the factory equipment that assembles the components to their next assembly. The sequence of assembly is established by the `previously_placed_component` and the `current_component`, in turn, and the minimum clearance between the two components is taken into consideration during assembly.

The data associated with a `Component_overlap_relationship` are the following:

- `current_component`;
- `maximum_added_clearance`;
- `minimum_added_clearance`;
- `previously_placed_component`.

4.2.131.1 `current_component`

The `current_component` specifies the `Next_higher_assembly_relationship` (see 4.2.556), of the component to be placed next, for the `Component_overlap_relationship`.

4.2.131.2 `maximum_added_clearance`

The `maximum_added_clearance` specifies the `Length_data_element` (see 4.2.511) of the maximum distance between the `current_component` and the `previously_placed_component` for the `Component_overlap_relationship`. The `maximum_added_clearance` need not be specified for a particular `Component_overlap_relationship`.

4.2.131.3 `minimum_added_clearance`

The `minimum_added_clearance` specifies the `Length_data_element` (see 4.2.511) of the minimum distance between the `current_component` and the `previously_placed_component` for the `Component_overlap_relationship`.

4.2.131.4 `previously_placed_component`

The `previously_placed_component` specifies the `Next_higher_assembly_relationship` (see 4.2.556), of the component previously placed for the `Component_overlap_relationship`.

Constraints:

WR1: The `previously_placed_component` shall not be the `current_component`.

WR2: Both components shall be in the same version of the assembly.

WR3: A `Datum_plane` shall be defined for each of the `current_component` and `previously_placed_component`.

WR4: The length shall be measured between the two `Datum_planes`.

WR5: Each `Datum_plane` shall be based on a physical feature of the component.

NOTE EXPRESS specification:

```

*)
ENTITY component_overlap_relationship
  SUBTYPE OF (managed_design_object);
    previously_placed_component : next_higher_assembly_relationship;
    current_component           : next_higher_assembly_relationship;
    minimum_added_clearance     : length_data_element;
    maximum_added_clearance     : OPTIONAL length_data_element;
END_ENTITY; -- component_overlap_relationship

```

4.2.132 Component_part_2d_non_planar_geometric_representation_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_part_2d_non_planar_geometric_representation_relationship is a type of Geometric_representation_relationship (see 4.2.418). A Component_part_2d_non_planar_geometric_representation_relationship is the association between a Part_template_planar_shape (see 4.2.628) or a Physical_unit_planar_shape (see 4.2.670) and the Assembly_component_2d_shape (see 4.2.35) that is the occurrence of that planar shape. If the type of the shape representation of the assembly is different from the type of the shape representation of the part, the Component_part_2d_non_planar_geometric_representation_relationship allows a processor to create a shape rep of the assembly type and establish an equivalency relationship between that shape representation and the part shape representation. If the shape representation of the assembly is of the same type as the part shape representation, the Component_part_2d_non_planar_geometric_representation_relationship shall reference the same shape representation as both the part_shape and the component_shape. That instance shall be a complex instance of the part shape and of the component shape.

The data associated with a Component_part_2d_non_planar_geometric_representation_relationship are the following:

- component_shape;
- part_shape.

4.2.132.1 component_shape

The component_shape specifies the role of the Assembly_component_non_planar_shape (see 4.2.37) for the Component_part_2d_non_planar_geometric_representation_relationship.

4.2.132.2 part_shape

The part_shape specifies the Part_template_planar_shape (see 4.2.628) for the Component_part_2d_non_planar_geometric_representation_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY component_part_2d_non_planar_geometric_representation_relationship
  SUBTYPE OF (geometric_representation_relationship);
  DERIVE
    part_shape      : part_template_planar_shape :=
                      SELF\geometric_representation_relationship.shape_1;
    component_shape : assembly_component_non_planar_shape :=
                      SELF\geometric_representation_relationship.shape_2;
END_ENTITY; -- component_part_2d_non_planar_geometric_representation_relationship
( *

```

4.2.133 Component_part_2d_geometric_representation_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_part_2d_geometric_representation_relationship is a type of Geometric_representation_relationship (see 4.2.418). A Component_part_2d_geometric_representation_relationship is the association between a Part_template_planar_shape (see 4.2.628) or a Physical_unit_planar_shape (see 4.2.670) and the Assembly_component_2d_shape (see 4.2.35) that is the occurrence of that planar shape. If the type of the shape representation of the assembly is different from the type of the shape representation of the part, the Component_part_2d_geometric_representation_relationship allows a processor to create a shape rep of the assembly type and establish an equivalency relationship between that shape representation and the part shape representation. If the shape representation of the assembly is of the same type as the part shape representation, the Component_part_2d_geometric_representation_relationship shall reference the same shape representation as both the part_shape and the component_shape. That instance shall be a complex instance of the part shape and of the component shape.

The data associated with a Component_part_2d_geometric_representation_relationship are the following:

- component_shape;
- part_shape.

4.2.133.1 component_shape

The component_shape specifies the role of the Assembly_component_2d_shape (see 4.2.35) for the Component_part_2d_geometric_representation_relationship.

4.2.133.2 part_shape

The part_shape specifies either the Part_template_planar_shape (see 4.2.628) or the Physical_unit_planar_shape (see 4.2.670) for the Component_part_2d_geometric_representation_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY component_part_2d_geometric_representation_relationship
  SUBTYPE OF (geometric_representation_relationship);
  DERIVE
    part_shape      : part_template_or_physical_unit_2d_shape_select :=
                      SELF\geometric_representation_relationship.shape_1;
    component_shape : assembly_component_2d_shape :=
                      SELF\geometric_representation_relationship.shape_2;

(*

```

4.2.134 Component_part_3d_geometric_representation_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_part_3d_geometric_representation_relationship is a type of Geometric_representation_relationship (see 4.2.418). A Component_part_3d_geometric_representation_relationship is the association between a Part_template_3d_shape (see 4.2.621) or a Physical_unit_3d_shape (see 4.2.666) and the Assembly_component_3d_shape (see 4.2.36) that is the occurrence of the three-dimensional shape. If the type of the shape representation of the assembly is different from the type of the shape representation of the part, the Component_part_3d_geometric_representation_relationship allows a processor to create a shape rep of the assembly type and establish an equivalency relationship between that shape representation and the part shape representation. If the shape representation of the assembly is of the same type as the part shape representation, the Component_part_3d_geometric_representation_relationship shall reference the same shape representation as both the part_shape and the component_shape. That instance shall be a complex instance consisting of a combination of a part shape and of a component shape.

The data associated with a Component_part_3d_geometric_representation_relationship are the following:

- component_shape;
- part_shape.

4.2.134.1 component_shape

The component_shape specifies the role of the Assembly_component_3d_shape (see 4.2.36) for the Component_part_3d_geometric_representation_relationship.

4.2.134.2 part_shape

The part_shape specifies the Part_template_3d_shape (see 4.2.621), or the Part_template_non_planar_2d_shape (see 4.2.625), or the Physical_unit_3d_shape (see 4.2.666) for the Component_part_3d_geometric_representation_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY component_part_3d_geometric_representation_relationship
  SUBTYPE OF (geometric_representation_relationship);
  DERIVE
    part_shape      : part_template_or_physical_unit_3d_shape_select :=
                        SELF\geometric_representation_relationship.shape_1;
    component_shape : assembly_component_3d_shape :=
                        SELF\geometric_representation_relationship.shape_2;
END_ENTITY; -- component_part_3d_geometric_representation_relationship
( *
```

4.2.135 Component_placement_restriction_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_placement_restriction_assignment is a type of Managed_design_object (see 4.2.524). A Component_placement_restriction_assignment is the relationship between the area of an entire Interconnect_module_component (see 4.2.442) or a portion thereof and restrictions to placement of other components in that area due to an item in the design. The context of a Component_placement_restriction_assignment is the design of the assembly within which both the Interconnect_module_component and associated components are identified.

The data associated with a Component_placement_restriction_assignment are the following:

- area;
- components_permitted;
- maximum_mounting_clearance;
- maximum_negative_component_height;
- maximum_positive_component_height;
- minimum_mounting_clearance;
- requirement;
- volume.

4.2.135.1 area

The area specifies the role of the Mounting_restriction_area (see 4.2.550) for the Component_placement_restriction_assignment. The area is an area on an Interconnect_module_component.

4.2.135.2 components_permitted

The `components_permitted` specifies whether or not there is a restriction upon placement of components in an area for the `Component_placement_restriction_assignment`. The value of `TRUE` states that components are permitted; the value of `FALSE` states that components are not permitted to be placed in the defined area.

4.2.135.3 maximum_mounting_clearance

The `maximum_mounting_clearance` specifies the largest `Datum_based_length_measure` (see 4.2.219) for which the `Component_placement_restriction_assignment` is made. The `maximum_mounting_clearance` need not be specified for a particular `Component_placement_restriction_assignment`.

EXAMPLE 1 An example of the `maximum_mounting_clearance` attribute is for a printed circuit assembly with through-hole components, where some packages are required to be mounted other than flush with the surface of the printed circuit board, for purposes of cleaning or of thermal dissipation. The `maximum_mounting_clearance` is less frequently seen than the `minimum_mounting_clearance`, but it is included for completeness. When a maximum dimension is required, it is often described by the `maximum_positive_component_height` attribute, which takes into consideration the maximum material condition of the package as well as the clearance from the printed circuit board.

4.2.135.4 maximum_negative_component_height

The `maximum_negative_component_height` specifies the largest `Datum_based_length_measure` (see 4.2.219) in the negative direction from that Datum (see 4.2.214), for which the `Component_placement_restriction_assignment` is made. The `maximum_negative_component_height` need not be specified for a particular `Component_placement_restriction_assignment`.

EXAMPLE 1 An example of the `maximum_negative_component_height` attribute is a printed circuit assembly with through-hole components, where the maximum lead protrusion dimension is given. That dimension is the `maximum_negative_component_height`. Another example of the `maximum_negative_component_height` attribute is a printed circuit assembly with surface mounted components on both sides. The `maximum_negative_component_height` attribute is the distance between the established datum and the maximum material condition of the vertical dimension of the highest surface mount component on the secondary side of the printed circuit assembly.

4.2.135.5 maximum_positive_component_height

The `maximum_positive_component_height` specifies the largest `Datum_based_length_measure` (see 4.2.219) in the positive direction from the Datum (see 4.2.214), for which the `Component_placement_restriction_assignment` is made. The `maximum_positive_component_height` need not be specified for a particular `Component_placement_restriction_assignment`.

EXAMPLE 1 An example of the `maximum_positive_component_height` attribute is a printed circuit assembly where the maximum component height in the positive direction relative to a datum is given. This dimension pertains to the fit of the printed circuit assembly in its next assembly. That dimension is the `maximum_positive_component_height`.

4.2.135.6 minimum_mounting_clearance

The minimum_mounting_clearance specifies the smallest Datum_based_length_measure (see 4.2.219) for which the Component_placement_restriction_assignment is made. The minimum_mounting_clearance need not be specified for a particular Component_placement_restriction_assignment.

EXAMPLE 1 An example of the minimum_mounting_clearance attribute is for a printed circuit assembly with through-hole components, where some packages are required to be mounted other than flush with the surface of the printed circuit board for purposes of cleaning or of thermal dissipation. The minimum_mounting_clearance is more frequently seen than the maximum_mounting_clearance. The usual default clearance dimension is zero, meaning that the component package is intended to be mounted flush with the printed circuit board. Packages that often require a minimum_mounting_clearance include radial capacitors and certain other devices where the leads protrude from the bottom of the package, and where the package is not usually intended to be bonded directly to the printed circuit board.

4.2.135.7 requirement

The requirement specifies the role of the Item_restricted_requirement_occurrence (see 4.2.478) for the Component_placement_restriction_assignment.

4.2.135.8 volume

The volume specifies the role of the Mounting_restriction_volume (see 4.2.551) for the Component_placement_restriction_assignment. The volume is in the context of the assembly.

Constraints:

WR1: The direction of negative measurement is antiparallel to the normal of the surface of the Interconnect_module_component specified by area.mounting_surface.

WR2: The direction of positive measurement is parallel to the normal of the surface of the Interconnect_module_component specified by area.mounting_surface.

WR3: The location of the Datum for the maximum_mounting_clearance_relationship shall be on the same side of the Interconnect_module_component as that specified by area.mounting_surface.

WR4: The location of the Datum for the minimum_mounting_clearance_relationship shall be on the same side of the Interconnect_module_component as that specified by area.mounting_surface.

WR5: At least one of area or volume shall be provided.

NOTE EXPRESS specification:

```

*)
ENTITY component_placement_restriction_assignment
  SUBTYPE OF (managed_design_object);
    maximum_negative_component_height : OPTIONAL datum_based_length_measure;
    maximum_positive_component_height : OPTIONAL datum_based_length_measure;

```

4.2.136 Component_swap_specification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_swap_specification is a type of Change_design_object_management_relationship (see 4.2.95). The Component_swap_specification specifies which component has been swapped for which other component in a design; both the swapped-out and the swapped-in components are specified.

NOTE The Component_swap_specification supports the component identification portion of the gate swap specification. It is necessary when components, such as the microcircuits known as U1, U2, etc. are being swapped.

The data associated with a Component_swap_specification are the following:

- current_design_object;
- previous_design_object.

4.2.136.1 current_design_object

The current_design_object specifies the Design_functional_unit_allocation_to_assembly_component (see 4.2.263) for the resulting design object after swapping, for the Component_swap_specification.

4.2.136.2 previous_design_object

The previous_design_object specifies the Design_functional_unit_allocation_to_assembly_component (see 4.2.263) for the original design object before swapping, for the Component_swap_specification.

NOTE EXPRESS specification:

```

*)
ENTITY component_swap_specification
  SUBTYPE OF (change_design_object_management_relationship);

```

4.2.137 Component_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_terminal is a type of Component_feature (see 4.2.118). A Component_terminal is one of an Assembly_module_component_terminal (see 4.2.45), a Bare_die_component_terminal (see 4.2.62), a Component_termination_passage_join_terminal (see 4.2.149), a Conductive_interconnect_element_terminal (see 4.2.172), an Interconnect_component_join_terminal (see 4.2.439), an Interconnect_module_component_terminal (see 4.2.445), a Land_join_terminal (see 4.2.492), a Non_functional_land_join_terminal (see 4.2.564), a Packaged_component_join_terminal (see 4.2.586), a Printed_component_join_terminal (see 4.2.722), or a Via_terminal (see 4.2.954). A Component_terminal is the defined conductive shape for conductors from other components to access electrical functionality of the Assembly_component (see 4.2.34).

The data associated with a Component_terminal are the following:

- connected_node;
- global_swappable;
- local_swappable;
- node_implementation;
- swap-code.

4.2.137.1 connected_node

The connected_node is an inverse relationship that specifies the Physical_connectivity_definition (see 4.2.652) that specifies the Component_terminal as its associated_terminals. There shall be no more than one Physical_connectivity_definition for a Component_terminal. The connected_node need not be specified for a particular Component_terminal.

4.2.137.2 global_swappable

The global_swappable specifies a boolean value that indicates if the terminal can be exchanged within associated functional units of the same type.

4.2.137.3 local_swappable

The local_swappable specifies a boolean value that indicates if the terminal can be exchanged within the associated functional unit.

4.2.137.4 node_implementation

The node_implementation is an inverse relationship that specifies the Physical_network (see 4.2.660) that specifies the Component_terminal as its connectivity_requirement_element. There shall be no more than one Physical_network for a Component_terminal. The node_implementation need not be specified for a particular Component_terminal.

4.2.137.5 swap-code

The swap_code specifies the string that is the type of exchange that is valid.

Constraints:

IP1: Each Component_terminal that is referenced by a Physical_connectivity_definition as an associated_terminal shall not also be in the design view of the implementation of that Physical_connectivity_definition.

IP2: The node_implementation and the connected_node shall not both exist.

NOTE EXPRESS specification:

4.2.142 Component_terminal_to_pca_terminal_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Component_terminal_to_pca_terminal_assignment` is a type of `Managed_design_object` (see 4.2.524). A `Component_terminal_to_pca_terminal_assignment` is the relationship between a `Pca_terminal` (see 4.2.640) and one of an `Assembly_module_component_terminal` (see 4.2.45), a `Component_interface_terminal` (see 4.2.125), or an `Interconnect_module_component_terminal` (see 4.2.445), to provide traceability from the data in the design view to the data in the usage view for the design organization for archival purposes.

The data associated with a `Component_terminal_to_pca_terminal_assignment` are the following:

- `assigned_terminal`;
- `usage_view_terminal`.

4.2.142.1 assigned_terminal

The `assigned_terminal` specifies one of an `Assembly_module_component_terminal` (see 4.2.45), a `Component_interface_terminal` (see 4.2.125), or an `Interconnect_module_component_terminal` (see 4.2.445) for the `Component_terminal_to_pca_terminal_assignment`.

4.2.142.2 usage_view_terminal

The usage_view_terminal specifies the role of the Pca_terminal (see 4.2.640) for the Component_terminal_to_pca_terminal_assignment.

Constraints:

UR1: The usage_view_terminal shall be unique within a population of Component_terminal_to_pca_terminal_assignments.

NOTE EXPRESS specification:

```

*)
ENTITY component_terminal_to_pca_terminal_assignment
  SUBTYPE OF (component_feature_to_physical_usage_view_assignment);
DERIVE
    usage_view_terminal : pca_terminal :=

      defined_part_feature;
    assigned_terminal : pca_interface_select :=
      SELF\component_feature_to_physical_usage_view_assignment.
      assigned_design_object;
  UNIQUE
    UR1 : usage_view_terminal;
END_ENTITY; -- component_terminal_to_pca_terminal_assignment

( *
```

4.2.143 Component_termination_passage

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_termination_passage is a type of Plated_passage (see 4.2.690) through which a Component_terminal (see 4.2.137) may pass. The properties of the Component_termination_passage are selected to support the Component_terminal.

NOTE 1 The model in this part of ISO 10303 is that the wall of the passage is directly supporting current flow.

NOTE 2 Support for the member of `Component_terminal` that passes through an `Inter_stratum_feature` (see 4.2.432) but is not assembled to the wall of that `Inter_stratum_feature` is provided by the `Cutout` (see 4.2.208) concept.

NOTE 3 Support for the member of `Component_terminal` that electrically is connected only to the surface of an `Interconnect_module` (see 4.2.440) is provided by the `Land` (see 4.2.490) concept.

NOTE 4 There is no requirement for the `Component_termination_passage` to completely penetrate the interconnect substrate.

EXAMPLE 1 Figure 15 is a detail of a layout drawing that superimposes components from the next level of assembly in order to illustrate the physical relationship of a `Component_termination_passage` to the terminals of those components. This example omits the details of how this part of ISO 10303 establishes the relationship between the terminal and the passage for clarity.

EXAMPLE 2 Figure 16 is a detail of a cross-section of an interconnect substrate showing a case of complete penetration of the substrate by the `Component_termination_passage`.

The data associated with a `Component_termination_passage` are the following:

- `access_mechanism`;
- `interface_access_mechanism`;
- `usage_definition`.

4.2.143.1 access_mechanism

The `access_mechanism` is an inverse relationship that specifies that the existence of the `Component_termination_passage` is dependent on the existence of the `Component_termination_passage_join_terminal` (see 4.2.149) that specifies the `Component_termination_passage` as its associated_component. There shall be one or more `Component_termination_passage_join_terminal` for a `Component_termination_passage`.

4.2.143.2 interface_access_mechanism

The `interface_access_mechanism` is an inverse relationship that specifies that the existence of the `Component_termination_passage` is dependent on the existence of the `Component_termination_passage_interface_terminal` (see 4.2.148) that specifies the `Component_termination_passage` as its associated_component.

4.2.143.3 usage_definition

The `usage_definition` specifies the role of the `Component_termination_passage_template` (see 4.2.150) for the `Component_termination_passage`.

Note : Packaged_component are at next level of product structure.

Figure 15 – Component_termination_passage role in an assembly

Figure 16 – Component_termination_passage cross-section view

Constraints:

WR1: A Component_termination_passage shall be a feature of size.

NOTE A Component_termination_passage is a feature of size, because it is part of the interface to another product in the assembly and the size of the passage shall be compatible with the appropriate assembly requirements of that product. Information about the other product's features needed for this function is specified in this part of ISO 10303 in the Default_component_termination_passage_definition specified by usage_definition.of_passage-technology.

NOTE EXPRESS specification:

```

```

4.2.144 Component_termination_passage_and_contact_size_dependent_land

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_termination_passage_and_contact_size_dependent_land is a type of Land (see 4.2.490). The shape of the Component_termination_passage_and_contact_size_dependent_land is dependent both on the passage that is within the shape of the land (where that passage is included for the purpose of connecting the component terminal to a trace on the substrate) and on the size of the terminal that is going to be resting on the board. A Component_termination_passage_and_contact_size_dependent_land is an interface to a PCB or to a PWB, and therefore includes an external access mechanism.

NOTE A Component_termination_passage_and_contact_size_dependent_land principally provides a location for the solder joint.

The data associated with a `Component_termination_passage_and_contact_size_dependent_land` are the following:

- `interface_access_mechanism`;
- `reference_passage`;
- `usage_definition`.

4.2.144.1 `interface_access_mechanism`

The `interface_access_mechanism` is an inverse relationship that specifies that the existence of the `Component_termination_passage_and_contact_size_dependent_land` is dependent on the existence of the `Land_interface_terminal` (see 4.2.491) that specifies the `Component_termination_passage_and_contact_size_dependent_land` as its `associated_component`. This relationship is for external access only.

4.2.144.2 `reference_passage`

The `reference_passage` specifies the role of the `Component_termination_passage` (see 4.2.143) for the `Component_termination_passage_and_contact_size_dependent_land`.

4.2.144.3 `usage_definition`

The `usage_definition` specifies the role of the `Default_attachment_size_and_component_termination_passage_based_land_physical_template` (see 4.2.245) for the `Component_termination_passage_and_contact_size_dependent_land`.

NOTE EXPRESS specification:

```

4.2.145

`Component_termination_passage_and_contact_size_dependent_non_functional_land`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Component_termination_passage_and_contact_size_dependent_non_functional_land` is a type of `Non_functional_land` (see 4.2.562). The shape of the `Component_termination_passage_and_contact_size_dependent_non_functional_land` is dependent both on the passage that is within the shape of the land (where that passage is included for the purpose of connecting the component terminal to a trace on the substrate) and on the size of the terminal that is going to be resting on the board.

NOTE A `Component_termination_passage_and_contact_size_dependent_non_functional_land` principally provides a location for the solder joint.

The data associated with a `Component_termination_passage_and_contact_size_dependent_non_functional_land` are the following:

- `interface_access_mechanism`;
- `reference_passage`;
- `usage_definition`.

4.2.145.1 interface_access_mechanism

The `interface_access_mechanism` is an inverse relationship that specifies that the existence of the `Component_termination_passage_and_contact_size_dependent_non_functional_land` is dependent on the existence of the `Non_functional_land_interface_terminal` (see ??) that specifies the `Component_termination_passage_and_contact_size_dependent_non_functional_land` as its `associated_component`. This relationship is for external access only.

4.2.145.2 reference_passage

The `reference_passage` specifies the role of the `Component_termination_passage` (see 4.2.143) for the `Component_termination_passage_and_contact_size_dependent_non_functional_land`.

4.2.145.3 usage_definition

The `usage_definition` specifies the role of the `Default_attachment_size_and_component_termination_passage_based_land_physical_template` (see 4.2.245) for the `Component_termination_passage_and_contact_size_dependent_non_functional_land`.

NOTE EXPRESS specification:

```

*)

INVERSE
  interface_access_mechanism : non_functional_land_interface_terminal FOR associated_comp
END_ENTITY; -- component_termination_passage_and_contact_size_dependent_non_functional_land

( *

```

4.2.146 Component_termination_passage_dependent_land

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_termination_passage_dependent_land is a type of Land (see 4.2.490). The shape of the Component_termination_passage_dependent_land is dependent only on the passage that is within the shape of the land (where that passage is included for the purpose of connecting the component terminal to a trace on the substrate).

The data associated with a Component_termination_passage_dependent_land are the following:

- reference_passage;
- usage_definition.

4.2.146.1 reference_passage

The reference_passage specifies the role of the Component_termination_passage (see 4.2.143) for the Component_termination_passage_dependent_land.

4.2.146.2 usage_definition

The usage_definition specifies the role of the Default_component_termination_passage_based_land_physical_template (see 4.2.248) for the Component_termination_passage_dependent_land.

NOTE EXPRESS specification:

```

*)
ENTITY component_termination_passage_dependent_land
  SUBTYPE OF (land);
    reference_passage                : component_termination_passage;
    SELF\assembly_component.usage_definition :
default_component_termination_passage_based_land_physical_template;
END_ENTITY; -- component_termination_passage_dependent_land

( *

```

4.2.147 Component_termination_passage_dependent_non_functional_land

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_termination_passage_dependent_non_functional_land is a type of Non_functional_land (see 4.2.562). The shape of the Component_termination_passage_dependent_non_functional_land is dependent only on the passage that is within the shape of the land (where that passage is included for the purpose of connecting the component terminal to a trace on the substrate).

The data associated with a Component_termination_passage_dependent_non_functional_land are the following:

- reference_passage;
- usage_definition.

4.2.147.1 reference_passage

The reference_passage specifies the role of the Component_termination_passage (see 4.2.143) for the Component_termination_passage_dependent_non_functional_land.

4.2.147.2 usage_definition

The usage_definition specifies the role of the Default_component_termination_passage_based_land_physical_template (see 4.2.248) for the Component_termination_passage_dependent_non_functional_land.

NOTE EXPRESS specification:

```

*)
ENTITY component_termination_passage_dependent_non_functional_land
  SUBTYPE OF (non_functional_land);
    reference_passage                : component_termination_passage;

default_component_termination_passage_based_land_physical_template;
END_ENTITY; -- component_termination_passage_dependent_non_functional_land

( *

```

4.2.148 Component_termination_passage_interface_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_termination_passage_interface_terminal is a type of Component_feature (see 4.2.118). The Component_termination_passage_interface_terminal is the internal wall of the passage only and is the complete internal wall. It does not extend to the exterior top or bottom edges of the passage. It does not include an exterior surface of the passage. This terminal is the definition of an interface mechanism for an interconnect.

NOTE In normal usage, the interior wall has a smaller diameter than the exterior wall.

The data associated with a Component_termination_passage_interface_terminal are the following:

- associated_component;
- definition.

4.2.148.1 associated_component

The associated_component specifies the role of the Component_termination_passage (see 4.2.143) for the Component_termination_passage_interface_terminal.

4.2.148.2 definition

The definition specifies the role of the Component_termination_passage_template_interface_terminal (see 4.2.151) for the Component_termination_passage_interface_terminal.

EXAMPLE 1 One use of this capability occurs when a member of Component_feature_to_physical_usage-view_assignment references a member of Component_termination_passage_interface_terminal.

NOTE EXPRESS specification:

```

*)
ENTITY component_termination_passage_interface_terminal
  SUBTYPE OF (laminate_component_interface_terminal);
  SELF\component_feature.definition :
component_termination_passage_template_interface_terminal;
  SELF\component_feature.associated_component : component_termination_passage;
END_ENTITY; -- component_termination_passage_interface_terminal

( *

```

4.2.149 Component_termination_passage_join_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_termination_passage_join_terminal is a type of Component_terminal (see 4.2.137). The Component_termination_passage_join_terminal is the exterior surface of the passage. The exterior surface has a larger nominal diameter than the interior surface.

NOTE One Component_termination_passage_join_terminal may be related to multiple Land_join_terminals, since each stratum may have a Land (see 4.2.490) associated with the Component_termination_passage (see 4.2.143).

The data associated with a Component_termination_passage_join_terminal are the following:

- associated_component;
- definition.

4.2.149.1 associated_component

The associated_component specifies the role of the Component_termination_passage for the Component_termination_passage_join_terminal.

4.2.149.2 definition

The definition specifies the role of the Component_termination_passage_template_join_terminal (see 4.2.152) for the Component_termination_passage_join_terminal.

NOTE EXPRESS specification:

```

*)
ENTITY component_termination_passage_join_terminal
  SUBTYPE OF (laminate_component_join_terminal);
  SELF\component_feature.definition      :
component_termination_passage_template_join_terminal;
  SELF\component_feature.associated_component : component_termination_passage;
END_ENTITY; -- component_termination_passage_join_terminal

( *

```

4.2.150 Component_termination_passage_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_termination_passage_template is a type of Inter_stratum_feature_template (see 4.2.435). The Component_termination_passage_template defines all shape data for the associated Component_termination_passage (for which it is the usage_definition), and also where the connection (dependency) on passage technology is established for the properties.

NOTE Properties other than shape are to be found in the of_passage_technology.

The data associated with a Component_termination_passage_template are the following:

- access_mechanisms;
- of_passage_technology.

4.2.150.1 access_mechanisms

The access_mechanisms is an inverse relationship that specifies that the existence of the Component_termination_passage_template is dependent on the existence of the Component_termination_passage_template_terminal (see 4.2.153) that specifies the Component_termination_passage_template as its associated_definition. There shall be two or more Component_termination_passage_template_terminals for a Component_termination_passage_template.

4.2.150.2 of_passage_technology

The of_passage_technology specifies the role of the Default_component_termination_passage_definition (see 4.2.249) for the Component_termination_passage_template.

Constraints:

WR1: One access_mechanisms shall be a Component_termination_passage_template_interface_terminal.

WR2: One access_mechanisms shall be a Component_termination_passage_template_join_terminal.

NOTE EXPRESS specification:

```

*)
ENTITY component_termination_passage_template
  SUBTYPE OF (inter_stratum_feature_template);
  SELF\inter_stratum_feature_template.of_passage_technology :
default_component_termination_passage_definition;
  INVERSE
    access_mechanisms : SET [2:?] OF component_termination_passage_template_terminal
      FOR associated_definition;
END_ENTITY; -- component_termination_passage_template

( *
```

4.2.151 Component_termination_passage_template_interface_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Component_termination_passage_template_interface_terminal is a type of Component_termination_passage_template_terminal (see 4.2.153), an occurrence of which provides an interface capability to the next level of assembly.

NOTE Use of this capability occurs when a member of Component_feature_to_physical_usage_view_assignment references a member of an occurrence of Component_termination_passage_template_interface_terminal.

EXAMPLE 1 Figure 17 illustrates details related to the definition (in a usage view) and occurrence (in a design view) of the terminals associated with a Component_termination_passage_template.

NOTE EXPRESS specification:

```

*)
ENTITY component_termination_passage_template_interface_terminal
  SUBTYPE OF (component_termination_passage_template_terminal);
END_ENTITY; -- component_termination_passage_template_interface_terminal

( *
```

4.2.152 Component_termination_passage_template_join_terminal

Figure 17 – Component_termination_passage_template terminals

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Component_termination_passage_template_join_terminal` is a type of `Component_termination_passage_template_terminal` (see 4.2.153), an occurrence of which provides a fabrication join capability, within an optionally constrained set of `Stratum` (see 4.2.845).

The data associated with a `Component_termination_passage_template_join_terminal` are the following:

— `disallowed_inter_stratum_extent`.

4.2.152.1 `disallowed_inter_stratum_extent`

The `disallowed_inter_stratum_extent` specifies the `Inter_stratum_extent` (see 4.2.431) for which a connection to the `Component_termination_passage_template_join_terminal` is disallowed. The `disallowed_inter_stratum_extent` need not be supplied for a `Component_termination_passage_template_join_terminal`. There may be more than one `Inter_stratum_extent` for a `Component_termination_passage_template_join_terminal`.

NOTE EXPRESS specification:

```
*)
ENTITY component_termination_passage_template_join_terminal
  SUBTYPE OF (component_termination_passage_template_terminal);
  --tt tc1 wd8 modified
    disallowed_inter_stratum_extent : OPTIONAL SET [1:?] OF inter_stratum_extent;
END_ENTITY; -- component_termination_passage_template_join_terminal

( *
```

4.2.153 `Component_termination_passage_template_terminal`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Component_termination_passage_template_terminal` is a type of `Shape_element` (see 4.2.810). A `Component_termination_passage_template_terminal` is one of a `Component_termination_passage_template_interface_terminal` (see 4.2.151) or a `Component_termination_passage_template_join_terminal` (see 4.2.152).

The data associated with a `Component_termination_passage_template_terminal` are the following:

— `associated_definition`;

— `name`;

— `terminal_connection_zone`.

4.2.153.1 associated_definition

The associated_definition specifies the role of the Component_termination_passage_template (see 4.2.150) for the Component_termination_passage_template_terminal.

4.2.153.2 name

The name specifies the string identifying the Component_termination_passage_template_terminal.

4.2.153.3 terminal_connection_zone

The terminal_connection_zone specifies the role of the Connection_zone (see 4.2.185) for the Component_termination_passage_template_terminal. The terminal_connection_zone is optional and need not be supplied if the data is unavailable in the source system. If the data is available in the source system, it shall be supplied.

Constraints:

UR1: The combination of the associated_definition and the name shall be unique within a population of Component_termination_passage_template_terminals.

WR1: The points comprising the terminal_connection_zones shall be defined in the coordinate system of the device being accessed via the terminal_connection_zones.

NOTE EXPRESS specification:

```

*)
ENTITY component_termination_passage_template_terminal
  ABSTRACT SUPERTYPE OF (ONEOF (
    component_termination_passage_template_interface_terminal,
    component_termination_passage_template_join_terminal))

```

4.2.154 Compound_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Compound_characteristic is a type of Characteristic (see 4.2.98). A Compound_characteristic may be a Characteristic_data_table (see 4.2.100). A Compound_characteristic is a property of an item. A Compound_characteristic helps to compose a structured characteristic, in conjunction with Compound_characteristic_definition (see ??).

NOTE A Compound_characteristic may describe either a physical item, like a realized part, or a description that is unrealizable, such as a simulation model. A Compound_characteristic is most often used to describe a table of values that may range over a discrete parameter, e.g., a table of response values vs. frequency or time.

The data associated with a Compound_characteristic are the following:

— property_value.

4.2.154.1 property_value

The property_value specifies the role of a Compound_characteristic_definition (see ??) for the Compound_characteristic.

NOTE EXPRESS specification:

```
*)
ENTITY compound_characteristic
  ABSTRACT SUPERTYPE OF (ONEOF (characteristic_data_set, characteristic_data_table))
  SUBTYPE OF (characteristic);
  SELF\characteristic.property_value : compound_characteristic_definition;
END_ENTITY; -- compound_characteristic
(*
```

4.2.155 Composite_curve

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Composite_curve is a type of Curve (see 4.2.203) that combines more than one Curve into its structure. The Composite_curve shall be continuous.

The data associated with a Composite_curve are the following:

— curve_segment.

4.2.155.1 curve_segment

The curve_segment specifies the role of the Composite_curve_segment (see 4.2.156) for the Composite_curve. There shall be one or more Composite_curve_segment for a Composite_curve. No Composite_curve_segment shall be specified more than once as a curve_segment for a particular Composite_curve.

NOTE EXPRESS specification:

```
*)
ENTITY composite_curve
  SUBTYPE OF (curve);
  curve_segment : LIST [1:?] OF UNIQUE composite_curve_segment;
END_ENTITY; -- composite_curve
```

(*

4.2.156 Composite_curve_segment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Composite_curve_segment is a type of Managed_design_object (see 4.2.524) that is a segment of a Composite_curve (see 4.2.155). A Composite_curve_segment associates Curves with a Composite_curve to help compose the Composite_curve.

The data associated with a Composite_curve_segment are the following:

- segment_curve;
- using_curves.

4.2.156.1 segment_curve

The segment_curve specifies the role of the Curve (see 4.2.203) for the Composite_curve_segment.

4.2.156.2 using_curves

The using_curves is an inverse relationship that specifies that the existence of the Composite_curve_segment is dependent on the existence of the Composite_curve (see 4.2.155) that specifies the Composite_curve_segment as its curve_segment. There shall be one or more Composite_curve for a Composite_curve_segment.

NOTE EXPRESS specification:

```
*)
ENTITY composite_curve_segment
  SUBTYPE OF (managed_design_object);
  segment_curve : curve;
  INVERSE
  using_curves : SET [1:?] OF composite_curve FOR curve_segment;
END_ENTITY; -- composite_curve_segment
```

(*

4.2.157 Composite_feature_locating_position_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Composite_feature_locating_position_tolerance is a type of Position_tolerance_with_referenced_datum_system (see 4.2.696). The Composite_feature_locating_position_tolerance is used in conjunction with one to three Composite_feature_relating_position_tolerance (see 4.2.158) to apply a less restrictive specification on the location of a Shape_element (see 4.2.810) group with respect to one or more Datum (see 4.2.214) than on the location and orientation of those Shape_element within the group with respect to each other. The Tolerance_zone (see 4.2.913) defined by the Composite_feature_locating_position_tolerance is located relative to the Datum_system (see 4.2.236) the definition of which is specified as the datum_system_definition.

NOTE 1 The attribute datum_system_definition is declared in the Geometric_tolerance_with_referenced_datum_system entity of which this entity is a subtype.

NOTE 2 Composite positional tolerancing is discussed in 5.4.1 of ASME Y14.5M.

Constraints:

WR1: The Composite_feature_locating_position_tolerance shall not also be a Composite_feature_relating_position_tolerance.

WR2: The Composite_feature_locating_position_tolerance shall be specified as the refined_control by exactly one Composite_feature_relating_position_tolerance.

WR3: The Shape_element that is specified as the toleranced_shape_element shall be a Composite_group_shape_element.

NOTE The attribute toleranced_shape_element is declared in the Geometric_tolerance entity of which this entity is a subtype.

NOTE EXPRESS specification:

```
*)
ENTITY composite_feature_locating_position_tolerance
  SUBTYPE OF (position_tolerance_with_referenced_datum_system);
END_ENTITY; -- composite_feature_locating_position_tolerance

( *
```

4.2.158 Composite_feature_relating_position_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Composite_feature_relating_position_tolerance` is a type of `Position_tolerance` (see 4.2.695) that is used in conjunction with a `Composite_feature_locating_position_tolerance` (see 4.2.157) and possibly two other `Composite_feature_relating_position_tolerance` to apply a less restrictive specification on the location of a `Shape_element` (see 4.2.810) group with respect to one or more `Datum` (see 4.2.214) than on the location and orientation of those `Shape_element` within the group with respect to each other. If the `Composite_feature_relating_position_tolerance` is also a `Position_tolerance_with_referenced_datum_system` (see 4.2.696), the defined `Tolerance_zone` (see 4.2.913) is oriented but not located relative to the `Datum_system` (see 4.2.236) the definition of which is specified as the `datum_system_definition`.

The data associated with a `Composite_feature_relating_position_tolerance` are the following:

— `refined_control`.

NOTE The attribute `datum_system_definition` is declared in the `Geometric_tolerance_with_referenced_datum_system` entity of which this entity is a subtype.

4.2.158.1 `refined_control`

The `refined_control` specifies either a `Composite_feature_locating_position_tolerance` (see 4.2.157) or another `Composite_feature_relating_position_tolerance` to which this `Composite_feature_relating_position_tolerance` assists in specifying design requirements by specifying a further refinement of the location and orientation of the group of `Shape_element` (see 4.2.810) in relation to each other.

Constraints:

WR1: The `Shape_element` specified as the `toleranced_shape_element` by this `Composite_feature_relating_position_tolerance` shall be the same instance of `Shape_element` as specified as the `toleranced_shape_element` by the `Position_tolerance` that is specified as the `refined_control`.

WR2: If this `Composite_feature_relating_position_tolerance` is also a `Position_tolerance_without_referenced_datum_system`, it shall not be specified as a `refined_control` by another `Composite_feature_relating_position_tolerance`.

WR3: If this `Composite_feature_relating_position_tolerance` specifies a `Composite_feature_relating_position_tolerance` as the `refined_control`, this `Composite_feature_relating_position_tolerance` shall either be a `Position_tolerance_without_referenced_datum_system` or have less `Datum` in its `Datum_system` than the `Datum_system` of the `Composite_feature_relating_position_tolerance` specified as the `refined_control`.

WR4: If this `Composite_feature_relating_position_tolerance` specifies a `Composite_feature_locating_position_tolerance` as the `refined_control`, this `Composite_feature_relating_position_tolerance` shall either be a `Position_tolerance_without_referenced_datum_system` or have less than or an equal number of `Datum` in its `Datum_system` than the `Datum_system` of the `Composite_feature_locating_position_tolerance` specified as the `refined_control`.

WR5: If this `Composite_feature_relating_position_tolerance` is a `Position_tolerance_with_referenced_datum_system`, the `Datum` in its `Datum_system` shall be in the `Datum_system` of the `Position_tolerance` specified as the `refined_control` and shall be assigned the same datum precedence.

WR6: If this `Composite_feature_relating_position_tolerance` specifies a `Position_tolerance` that specifies a `Datum_system_defining_conditions_without_material_conditions` as the `datum_system_definition`, the `Position_tolerance` specified as the `refined_control` shall also specify a `Datum_system_defining_conditions_without_material_conditions` as its `datum_system_definition`.

WR7: If this `Composite_feature_relating_position_tolerance` specifies a `Position_tolerance` that specifies a `Datum_system_defining_conditions_with_material_conditions` as the `datum_system_definition`; the `Position_tolerance` specified as the `refined_control` shall also specify a `Datum_system_defining_conditions_with_material_conditions` as its `datum_system_definition`, and each `Datum_feature` of the `Datum_system` of this `Composite_feature_relating_position_tolerance` shall be assigned the same material condition property as is assigned to it in the `Datum_system` of the `Position_tolerance` specified as the `refined_control`.

WR8: The size of the `Tolerance_zone_boundary` of this `Composite_feature_relating_position_tolerance` shall be less than the size of the `Tolerance_zone_boundary` of the `Position_tolerance` specified as the `refined_control`.

WR9: Both the `Composite_feature_relating_position_tolerance` and the `Position_tolerance` specified as the `refined_control` shall specify the same type of `Tolerance_zone_definition`.

WR10: The `Composite_feature_relating_position_tolerance` shall be specified as a `refined_control` by at most one `Composite_feature_relating_position_tolerance`.

WR11: Both the `Composite_feature_relating_position_tolerance` and the `Position_tolerance` specified as the `refined_control` shall specify the same type of `Tolerance_zone_boundary_definition`.

WR12: Both the `Composite_feature_relating_position_tolerance` and the `Position_tolerance` specified as the `refined_control` shall specify the same type of `Boundary_size_characteristic`.

NOTE EXPRESS specification:

```
*)
ENTITY composite_feature_relating_position_tolerance
  SUBTYPE OF (position_tolerance);
    refined_control : locating_or_relating_position_tolerance;
END_ENTITY; -- composite_feature_relating_position_tolerance

( *
```

4.2.159 Composite_group_shape_element

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Composite_group_shape_element` is a type of `Composite_shape_element` (see 4.2.162) in which the composite may be thought of as a group of individual `Shape_element` (see 4.2.810) in which any property that is applied to the `Composite_group_shape_element` is applied to each of the constituent `Shape_elements` on an individual basis.

EXAMPLE 1 A group of cylindrical holes in a printed circuit board may be grouped with a `Composite_group_shape_element` for the purpose of applying the same `Cylindricity_tolerance` to each of the constituent holes in the group.

Constraints:

WR1: If all the `Shape_elements` that compose the `Composite_group_shape_element` are of the same type then the `Composite_shape_element` shall also be of that type.

EXAMPLE 2 If all the `Shape_elements` that compose a `Composite_group_shape_element` are of type `Centre_axis` then, the `Composite_group_shape_element` will also be of type `Centre_axis`.

NOTE EXPRESS specification:

```
* )
ENTITY composite_group_shape_element
  SUBTYPE OF (composite_shape_element);
END_ENTITY; -- composite_group_shape_element

( *
```

4.2.160 `Composite_linear_profile_locating_tolerance`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Composite_linear_profile_locating_tolerance` is a type of `Profile_of_any_line_tolerance_with_referenced_datum_system` (see 4.2.745). The `Composite_linear_profile_locating_tolerance` is used in conjunction with one to three `Composite_linear_profile_refinement_tolerance` (see 4.2.161) to apply a more restrictive specification on the form, orientation, and possibly size of a `Physical_feature_or_part_template` (see 4.2.658) than on the location of the `Physical_feature_or_part_template`. The `Tolerance_zone` (see 4.2.913) defined by the `Composite_linear_profile_locating_tolerance` is located relative to the `Datum_system` (see 4.2.236) the definition of which is specified as the `datum_system_definition`.

NOTE The attribute `datum_system_definition` is declared in the `Geometric_tolerance_with_referenced_datum_system` entity of which this entity is a subtype.

Constraints:

WR1: The `Composite_linear_profile_locating_tolerance` shall not also be a `Composite_linear_profile_refinement_tolerance`.

WR2: The `Composite_linear_profile_locating_tolerance` shall be specified as the `refined_control` by exactly one `Composite_linear_profile_refinement_tolerance`.

NOTE EXPRESS specification:

```
*)
ENTITY composite_linear_profile_locating_tolerance
  SUBTYPE OF (profile_of_any_line_tolerance_with_referenced_datum_system);
END_ENTITY; -- composite_linear_profile_locating_tolerance

( *
```

4.2.161 Composite_linear_profile_refinement_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Composite_linear_profile_refinement_tolerance` is a type of `Profile_of_any_line_tolerance` (see 4.2.744) that is used in conjunction with a `Composite_linear_profile_locating_tolerance` (see 4.2.160) and possibly two other `Composite_linear_profile_refinement_tolerance` to apply a more restrictive specification on the form, orientation, and possibly size of a `Physical_feature_or_part_template` (see 4.2.658) than on the location of the `Physical_feature_or_part_template`. If the `Composite_linear_profile_refinement_tolerance` is also a `Profile_of_any_line_tolerance_with_referenced_datum_system` (see 4.2.745) the defined `Tolerance_zone` (see 4.2.913) is oriented but not located relative to the `Datum_system` (see 4.2.236) the definition of which is specified as the `datum_system_definition`.

NOTE The attribute `datum_system_definition` is declared in the `Geometric_tolerance_with_referenced_datum_system` (see 4.2.422) entity of which this entity is a subtype.

The data associated with a `Composite_linear_profile_refinement_tolerance` are the following:

— `refined_control`.

4.2.161.1 refined_control

The `refined_control` specifies either a `Composite_linear_profile_locating_tolerance` (see 4.2.160) or another `Composite_linear_profile_refinement_tolerance` to which this `Composite_linear_profile_refinement_tolerance` assists in specifying design requirements by specifying a further refinement of the form, orientation, and possibly size of the `Physical_feature_or_part_template` (see 4.2.658) specified as the `toleranced_shape_element`.

NOTE The attribute `toleranced_shape_element` is declared in the `Geometric_tolerance` entity of which this entity is a subtype.

Constraints:

WR1: The `Physical_feature_or_part_template` specified as the `toleranced_shape_element` by this `Composite_linear_profile_refinement_tolerance` shall be the same instance of `Physical_feature_or_part_template` as specified as the `toleranced_shape_element` by the `Profile_of_any_line_tolerance` that is specified as the `refined_control`.

WR2: If this `Composite_linear_profile_refinement_tolerance` is also a `Profile_of_any_line_tolerance_without_referenced_datum_system`, it shall not be specified as a `refined_control` by another `Composite_linear_profile_refinement_tolerance`.

WR3: If this `Composite_linear_profile_refinement_tolerance` specifies a `Composite_linear_profile_refinement_tolerance` as the `refined_control`, this `Composite_linear_profile_refinement_tolerance` shall either be a `Profile_of_any_line_tolerance_without_referenced_datum_system` or have less `Datum` in its `Datum_system` than the `Datum_system` of the `Composite_linear_profile_refinement_tolerance` specified as the `refined_control`.

WR4: If this `Composite_linear_profile_refinement_tolerance` specifies a `Composite_linear_profile_locating_tolerance` as the `refined_control`, this `Composite_linear_profile_refinement_tolerance` shall either be a `Profile_of_any_line_tolerance_without_referenced_datum_system` or have less than or an equal number of `Datum` in its `Datum_system` than the `Datum_system` of the `Composite_linear_profile_locating_tolerance` specified as the `refined_control`.

WR5: If this `Composite_linear_profile_refinement_tolerance` is a `Profile_of_any_line_tolerance_with_referenced_datum_system`, the `Datum` in its `Datum_system` shall be in the `Datum_system` of the `Profile_of_any_line_tolerance` specified as the `refined_control` and shall be assigned the same datum precedence.

WR6: If this `Composite_linear_profile_refinement_tolerance` specifies a `Profile_of_any_line_tolerance` that specifies a `Datum_system_defining_conditions_without_material_conditions` as the `datum_system_definition`, the `Profile_of_any_line_tolerance` specified as the `refined_control` shall also specify a `Datum_system_defining_conditions_without_material_conditions` as its `datum_system_definition`.

WR7: If this `Composite_linear_profile_refinement_tolerance` specifies a `Profile_of_any_line_tolerance` that specifies a `Datum_system_defining_conditions_with_material_conditions` as the `datum_system_definition`; the `Profile_of_any_line_tolerance` specified as the `refined_control` shall also specify a `Datum_system_defining_conditions_with_material_conditions` as its `datum_system_definition`, and each `Datum_feature` of the `Datum_system` of this `Composite_linear_profile_refinement_tolerance` shall be assigned the same material condition property as is assigned to it in the `Datum_system` of the `Profile_of_any_line_tolerance` specified as the `refined_control`.

WR8: The size of the `Tolerance_zone_boundary` of this `Composite_linear_profile_refinement_tolerance` shall be less than the size of the `Tolerance_zone_boundary` of the `Profile_of_any_line_tolerance` specified as the `refined_control`.

WR9: The `Tolerance_zone_boundary` of this `Composite_linear_profile_refinement_tolerance` shall be based on the same `True_profile` as the `Tolerance_zone_boundary` of the `Profile_of_any_line_tolerance` specified as the `refined_control`.

WR10: The `Composite_linear_profile_refinement_tolerance` shall be specified as a `refined_control` by at most one `Composite_linear_profile_refinement_tolerance`.

WR11: If the `Tolerance_zone_definition` that is specified as the `tolerance_zone_or_boundary_definition` is a `Tolerance_zone_definition_with_specified_orientation`, the `Tolerance_zone_definition` that is specified as the `tolerance_zone_or_boundary_definition` by the `Profile_of_any_line_tolerance` that is specified as the `refined_control` shall also be a `Tolerance_zone_definition_with_specified_orientation`, and the orientations shall be the same.

NOTE EXPRESS specification:

4.2.162 Composite_shape_element

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

`Composite_shape_element` is a type of `Shape_element` (see 4.2.810) that is composed of two or more constituent `Shape_elements`. A `Composite_shape_element` is either a `Composite_group_shape_element` (see 4.2.159) or a `Composite_unit_shape_element` (see 4.2.167).

The data associated with a `Composite_shape_element` are the following:

— `composing_relationships`.

4.2.162.1 composing_relationships

The `composing_relationships` is an inverse relationship that specifies that the existence of the `Composite_shape_element` is dependent on the existence of the `Shape_element_composing_relationship` (see 4.2.812) that specifies the `Composite_shape_element` as its `relating_shape_element`. There shall be two or more `Shape_element_composing_relationship` for a `Composite_shape_element`.

NOTE EXPRESS specification:

```

*)
ENTITY composite_shape_element
  ABSTRACT SUPERTYPE OF (ONEOF (composite_group_shape_element,
    composite_unit_shape_element))
  SUBTYPE OF (shape_element);

```

4.2.163 Composite_signal_property

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Composite_signal_property is a type of Signal_property (see 4.2.824) that combines more than one signal property into its structure. This part of ISO 10303 does not predefine the domain semantics of the structural relationship.

The data associated with a Composite_signal_property are the following:

— signal_property_structure.

4.2.163.1 signal_property_structure

The signal_property_structure is an inverse relationship that specifies that the existence of the Composite_signal_property is dependent on the existence of the Composite_signal_property_relationship (see 4.2.164) that specifies the Composite_signal_property as its composition. There shall be one or more Composite_signal_property_relationship for a Composite_signal_property.

NOTE EXPRESS specification:

```

*)
ENTITY composite_signal_property
  SUBTYPE OF (signal_property);
  INVERSE
    signal_property_structure : SET [1:?] OF composite_signal_property_relationship FOR
      composition;
END_ENTITY; -- composite_signal_property

( *

```

4.2.164 Composite_signal_property_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Composite_signal_property_relationship is a type of Managed_design_object (see 4.2.524). A Composite_signal_property_relationship is the aggregation of the Signal_property (see 4.2.824) that compose the Composite_signal_property (see 4.2.163).

The data associated with a Composite_signal_property_relationship are the following:

- aggregation_operation;
- composition;
- signal_property_structural_element.

4.2.164.1 aggregation_operation

The aggregation_operation specifies the External_definition (see 4.2.361) for the mathematical model for the inclusion of an element in the Composite_signal_property_relationship. The structure that the aggregation_operation helps to implement shall be specified by an ISO or an IEC standard.

4.2.164.2 composition

The composition specifies the role of the Composite_signal_property (see 4.2.163) for the Composite_signal_property_relationship. The structure shall be defined by an ISO or IEC standard.

4.2.164.3 signal_property_structural_element

The signal_property_structural_element specifies the Signal_property (see 4.2.824) that is being included in the Composite_signal_property_relationship.

NOTE Signal property composition may be domain specific and is covered by available standards.

NOTE EXPRESS specification:

```
*)
ENTITY composite_signal_property_relationship
  SUBTYPE OF (managed_design_object);
    composition                : composite_signal_property;
    signal_property_structural_element : signal_property;
    aggregation_operation       : external_definition;
END_ENTITY; -- composite_signal_property_relationship

```

4.2.165 Composite_surface_profile_locating_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Composite_surface_profile_locating_tolerance` is a type of `Profile_of_any_surface_tolerance_with_referenced_datum_system` (see 4.2.748). The `Composite_surface_profile_locating_tolerance` is used in conjunction with one to three `Composite_surface_profile_refinement_tolerance` (see 4.2.166) to apply a more restrictive specification on the form, orientation, and possibly size of a `Physical_feature_or_part_template` (see 4.2.658) than on the location of the `Physical_feature_or_part_template`. The `Tolerance_zone` (see 4.2.913) defined by the `Composite_surface_profile_locating_tolerance` is located relative to the `Datum_system` (see 4.2.236) the definition of which is specified as the `datum_system_definition`.

NOTE 1 The attribute `datum_system_definition` is declared in the `Geometric_tolerance_with_referenced_datum_system` entity of which this entity is a subtype.

NOTE 2 Composite profile tolerancing is discussed in 6.5.9.1 of ASME Y14.5M.

Constraints:

WR1: The `Composite_surface_profile_locating_tolerance` shall not also be a `Composite_surface_profile_refinement_tolerance`.

WR2: The `Composite_surface_profile_locating_tolerance` shall be specified as the `refined_control` by exactly one `Composite_surface_profile_refinement_tolerance`.

NOTE EXPRESS specification:

```
* )
ENTITY composite_surface_profile_locating_tolerance
  SUBTYPE OF (
    profile_of_any_surface_tolerance_with_referenced_datum_system);
END_ENTITY; -- composite_surface_profile_locating_tolerance

( *
```

4.2.166 Composite_surface_profile_refinement_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Composite_surface_profile_refinement_tolerance` is a type of `Profile_of_any_surface_tolerance` (see 4.2.747) that is used in conjunction with a `Composite_surface_profile_locating_tolerance` (see 4.2.165) and possibly two other `Composite_surface_profile_refinement_tolerance` to apply a more restrictive specification on the form, orientation, and possibly size of a `Physical_feature_or_part_template` (see 4.2.658) than on the location of the `Physical_feature_or_part_template`. If the `Composite_surface_profile_refinement_tolerance` is also a `Profile_of_any_surface_tolerance_with_referenced_datum_system` (see 4.2.748) the defined `Tolerance_zone` (see 4.2.913) is oriented but not located relative to the `Datum_system` (see 4.2.236) the definition of which is specified as the `datum_system_definition`.

NOTE The attribute datum_system_definition is declared in the Geometric_tolerance_with_referenced_datum_system (see 4.2.422) entity of which this entity is a subtype.

The data associated with a Composite_surface_profile_refinement_tolerance are the following:

— refined_control.

4.2.166.1 refined_control

The refined_control specifies either a Composite_surface_profile_locating_tolerance (see 4.2.165) or another Composite_surface_profile_refinement_tolerance to which this Composite_surface_profile_refinement_tolerance assists in specifying design requirements by specifying a further refinement of the form, orientation, and possibly size of the Physical_feature_or_part_template (see 4.2.658) specified as the toleranced_shape_element.

NOTE The attribute toleranced_shape_element is declared in the Geometric_tolerance entity of which this entity is a subtype.

Constraints:

WR1: The Physical_feature_or_part_template specified as the toleranced_shape_element by this Composite_surface_profile_refinement_tolerance shall be the same instance of Physical_feature_or_part_template as specified as the toleranced_shape_element by the Profile_of_any_surface_tolerance that is specified as the refined_control.

WR2: If this Composite_surface_profile_refinement_tolerance is also a Profile_of_any_surface_tolerance_without_referenced_datum_system, it shall not be specified as a refined_control by another Composite_surface_profile_refinement_tolerance.

WR3: If this Composite_surface_profile_refinement_tolerance specifies a Composite_surface_profile_refinement_tolerance as the refined_control, this Composite_surface_profile_refinement_tolerance shall either be a Profile_of_any_surface_tolerance_without_referenced_datum_system or have less Datum in its Datum_system than the Datum_system of the Composite_surface_profile_refinement_tolerance specified as the refined_control.

WR4: If this Composite_surface_profile_refinement_tolerance specifies a Composite_surface_profile_locating_tolerance as the refined_control, this Composite_surface_profile_refinement_tolerance shall either be a Profile_of_any_surface_tolerance_without_referenced_datum_system or have less than or an equal number of Datum in its Datum_system than the Datum_system of the Composite_surface_profile_locating_tolerance specified as the refined_control.

WR5: If this Composite_surface_profile_refinement_tolerance is a Profile_of_any_surface_tolerance_with_referenced_datum_system, the Datum in its Datum_system shall be in the Datum_system of the Profile_of_any_surface_tolerance specified as the refined_control and shall be assigned the same datum precedence.

WR6: If this Composite_surface_profile_refinement_tolerance specifies a Profile_of_any_surface_tolerance that specifies a Datum_system_defining_conditions_without_material_conditions as the datum_system_definition, the Profile_of_any_surface_tolerance specified as the refined_control shall also specify a Datum_system_defining_conditions_without_material_conditions as its datum_system_definition.

WR7: If this Composite_surface_profile_refinement_tolerance specifies a Profile_of_any_surface_tolerance that specifies a Datum_system_defining_conditions_with_material_conditions as the datum_system_definition; the Profile_of_any_surface_tolerance specified as the refined_control shall also specify a Datum_system_defining_conditions_with_material_conditions as its datum_system_definition, and each Datum_feature of the Datum_system of this Composite_surface_profile_refinement_tolerance shall be assigned the same material condition property as is assigned to it in the Datum_system of the Profile_of_any_surface_tolerance specified as the refined_control.

WR8: The size of the Tolerance_zone_boundary of this Composite_surface_profile_refinement_tolerance shall be less than the size of the Tolerance_zone_boundary of the Profile_of_any_surface_tolerance specified as the refined_control.

WR9: The Tolerance_zone_boundary of this Composite_surface_profile_refinement_tolerance shall be based on the same True_profile as the Tolerance_zone_boundary of the Profile_of_any_surface_tolerance specified as the refined_control.

WR10: The Composite_surface_profile_refinement_tolerance shall be specified as a refined_control by at most one Composite_surface_profile_refinement_tolerance.

NOTE EXPRESS specification:

```
*)
ENTITY composite_surface_profile_refinement_tolerance
  SUBTYPE OF (profile_of_any_surface_tolerance);
    refined_control : locating_or_refinement_surface_profile_tolerance;
END_ENTITY; -- composite_surface_profile_refinement_tolerance

( *
```

4.2.167 Composite_unit_shape_element

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Composite_unit_shape_element is a type of Composite_shape_element (see 4.2.162) that is treated as a unit, as opposed to as a group of individual Shape_element (see 4.2.810).

EXAMPLE 1 A Profile_of_any_surface_tolerance (see 4.2.747) is applied to a square cut-out that goes through a printed circuit board. The square cut-out is a Composite_unit_shape_element that consists of the four constituent Shape_elements that correspond to the four surfaces of the cut-out.

EXAMPLE 2 A Flatness_tolerance (see 4.2.386) may be applied to a Composite_unit_shape_element to specify that the coplanar surfaces that make up the Composite_unit_shape_element are required to fall within a common Tolerance_zone (see 4.2.913).

NOTE Common tolerance zones are described in 7.5 of ISO 1101.

NOTE EXPRESS specification:

```
*)  
ENTITY composite_unit_shape_element  
  SUBTYPE OF (composite_shape_element);  
END_ENTITY; -- composite_unit_shape_element  
  
(*
```

4.2.168 Concentricity_and_coaxiality_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Concentricity_and_coaxiality_tolerance is a type of Geometric_tolerance_with_referenced_datum_system (see 4.2.422) that specifies or partially specifies the design requirement on either the concentricity or the coaxiality of the tolerated Shape_element (see 4.2.810) in relation to a Datum (see 4.2.214). Coaxiality is the quality or state of being coaxial.

NOTE Concentricity and coaxiality tolerance is defined in terms of tolerance zone definitions in 14.11 of ISO 1101.

Constraints:

WR1: The Shape_element specified as the tolerated_shape_element shall be either a Centre_axis or a Centre_point.

NOTE The attribute tolerated_shape_element is declared in the Geometric_tolerance entity of which this entity is a subtype.

WR2: There shall be exactly one Datum in the Datum_system the definition of which is specified as the datum_system_definition.

NOTE The attribute datum_system_definition is declared in the Geometric_tolerance_with_referenced_datum_system entity of which this entity is a subtype.

WR3: If the Shape_element specified as the tolerated_shape_element is a Centre_point, the Datum of the Datum_system the definition of which is specified as the datum_system_definition shall be a Datum_point.

WR4: If the Shape_element specified as the tolerated_shape_element is a Centre_axis, the Datum of the Datum_system the definition of which is specified as the datum_system_definition shall be a Datum_axis.

WR5: The Concentricity_and_coaxiality_tolerance shall specify a Tolerance_zone_definition as its tolerance_zone_or_boundary_definition; and that Tolerance_zone_definition shall specify a Tolerance_zone_boundary_definition_with_specified_size as its boundary_definition; and that Tolerance_zone_boundary_definition_with_specified_size shall specify a Diametrical_boundary_size_characteristic as its specified_boundary_size.

IP1: The form of the tolerated Shape_element shall be consistent with the form of a shape element for which the application of a concentricity and coaxiality tolerance is sensible.

NOTE EXPRESS specification:

```
*)

4.2.170 Conductive_filled_area

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Conductive_filled_area` is a type of `Stratum_feature` (see 4.2.851) in which the material is conductive. A `Conductive_filled_area` may be a `Connected_filled_area` (see 4.2.184).

NOTE EXPRESS specification:

```
*)
ENTITY conductive_filled_area
  SUPERTYPE OF (connected_filled_area)
  SUBTYPE OF (stratum_feature);
END_ENTITY; -- conductive_filled_area

( *
```

4.2.171 Conductive_interconnect_element

A `Conductive_interconnect_element` is a type of `Laminate_component` (see 4.2.483). A `Conductive_interconnect_element` is either a `Conductive_interconnect_element_with_pre_defined_transitions` (see 4.2.174) or a `Conductive_interconnect_element_with_user_defined_single_transition` (see 4.2.175) or an `Unrouted_conductive_interconnect_element` (see 4.2.937). A `Conductive_interconnect_element` specifies one portion of a `Stratum_feature` (see 4.2.851) that has a sequential arrangement of `Layer_connection_point` (see 4.2.499).

NOTE A domain term for a `Conductive_interconnect_element` is a trace. The domain term may include additional aspects over that defined in this application object in certain cases. For that reason, this part of ISO 10303 does not attempt to prescribe or limit the application of the term trace by standardizing it.

EXAMPLE 1 An example of multiple `Conductive_interconnect_element`, `Land` (see 4.2.490), and `Stratum_feature_template_component` (see 4.2.862) that contribute to the definition of a `Conductor` (see 4.2.176) are shown in the partially exploded view of a `Conductor` in figure 18.

The data associated with a `Conductive_interconnect_element` are the following:

- `access_mechanisms`;
- `composed_conductor`.

4.2.171.1 access_mechanisms

The `access_mechanisms` is an inverse relationship that specifies that the existence of the `Conductive_interconnect_element` is dependent on the existence of the `Conductive_interconnect_element_terminal` (see 4.2.172) that specifies the `Conductive_interconnect_element` as its `associated_component`. There shall be at least two `Conductive_interconnect_element_terminals` for a `Conductive_interconnect_element`.

Figure 18 – Partially exploded view of a Conductor

4.2.171.2 composed_conductor

The `composed_conductor` specifies the role of the `Stratum_feature` (see 4.2.851) for the `Conductive_interconnect_element`. The `composed_conductor` need not be specified for a `Conductive_interconnect_element`.

Constraints:

WR1: The members of `Layer_connection_point` specified by a member of `Conductive_interconnect_element` shall also be specified by the feature this `interconnect_element` is composing. This is a non-exclusive rule. Other members of `Layer_connection_point` may be specified by the conductor.

NOTE EXPRESS specification:

```

*)
ENTITY conductive_interconnect_element
  ABSTRACT SUPERTYPE OF (ONEOF (
    unrouted_conductive_interconnect_element,
    conductive_interconnect_element_with_pre_defined_transitions,
    conductive_interconnect_element_with_user_defined_single_transition))
  SUBTYPE OF (laminate_component);

      associated_component;
END_ENTITY; -- conductive_interconnect_element

( *
```

4.2.172 Conductive_interconnect_element_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Conductive_interconnect_element_terminal` is a type of `Component_terminal` (see 4.2.137). The `Conductive_interconnect_element_terminal` is a terminal for the trace defined by `Conductive_interconnect_element`.

NOTE This is used for detailed design and analysis, and also as a means to check the quality of geometry representation and transfer.

The data associated with a `Conductive_interconnect_element_terminal` are the following:

- `associated_component`;
- `connection`;
- `location`;
- `name`.

4.2.172.1 associated_component

The `associated_component` specifies the role of the `Conductive_interconnect_element` (see 4.2.171) for the `Conductive_interconnect_element_terminal`.

4.2.172.2 connection

The `connection` specifies the role of the `Connection_zone` (see 4.2.185) for the `Conductive_interconnect_element_terminal`. The `connection` is optional and need not be supplied if the data is not available in the source system. If the data is available in the source system, it shall be supplied.

4.2.172.3 location

The `location` is an inverse attribute that specifies the `Design_view_terminal_component_shape_relationship` that the `Conductive_interconnect_element_terminal` is existence dependent on. There may be one or two `Design_view_terminal_component_shape_relationship` depending on whether there is a single shape representation for the design or whether there is a two dimensional shape and a three dimensional shape.

4.2.172.4 name

The `name` specifies the string for the human-interpretable identifier for the `Conductive_interconnect_element_terminal`.

Constraints:

UR1: The combination of name and associated_component inherited from Component_feature shall be unique within a population of Conductive_interconnect_element_terminal.

WR1: The same Stratum shall be referenced by the path starting at location and the path starting at associated_component inherited from the Component_feature.

NOTE EXPRESS specification:

```

*)
ENTITY conductive_interconnect_element_terminal
  SUBTYPE OF (laminate_component_feature);
    SELF\component_feature.associated_component : conductive_interconnect_element;
    connection                                : OPTIONAL connection_zone;
    name                                       : STRING;
    location : layer_connection_point;
UNIQUE
  UR1: name, SELF\component_feature.associated_component;
WHERE
  WR1: NOT(EXISTS(SELF\component_feature.
    associated_component\conductive_interconnect_element.
    composed_conductor)) OR
    (location.resident_design_layer_stratum = SELF\component_feature.
    associated_component\conductive_interconnect_element.
    composed_conductor.resident_stratum);
END_ENTITY; -- conductive_interconnect_element_terminal
(

```

4.2.173 Conductive_interconnect_element_terminal_link

A Conductive_interconnect_element_terminal_link is a type of Managed_design_object (see 4.2.524). A Conductive_interconnect_element_terminal_link is a directed link between two Conductive_interconnect_element_terminal (see 4.2.172) in order to support the sequence of Conductive_interconnect_element_terminal required in Conductive_interconnect_element_with_pre_defined_transitions (see 4.2.174).

The data associated with a Conductive_interconnect_element_terminal_link are the following:

- associated_element;
- precedent_point;
- subsequent_point.

4.2.173.1 associated_element

An associated_element specifies the role of the Conductive_interconnect_element_with_pre_defined_transitions (see 4.2.174) for a Conductive_interconnect_element_terminal_link.

4.2.173.2 precedent_point

A precedent_point specifies one role of the Conductive_interconnect_element_terminal (see 4.2.172) for a Conductive_interconnect_element_terminal_link.

4.2.173.3 subsequent_point

A subsequent_point specifies one role of the Conductive_interconnect_element_terminal (see 4.2.172) for a Conductive_interconnect_element_terminal_link.

Constraints:

WR1: The precedent_point shall not be the subsequent_point.

WR2: The precedent_point shall be on the associated_element.

WR3: The subsequent_point shall be on the associated_element.

NOTE EXPRESS specification:

```

*)
ENTITY conductive_interconnect_element_terminal_link
  SUBTYPE OF (managed_design_object);
    associated_element : conductive_interconnect_element_with_pre_defined_transitions;
    precedent_point    : conductive_interconnect_element_terminal;
    subsequent_point   : conductive_interconnect_element_terminal;
WHERE
  WR1 : precedent_point &#60;&#62; subsequent_point;
  WR2 : precedent_point.associated_component = associated_element;
  WR3 : subsequent_point.associated_component = associated_element;
END_ENTITY; -- conductive_interconnect_element_terminal_link
( *
```

4.2.174 Conductive_interconnect_element_with_pre_defined_transitions

A `Conductive_interconnect_element_with_pre_defined_transitions` is a type of `Conductive_interconnect_element` (see 4.2.171). The data provided by `Conductive_interconnect_element_with_pre_defined_transitions` is typical data available from two dimensional CAD applications. The data does not include explicit representation of the variability in the vertical dimension that occurs in a real "planar" product due to material build up of successive layers of material. The `usage_definition` is required to be orthogonal to the `centreline_shape_representation`, but this is insufficient information in a three-dimensional layout. In a two-dimensional layout, the `usage_definition` shape x direction vector is constrained to be parallel with the x direction vector of the shape of the `Stratum_feature` (see 4.2.851) referenced by the inherited attribute `composed_conductor`. In a two-dimensional design, all `Stratum_features` are parallel. In a three-dimensional design, the same parallelism constraint applies, but the underlying substrate is not presumed to be planar. The underlying surface shape idealization is contained in the `Stratum_surface_shape` (see 4.2.870) or `Stratum_average_surface_shape` (see 4.2.848). The `Stratum_feature_shape_stratum_surface_shape_relationship` (see 4.2.859) or `Stratum_feature_shape_stratum_average_surface_shape_relationship` (see 4.2.858) shall be populated to specify to a processor the design intent. The `centreline_shape_representation` shall be a subset of either the points in the `Stratum_average_surface_shape` or of the points in the `Stratum_surface_shape`.

NOTE The "pre-defined transition" refers to the extrusion of the `trace_template` shape (a cross-sectional definition) along the path defined by its `centreline_shape_representation` (a `Curve` (see 4.2.203)).

The data associated with a `Conductive_interconnect_element_with_pre_defined_transitions` are the following:

- `centreline_shape_representation`;
- `connected_point`;
- `usage_definition`.

4.2.174.1 centreline_shape_representation

The `centreline_shape_representation` specifies the `Curve` representing the centreline of the `Conductive_interconnect_element_with_pre_defined_transitions`. The centreline when combined with the `usage_definition` provides a CAD abstraction of the physical shape.

4.2.174.2 connected_point

The `connected_points` is an inverse relationship that specifies that the `Conductive_interconnect_element_with_pre_defined_transitions` is existence dependent on at least one `Conductive_interconnect_element_terminal_link` (see 4.2.173) for the `Conductive_interconnect_element`.

4.2.174.3 usage_definition

The usage_definition specifies the role of the Trace_template (see 4.2.930) for the Conductive_interconnect_element_with_pre_defined_transitions. The usage_definition is a cross section definition. When combined with the centreline shape, a complete CAD abstraction is formed for the two-dimensional case. The three-dimensional case requires additional data representing the abstract surface in which the conductor being defined will be located.

NOTE The Trace_template describes the cross-section parameters required by a processor that adds material along the path described by the centreline.

NOTE EXPRESS specification:

4.2.175 Conductive_interconnect_element_with_user_defined_single_transition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Conductive_interconnect_element_with_user_defined_single_transition is a type of Conductive_interconnect_element (see 4.2.171). The Conductive_interconnect_element_with_user_defined_single_transition supports the specification of custom start and end shape templates and separately specified left_curve_shape_representation and right_curve_shape_representation (which are either Bounding_curve or Trimmed_line).

NOTE 1 For examples of the curves that can be used, see Bounding_curve (see 4.2.80).

NOTE 2 The electrical properties of the Conductive_interconnect_element_with_user_defined_single_transition may be assigned using a requirement allocation structure.

EXAMPLE 1 Figure 12 illustrates a detail of a layout drawing that shows a transition on a trace. The segment "I" is supported in this part of ISO 10303 as a member of `Conductive_interconnect_element_with_user_defined_single_transition`.

The data associated with a `Conductive_interconnect_element_with_user_defined_single_transition` are the following:

- `end_definition`;
- `end_terminus` ;
- `left_curve_shape_representation` ;
- `right_curve_shape_representation` ;
- `start_definition` ;
- `start_terminus` .

4.2.175.1 `end_definition`

The `end_definition` specifies one role of the `Trace_template` (see 4.2.930) for the `Conductive_interconnect_element_with_user_defined_single_transition`.

4.2.175.2 `end_terminus`

The `end_terminus` specifies one role of the `Layer_connection_point` (see 4.2.499) for the `Conductive_interconnect_element_with_user_defined_single_transition`.

4.2.175.3 `left_curve_shape_representation`

The `left_curve_shape_representation` specifies one role of either a `Bounding_curve` (see 4.2.80) or `Trimmed_line` (see 4.2.933) for the `Conductive_interconnect_element_with_user_defined_single_transition`.

4.2.175.4 `right_curve_shape_representation`

The `right_curve_shape_representation` specifies one role of either a `Bounding_curve` (see 4.2.80) or `Trimmed_line` (see 4.2.933) for the `Conductive_interconnect_element_with_user_defined_single_transition`.

4.2.175.5 `start_definition`

The `start_definition` specifies one role of the `Trace_template` (see 4.2.930) for the `Conductive_interconnect_element_with_user_defined_single_transition`.

4.2.175.6 start_terminus

The start_terminus specifies one role of the Layer_connection_point (see 4.2.499) for the Conductive_interconnect_element_with_user_defined_single_transition.

NOTE EXPRESS specification:

```

*)
ENTITY conductive_interconnect_element_with_user_defined_single_transition
  SUBTYPE OF (conductive_interconnect_element);
  SELF\conductive_interconnect_element.
    composed_conductor      : stratum_feature;

4.2.176 Conductor

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Conductor is a type of Stratum_feature (see 4.2.851) realized in a Design_layer_stratum (see 4.2.275) that participates in the implementation of a Physical_network (see 4.2.660).

EXAMPLE 1 Figure 19 illustrates a detail of a layout drawing that shows the Conductor in relationship to a component at the next level of the assembly.

The data associated with a Conductor are the following:

— implementation_requirement.

4.2.176.1 implementation_requirement

The implementation_requirement specifies the Intra_stratum_join_relationship (see 4.2.477) that is used to constrain the Conductor by specifying the Layer_connection_point (see 4.2.499) that are to be connected by the Conductor.

A Feature_shape_definition that is a Curve that is a Closed_curve in the role of face_inner_bound for a Planar_bound_face. This is in the role of a shape_face_representation for a Stratum_feature.

A Feature_shape_definition that is a Curve that is a Closed_curve in the role of face_outer_bound for a Planar_bound_face. This is in the role of a shape_face_representation for a Stratum_feature.

Four traces (domain term) converging on a location separately, in order to avoid three obstructions. All participate in the same implementation of a connectivity requirement.

Figure 19 – Conductor

Constraints:

WR1: The shape that is a Stratum_feature shape shall not violate the nearest approach constraint to another shape assigned to the same design layer and realized as the stratum material of the design layer stratum.

WR2: A Conductor shall enclose two or more layer connection point in the region between or on the outer bound and an inner bound; or inside or on the outer bound that has no inner bound.

NOTE EXPRESS specification:

4.2.177 Configuration_controlled_message

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Configuration_controlled_message is a type of Managed_design_object (see 4.2.524). A Configuration_controlled_message is a message that has its content under version control, and that is source data for application of marking materials to a product.

The data associated with a Configuration_controlled_message are the following:

- message_content;
- message_source;
- message_type_specification.

4.2.177.1 message_content

The message_content specifies the text in the Configuration_controlled_message.

4.2.177.2 message_source

The message_source specifies either an Ee_approval (see 4.2.314), an Ee_product_version (see 4.2.328), or an Organization (see 4.2.569) for the Configuration_controlled_message.

4.2.177.3 message_type_specification

The message_type_specification specifies either an approval_date, a manufacturer_code, a part_number, or a revision_identifier for the Configuration_controlled_message. A message_type_specification is necessary to differentiate among the possible message sources to identify the one that has been selected for the literal string.

Constraints:

WR1: If message_type_specification is "approval_date" then message_content is equal to Ee_approval.signoff_date.

WR2: If message_type_specification is "manufacturer_code" then message_content is equal to Organization.identifier.

WR3: If message_type_specification is "part_number" then message_content is equal to Ee_product.part_number.

WR4: If message_type_specification is "revision_code" then message_content is equal to Ee_product_version.revision_code.

NOTE EXPRESS specification:

```

*)

4.2.178 Conical_tolerance_zone_boundary

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Conical_tolerance_zone_boundary is a type of Tolerance_zone_boundary (see 4.2.915) that is conical in form. The shape of the Conical_tolerance_zone_boundary is defined by a frustum the size of which is specified at the surfaces that define the ends of the frustum.

The data associated with a Conical_tolerance_zone_boundary are the following:

— boundary_and_surface_relationships.

4.2.178.1 boundary_and_surface_relationships

The boundary_and_surface_relationships is an inverse relationship that specifies that the existence of the Conical_tolerance_zone_boundary is dependent on the existence of two Conical_tolerance_zone_boundary_and_surface_relationship (see 4.2.179) that specify the Conical_tolerance_zone_boundary as their sized_tolerance_zone_boundary. There shall be exactly two Conical_tolerance_zone_boundary_and_surface_relationship for a Conical_tolerance_zone_boundary.

NOTE EXPRESS specification:

```

*)
ENTITY conical_tolerance_zone_boundary
  SUBTYPE OF (tolerance_zone_boundary);
  INVERSE
    boundary_and_surface_relationships : SET [2:2] OF
    conical_tolerance_zone_boundary_and_surface_relationship FOR
    sized_tolerance_zone_boundary;
END_ENTITY; -- conical_tolerance_zone_boundary

( *
```

4.2.179 Conical_tolerance_zone_boundary_and_surface_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Conical_tolerance_zone_boundary_and_surface_relationship is a type of Managed_design_object (see 4.2.524). A Conical_tolerance_zone_boundary_and_surface_relationship is a relationship that associates a Conical_tolerance_zone_boundary (see 4.2.178) with one of the two Physical_feature_or_part_template (see 4.2.658) at which the Conical_tolerance_zone_boundary diameter is specified.

The data associated with a Conical_tolerance_zone_boundary_and_surface_relationship are the following:

- size_characteristic;
- sized_tolerance_zone_boundary;
- terminating_surface.

4.2.179.1 size_characteristic

The size_characteristic is an inverse relationship that specifies that the existence of the Conical_tolerance_zone_boundary_and_surface_relationship is dependent on the existence of the Conical_tolerance_zone_boundary_diametrical_size_characteristic (see 4.2.181) that specifies the Conical_tolerance_zone_boundary_and_surface_relationship as its sized_boundary_at_surface.

4.2.179.2 sized_tolerance_zone_boundary

The sized_tolerance_zone_boundary specifies the Conical_tolerance_zone_boundary (see 4.2.178) the diameter of which is specified at the Physical_feature_or_part_template (see 4.2.658) specified as the terminating_surface.

4.2.179.3 terminating_surface

The terminating_surface specifies the Physical_feature_or_part_template (see 4.2.658) at which the diameter is specified for the Conical_tolerance_zone_boundary (see 4.2.178).

NOTE EXPRESS specification:

```

*)
ENTITY conical_tolerance_zone_boundary_and_surface_relationship
  SUBTYPE OF (managed_design_object);

4.2.180 Conical_tolerance_zone_boundary_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Conical_tolerance_zone_boundary_definition is a type of Tolerance_zone_boundary_definition (see 4.2.916) that characterizes a Conical_tolerance_zone_boundary (see 4.2.178).

The data associated with a Conical_tolerance_zone_boundary_definition are the following:

- boundary_sizes;
- defined_zone_boundary.

4.2.180.1 boundary_sizes

The boundary_sizes specifies the Conical_tolerance_zone_boundary_diametrical_size_characteristic (see 4.2.181) that defines the size of the Conical_tolerance_zone_boundary (see 4.2.178) at specified Physical_feature_or_part_templates. There shall be exactly two Conical_tolerance_zone_boundary_diametrical_size_characteristic specified as the boundary_sizes for the Conical_tolerance_zone_boundary_definition.

4.2.180.2 defined_zone_boundary

The defined_zone_boundary specifies the Conical_tolerance_zone_boundary (see 4.2.178) that is characterized by the Conical_tolerance_zone_boundary_definition.

Constraints:

WR1: Each Geometric_tolerance that defines a Conical_tolerance_zone_boundary_diametrical_size_-characteristic of the Conical_tolerance_zone_boundary_definition shall be of the same type.

WR2: Each Geometric_tolerance that defines a Conical_tolerance_zone_boundary_diametrical_size_-characteristic of the Conical_tolerance_zone_boundary_definition shall reference the same Datum_system_defining_conditions.

WR3: Each Geometric_tolerance that defines a Conical_tolerance_zone_boundary_diametrical_size_-characteristic of the Conical_tolerance_zone_boundary_definition shall specify the same value for the applied_material_condition_property_name.

WR4: Each Geometric_tolerance that defines a Conical_tolerance_zone_boundary_diametrical_size_-characteristic of the Conical_tolerance_zone_boundary_definition shall specify the same instance of Centre_axis as the toleranced_shape_element.

WR5: The Conical_tolerance_zone_boundary_definition shall be specified as the boundary_definition by a Conical_tolerance_zone_definition.

NOTE EXPRESS specification:

```

*)
ENTITY conical_tolerance_zone_boundary_definition

conical_tolerance_zone_boundary;
END_ENTITY; -- conical_tolerance_zone_boundary_definition

```

(*

4.2.181 Conical_tolerance_zone_boundary_diametrical_size_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Conical_tolerance_zone_boundary_diametrical_size_characteristic is a type of Managed_design_object (see 4.2.524). A Conical_tolerance_zone_boundary_diametrical_size_characteristic is a definition that characterizes the size of a Conical_tolerance_zone_boundary (see 4.2.178) at one of the Physical_feature_or_part_template (see 4.2.658) that defines the ends of the Conical_tolerance_zone_boundary.

The data associated with a `Conical_tolerance_zone_boundary_diametrical_size_characteristic` are the following:

- `boundary_definition`;
- `sized_boundary_at_surface`;
- `tolerance_value`.

4.2.181.1 `boundary_definition`

The `boundary_definition` is an inverse relationship that specifies that the existence of the `Conical_tolerance_zone_boundary_diametrical_size_characteristic` is dependent on the existence of the `Conical_tolerance_zone_boundary_definition` (see 4.2.180) that specifies the `Conical_tolerance_zone_boundary_diametrical_size_characteristic` as one of its `boundary_sizes`.

4.2.181.2 `sized_boundary_at_surface`

The `sized_boundary_at_surface` specifies the `Conical_tolerance_zone_boundary_and_surface_relationship` (see 4.2.179) that associates the `Conical_tolerance_zone_boundary` (see 4.2.178) with a `Physical_feature_or_part_template` (see 4.2.658) that defines an end of the `Conical_tolerance_zone_boundary` at which the size is characterized by the `Conical_tolerance_zone_boundary_diametrical_size_characteristic`.

4.2.181.3 `tolerance_value`

The `tolerance_value` specifies the `Length_data_element` (see 4.2.511) that represents the diameter of the specified `Conical_tolerance_zone_boundary` (see 4.2.178) at the specified `Physical_feature_or_part_template` (see 4.2.658) for the `Conical_tolerance_zone_boundary_diametrical_size_characteristic`.

Constraints:

WR1: The `Conical_tolerance_zone_boundary` specified as the `sized_tolerance_zone_boundary` by the `Conical_tolerance_zone_boundary_and_surface_relationship` that is specified as the `sized_boundary_at_surface` shall be the same instance of `Conical_tolerance_zone_boundary` as specified as the `defined_zone_boundary` by the `Conical_tolerance_zone_boundary_definition` that is specified as the `boundary_definition`. That is, the `Conical_tolerance_zone_boundary_diametrical_size_characteristic` and the `Conical_tolerance_zone_boundary_definition` specified as the `boundary_definition` shall define the same `Conical_tolerance_zone_boundary`.

WR2: The `Conical_tolerance_zone_boundary_diametrical_size_characteristic` shall be specified by exactly one `Geometric_tolerance` as the `tolerance_zone_or_boundary_definition`, and that `Geometric_tolerance` shall be one of a `Position_tolerance`, a `Parallelism_tolerance`, a `Perpendicularity_tolerance`, or an `Angularity_tolerance`.

NOTE EXPRESS specification:

```

```

4.2.182 Conical_tolerance_zone_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Conical_tolerance_zone_definition is a type of Tolerance_zone_definition (see 4.2.920) the boundary of which is defined by a Conical_tolerance_zone_boundary_definition (see 4.2.180). A Conical_tolerance_zone_definition is defined when it is desired to place a more restrictive specification on one end of a Shape_element (see 4.2.810) than on the other end.

NOTE Conical tolerance zones are described in 5.8 of ASME Y14.5M.

The data associated with a Conical_tolerance_zone_definition are the following:

— boundary_definition.

4.2.182.1 boundary_definition

The boundary_definition specifies the Conical_tolerance_zone_boundary_definition (see 4.2.180) that defines the boundary for the Conical_tolerance_zone_definition.

Constraints:

WR1: The Conical_tolerance_zone_definition shall not be specified as the tolerance_zone_or_boundary_definition by a Geometric_tolerance.

NOTE EXPRESS specification:

```

*)
ENTITY conical_tolerance_zone_definition
  SUBTYPE OF (tolerance_zone_definition);
  SELF\tolerance_zone_definition.boundary_definition :
conical_tolerance_zone_boundary_definition;
END_ENTITY; -- conical_tolerance_zone_definition

--tt tc1 wd9
( *

```

4.2.183 Connected_area_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Connected_area_component is a type of Stratum_feature_template_component (see 4.2.862).

NOTE EXPRESS specification:

```

*)
ENTITY connected_area_component
  SUBTYPE OF (stratum_feature_template_component);
--tt tc1 wd9 deleted following
-- SELF\assembly_component.usage_definition : stratum_feature_template;
-- SELF\stratum_feature_template_component.stratum_feature_implementation : stratum_fea
associated_layer_connection_point : SET [1:?] OF layer_connection_point;
WHERE
  WR1: NOT(EXISTS(SELF\assembly_component.usage_definition));
END_ENTITY; -- connected_area_component

( *

```

4.2.184 Connected_filled_area

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Connected_filled_area is a type of Conductive_filled_area (see 4.2.170). The Connected_filled_area is a Conductive_filled_area (see 4.2.170) with which a set of layer connection points are associated (as specified in the implementation_requirement attribute).

The data associated with a Connected_filled_area are the following:

— implementation_requirement.

4.2.184.1 implementation_requirement

The implementation_requirement specifies the Intra_stratum_join_relationship (see 4.2.477) for which the Connected_filled_area is generated.

NOTE EXPRESS specification:

```
*)
ENTITY connected_filled_area
  SUBTYPE OF (conductive_filled_area);
  --tt tc1 wd9 added
    SELF\stratum_feature.resident_stratum      : design_layer_stratum;
    implementation_requirement : intra_stratum_join_relationship;
END_ENTITY; -- connected_filled_area

( *
```

4.2.185 Connection_zone

A Connection_zone is a type of Managed_design_object (see 4.2.524). A Connection_zone is an area on the surface of a design object that may be used to establish electrical or physical connectivity with another design object. A Connection_zone shape is defined in the shape definition of the feature that references the Connection_zone. Since more than one feature may reference the same shape but for different positions, more than one feature may reference the same Connection_zone.

The data associated with a Connection_zone are the following:

- zone_shape_1;
- zone_shape_2;
- representation_colour.

4.2.185.1 zone_shape_1

The zone_shape_1 is an inverse relationship that specifies that the Connection_zone is existent dependent on the Connection_zone_shape (see ??) that specifies the Connection_zone. There shall be zero or more zone_shape_1 for a Connection_zone.

4.2.185.2 zone_shape_2

The zone_shape_2 is an inverse relationship that specifies that the Connection_zone is existent dependent on the Connection_zone_shape (see ??) that specifies the Connection_zone. There shall be zero or more zone_shape_2 for a Connection_zone.

4.2.185.3 representation_colour

The representation_colour specifies the Ee_colour (see 4.2.315) that depicts the area constituting the Connection_zone. The representation_colour need not be specified.

Constraints:

WR1: All points in a Connection_zone shall be topologically connected.

WR2: A particular instance of Connection_zone shall be referenced by at least one shape instantiation.

NOTE EXPRESS specification:

```

*)
ENTITY connection_zone
  SUBTYPE OF (managed_design_object);
  representation_colour : OPTIONAL ee_colour;
INVERSE
  zone_shape_1          : SET [0:1] OF
    design_view_connection_zone_position_relationship for
    associated_usage;
  zone_shape_2          : SET [0:1] OF
    usage_view_connection_zone_terminal_shape_relationship for
    associated_usage;
WHERE
  WR1: SIZEOF(USEDIN(SELF, 'AP210_ARM.ASSEMBLY_MODULE_TERMINAL.TERMINAL_CONNECTION_ZONE')) +
    SIZEOF(USEDIN(SELF, 'AP210_ARM.BARE_DIE_TERMINAL.EXTERNAL_CONNECTION_AREA')) +
    SIZEOF(USEDIN(SELF, 'AP210_ARM.COMPONENT_TERMINATION_PASSAGE_TEMPLATE_TERMINAL.TERMINAL_CONNECTION_ZONE')) +
    SIZEOF(USEDIN(SELF, 'AP210_ARM.CONDUCTIVE_INTERCONNECT_ELEMENT_TERMINAL.CONNECTION')) +
    SIZEOF(USEDIN(SELF, 'AP210_ARM.INTERCONNECT_COMPONENT_INTERFACE_TERMINAL.CONNECTION')) +
    SIZEOF(USEDIN(SELF, 'AP210_ARM.INTERCONNECT_COMPONENT_JOIN_TERMINAL.CONNECTION')) +
    SIZEOF(USEDIN(SELF, 'AP210_ARM.INTERCONNECT_MODULE_TERMINAL.TERMINAL_CONNECTION_ZONE')) +
    SIZEOF(USEDIN(SELF, 'AP210_ARM.LAND_TEMPLATE_TERMINAL.TERMINAL_CONNECTION_ZONE')) +
    SIZEOF(USEDIN(SELF, 'AP210_ARM.PACKAGE_TERMINAL.EXTERNAL_CONNECTION_ZONE')) +
    SIZEOF(USEDIN(SELF, 'AP210_ARM.PACKAGE_TERMINAL.INTERNAL_CONNECTION_ZONE')) +
    SIZEOF(USEDIN(SELF, 'AP210_ARM.PRINTED_PART_TEMPLATE_TERMINAL.TERMINAL_CONNECTION_ZONE')) +
    SIZEOF(USEDIN(SELF, 'AP210_ARM.VIA_TEMPLATE_TERMINAL.TERMINAL_CONNECTION_ZONE')) +
    SIZEOF(USEDIN(SELF, 'AP210_ARM.PART_MOUNTING_FEATURE.MOUNTING_AREA')) &#62;= 0;

4.2.186 Connection_zone_based_assembly_joint

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Connection_zone_based_assembly_joint` is a type of `Assembly_joint` (see 4.2.41). A `Connection_zone_based_assembly_joint` consists of a `zone_1` and a `zone_2`.

The data associated with a `Connection_zone_based_assembly_joint` are the following:

- `zone_1`;
- `zone_2`.

4.2.186.1 `zone_1`

A `zone_1` specifies one role of a `Connection_zone` (see 4.2.185) for a `Connection_zone_based_assembly_joint`.

4.2.186.2 `zone_2`

A `zone_2` specifies one role of a `Connection_zone` (see 4.2.185) for a `Connection_zone_based_assembly_joint`.

NOTE There are no semantics associated with the sequence of zones in a `Connection_zone_based_assembly_joint`.

Constraints:

WR1: The `zone_1` shall not be `zone_2`.

NOTE EXPRESS specification:

```

*)
ENTITY connection_zone_based_assembly_joint
  SUBTYPE OF (assembly_joint);
    zone_1 : connection_zone;
    zone_2 : connection_zone;
WHERE
  WR1: zone_1 :&#60;&#62;: zone_2;
(* The zone_1 shall be referenced by assembled_features_1 inherited from
the assembly_joint supertype either directly or indirectly.
The zone_1 shall not be referenced by assembled_features_2 inherited from
the assembly_joint supertype either directly or indirectly.
The zone_2 shall be referenced by assembled_features_2 inherited from
the assembly_joint supertype either directly or indirectly.
The zone_2 shall not be referenced by assembled_features_1 inherited from
the assembly_joint supertype either directly or indirectly. *)
END_ENTITY; -- connection_zone_based_assembly_joint

```

4.2.187 Connection_zone_based_fabrication_joint

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Connection_zone_based_fabrication_joint is a type of Fabrication_joint (see 4.2.368). A Connection_zone_based_fabrication_joint consists of a zone_1 and a zone_2.

The data associated with a Connection_zone_based_fabrication_joint are the following:

- zone_1;
- zone_2.

4.2.187.1 zone_1

A zone_1 specifies one role of a Connection_zone (see 4.2.185) for a Connection_zone_based_fabrication_joint.

4.2.187.2 zone_2

A zone_2 specifies one role of a Connection_zone (see 4.2.185) for a Connection_zone_based_fabrication_joint.

NOTE There are no semantics associated with the sequence of zones in a Connection_zone_based_fabrication_joint.

Constraints:

WR1: The zone_1 shall not be zone_2.

NOTE EXPRESS specification:

```

*)
ENTITY connection_zone_based_fabrication_joint
  SUBTYPE OF (fabrication_joint);
    zone_1 : connection_zone;
    zone_2 : connection_zone;
WHERE
  WR1: zone_1 :&#60;&#62;: zone_2;

```

4.2.188 Connection_zone_interface_plane_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Connection_zone_interface_plane_relationship is a type of Managed_design_object (see 4.2.524). A Connection_zone_interface_plane_relationship establishes a product structure relationship that may be represented in a geometric context for the purpose of deriving a 2D or 3D representation of the intersection of a terminal interface.

The data associated with a Connection_zone_interface_plane_relationship are the following:

- interface_plane;
- mating_zone;
- name.

4.2.188.1 interface_plane

An interface_plane specifies the role of a Seating_plane (see 4.2.802) for the Connection_zone_interface_plane_relationship.

4.2.188.2 mating_zone

A mating_zone specifies the role of a Connection_zone (see 4.2.185) for the Connection_zone_interface_plane_relationship.

4.2.188.3 name

A name specifies the string that identifies the Connection_zone_interface_plane_relationship.

Constraints:

UR1: The name shall be unique within a population of Connection_zone_interface_plane_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY connection_zone_interface_plane_relationship
  SUBTYPE OF (managed_design_object);
    interface_plane      : seating_plane;

END_ENTITY; -- connection_zone_map_identification

( *
```

4.2.190 Connection_zone_model_port_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Connection_zone_model_port_assignment is a type of Managed_design_object (see 4.2.524). A Connection_zone_model_port_assignment is the relationship between the Analytical_model_port (see 4.2.17) and the Connection_zone (see 4.2.185), for the purpose of mapping the connection points to the model ports directly.

NOTE 1 In some circumstances it may be necessary to assign the Connection_zones to model ports in order to characterize the functionality of the terminals more accurately.

NOTE 2 Part_device_terminal_model_port_assignment (see 4.2.608) may be used in conjunction with Part_feature_model_port_assignment (see 4.2.611) where this level of detail is not required.

The data associated with a Connection_zone_model_port_assignment are the following:

- source;
- target.

4.2.190.1 source

The source specifies the role of the Connection_zone (see 4.2.185) for the Connection_zone_model_port_assignment.

4.2.190.2 target

The target specifies the role of the Analytical_model_port (see 4.2.17) for the Connection_zone_model_port_assignment.

NOTE EXPRESS specification:

```

*)
ENTITY connection_zone_model_port_assignment
  SUBTYPE OF (managed_design_object);
    source : connection_zone;
    target : analytical_model_port;
END_ENTITY; -- connection_zone_model_port_assignment

( *

```

4.2.191 Connectivity_allocation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Connectivity_allocation is a type of Managed_design_object (see 4.2.524). A Connectivity_allocation is the relationship between a functional connectivity requirement and its implementation. The collection of functional terminals in the functional decomposition that are connected is allocated to one equivalent physical node. That equivalent physical node is an implementation in the Connectivity_allocation.

NOTE This part of ISO 10303 supports the capability to specify the paths through the functional decomposition that are reachable via terminals associated with given nodes. This is a statement of transitive closure for connectivity across the decomposition. This part of ISO 10303 does not separately represent a fully resolved functional node.

The data associated with a Connectivity_allocation are the following:

- connectivity_requirement;
- implementation.

4.2.191.1 connectivity_requirement

The connectivity_requirement specifies the role of the Aggregate_connectivity_requirement (see 4.2.7) for the Connectivity_allocation.

NOTE The connectivity_requirement effectively specifies one equivalent functional node.

4.2.191.2 implementation

The implementation specifies the role of the Physical_connectivity_definition (see 4.2.652) for the Connectivity_allocation.

Constraints:

UR1: The implementation shall be unique within a population of Connectivity_allocations.

NOTE EXPRESS specification:

```

*)
ENTITY connectivity_allocation
  SUBTYPE OF (managed_design_object);
    implementation      : physical_connectivity_definition;
    connectivity_requirement : aggregate_connectivity_requirement;

```

4.2.193 Constraint_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Constraint_occurrence is a type of Ee_requirement_occurrence (see 4.2.330) that limits possible solutions to the requirements specification by identifying boundary conditions for any potential solution. A Constraint_occurrence may be one of Ee_product_definition_based_constraint_occurrence (see 4.2.324) or of Rule_based_constraint_occurrence (see 4.2.782) or may be a combination of the two.

NOTE EXPRESS specification:

```
* )
ENTITY constraint_occurrence
  ABSTRACT SUPERTYPE OF
    (ee_product_definition_based_constraint_occurrence
     ANDOR rule_based_constraint_occurrence)
  SUBTYPE OF (ee_requirement_occurrence);
END_ENTITY; -- constraint_occurrence
( *
```

4.2.194 Contact_size_dependent_land

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Contact_size_dependent_land is a type of Land (see 4.2.490) whose shape is dependent on the size of the contact area of the Component_terminal (see 4.2.137) that will be joined to the Contact_size_dependent_land in the assembly.

EXAMPLE 1 Figure 20 is a detail that illustrates the Contact_size_dependent_land in relationship to the terminal that mates with it.

The data associated with a Contact_size_dependent_land are the following:

— usage_definition.

4.2.194.1 usage_definition

The usage_definition specifies the role of the Default_attachment_size_based_land_physical_template (see 4.2.247) for the Contact_size_dependent_land.

Figure 20 – Contact_size_dependent_land

NOTE EXPRESS specification:

```

*)

  default_attachment_size_based_land_physical_template;
END_ENTITY; -- contact_size_dependent_land

```

(*

4.2.195 Contact_size_dependent_non_functional_land

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Contact_size_dependent_non_functional_land` is a type of `Non_functional_land` (see 4.2.562) whose shape is dependent on the size of the contact area of the `Component_terminal` (see 4.2.137) that will be joined to the `Contact_size_dependent_land` (see 4.2.194) in the assembly.

The data associated with a `Contact_size_dependent_non_functional_land` are the following:

— `usage_definition`.

4.2.195.1 `usage_definition`

The `usage_definition` specifies the role of the `Default_attachment_size_based_land_physical_template` (see 4.2.247) for the `Contact_size_dependent_non_functional_land`.

NOTE EXPRESS specification:

```
*)
ENTITY contact_size_dependent_non_functional_land
  SUBTYPE OF (non_functional_land);
  SELF\assembly_component.usage_definition :
  default_attachment_size_based_land_physical_template;
END_ENTITY; -- contact_size_dependent_non_functional_land

```

4.2.196 `Contract`

A `Contract` is a type of `Managed_design_object` (see 4.2.524). A `Contract` is the identification of certain enterprise data related to a formal agreement between two business entities that is useful for managing product data.

NOTE This part of ISO 10303 does not support the exchange of the contents of a contract.

The data associated with a `Contract` are the following:

— `contractor`;

— `contract_approval`;

— `contract_date`;

— `contract_number`.

4.2.196.1 contractor

The contractor specifies either the Person_and_organization (see 4.2.647) or the Organization (see 4.2.569) performing work under the scope of the Contract. The contractor need not be specified for a particular Contract.

4.2.196.2 contract_approval

The contract_approval specifies the role of the Ee_approval (see 4.2.314) for the Contract. The contract_approval is optional and need not be supplied.

4.2.196.3 contract_date

The contract_date specifies either the Date (see 4.2.212) or the Date_and_time (see 4.2.213) for the Contract. The contract_date is optional and need not be supplied.

4.2.196.4 contract_number

The contract_number specifies the role of the Ee_text (see 4.2.339) for the identifier of the Contract.

Constraints:

UR1: The contract_number shall be unique within a population of Contracts.

NOTE EXPRESS specification:

```

*)
ENTITY contract
  SUBTYPE OF (managed_design_object);
    contractor      : OPTIONAL person_organization;

```

4.2.197 Coordinated_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Coordinated_characteristic` is a type of `Managed_design_object` (see 4.2.524) that may include more than one discrete `Characteristic` (see 4.2.98) and that is dependent upon a specified environment for its validity. A `Coordinated_characteristic` may be a `Tolerance_characteristic` (see 4.2.911) or may be a `Range_characteristic` (see 4.2.760). The members of `component_characteristic` shall be coordinated in accordance with the definition associated with the `type_name` in the `reference_document`.

NOTE This part of ISO 10303 predefines several categories of `Tolerance_characteristic`.

The data associated with a `Coordinated_characteristic` are the following:

- `component_characteristic`;
- `dependent_environment`;
- `reference_document`;
- `type_name`.

EXAMPLE 1 An example of `coordinated_characteristic` is Poisson's ratio. This measurement, for some materials, is dependent upon the orientation of the measurement relative to the specimen being measured. Poisson's ratio, as a characteristic, is specified by three values of stress strain ratio along three orthogonal axes where one axis is along a characteristic direction of the material being described.

4.2.197.1 `component_characteristic`

The `component_characteristic` specifies the `Characteristic` (see 4.2.98) for the `Coordinated_characteristic`. There shall be one or more `Characteristic` for a `Coordinated_characteristic`.

4.2.197.2 `dependent_environment`

The `dependent_environment` specifies the text that describes the environment under which the `Coordinated_characteristic` is valid. The `dependent_environment` need not be specified for a particular `Coordinated_characteristic`.

4.2.197.3 `reference_document`

The `reference_document` specifies the `Ee_document` (see 4.2.316) or an identifier of the standard document for the type of `Coordinated_characteristic`.

4.2.197.4 `type_name`

The `type_name` specifies the string, defined in the `reference_document`, for the type of `Coordinated_characteristic`.

NOTE EXPRESS specification:

```

*)

```

4.2.198 Counterbore_passage_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Counterbore_passage_template is a type of Unsupported_passage_template (see 4.2.941). A Counterbore_passage_template is a combination of two round coaxial passages. The first passage is either a through-hole or a blind hole, and the orientation of the second passage (the counterbore) is the same as that of the first passage. The first passage is smaller than the second passage, which has a blind bottom condition that mates with the top of the first passage.

The data associated with a Counterbore_passage_template are the following:

- larger_passage;
- smaller_passage.

4.2.198.1 larger_passage

The larger_passage specifies the Blind_passage_template (see 4.2.70) for the Counterbore_passage_template. The larger_passage specifies the data that is associated with the larger opening of the Counterbore.

4.2.198.2 smaller_passage

The smaller_passage specifies the Unsupported_passage_template (see 4.2.941) for the Counterbore_passage_template. The smaller_passage specifies the data that is associated with the smaller opening of the Counterbore.

NOTE EXPRESS specification:

```

*)
ENTITY counterbore_passage_template
  SUBTYPE OF (unsupported_passage_template);
    smaller_passage : unsupported_passage_template;
    larger_passage  : blind_passage_template;
END_ENTITY; -- counterbore_passage_template

( *

4.2.199 Countersunk_passage_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Countersunk_passage_template is a type of Unsupported_passage_template (see 4.2.941). A Countersunk_passage_template is a combination of two round coaxial passages, one cylindrical and one tapered. The initial diameter of the tapered passage will be larger than the diameter of the cylindrical passage, and will linearly taper to be the same diameter as the cylindrical passage where the two passages meet.

The data associated with a Countersunk_passage_template are the following:

- constant_diameter_passage;
- tapered_passage.

4.2.199.1 constant_diameter_passage

The constant_diameter_passage specifies the Unsupported_passage_template (see 4.2.941) for the Countersunk_passage_template. The constant_diameter_passage specifies the data that is associated with the constant diameter opening of the Countersunk passage.

4.2.199.2 tapered_passage

The tapered_passage specifies the Blind_passage_template (see 4.2.70) for the Countersunk_passage_template. The tapered_passage specifies the data that is associated with the tapered area of the Countersunk passage.

NOTE EXPRESS specification:

```

*)
ENTITY countersunk_passage_template
  SUBTYPE OF (unsupported_passage_template);
    constant_diameter_passage : unsupported_passage_template;
    tapered_passage           : blind_passage_template;
END_ENTITY; -- countersunk_passage_template

--tt tc1 wd9 added

```

4.2.200 Csg_2d_shape

A Csg_2d_shape is a type of Planar_shape (see 4.2.678).

NOTE EXPRESS specification:

```

*)
ENTITY csg_2d_shape
  SUBTYPE OF (planar_shape);
WHERE
  WR1: SIZEOF(QUERY ( c &#60;* SELF\shape_definition.element |
    'AP210_ARM.CURVE' IN TYPEOF(c)
  )) = 0;
END_ENTITY; -- csg_2d_shape

( *

```

4.2.201 Csg_primitive

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Csg_primitive is a type of Managed_design_object (see 4.2.524). A Csg_primitive is either a Right_angular_wedge (see 4.2.775), or a Right_circular_cylinder (see 4.2.776), or a Block (see 4.2.72). A Csg_primitive is used in forming a "CSG" solid model.

NOTE EXPRESS specification:

```

*)
ENTITY csg_primitive
  SUPERTYPE OF (ONEOF (block,right_circular_cylinder,right_angular_wedge))
  SUBTYPE OF (managed_design_object);
END_ENTITY; -- csg_primitive

( *

```

4.2.202 Csg_solid

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Csg_solid is a type of Bound_volume_shape (see 4.2.76). A Csg_solid is a solid represented as a CSG model that is defined by a collection of primitive solids, combined using regularized boolean operations. The allowed operations are intersection, union and difference. Csg_solids may be used in conjunction with other solid models and boolean operations to construct larger solid models.

NOTE EXPRESS specification:

```
*)
ENTITY csg_solid
  SUBTYPE OF (bound_volume_shape);
END_ENTITY; -- csg_solid

--tt tc1 wd9 modified
( *
```

4.2.203 Curve

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Curve is a type of Shape_item (see 4.2.818). A Curve may be a Bounding_curve (see 4.2.80) or a Closed_curve (see 4.2.104), or additionally may be a Composite_curve (see 4.2.155) or additionally may be a Trimmed_line (see 4.2.933). A Curve is the path of a point moving through its three-dimensional coordinate space or of a point moving through its two-dimensional coordinate space. A Curve shall be arc-wise connected. A Curve shall have an arc length greater than zero.

NOTE EXPRESS specification:

```
*)
ENTITY curve
  SUPERTYPE OF ((ONEOF (closed_curve,bounding_curve) ANDOR trimmed_line)
    ANDOR composite_curve)
  SUBTYPE OF (shape_item);
END_ENTITY; -- curve

( *
```

4.2.204 Curve_dimension

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Curve_dimension is a type of Single_boundary_dimension (see 4.2.827) that is measured along the entire path of the characterized Shape_element (see 4.2.810) the form of which is that of a curve.

NOTE 1 The attribute dimension_type is declared in the Dimensional_characteristic entity of which this entity is a subtype.

NOTE 2 The attribute size_of is declared in the Dimensional_size entity of which this entity is a subtype.

Constraints:

WR1: The dimension_type of the Curve_dimension shall not be "angular".

IP1: The form of the Shape_element that is specified as the size_of shall be consistent with the form of a curve.

NOTE EXPRESS specification:

```
*)  
ENTITY curve_dimension  
  SUBTYPE OF (single_boundary_dimension);  
END_ENTITY; -- curve_dimension
```

(*

4.2.205 Curve_style

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Curve_style is a type of Managed_design_object (see 4.2.524). A Curve_style is the definition of a set of properties that are of a geometric nature. Curve_style provides parametric data used by a processor to create physical material along a path, where the path is described outside of the style. The Curve_style algorithm is rule based and is formally described in the domain rules. The width_uncertainty represents the uncertainty in the originating CAD system, not a material processing tolerance.

The data associated with a Curve_style are the following:

- corner_style;
- curve_font;
- curve_width;
- end_extension;
- end_style;
- name.

Figure 21 – Square corners with extend

4.2.205.1 corner_style

The corner_style specifies either the "extend" or "chord 2 extend" or "round" or "truncate" style for the Curve_style. Figures 21 and 23 illustrate the construction options associated with "extend", "chord 2 extend" and "truncate" corners. These illustrations shall be interpreted as describing construction of the outer boundary near the intersection only. At some distance away from the intersection, the basic width attribute governs the shape. Figure 24 illustrates the construction associated with round corners. Figure 25 illustrates the construction of the end treatment of the curve. The end treatment is applied individually to each end. Figure 26 illustrates the completed result for a Curve (see 4.2.203) that has been styled using this Curve_style. Even though the Curve does not show material inside, that is required if the Curve is applied to material.

Figure 22 – Corners with positive extend

Figure 23 – Square corners with truncate

Figure 24 – Round corners

Figure 25 – Curve end treatment

Curve_style.corner_style = round
 Curve_style.end_style = round
 Curve_style.end_extension = extend

Figure 26 – Completed curve

4.2.205.2 curve_font

The curve_font specifies either the Curve_style_font_and_scaling (see 4.2.207), or one of Curve_style_font (see 4.2.206), Externally_defined_curve_font (see 4.2.362), or Solid_curve (see 4.2.831) for the Curve_style. The curve_font need not be specified.

4.2.205.3 curve_width

The curve_width specifies the role of the Length_data_element (see 4.2.511) for the Curve_style.

4.2.205.4 end_extension

The end_extension specifies how the physical material will terminate on the Layer_connection_point (see 4.2.499) that is the start or end of the centreline curve. The end_extension is applied by a continuation (termination) of the Curve (see 4.2.203) that is being styled along the tangent to the Curve at the terminus of the Curve. If the end_extension is "extend", there will be material added after the Layer_connection_point. If the end_extension is "truncate", there will be no material added after the Layer_connection_point.

NOTE This Application Object does not describe tolerances associated with fabrication processes. Reference Stratum_technology (see 4.2.871) as an example of tolerance information related to fabrication processes.

4.2.205.5 end_style

The end_style specifies either the "round" or "square" style ends for the Curve_style. Figures 21 and 23 illustrate the construction options associated with square corners. These illustrations shall be interpreted as describing construction of the outer boundary near the end only. At some distance away from the end, the basic width attribute governs the shape. Figure 25 illustrates the construction of the end treatment of the curve. The end treatment is applied individually to each end. Figure 26 illustrates the completed result for a Curve (see 4.2.203) that has been styled using this Curve_style. Even though the Curve does not show material inside, that is required if the Curve is applied to material.

4.2.205.6 name

The name specifies the string for the identifier for the Curve_style.

Constraints:

UR1: The name shall be unique within a population of Curve_style.

WR1: When the end_extension is "truncate", the Layer_connection_point for the end of interest shall be the terminus of the curve.

WR2: When the end_style is "square", the centreline of the square shall be congruent with the tangent of the centreline curve at the Layer_connection_point for the end of interest.

WR3: When the end_style is "round" and the end_extension is "extend", the Layer_connection_point for the end of interest shall be the center of a circle with radius equal to 0.5 times width.

WR4: When the end_style is "square" and the end_extension is "extend", the Layer_connection_point for the end of interest shall be the center of a square with side equal to the width.

WR5: When the corner_style is "extend", the final shape shall be the result of a union operation and a fill operation. The union operation shall be between the styled curve segments approaching the Cartesian_point of interest in the neighbourhood of the Cartesian_point. The fill operation shall maximize the material enclosed while maintaining the following conditions: The fill boundary shall be two lines that are extensions of the right hand boundary of the filled material as it traverses the corner, in the direction of the centreline curve.

WR6: When the corner_style is "chord 2 extend", the final shape shall be the result of an intersection and fill operation between the styled curve segments approaching the Cartesian_point of interest in the neighbourhood of the Cartesian_point, where there is a 2 chord approximation to a circular arc applied, which has radius equal to 0.5 times width. The final shape shall be the result of a fill operation after the union operation is performed between the styled curve segments approaching the Cartesian_point of interest in the neighbourhood of the Cartesian_point. The circular arc shall be constructed as required by the "round" corner_style rule.

WR7: When the `corner_style` is "truncate", the final shape shall be the result of an union operation followed by a fill operation. The union operation shall be between the styled curve segments approaching the `Cartesian_point` of interest in the neighbourhood of the `Cartesian_point`, where there is a bevel end applied. The final shape shall be the result of a fill operation after the union operation is performed between the styled curve segments approaching the `Cartesian_point` of interest in the neighbourhood of the `Cartesian_point`. The fill operation shall maximize the material enclosed while maintaining the following conditions: The fill boundary line shall be perpendicular to the angle bisector formed between the two Curve segments at the `Cartesian_point` of interest; the fill boundary line shall intersect the previously described result of the union operation in exactly two places; the fill boundary line shall not contain the `Cartesian_point` of interest.

WR8: When the `corner_style` is "round", the final shape shall be the result of a union operation between the styled curve segments approaching the `Cartesian_point` of interest in the neighbourhood of the `Cartesian_point`, followed by a fill operation with a circular arc of radius 0.5 times width applied. The circular arc shall be centred on the `Cartesian_point`.

WR9: When the Curve to which the `Curve_style` is applied is closed, `end_treatment` shall be ignored.

NOTE EXPRESS specification:

4.2.206 Curve_style_font

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Curve_style_font` is a type of `Managed_design_object` (see 4.2.524). A `Curve_style_font` is the computer interpretable font used to present the Curve (see 4.2.203).

NOTE EXPRESS specification:

```

*)
ENTITY curve_style_font
  SUBTYPE OF (managed_design_object);
END_ENTITY; -- curve_style_font

( *

```

4.2.207 Curve_style_font_and_scaling

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Curve_style_font_and_scaling is a type of Managed_design_object (see 4.2.524). A Curve_style_font_and_scaling is the combination of the computer interpretable font and the scale factor for that font used to present the Curve (see 4.2.203).

The data associated with a Curve_style_font_and_scaling are the following:

- curve_font;
- curve_font_scaling;
- name.

4.2.207.1 curve_font

The curve_font specifies either a Curve_style_font (see 4.2.206), Curve_style_font, an Externally_defined_curve_font (see 4.2.362), Externally_defined_curve_font, or a Solid_curve (see 4.2.831), Solid_curve for the Curve_style_font_and_scaling.

4.2.207.2 curve_font_scaling

The curve_font_scaling specifies the Positive_ratio_measure (see ??) used for the Curve_style_font_and_scaling.

4.2.207.3 name

The name specifies the string used for the identifier for the combination of Curve_style_font_and_scaling.

Constraints:

UR1: The name shall be unique within a population of Curve_style_font_and_scaling.

NOTE EXPRESS specification:

```

*)
ENTITY curve_style_font_and_scaling
  SUBTYPE OF (managed_design_object);

```

4.2.208 Cutout

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Cutout is a type of Inter_stratum_feature (see 4.2.432). A Cutout may be a Physical_connectivity_-interrupting_cutout (see 4.2.655). A Cutout is a closed, internal shape in a substrate. A Cutout may not extend completely through the substrate. Complex Cutouts may be created by using the facilities in Assembly_group_component (see 4.2.40).

EXAMPLE 1 Figure 27 illustrates the information required to fabricate the interconnect substrate and also assemble a component onto the interconnect. The Cutout illustrated has a form that is dependent on the component installed in it. Each end of the internal conductor path shown in the figure that mates with a component terminal should be modeled as an Interconnect_module_component_terminal (see 4.2.445). During design of the interconnect substrate, these features would be considered as interface features whose location is controlled by the mating requirement. In this example the mating requirement is simplified because the component is not a connector.

EXAMPLE 2 Figure 28 illustrates a detail that shows information required to fabricate the interconnect substrate. The Cutout illustrated includes a blind passage at the base. The blind passage would be defined by a Blind_passage_template (see 4.2.70).

Constraints:

WR1: A Cutout shall not form part of the edge of the Interconnect_module.

Figure 27 – Cutout plan view showing installed component

Figure 28 – Cutout cross-section view showing installed component

NOTE EXPRESS specification:

```

*)
ENTITY cutout
  SUPERTYPE OF (ONEOF(
    physical_connectivity_interrupting_cutout,

```

4.2.209 Cutout_edge_segment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Cutout_edge_segment is a type of Inter_stratum_feature (see 4.2.432) that defines an edge segment of a Cutout (see 4.2.208). When the Cutout_edge_segment participates in a Cutout that is fully described by a collection of Cutout_edge_segment, the end_vertex of the final segment shall be the start_vertex of the first segment. Adjacent Cutout_edge_segment reference the same member of Edge_segment_vertex (see 4.2.312) but in different roles to ensure continuity.

EXAMPLE 1 Figure 29 illustrates a Cutout_edge_segment.

The data associated with a Cutout_edge_segment are the following:

- composed_cutout;
- end_vertex;
- start_vertex.

NOTE Some Cutouts have edges that differ in cross-section shape. This object is to describe one segment of the edge of one member of that type.

4.2.209.1 composed_cutout

The composed_cutout specifies the Cutout (see 4.2.208) that contains the Cutout_edge_segment.

4.2.209.2 end_vertex

The end_vertex specifies one role of an Edge_segment_vertex for the Cutout_edge_segment.

4.2.209.3 start_vertex

The start_vertex specifies one role of an Edge_segment_vertex for the Cutout_edge_segment.

As with the board edge, a passage edge may have an edge section to identify an area of the passage edge that may require special treatment.

Figure 29 – Cutout_edge_segment

Constraints:

WR1: The Cutout_edge_segment shall help to compose only inner features of the Interconnect_module

WR2: The start_vertex shall not be the end_vertex.

NOTE EXPRESS specification:

```

*)
ENTITY cutout_edge_segment
  SUPERTYPE OF (plated_cutout_edge_segment)
  SUBTYPE OF (inter_stratum_feature);
    composed_cutout                : cutout;
    start_vertex                    : edge_segment_vertex;
    end_vertex                      : edge_segment_vertex;
    SELF\inter_stratum_feature.usage_definition :
inter_stratum_feature_edge_segment_template;
WHERE
  WR1: start_vertex :&#60;&#62;: end_vertex;
END_ENTITY; -- cutout_edge_segment

( *
```

4.2.210 Cylindricity_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Cylindricity_tolerance is a type of Geometric_tolerance_without_referenced_datum_system (see 4.2.423) that specifies or partially specifies the design requirement on the cylindricity of the Physical_feature_-or_part_template (see 4.2.658) to which the Cylindricity_tolerance is applied.

NOTE Cylindricity tolerance is defined in terms of a tolerance zone definition in 14.4 of ISO 1101.

Constraints:

WR1: The Shape_element specified by the toleranced_shape_element shall be a Physical_feature_or_part_template.

NOTE The attribute toleranced_shape_element is declared in the Geometric_tolerance entity of which this entity is a subtype.

WR2: The Cylindricity_tolerance shall not be a Geometric_tolerance_with_applied_material_condition_property.

WR3: The Cylindricity_tolerance shall specify a Tolerance_zone_definition as its tolerance_zone_or_boundary_definition; and that Tolerance_zone_definition shall specify a Tolerance_zone_boundary_definition_with_specified_size as its boundary_definition; and that Tolerance_zone_boundary_definition_with_specified_size shall specify an Opposing_boundary_set_size_characteristic as its specified_boundary_size.

IP1: The form of the toleranced Physical_feature_or_part_template shall be consistent with the form of a feature for which the application of a cylindricity tolerance is sensible.

NOTE EXPRESS specification:

```
*)
ENTITY cylindricity_tolerance
  SUBTYPE OF (geometric_tolerance_without_referenced_datum_system);
END_ENTITY; -- cylindricity_tolerance

--tt tc1 wd12 modified
--tt tc1 wd9 modified
(*

4.2.211 Data_element

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Data_element is a type of Managed_design_object (see 4.2.524). A Data_element may be an Angle_data_element (see 4.2.23) or a Length_data_element (see 4.2.511). A Data_element is a quantitative value that includes the measurement units associated with the value. This part of ISO 10303 predefines base units from which user defined units may be mapped. ISO 10303-41 defines the mechanism for mapping between user defined units and predefined units.

The data associated with a Data_element are the following:

- measure_value;
- unit_of_measure.

4.2.211.1 measure_value

The measure_value specifies the REAL type for the Data_element. The interpretation of the measure_value shall be in accordance with the unit_of_measure.

4.2.211.2 unit_of_measure

The unit_of_measure specifies the descriptive label for the unit of measure for the associated measure_value of the Data_element. The units may be SI, derived from SI, or context dependent, and may have prefixes included whose syntax is defined in ISO 10303-41 and whose semantic is defined in ISO 31.

NOTE This note will need to turn into normative text when the xx_prefix attribute is added!!!!!!!!!!!!!!!!!!!! allowed values for prefix: (exa, peta, tera, giga, mega, kilo, hecto, deca, deci, centi, milli, micro, nano, pico, femto, atto);

4.2.212 Date

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Date is a type of Managed_design_object (see 4.2.524). A Date may be a Date_and_time (see 4.2.213). The Date is the day of the calendar.

The data associated with a Date are the following:

- day;
- month;
- year.

4.2.212.1 day

The day specifies the integer for the day of the month for the Date.

4.2.212.2 month

The month specifies the integer for the month representation for the Date.

NOTE These integers range between 1 and 12, inclusively.

4.2.212.3 year

The year specifies the integer for the year of the Date.

Constraints:

WR1: The year shall be a four digit positive integer.

NOTE EXPRESS specification:

```

*)
ENTITY date
  SUPERTYPE OF (date_and_time)

4.2.213 Date_and_time

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Date_and_time` is a type of `Date` (see 4.2.212) that includes the clock time together with the calendar Date. Resolution to the second is provided by this object.

The data associated with a `Date_and_time` are the following:

- `hour`;
- `minute`;
- `second`;
- `time_zone`.

4.2.213.1 `hour`

The `hour` specifies the integer for the period of clock time consisting of sixty minutes, for the `Date_and_time`.

4.2.213.2 `minute`

The `minute` specifies the integer for the period of clock time consisting of sixty seconds, for the `Date_and_time`.

4.2.213.3 `second`

The `second` specifies the integer for the second portion of the clock time for the `Date_and_time`.

4.2.213.4 `time_zone`

The `time_zone` specifies the integer number of hours that the local time is offset from coordinated universal time, and the direction of the offset, for the `Date_and_time`.

NOTE EXPRESS specification:

```
*)
ENTITY date_and_time
  SUBTYPE OF (date);

```

4.2.214 Datum

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum is a type of `Non_feature_shape_element` (see 4.2.560) that is a theoretically exact geometric reference such as a point, an axis, or a plane, to which tolerated `Shape_element` (see 4.2.810) are related. Each Datum is either a `Datum_point` (see 4.2.233) or a `Datum_axis` (see 4.2.215) or a `Datum_plane` (see 4.2.232). Additionally each Datum may be either a `Single_datum` (see 4.2.828) or a `Common_datum` (see 4.2.105).

EXAMPLE 1 Figure 30 illustrates the usage of a Datum.

NOTE Datums are described in clause 8 of ISO 1101.

The data associated with a Datum are the following:

— `datum_feature_usages`.

Figure 30 – Datum

4.2.214.1 datum_feature_usages

The `datum_feature_usages` is an inverse relationship that specifies that the Datum may be referenced by `Datum_feature_usage_in_datum_relationship` (see 4.2.229) that specifies the Datum as its relating_shape_element. The `datum_feature_usages` need not be specified for a particular Datum.

Constraints:

WR1: A Datum shall be a `Datum_axis`, `Datum_plane`, or `Datum_point`.

NOTE EXPRESS specification:

```

*)
ENTITY datum
  ABSTRACT SUPERTYPE OF (ONEOF (datum_point, datum_axis, datum_plane)
    ANDOR ONEOF (single_datum, common_datum))
  SUBTYPE OF (non_feature_shape_element);
  INVERSE
    datum_feature_usages : SET [0:?] OF
      datum_feature_usage_in_datum_relationship FOR
      relating_shape_element;
END_ENTITY; -- datum

```

(*

4.2.215 Datum_axis

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_axis is a type of Datum (see 4.2.214) that is a theoretically exact axis to which tolerated Shape_element (see 4.2.810) are related.

Constraints:

WR1: If the Datum_axis is not specified as a reference_axes by a Datum_reference_frame then the Datum_axis shall be either a Common_datum, or a Single_datum.

NOTE EXPRESS specification:

```

*)
ENTITY datum_axis
  SUBTYPE OF (datum);
END_ENTITY; -- datum_axis

```

(*

4.2.216 Datum_axis_and_tolerance_zone_orienting_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_axis_and_tolerance_zone_orienting_relationship is a type of Managed_design_object (see 4.2.524).
 A Datum_axis_and_tolerance_zone_orienting_relationship is a relationship that associates a Tolerance_zone (see 4.2.913) with the Datum_axis (see 4.2.215) by which it is oriented.

The data associated with a Datum_axis_and_tolerance_zone_orienting_relationship are the following:

- oriented_tolerance_zone;
- orienting_datum_axis;
- zone_orientation.

4.2.216.1 oriented_tolerance_zone

The oriented_tolerance_zone specifies the Tolerance_zone (see 4.2.913) that is oriented with respect to the Datum_axis (see 4.2.215) specified as the orienting_datum_axis.

4.2.216.2 orienting_datum_axis

The orienting_datum_axis specifies the Datum_axis (see 4.2.215) by which the Tolerance_zone (see 4.2.913) that is specified as the oriented_tolerance_zone is oriented.

4.2.216.3 zone_orientation

The zone_orientation is an inverse relationship that specifies that the existence of the Datum_axis_and_tolerance_zone_orienting_relationship is dependent on the existence of the Datum_axis_related_orientation (see 4.2.217) that specifies the Datum_axis_and_tolerance_zone_orienting_relationship as its orienting_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY datum_axis_and_tolerance_zone_orienting_relationship
  SUBTYPE OF (managed_design_object);
    oriented_tolerance_zone : tolerance_zone;
    orienting_datum_axis    : datum_axis;
  INVERSE
    zone_orientation : datum_axis_related_orientation FOR
                      orienting_relationship;
END_ENTITY; -- datum_axis_and_tolerance_zone_orienting_relationship

( *
```

4.2.217 Datum_axis_related_orientation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_axis_related_orientation is a type of Managed_design_object (see 4.2.524). A Datum_axis_related_orientation is a definition that characterizes the orientation of a Tolerance_zone (see 4.2.913) in relation to a Datum_axis (see 4.2.215).

The data associated with a Datum_axis_related_orientation are the following:

- orientation_type;
- orienting_relationship.

4.2.217.1 orientation_type

The orientation_type specifies a label that indicates the manner in which the specified Tolerance_zone (see 4.2.913) is oriented with respect to the specified Datum_axis (see 4.2.215). The orientation_type shall either be "centred_on_arc", or "centred_on_radial".

EXAMPLE 1 In the polar coordinate method of bidirectional positional tolerancing the bidirectional tolerance zone consists of two tolerance zones. One that is bounded by a pair of parallel planes that is centred along a radial from the datum axis and another that is bounded by a pair of concentric cylindrical arc boundaries that are centred along a cylindrical arc the origin of which is the datum axis. An orientation_type of "centred_on_radial" corresponds to the first tolerance zone and "centred_on_arc" corresponds to the second tolerance zone.

NOTE The polar method of bidirectional positional tolerancing is discussed in 5.9.2 of ASME Y14.5M.

4.2.217.2 orienting_relationship

The orienting_relationship specifies the Datum_axis_and_tolerance_zone_orienting_relationship (see 4.2.216) that associates the Tolerance_zone (see 4.2.913) with the Datum_axis (see 4.2.215) with which it is oriented. The specified Datum_axis_and_tolerance_zone_orienting_relationship is characterized by the Datum_axis_related_orientation.

Constraints:

WR1: The Datum_axis_related_orientation shall be specified as the zone_orientation by exactly one Tolerance_zone_definition_with_specified_orientation.

NOTE EXPRESS specification:

```
*)
ENTITY datum_axis_related_orientation
  SUBTYPE OF (managed_design_object);
    orienting_relationship : datum_axis_and_tolerance_zone_orienting_relationship;
    orientation_type       : centre_type;
END_ENTITY; -- datum_axis_related_orientation

( *
```

4.2.218 Datum_based_direction_vector

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_based_direction_vector is a type of Managed_design_object (see 4.2.524). A Datum_based_direction_vector is a characterization of a direction away from and normal to a Datum_plane (see 4.2.232).

The data associated with a Datum_based_direction_vector are the following:

- direction_vector_representation;
- positive_direction_vector;
- vector_of.

4.2.218.1 direction_vector_representation

The direction_vector_representation specifies an Axis_placement (see 4.2.56) that is a representation for the Datum_based_direction_vector.

4.2.218.2 positive_direction_vector

The positive_direction_vector specifies a boolean value that indicates whether the Datum_based_direction_vector is in a positive or negative sense. A value of TRUE indicates that the Datum_based_direction_vector is in the positive sense. A value of FALSE indicates that the Datum_based_direction_vector is in the negative sense.

4.2.218.3 vector_of

The vector_of specifies the Datum_plane (see 4.2.232) from which the Datum_based_direction_vector is based.

Constraints:

WR1: The Datum_based_direction_vector shall be specified as the direction by at least one Direction_element.

NOTE EXPRESS specification:

```

*)
ENTITY datum_based_direction_vector
  SUBTYPE OF (managed_design_object);
    direction_vector_representation : axis_placement;
    vector_of                       : datum_plane;
    positive_direction_vector       : BOOLEAN;
END_ENTITY; -- datum_based_direction_vector

( *

```

4.2.219 Datum_based_length_measure

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_based_length_measure is a type of Managed_design_object (see 4.2.524). A Datum_based_length_measure is a dimensional measure of length that is taken from a defined Datum (see 4.2.214).

EXAMPLE 1 Figure 31 illustrates the usage of a Datum_based_length_measure.

The data associated with a Datum_based_length_measure are the following:

- measure;
- measure_orientation;
- of_datum.

4.2.219.1 measure

The measure specifies the role of the Length_data_element (see 4.2.511) for the Datum_based_length_measure.

4.2.219.2 measure_orientation

The measure_orientation specifies the role of the Direction (see 4.2.304) for the Datum_based_length_measure or specifies the role of the string 'normal' or specifies the role of the string 'reversed'. 'Normal' shall be interpreted as a description equivalent to the three dimensional concept of a vector parallel to the normal of the plane that is the datum upon which the Datum_based_length_measure is based. 'Reversed' shall be interpreted as a description equivalent to the three dimensional concept of a vector anti-parallel to the normal of the plane that is the datum upon which the Datum_based_length_measure is based. For the case that the Datum is a Datum_plane, the Direction vector shall be in the XZ plane of the Datum_plane, where the Z axis is the normal vector of the Datum_plane. The measure_orientation is measured from the X axis in the XZ plane. For the two-dimensional case, the Datum_plane if used, is considered to be congruent with the XY coordinate system.

Figure 31 – Datum_based_length_measure

NOTE The use of descriptive items allows the information to be conveyed when the geometric context is 2d, since orientation only supports a description within a 3d geometric context.

4.2.219.3 of_datum

The of_datum specifies the role of the Datum_plane (see 4.2.232) for the Datum_based_length_measure. A Datum_plane is required in order to support equivalent description between the 2d and 3d shape representation cases.

NOTE EXPRESS specification:

```

*)
ENTITY datum_based_length_measure
  SUBTYPE OF (managed_design_object);
    measure          : length_data_element;
    measure_orientation : descriptive_or_geometric_orientation;
    of_datum         : datum_plane;
END_ENTITY; -- datum_based_length_measure

( *
```

4.2.220 Datum_based_vector_orientation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_based_vector_orientation is a type of Managed_design_object (see 4.2.524). A Datum_based_vector_orientation is a definition of the orientation of a shape element that has the form of a vector and is based on the intersection of two shape elements that have the form of half-planes. Where a half-plane has the form of a plane except it is bounded on one side by a straight line. Each half-plane shape element is oriented with respect to three Datum_plane (see 4.2.232) and is defined by a Direction_element (see 4.2.305).

The data associated with a Datum_based_vector_orientation are the following:

— direction_components.

4.2.220.1 direction_components

The direction_components specifies the Direction_element (see 4.2.305) that defines the half-plane shape elements the intersection of which forms the vector that is defined by the Datum_based_vector_orientation. There shall be exactly two Direction_element for the Datum_based_vector_orientation.

Constraints:

WR1: The Datum_based_vector_orientation shall be specified as the zone_orientation by at least one Tolerance_zone_definition_with_specified_orientation, or as the measurement_direction by at least one Dimension_location_with_direction_vector, or as the measurement_orientation by at least one Angular_dimension_with_direction_vector.

WR2: The Datum_planes specified as the base_datum_plane by the two Direction_element specified as direction_components shall be different.

WR3: The Datum_planes specified as the base_datum_plane by the two Direction_element specified as direction_components shall be Datum_planes of the same Datum_reference_frame.

NOTE EXPRESS specification:

```
*)
ENTITY datum_based_vector_orientation
  SUBTYPE OF (managed_design_object);
  direction_components : SET [2:2] OF direction_element;
END_ENTITY; -- datum_based_vector_orientation
```

(*

4.2.221 Datum_difference

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_difference is a type of Composite_unit_shape_element (see 4.2.167). A Datum_difference is the basis for mapping from a geometric context model into a lexical context model for definitional purposes. A Datum_difference identifies the length or angular difference between two Datum. The difference may be referenced independently of the originating geometric model representation.

NOTE 1 One Datum may be located at the origin if a simple location is intended.

NOTE 2 The origin reference for a simple angular difference should be the X axis for two-dimensional case, and the XY axis for three-dimensional case.

The data associated with a Datum_difference are the following:

- precedent_datum;
- subsequent_datum.

4.2.221.1 precedent_datum

A precedent_datum specifies one role of a Datum (see 4.2.214) for a Datum_difference. The precedent_datum is the reference datum.

4.2.221.2 subsequent_datum

A subsequent_datum specifies one role of a Datum (see 4.2.214) for a Datum_difference. The subsequent_datum is the measureand.

NOTE EXPRESS specification:

```

*)
ENTITY datum_difference
  SUBTYPE OF (shape_element_relationship);
  SELF\shape_element_relationship.name : label;
DERIVE
  precedent_datum :
datum := SELF\shape_element_relationship.relatng_shape_element;
  subsequent_datum :
datum := SELF\shape_element_relationship.related_shape_element;
END_ENTITY; -- datum_difference

( *
```

4.2.222 Datum_difference_analytical_model_port_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_difference_analytical_model_port_assignment is a type of Managed_design_object (see 4.2.524). A Datum_difference_analytical_model_port_assignment is provided to map from the geometric context into a specific Analytical_model through its ports. The use of Datum_difference (see 4.2.221) isolates the model ports from a specific geometric representation.

The data associated with a Datum_difference_analytical_model_port_assignment are the following:

- assigned_analytical_model_port;
- of_datum_difference.

4.2.222.1 assigned_analytical_model_port

An assigned_analytical_model_port specifies the role of the Analytical_model_port (see 4.2.17) for the Datum_difference_analytical_model_port_assignment.

4.2.222.2 of_datum_difference

An of_datum_difference specifies the role of the Datum_difference (see 4.2.221) for the Datum_difference_analytical_model_port_assignment.

NOTE EXPRESS specification:

```

*)
ENTITY datum_difference_analytical_model_port_assignment
  SUBTYPE OF (managed_design_object);
    assigned_analytical_model_port : analytical_model_port;
    of_datum_difference             : datum_difference;

END_ENTITY; -- datum_difference_analytical_model_port_assignment

( *
```

4.2.223 Datum_difference_based_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_difference_based_characteristic is a type of Characteristic (see 4.2.98). A Datum_difference_based_characteristic is provided to allow characterization based on a geometric model. This is typically used where there is a reference geometric model available.

The data associated with a Datum_difference_based_characteristic are the following:

- of_datum_difference.

4.2.223.1 of_datum_difference

An of_datum_difference specifies the role of the Datum_difference (see 4.2.221) for the Datum_difference_based_characteristic.

NOTE EXPRESS specification:

```
*)
ENTITY datum_difference_based_characteristic
  SUBTYPE OF (characteristic);
    of_datum_difference : datum_difference;
END_ENTITY; -- datum_difference_based_characteristic

( *
```

4.2.224 Datum_difference_based_model_parameter

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_difference_based_model_parameter is a type of Model_parameter (see 4.2.549). In effect, the Datum_difference provides a geometric basis for the definition of the Model_parameter.

The data associated with a Datum_difference_based_model_parameter are the following:

— of_datum_difference.

4.2.224.1 of_datum_difference

An of_datum_difference specifies the role of the Datum_difference (see 4.2.221) for the Datum_difference_based_model_parameter.

NOTE EXPRESS specification:

```
*)
ENTITY datum_difference_based_model_parameter
  SUBTYPE OF (model_parameter);
    of_datum_difference : datum_difference;
END_ENTITY; -- datum_difference_based_model_parameter

( *
```

4.2.225 Datum_difference_functional_unit_usage_view_terminal_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_difference_functional_unit_usage_view_terminal_assignment is a type of Managed_design_object (see 4.2.524). A Datum_difference_functional_unit_usage_view_terminal_assignment provides the ability to map from a geometric context into the functional context of a Functional_unit_definition (see 4.2.401).

The data associated with a Datum_difference_functional_unit_usage_view_terminal_assignment are the following:

- assigned_functional_terminal_definition;
- assigned_datum_difference.

4.2.225.1 assigned_functional_terminal_definition

An assigned_functional_terminal_definition specifies the role of the Functional_unit_usage_view_terminal_definition (see 4.2.411) for the Datum_difference_functional_unit_usage_view_terminal_assignment.

4.2.225.2 assigned_datum_difference

An assigned_datum_difference specifies the role of the Datum_difference (see 4.2.221) for the Datum_difference_functional_unit_usage_view_terminal_assignment.

NOTE EXPRESS specification:

```

*)
ENTITY datum_difference_functional_unit_usage_view_terminal_assignment
  SUBTYPE OF (managed_design_object);
    assigned_functional_terminal_definition :
functional_unit_usage_view_terminal_definition;

END_ENTITY; -- datum_difference_functional_unit_usage_view_terminal_assignment

( *
```

4.2.226 Datum_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_feature is a type of Physical_feature_or_part_template (see 4.2.658) that is used to establish one or more Datum (see 4.2.214). A Datum_feature may be a Datum_target_set (see 4.2.241). A Datum_feature may be used to establish one Single_datum (see 4.2.828), and one or more Common_datum (see 4.2.105).

NOTE The definition of datum feature is given in 3.3 of ISO 5459.

The data associated with a Datum_feature are the following:

- datum_feature_usages;
- identification.

4.2.226.1 datum_feature_usages

The datum_feature_usages is an inverse relationship that specifies that the existence of the Datum_feature is dependent on the existence of the Datum_feature_usage_in_datum_relationship (see 4.2.229) that specifies the Datum_feature as its related_shape_element. There shall be one or more Datum_feature_usage_in_datum_relationship for a Datum_feature.

4.2.226.2 identification

The identification specifies the label by which the Datum_feature is referred.

NOTE Datum (see 4.2.214) letter identifiers are examples of identifiers of Datum features. The Datum letter identifier is described in 6.1.2 of ISO 5459.

Constraints:

WR1: A Datum_feature shall be used to establish at most one Single_datum.

NOTE EXPRESS specification:

```

*)
ENTITY datum_feature
  SUPERTYPE OF (datum_target_set)
  SUBTYPE OF (physical_feature_or_part_template);

```

4.2.227 Datum_feature_material_condition_property

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Datum_feature_material_condition_property` is a type of `Managed_design_object` (see 4.2.524). A `Datum_feature_material_condition_property` is a specification of a material condition property that defines the manner in which `Geometric_tolerance_with_referenced_datum_system` (see 4.2.422) requirements are dependent on the produced size of a `Datum_feature` (see 4.2.226) of the `Datum_system` (see 4.2.236).

The data associated with a `Datum_feature_material_condition_property` are the following:

- `applied_to`;
- `datum_system_conditions_definition`;
- `name`.

4.2.227.1 `applied_to`

The `applied_to` specifies the `Datum_feature_usage_in_datum_system_relationship` (see 4.2.230) that identifies the usage of a `Datum_feature` (see 4.2.226) in a `Datum_system` (see 4.2.236) and to which the material condition property is applied.

4.2.227.2 `datum_system_conditions_definition`

The `datum_system_conditions_definition` is an inverse relationship that specifies that the existence of the `Datum_feature_material_condition_property` depends on the existence of the `Datum_system_defining_conditions_with_material_conditions` (see 4.2.238) that specifies the `Datum_feature_material_condition_property` as its `applied_material_condition_properties`.

4.2.227.3 `name`

The `name` specifies the type of the applied material condition property, either "`least_material_requirement`" or "`maximum_material_principle`" for the `Datum_feature_material_condition_property`.

NOTE 1 The application of the maximum material principle to a Datum (see 4.2.214) feature is described in 4.3 ISO 2692.

NOTE 2 The application of the least material requirement to a Datum feature is described in clause 3 of ISO 2692-Amendment 1.

NOTE EXPRESS specification:

```

*)
ENTITY datum_feature_material_condition_property

4.2.228 Datum_feature_usage_in_common_datum_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_feature_usage_in_common_datum_relationship is a type of Datum_feature_usage_in_datum_relationship (see 4.2.229) that associates a Datum_feature (see 4.2.226) with a Common_datum (see 4.2.105) that the Datum_feature participates in establishing.

The data associated with a Datum_feature_usage_in_common_datum_relationship are the following:

— relating_shape_element.

4.2.228.1 relating_shape_element

The relating_shape_element specifies the Common_datum (see 4.2.105) that the Datum_feature (see 4.2.226) specified as the related_shape_element participates in establishing for the Datum_feature_usage_in_common_datum_relationship.

NOTE The attribute related_shape_element is declared in the Datum_feature_usage_in_datum_relationship (see 4.2.229) entity of which this entity is a subtype.

NOTE EXPRESS specification:

```

*)
ENTITY datum_feature_usage_in_common_datum_relationship
  SUBTYPE OF (datum_feature_usage_in_datum_relationship);
    SELF\shape_element_relationship.relatating_shape_element : common_datum;

```

(*

4.2.229 Datum_feature_usage_in_datum_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_feature_usage_in_datum_relationship is a type of Shape_element_relationship (see 4.2.816) that associates a Datum_feature (see 4.2.226) with a Datum (see 4.2.214) that the Datum_feature participates in establishing. A Datum_feature_usage_in_datum_relationship is either a Datum_feature_usage_in_common_datum_relationship (see 4.2.228) or a Datum_feature_usage_in_single_datum_relationship (see 4.2.231).

The data associated with a Datum_feature_usage_in_datum_relationship are the following:

- related_shape_element;
- relating_shape_element.

4.2.229.1 related_shape_element

The related_shape_element specifies the Datum_feature (see 4.2.226) that is used to establish the Datum (see 4.2.214) specified as the relating_shape_element for the Datum_feature_usage_in_datum_relationship.

4.2.229.2 relating_shape_element

The relating_shape_element specifies the Datum (see 4.2.214) that the specified Datum_feature (see 4.2.226) participates in establishing for the Datum_feature_usage_in_datum_relationship.

Constraints:

UR1: The combination of relating_shape_element and related_shape_element shall be unique within a population of Datum_feature_usage_in_datum_relationship. That is, a specific Datum_feature shall not be used more than once to establish a specific Datum.

NOTE EXPRESS specification:

```

*)
ENTITY datum_feature_usage_in_datum_relationship
  ABSTRACT SUPERTYPE OF (ONEOF (
    datum_feature_usage_in_single_datum_relationship,
    datum_feature_usage_in_common_datum_relationship))

4.2.230 Datum_feature_usage_in_datum_system_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_feature_usage_in_datum_system_relationship is a type of Managed_design_object (see 4.2.524). A Datum_feature_usage_in_datum_system_relationship is a relationship that associates a Datum_feature (see 4.2.226) with a Datum_system (see 4.2.236) that the Datum_feature participates in establishing.

The data associated with a Datum_feature_usage_in_datum_system_relationship are the following:

- applied_material_condition_property;
- established_datum_system;
- used_datum_feature.

4.2.230.1 applied_material_condition_property

The applied_material_condition_property is an inverse relationship that specifies that the existence of the Datum_feature_usage_in_datum_system_relationship depends on the existence of the Datum_feature_material_condition_property (see 4.2.227) that specifies the Datum_feature_usage_in_datum_system_relationship as its applied_to.

4.2.230.2 established_datum_system

The established_datum_system specifies the Datum_system (see 4.2.236) in which the specified Datum_feature (see 4.2.226) participates in establishing for the Datum_feature_usage_in_datum_system_relationship.

4.2.230.3 used_datum_feature

The used_datum_feature specifies the Datum_feature (see 4.2.226) that is used to establish the specified Datum_system (see 4.2.236) for the Datum_feature_usage_in_datum_system_relationship.

Constraints:

WR1: The Datum_feature specified by the used_datum_feature shall establish a Datum that participates in the establishment of the Datum_system specified as the established_datum_system.

NOTE EXPRESS specification:

```

*)
ENTITY datum_feature_usage_in_datum_system_relationship
  SUBTYPE OF (managed_design_object);
    established_datum_system : datum_system;
    used_datum_feature       : datum_feature;

```

4.2.231 Datum_feature_usage_in_single_datum_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_feature_usage_in_single_datum_relationship is a type of Datum_feature_usage_in_datum_relationship (see 4.2.229) that associates a Datum_feature (see 4.2.226) with the Single_datum (see 4.2.828) that the Datum_feature establishes.

The data associated with a Datum_feature_usage_in_single_datum_relationship are the following:

— relating_shape_element.

4.2.231.1 relating_shape_element

The relating_shape_element specifies the Single_datum (see 4.2.828) that the Datum_feature (see 4.2.226) specified as the related_shape_element establishes for the Datum_feature_usage_in_single_datum_relationship.

NOTE The attribute related_shape_element is declared in the Datum_feature_usage_in_datum_relationship entity of which this entity is a subtype.

NOTE EXPRESS specification:

```

*)
ENTITY datum_feature_usage_in_single_datum_relationship
  SUBTYPE OF (datum_feature_usage_in_datum_relationship);
  SELF\shape_element_relationship.relate_shape_element : single_datum;
END_ENTITY; -- datum_feature_usage_in_single_datum_relationship

( *

```

4.2.232 Datum_plane

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_plane is a type of Datum (see 4.2.214) that is a theoretically exact plane to which tolerated Shape_element (see 4.2.810) are related.

Constraints:

WR1: If the Datum_plane is not specified as a reference_planes of a Datum_reference_frame then the Datum_plane shall be either a Common_datum, or a Single_datum.

WR2: A Datum_plane shall be specified as the vector_of by at most two Datum_based_direction_vector.

WR3: If the Datum_plane is specified as the vector_of by two Datum_based_direction_vector, the two Datum_based_direction_vector shall specify different values for the positive_direction_vector.

NOTE EXPRESS specification:

```

*)
ENTITY datum_plane
  SUBTYPE OF (datum);
END_ENTITY; -- datum_plane

--tt tc1 wd9 modified
( *

```

4.2.233 Datum_point

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_point is a type of Datum (see 4.2.214) that is a theoretically exact point to which tolerated Shape_element (see 4.2.810) are related.

Constraints:

WR1: If the Datum_point is not specified as a reference_origin of a Datum_reference_frame then the Datum_point shall be either a Common_datum, or a Single_datum.

NOTE EXPRESS specification:

```

*)
ENTITY datum_point
  SUPERTYPE OF (edge_segment_vertex)
  SUBTYPE OF (datum);
  location_in_2d : OPTIONAL cartesian_point;
  location_in_3d : OPTIONAL cartesian_point;
  associated_volume_shape_intersection : OPTIONAL volume_shape_intersection;
WHERE
  WR1: NOT(EXISTS(location_in_2d) AND EXISTS(location_in_3d)) OR
        EXISTS(associated_volume_shape_intersection);
  WR2: NOT(EXISTS(location_in_2d)) OR (location_in_2d.geometric_context.dimensionality
                                     = two_dimensional);
  WR3: NOT(EXISTS(location_in_3d)) OR (location_in_3d.geometric_context.dimensionality
                                     = three_dimensional);
END_ENTITY; -- datum_point

( *
```

4.2.234 Datum_precedence_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_precedence_assignment is a type of Managed_design_object (see 4.2.524). A Datum_precedence_assignment is a specification that defines the order in which a Datum (see 4.2.214) is used to establish a Datum_system (see 4.2.236).

NOTE Datum systems established by a sequence of datums is discussed in 6.2.3 of ISO 5459.

The data associated with a Datum_precedence_assignment are the following:

- assigned_to;
- datum_system_conditions_definition;
- name.

4.2.234.1 assigned_to

The assigned_to specifies the Datum_usage_in_datum_system_relationship (see 4.2.243) that associates a Datum_system (see 4.2.236) with the Datum (see 4.2.214) to which the precedence in establishing the Datum_system is assigned by the Datum_precedence_assignment.

4.2.234.2 datum_system_conditions_definition

The datum_system_conditions_definition is an inverse relationship that specifies that the existence of the Datum_precedence_assignment depends on the existence of the Datum_system_defining_conditions (see 4.2.237) that specifies the Datum_precedence_assignment as its assigned_datum_precedences.

4.2.234.3 name

The name specifies the label that corresponds to the Datum_precedence_assignment of the specified usage of a Datum (see 4.2.214) in a Datum_system (see 4.2.236). The name shall be "primary", "secondary", or "tertiary".

EXAMPLE 1 The requirements may be such that Datum A is assigned as the primary Datum when it is used in one Datum_system. However, additional requirements may be such that Datum A is assigned as the tertiary Datum when it is used in a second Datum_system.

Constraints:

UR1: The combination of name and datum_system_conditions_definition shall be unique within a population of Datum_precedence_assignment. That is, the defining conditions of a Datum_system shall be such that no two Datum of the Datum_system have been assigned the same precedence.

NOTE EXPRESS specification:

```

*)
ENTITY datum_precedence_assignment
  SUBTYPE OF (managed_design_object);
    assigned_to : datum_usage_in_datum_system_relationship;
    name       : precedence_type;
  INVERSE
    datum_system_conditions_definition : datum_system_defining_conditions FOR
                                         assigned_datum_precedences;
  UNIQUE
    UR1 : datum_system_conditions_definition, name;
END_ENTITY; -- datum_precedence_assignment

( *
```

4.2.235 Datum_reference_frame

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_reference_frame is a type of Non_feature_shape_element (see 4.2.560) that is a system of Datum (see 4.2.214) that serve as a frame of reference by which tolerated Shape_element (see 4.2.810) may be located and oriented. The Datum_reference_frame is established by one or more Datum_system (see 4.2.236). The Datum_reference_frame consists of three mutually perpendicular Datum_plane (see 4.2.232), three mutually perpendicular Datum_axis (see 4.2.215), and a Datum_point (see 4.2.233). Each of the Datum_axis is located at the intersections of each unique pair of Datum_plane. The Datum_point is the origin of the Datum_reference_frame and is located at the mutual intersection of the three Datum_plane.

The data associated with a Datum_reference_frame are the following:

- reference_axes;
- reference_axis_pairs;
- reference_origin;
- reference_planes;
- reference_plane_pairs;
- used_datum_systems.

4.2.235.1 reference_axes

The reference_axes specifies the Datum_axis (see 4.2.215) that are part of the Datum_reference_frame. There shall be three Datum_axis specified for a Datum_reference_frame.

4.2.235.2 reference_axis_pairs

The reference_axis_pairs specifies the Perpendicular_shape_element_relationship (see 4.2.644) that define the perpendicularity between the reference_axes. There shall be three Perpendicular_shape_element_relationship in this role specified for a Datum_reference_frame.

4.2.235.3 reference_origin

The reference_origin specifies the Datum_point (see 4.2.233) that corresponds to the origin of the Datum_reference_frame.

4.2.235.4 reference_planes

The reference_planes specify the Datum_plane (see 4.2.232) that are part of the Datum_reference_frame. There shall be three Datum_plane specified for a Datum_reference_frame.

4.2.235.5 reference_plane_pairs

The `reference_plane_pairs` specifies the `Perpendicular_shape_element_relationship` (see 4.2.644) that define the perpendicularity between the reference_planes. There shall be three `Perpendicular_shape_element_relationship` in this role specified for a `Datum_reference_frame`.

4.2.235.6 used_datum_systems

The `used_datum_systems` is an inverse relationship that specifies that the existence of the `Datum_reference_frame` is dependent on the existence of the `Datum_system` (see 4.2.236) that specifies the `Datum_reference_frame` as its established_datum_reference_frame. There shall be one or more `Datum_system` for the `Datum_reference_frame`. Only members of `reference_axes` or `reference_planes` shall be `Datum` of the `used_datum_systems`.

Constraints:

WR1: Each of the `reference_axes` shall be specified to be an intersection of one of the pairs of `reference_planes`.

NOTE EXPRESS specification:

*)

(*

4.2.236 Datum_system

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_system is a type of Non_feature_shape_element (see 4.2.560) that is a system of Datum (see 4.2.214) that establish a Datum_reference_frame (see 4.2.235) by which toleranced Shape_element (see 4.2.810) may be located and oriented.

EXAMPLE 1 Figure 32 illustrates a Datum_system.

NOTE The definition of datum-system is given in 3.2 of ISO 5459.

The data associated with a Datum_system are the following:

- datum_usages;
- defining_conditions;
- established_datum_reference_frame.

Figure 32 – Datum_system

4.2.236.1 datum_usages

The datum_usages is an inverse relationship that specifies that the existence of the Datum_system is dependent on the existence of the Datum_usage_in_datum_system_relationship (see 4.2.243) that specifies the Datum_system as its established_datum_system. There shall be one, two, or three Datum_usage_in_datum_system_relationship for the Datum_system.

4.2.236.2 defining_conditions

The defining_conditions is an inverse relationship that specifies that the existence of the Datum_system is dependent on the existence of the Datum_system_defining_conditions (see 4.2.237) that specifies the Datum_system as its conditions_of.

4.2.236.3 established_datum_reference_frame

The established_datum_reference_frame specifies the Datum_reference_frame (see 4.2.235) that is established by the Datum_system.

Constraints:

WR1: Any particular Datum_feature shall be used no more than one time to establish the Datum_system.

WR2: Any particular Datum_target shall be used no more than one time to establish the Datum_system.

NOTE EXPRESS specification:

```

*)
ENTITY datum_system
  SUBTYPE OF (non_feature_shape_element);
    established_datum_reference_frame : datum_reference_frame;
  INVERSE
    datum_usages : SET [1:3] OF
                  datum_usage_in_datum_system_relationship FOR
                  established_datum_system;
    defining_conditions : datum_system_defining_conditions FOR conditions_of;
END_ENTITY; -- datum_system

( *
```

4.2.237 Datum_system_defining_conditions

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_system_defining_conditions is a type of Managed_design_object (see 4.2.524). A Datum_system_defining_conditions is either a Datum_system_defining_conditions_without_material_conditions (see 4.2.239) or a Datum_system_defining_conditions_with_material_conditions (see 4.2.238). A Datum_system_defining_conditions is the specification of the conditions under which a Datum_system (see 4.2.236) is established. The conditions include the order in which the Datum (see 4.2.214) are established within the Datum_system and any material condition properties that are explicitly applied to Datum_feature (see 4.2.226) that participate in the establishment of the Datum_system.

The data associated with a Datum_system_defining_conditions are the following:

- assigned_datum_precedences;
- conditions_of.

4.2.237.1 assigned_datum_precedences

The assigned_datum_precedences specify the Datum_precedence_assignment (see 4.2.234) that define the order in which the Datum (see 4.2.214) are established in the Datum_system (see 4.2.236) specified as the conditions_of for the Datum_system_defining_conditions. There shall be one, two, or three Datum_precedence_assignment for the Datum_system_defining_conditions.

4.2.237.2 conditions_of

The conditions_of specifies the role of the Datum_system (see 4.2.236) for which the Datum_system_defining_conditions are defined.

Constraints:

WR1: The conditions_of the Datum_system_defining_conditions shall be the same instance of Datum_system as specified by the established_datum_system attribute of the Datum_usage_in_datum_system_-relationship that is specified by the assigned_to attribute of the Datum_precedence_assignment specified by the assigned_datum_precedences. That is, the Datum_system_defining_conditions and the specified Datum_precedence_assignments must be associated with the same Datum_system.

WR2: The name tertiary shall not exist in the names of the assigned_datum_precedences unless the name secondary exists in the names of the assigned_datum_precedences.

WR3: The name secondary shall not exist in the names of the assigned_datum_precedences unless the name primary exists in the names of the assigned_datum_precedences.

WR4: The datum_system_defining_conditions shall be referenced by at least one Geometric_tolerance_with_referenced_datum_system or Dimension_location_with_specified_datum_system.

NOTE EXPRESS specification:

```

*)
ENTITY datum_system_defining_conditions
  ABSTRACT SUPERTYPE OF (ONEOF (
    datum_system_defining_conditions_with_material_conditions,
    datum_system_defining_conditions_without_material_conditions))
  SUBTYPE OF (managed_design_object);
  conditions_of          : datum_system;
  assigned_datum_precedences : SET [1:3] OF datum_precedence_assignment;
END_ENTITY; -- datum_system_defining_conditions

( *

```

4.2.238 Datum_system_defining_conditions_with_material_conditions

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_system_defining_conditions_with_material_conditions is a type of Datum_system_defining_conditions (see 4.2.237) that specifies the conditions under which a Datum_system (see 4.2.236) is established and in which either the "least_material_requirement" or the "maximum_material_principle" has been applied to usages of one or more Datum_feature (see 4.2.226) in the Datum_system.

NOTE If neither the "least_material_requirement" nor the "maximum_material_principle" is explicitly applied and the Datum_feature is a feature of size, the principle that is termed "regardless of feature size" in ASME Y14.5M is assumed to be in effect.

The data associated with a Datum_system_defining_conditions_with_material_conditions are the following:

— applied_material_condition_properties.

4.2.238.1 applied_material_condition_properties

The applied_material_condition_properties specify the Datum_feature_material_condition_property (see 4.2.227) that define the material condition properties that are explicitly applied to the Datum_feature (see 4.2.226) in the context of the Datum_system (see 4.2.236) for the Datum_system_defining_conditions_with_material_conditions. There shall be one or more Datum_feature_material_condition_property for a Datum_system_defining_conditions_with_material_conditions.

EXAMPLE 1 The requirements may be such that the "maximum material principle" applies to Datum_feature A when it is used in one Datum_system. However, additional requirements may be such that neither the "maximum material principle" nor the "least material requirement" applies to Datum_feature A when it is used in a second Datum_system.

Constraints:

WR1: The conditions_of the Datum_system_defining_conditions_with_material_conditions shall be the same instance of Datum_system as specified by the established_datum_system attribute of the Datum_feature_usage_in_datum_system_relationship that is specified by the applied_to attribute of the Datum_feature_material_condition_property specified by the applied_material_condition_properties. That is, the Datum_system_defining_conditions_with_material_conditions and the specified Datum_feature_material_condition_property shall be associated with the same Datum_system.

NOTE EXPRESS specification:

```

*)
ENTITY datum_system_defining_conditions_with_material_conditions
  SUBTYPE OF (datum_system_defining_conditions);
  applied_material_condition_properties :
SET [1:?] OF datum_feature_material_condition_property;
END_ENTITY; -- datum_system_defining_conditions_with_material_conditions

( *
```

4.2.239 Datum_system_defining_conditions_without_material_conditions

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_system_defining_conditions_without_material_conditions is a type of Datum_system_defining_conditions (see 4.2.237) that specifies the conditions under which a Datum_system (see 4.2.236) is established and in which neither the "least material requirement" nor the "maximum material principle" have been applied to any of the Datum_feature (see 4.2.226) used to establish the Datum_system.

NOTE EXPRESS specification:

```

*)
ENTITY datum_system_defining_conditions_without_material_conditions
  SUBTYPE OF (datum_system_defining_conditions);
END_ENTITY; -- datum_system_defining_conditions_without_material_conditions

( *
```

4.2.240 Datum_target

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_target is a type of Physical_feature_or_part_template (see 4.2.658) that is used to define one or more Datum_target_set (see 4.2.241).

NOTE 1 Typically datum targets are used when it is not appropriate to specify an entire surface as a Datum_-feature (see 4.2.226).

NOTE 2 The definition of datum target is given in 3.4 of ISO 5459.

The data associated with a Datum_target are the following:

— datum_target_usages.

4.2.240.1 datum_target_usages

The datum_target_usages is an inverse relationship that specifies that the existence of the Datum_target is dependent on the existence of the Datum_target_usage_in_datum_target_set_relationship (see 4.2.242) that specifies the Datum_target as its used_datum_target. There shall be one or more Datum_target_usage_in_datum_target_set_relationship for the Datum_target.

NOTE EXPRESS specification:

```

*)
ENTITY datum_target
  SUBTYPE OF (physical_feature_or_part_template);
  INVERSE
    datum_target_usages : SET [1:?] OF
                        datum_target_usage_in_datum_target_set_relationship FOR
                        used_datum_target;
END_ENTITY; -- datum_target

( *
```

4.2.241 Datum_target_set

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_target_set is a type of Datum_feature (see 4.2.226) that is composed of one or more Datum_target (see 4.2.240).

The data associated with a Datum_target_set are the following:

— included_datum_targets.

4.2.241.1 included_datum_targets

The included_datum_targets is an inverse relationship that specifies that the existence of the Datum_target_set is dependent on the existence of the Datum_target_usage_in_datum_target_set_relationship (see 4.2.242) that specifies the Datum_target_set as its defined_datum_target_set. There shall be one or more Datum_target_usage_in_datum_target_set_relationship for the Datum_target_set.

Constraints:

WR1: A Datum_target_set shall not participate as a related_shape_element in a Shape_element_constituent_relationship. That is, a Datum_target_set shall not be a constituent of another Shape_element.

NOTE EXPRESS specification:

```

*)
ENTITY datum_target_set
  SUBTYPE OF (datum_feature);
  INVERSE
    included_datum_targets : SET [1:?] OF
      datum_target_usage_in_datum_target_set_relationship FOR
      defined_datum_target_set;
END_ENTITY; -- datum_target_set

( *
```

4.2.242 Datum_target_usage_in_datum_target_set_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

Datum_target_usage_in_datum_target_set_relationship is a type of Managed_design_object (see 4.2.524). A Datum_target_usage_in_datum_target_set_relationship is a relationship that associates a Datum_target (see 4.2.240) with a Datum_target_set (see 4.2.241) that the Datum_target participates in defining.

The data associated with a Datum_target_usage_in_datum_target_set_relationship are the following:

- datum_target_number;
- defined_datum_target_set;
- used_datum_target.

4.2.242.1 datum_target_number

The datum_target_number specifies the positive integer that identifies the usage of the Datum_target (see 4.2.240) in the definition of a Datum_target_set (see 4.2.241) for the Datum_target_usage_in_datum_target_set_relationship.

NOTE The datum target number is described in 7.1.1 of ISO 5459.

4.2.242.2 defined_datum_target_set

The defined_datum_target_set specifies the Datum_target_set (see 4.2.241) in which the specified Datum_target (see 4.2.240) participates in defining.

4.2.242.3 used_datum_target

The `used_datum_target` specifies the `Datum_target` (see 4.2.240) that is used to define the `Datum_target_set` (see 4.2.241) specified as the `defined_datum_target_set` for the `Datum_target_usage_in_datum_target_set_relationship`.

NOTE Since a `Datum_target` may be used to define multiple `Datum_target_sets` and the `Datum_target` number may be different depending on the `Datum_target_set` that the `Datum_target` participates in defining, the `Datum_target_number` is assigned to the `Datum_target_usage_in_datum_target_set_relationship` rather than on the `Datum_target`.

EXAMPLE 1 A datum target is used to define datum target sets A and G. The usage of the datum target in the definition of datum target set A is assigned a datum target number of 3. The usage of the datum target in defining datum target set G is assigned a datum target number of 1. This situation would be represented by a single instance of `Datum_target`, two instances of `Datum_target_set`, and two instances of `Datum_target_usage_in_datum_target_set_relationship`. The instances of `Datum_target_set` would be assigned the identifications of "A" and "G". The instances of `Datum_target_usage_in_datum_target_set_relationship` that associate the instance of `Datum_target` to the instances of `Datum_target_set` identified as "A" and "G" would have `datum_target_number` values of 3 and 1, respectively.

Constraints:

UR1: The combination of `used_datum_target` and `defined_datum_target_set` shall be unique within a population of `Datum_target_usage_in_datum_target_set_relationship`. That is, a specific `Datum_target` shall not be used more than once to define a specific `Datum_feature`.

UR2: The combination of `datum_target_number` and `defined_datum_target_set` shall be unique within a population of `Datum_target_usage_in_datum_target_set_relationship`.

NOTE EXPRESS specification:

```

*)
ENTITY datum_target_usage_in_datum_target_set_relationship
  SUBTYPE OF (managed_design_object);
    defined_datum_target_set : datum_target_set;
    used_datum_target        : datum_target;
    datum_target_number      : positive_integer;
  UNIQUE
    UR1 : used_datum_target, defined_datum_target_set;
    UR2 : datum_target_number, defined_datum_target_set;
END_ENTITY; -- datum_target_usage_in_datum_target_set_relationship

( *
```

4.2.243 Datum_usage_in_datum_system_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Datum_usage_in_datum_system_relationship is a type of Managed_design_object (see 4.2.524). A Datum_usage_in_datum_system_relationship is a relationship that associates a Datum_system (see 4.2.236) with a Datum (see 4.2.214) that participates in establishing the Datum_system.

The data associated with a Datum_usage_in_datum_system_relationship are the following:

- established_datum_system;
- precedence_assignment;
- used_datum.

4.2.243.1 established_datum_system

The established_datum_system specifies the Datum_system (see 4.2.236) that the Datum (see 4.2.214) specified as the used_datum participates in establishing for the Datum_usage_in_datum_system_relationship.

4.2.243.2 precedence_assignment

The precedence_assignment is an inverse relationship that specifies that the existence of the Datum_usage_in_datum_system_relationship is dependent on the existence of the Datum_precedence_assignment (see 4.2.234) that specifies the Datum_usage_in_datum_system_relationship as its assigned_to.

4.2.243.3 used_datum

The used_datum specifies the Datum (see 4.2.214) that is used to establish the Datum_system (see 4.2.236) specified as the established_datum_system for the Datum_usage_in_datum_system_relationship.

Constraints:

UR1: The combination of used_datum and established_datum_system shall be unique within a population of Datum_usage_in_datum_system_relationship. That is, a specific Datum shall not be used more than once to establish a specific Datum_system.

WR1: The Datum specified as the used_datum shall either be a Common_datum or a Single_datum.

IP1: The Datum specified as the used_datum shall either be a constituent Datum of the Datum_reference_frame established by the Datum_system specified by the established_datum_system, or it shall be dimensioned from one or more constituent Datum of the established Datum_reference_frame.

NOTE EXPRESS specification:

```

*)
ENTITY datum_usage_in_datum_system_relationship
  SUBTYPE OF (managed_design_object);
    established_datum_system : datum_system;
    used_datum                : datum;
  INVERSE
    precedence_assignment : datum_precedence_assignment FOR assigned_to;
  UNIQUE
    UR1 : used_datum, established_datum_system;
END_ENTITY; -- datum_usage_in_datum_system_relationship

```

(*

4.2.244 Default_assembly_bond_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Default_assembly_bond_shape is a type of Bound_volume_shape (see 4.2.76) and a type of Feature_shape_definition (see 4.2.372). A Default_assembly_bond_shape is the shape of an Assembly_bond_definition (see 4.2.33).

The data associated with a Default_assembly_bond_shape are the following:

— characterized_bond_definition.

4.2.244.1 characterized_bond_definition

The characterized_bond_definition specifies the role of the Assembly_bond_definition (see 4.2.33) for the Default_assembly_bond_shape.

NOTE EXPRESS specification:

```

*)
ENTITY default_assembly_bond_shape
  SUBTYPE OF (bound_volume_shape, feature_shape_definition);
    characterized_bond_definition : assembly_bond_definition;
END_ENTITY; -- default_assembly_bond_shape

```

(*

4.2.245 Default_attachment_size_and_component_termination_passage_based_land_physical_template

A Default_attachment_size_and_component_termination_passage_based_land_physical_template is a type of Default_attachment_size_based_land_physical_template (see 4.2.247) and of Default_component_termination_passage_based_land_physical_template (see 4.2.248). The shape of this template is dependent on both the requirements from the passage definition and the requirement for support of the interface between the instance of the Part_terminal (see 4.2.630) intended to mate with an instance of the Land_physical_template (see 4.2.493).

NOTE EXPRESS specification:

```
*)
ENTITY default_attachment_size_and_component_termination_passage_based_land_physical_template
  SUBTYPE OF (
    default_component_termination_passage_based_land_physical_template,
    default_attachment_size_based_land_physical_template);
END_ENTITY;
-- default_attachment_size_and_component_termination_passage_based_land_physical_template
(*
```

4.2.246 Default_attachment_size_and_via_based_land_physical_template

A Default_attachment_size_and_via_based_land_physical_template is a type of Default_attachment_size_based_land_physical_template (see 4.2.247) and of Default_via_based_land_physical_template (see 4.2.255). This template shape is dependent on both the requirement from the Default_via_definition (see 4.2.256) and the shape of the related Part_terminal (see 4.2.630).

NOTE EXPRESS specification:

```
*)
ENTITY default_attachment_size_and_via_based_land_physical_template
  SUBTYPE OF (default_via_based_land_physical_template,
    default_attachment_size_based_land_physical_template);
END_ENTITY; -- default_attachment_size_and_via_based_land_physical_template
(*
```

4.2.247 Default_attachment_size_based_land_physical_template

A Default_attachment_size_based_land_physical_template is a type of Default_land_physical_template (see 4.2.250). A Default_attachment_size_based_land_physical_template may be a Default_attachment_size_and_component_termination_passage_based_land_physical_template (see 4.2.245) or a Default_attachment_size_and_via_based_land_physical_template (see 4.2.246). This template shape is dependent only on the shape of the Part_terminal (see 4.2.630) it is intended to mate with.

The data associated with a Default_attachment_size_based_land_physical_template are the following:

- interface_access_mechanisms;
- minimum_attachment_region_size;
- maximum_attachment_region_size.

4.2.247.1 interface_access_mechanisms

The interface_access_mechanisms is an inverse relationship that specifies that the existence of the Default_attachment_size_based_land_physical_template is dependent on the existence of the Land_template_interface_terminal (see 4.2.494) that specifies the Default_attachment_size_based_land_physical_template as its associated_definition. There shall be one or more Land_template_interface_terminal for a Default_attachment_size_based_land_physical_template. Fabrication and assembly tolerances define the required shapes and variances for the terminal shapes.

4.2.247.2 minimum_attachment_region_size

The minimum_attachment_region_size specifies one of the roles of the Connection_zone for the Default_attachment_size_based_land_physical_template. The minimum_attachment_region_size specifies the smallest Connection_zone for the Default_attachment_size_based_land_physical_template.

4.2.247.3 maximum_attachment_region_size

The maximum_attachment_region_size specifies one of the roles of the Connection_zone for the Default_attachment_size_based_land_physical_template. The maximum_attachment_region_size specifies the largest Connection_zone for the Default_attachment_size_based_land_physical_template.

NOTE EXPRESS specification:

```

*)
ENTITY default_attachment_size_based_land_physical_template
  SUPERTYPE OF (ONEOF (
    default_attachment_size_and_component_termination_passage_based_land_physical_template,
    default_attachment_size_and_via_based_land_physical_template))

END_ENTITY; -- default_attachment_size_based_land_physical_template
( *

```

4.2.248 Default_component_termination_passage_based_land_physical_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Default_component_termination_passage_based_land_physical_template is a type of Default_passage_based_land_physical_template (see 4.2.251). A Default_component_termination_passage_based_land_physical_template may be a Default_attachment_size_and_component_termination_passage_based_land_physical_template (see 4.2.245). The shape of the land template is dependent upon the requirements from Passage_technology (see 4.2.638).

The data associated with a Default_component_termination_passage_based_land_physical_template are the following:

— of_passage_technology.

4.2.248.1 of_passage_technology

The of_passage_technology specifies the role of the Default_component_termination_passage_definition (see 4.2.249) for the Default_component_termination_passage_based_land_physical_template.

NOTE EXPRESS specification:

```

*)
ENTITY default_component_termination_passage_based_land_physical_template

END_ENTITY; -- default_component_termination_passage_based_land_physical_template

( *

```

4.2.249 Default_component_termination_passage_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Default_component_termination_passage_definition is a type of Passage_technology (see 4.2.638) that defines a default passage based on characteristics of the associated Part_terminal (see 4.2.630).

The data associated with a Default_component_termination_passage_definition are the following:

- deposition_material;
- maximum_allowed_component_terminal_extent;
- minimum_allowed_component_terminal_extent;
- minimum_as_finished_deposition_thickness;
- minimum_as_finished_passage_extent.

4.2.249.1 deposition_material

The deposition_material specifies the role of the Ee_material (see 4.2.318) for the Default_component_termination_passage_definition.

4.2.249.2 maximum_allowed_component_terminal_extent

The maximum_allowed_component_terminal_extent specifies one role of the Length_data_element (see 4.2.511) for the Default_component_termination_passage_definition.

4.2.249.3 minimum_allowed_component_terminal_extent

The minimum_allowed_component_terminal_extent specifies one role of the Length_data_element (see 4.2.511) for the Default_component_termination_passage_definition.

4.2.249.4 minimum_as_finished_deposition_thickness

The minimum_as_finished_deposition_thickness specifies one role of the Length_data_element (see 4.2.511) for the Default_component_termination_passage_definition.

4.2.249.5 minimum_as_finished_passage_extent

The minimum_as_finished_passage_extent specifies one role of the Length_data_element (see 4.2.511) for the Default_component_termination_passage_definition.

Constraints:

WR1: The passage deposition material shall be conductive.

NOTE EXPRESS specification:

END_ENTITY; -- default_land_physical_template

( *

```

4.2.251 Default_passage_based_land_physical_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Default_passage_based_land_physical_template is a type of Default_land_physical_template (see 4.2.250). A Default_passage_based_land_physical_template is either a Default_component_termination_passage_based_land_physical_template (see 4.2.248), a Default_unsupported_passage_based_land_physical_template (see 4.2.253), or a Default_via_based_land_physical_template (see 4.2.255). The shape of a Land (see 4.2.490) based on this template is dependent on the shape of the passage with which it is associated.

EXAMPLE 1 Figure 33 illustrates the relationship between the minimum_annular_ring and the size category of finished hole for which the minimum_annular_ring is defined. The category information is specified in the member of Passage_technology (see 4.2.638) associated with this Default_passage_based_land_physical_template.

NOTE The usual domain technical reference is ANSI/IPC D-275.

The data associated with a Default_passage_based_land_physical_template are the following:

- minimum_annular_ring;
- minimum_fabrication_allowance;
- of_passage_technology;
- of_stratum_extent.

4.2.251.1 minimum_annular_ring

The minimum_annular_ring specifies the Length_data_element (see 4.2.511) of the smallest dimension between each point on the inner bound of a passage and the nearest point on the outer bound of a Land (see 4.2.490) containing the passage for the Default_passage_based_land_physical_template.

Figure 33 – Measurement arrangement for minimum_annular_ring

4.2.251.2 minimum_fabrication_allowance

The minimum_fabrication_allowance specifies the Length_data_element (see 4.2.511) for the smallest dimension of the total of the manufacturing process tolerance effects for the Default_passage_based_land_physical_template.

4.2.251.3 of_passage_technology

The of_passage_technology specifies the role of the Passage_technology (see 4.2.638) for the Default_passage_based_land_physical_template.

4.2.251.4 of_stratum_extent

The of_stratum_extent specifies the role of the Inter_stratum_extent (see 4.2.431) for the Default_passage_based_land_physical_template. The of_stratum_extent specifies the actual subset of the passage specified by of_passage_technology to which this Default_passage_based_land_physical_template applies.

Constraints:

UR1: The combination of the attribute of_passage_technology and the attribute of_stratum_technology inherited from the supertype Default_land_physical_template shall be unique in a population of Default_passage_based_land_physical_template.

WR1: The stratum extent specified by of_stratum_extent shall be a subset of the stratum extent specified by the of_passage_technology.

NOTE EXPRESS specification:

*)

```

4.2.252 Default_trace_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Default_trace_template is a type of Trace_template (see 4.2.930). The Default_trace_template is associated with a particular Stratum_technology (see 4.2.871), to allow verification that the design of the trace template meets the relevant minimum and maximum guidelines of that Stratum_technology.

The data associated with a Default_trace_template are the following:

— of_stratum_technology.

4.2.252.1 of_stratum_technology

The of_stratum_technology specifies the role of the Stratum_technology (see 4.2.871) for the Default_trace_template.

NOTE EXPRESS specification:

*)

```
ENTITY default_trace_template
  SUBTYPE OF (trace_template);
  of_stratum_technology : stratum_technology;

```

(*

4.2.253 Default_unsupported_passage_based_land_physical_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Default_unsupported_passage_based_land_physical_template is a type of Default_passage_based_land_physical_template (see 4.2.251) where the passage type is a passage that has no metallized support.

The data associated with a Default_unsupported_passage_based_land_physical_template are the following:

— of_passage_technology.

4.2.253.1 of_passage_technology

The of_passage_technology specifies the role of the Default_unsupported_passage_definition (see 4.2.254) for the Default_unsupported_passage_based_land_physical_template.

NOTE EXPRESS specification:

```
*)
ENTITY default_unsupported_passage_based_land_physical_template
  SUBTYPE OF (default_passage_based_land_physical_template);
  SELF\default_passage_based_land_physical_template.of_passage_technology :

END_ENTITY; -- default_unsupported_passage_based_land_physical_template

( *
```

4.2.254 Default_unsupported_passage_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Default_unsupported_passage_definition is a type of Passage_technology (see 4.2.638) where the passage is unsupported by metallization.

The data associated with a Default_unsupported_passage_definition are the following:

— minimum_as_finished_passage_definition.

4.2.254.1 minimum_as_finished_passage_definition

The minimum_as_finished_passage_definition specifies one role of the Length_data_element (see 4.2.511) for the Default_via_definition (see 4.2.256).

NOTE EXPRESS specification:

```

*)
ENTITY default_unsupported_passage_definition
  SUBTYPE OF (passage_technology);
  SELF\passage_technology.minimum_as_finished_passage_extent : length_data_element;
END_ENTITY; -- default_unsupported_passage_definition

( *

```

4.2.255 Default_via_based_land_physical_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Default_via_based_land_physical_template is a type of Default_passage_based_land_physical_template (see 4.2.251) where the passage type is a Via (see 4.2.947). A Default_via_based_land_physical_template may be a Default_attachment_size_and_via_based_land_physical_template (see 4.2.246).

The data associated with a Default_via_based_land_physical_template are the following:

— of_passage_technology.

4.2.255.1 of_passage_technology

The of_passage_technology specifies the role of the Default_via_definition (see 4.2.256) for the Default_via_based_land_physical_template.

NOTE EXPRESS specification:

```

*)
ENTITY default_via_based_land_physical_template
  SUPERTYPE OF (
    default_attachment_size_and_via_based_land_physical_template)
  SUBTYPE OF (default_passage_based_land_physical_template);

  default_via_definition;
END_ENTITY; -- default_via_based_land_physical_template

( *

```

4.2.256 Default_via_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Default_via_definition is a type of Passage_technology (see 4.2.638) that defines the default shape of the Via (see 4.2.947).

The data associated with a Default_via_definition are the following:

- deposition_material;
- minimum_as_finished_deposition_thickness;
- minimum_as_finished_passage_extent.

4.2.256.1 deposition_material

The deposition_material specifies the role of the Ee_material (see 4.2.318) in the Via (see 4.2.947) for the Default_via_definition.

4.2.256.2 minimum_as_finished_deposition_thickness

The minimum_as_finished_deposition_thickness specifies the Length_data_element (see 4.2.511) that is the lower bound for the thickness of the deposited Ee_material (see 4.2.318) for the Default_via_definition.

4.2.256.3 minimum_as_finished_passage_extent

The minimum_as_finished_passage_extent specifies one role of the Length_data_element (see 4.2.511) for the Default_via_definition.

Constraints:

WR1: The passage deposition material shall be conductive.

NOTE EXPRESS specification:

4.2.257 Delete_design_object_management_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Delete_design_object_management_relationship is a type of Design_object_management_relationship (see 4.2.278). Together with Change_design_object_management_relationship and Add_design_object_management_relationship, Delete_design_object_management_relationship supports the exchange of changes to a design by the use of a data set containing only (1) the information necessary to identify the design (e.g., an Ee_product_definition or an Ee_product_version), which is assumed to be already known to the receiving system, and (2) the design objects that have been added, changed, or deleted.

NOTE Note that all the quality and structural requirements defined in this part of ISO 10303 also apply to the resultant new design iteration.

The data associated with a Delete_design_object_management_relationship are the following:

— previous_design_object.

4.2.257.1 previous_design_object

The previous_design_object specifies the role of the Managed_design_object (see 4.2.524) for the Delete_design_object_management_relationship.

Constraints:

UR1: The combination of the previous_design_object and the previous_design inherited from Design_object_management_relationship shall be unique within a population of Delete_design_object_management_relationships.

NOTE EXPRESS specification:

```
*)
ENTITY delete_design_object_management_relationship

4.2.259 **Dependently_located_layer_connection_point**

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Dependently_located_layer_connection_point is a type of Layer_connection_point (see 4.2.499) that is position dependent on the location of an Interconnect_module_terminal (see 4.2.463) or an Inter_stratum_feature (see 4.2.432).

NOTE This part of ISO 10303 provides the capability to support one interconnect design for multiple assembly designs where components at the assembly level may or may not exist for any or all of the multiple assembly designs.

EXAMPLE 1 An example of an Dependently_located_layer_connection_point is the case where a common interconnect must be supplied for several assemblies. A specific microcircuit device, such as "U32" may be supplied for one or more, but not all, of the assemblies, but the interconnect must be identical.

EXAMPLE 2 Figure 34 illustrates a detail of a layout drawing that shows the relationship of two members of Dependently_located_layer_connection_point and the associated Conductor (see 4.2.176).

The data associated with a Dependently_located_layer_connection_point are the following:

— associated_design_object.

4.2.259.1 **associated_design_object**

The associated_design_object specifies either the role of an Interconnect_module_terminal (see 4.2.463) or the role of an Inter_stratum_feature (see 4.2.432) for the Dependently_located_layer_connection_point.

NOTE The associated_design_object may not fully constrain the location of the Dependently_located_layer_connection_point.

Constraints:

IP1: The Layer_connection_point is constrained to be within the material volume specified by the associated_design_object.

Figure 34 – Dependently_located_layer_connection_point

NOTE EXPRESS specification:

4.2.260 Derived_shape_element

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Derived_shape_element is a type of Non_feature_shape_element (see 4.2.560) that is derived from a set of one or more other Shape_element (see 4.2.810). A Derived_shape_element is one of an Apex (see 4.2.27), a Centre_of_symmetry (see 4.2.91), a Geometric_alignment (see 4.2.416), a Geometric_intersection (see 4.2.417), a Linear_extension (see 4.2.518), or a Tangent_shape_element (see 4.2.885).

The data associated with a Derived_shape_element are the following:

— deriving_relationships.

4.2.260.1 deriving_relationships

The `deriving_relationships` is an inverse relationship that specifies that the existence of the `Derived_shape_element` is dependent on the existence of the `Shape_element_deriving_relationship` (see 4.2.814) that specifies the `Derived_shape_element` as its `relating_shape_element`. There shall be one or more `Shape_element_deriving_relationship` specified as the `deriving_relationships` for a `Derived_shape_element`.

EXAMPLE 1 The `Centre_axis` (see 4.2.90) of a cylindrical hole is a `Derived_shape_element`. The `Centre_axis` cannot exist unless the hole exists.

Constraints:

WR1: A `Derived_shape_element` shall not be derived from itself, either directly or through intermediate `Derived_shape_elements`.

NOTE EXPRESS specification:

```
*)
ENTITY derived_shape_element
  ABSTRACT SUPERTYPE OF (ONEOF (apex,centre_of_symmetry,linear_extension,
    geometric_intersection,geometric_alignment,tangent_shape_element))

ENTITY design_characteristic_occurrence
  SUBTYPE OF (ee_requirement_occurrence);
END_ENTITY; -- design_characteristic_occurrence

( *
```

4.2.262 Design_composition_path

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_composition_path is a type of Managed_design_object (see 4.2.524). A Design_composition_path is a collection of Functional_unit (see 4.2.400) that together compose one path through the complete functional definition that has the design_functional_unit as a reference to the Functional_unit_definition (see 4.2.401) that is the leaf node. The functional definition has a root node that is a Functional_unit_network_definition (see 4.2.402). The path is then established by starting at the leaf element and traversing the collection of path_element in the sequence in which they exist in the functional definition between the leaf element and the root element. Each member of path_element establishes a link in the sequence. The Design_composition_path is a mapping source for a packaging application to use to map between a hierarchical description and a flattened description of a network.

NOTE The types of node elements that are composing a directed acyclic graph must be consistent. This part of ISO 10303 uses Functional_unit_definition (see 4.2.401) as the node elements.

The data associated with a Design_composition_path are the following:

- design_functional_unit;
- path_element.

4.2.262.1 design_functional_unit

The design_functional_unit specifies the Functional_unit (see 4.2.400) for the leaf element for the Design_composition_path.

4.2.262.2 path_element

The path_element specifies the role of the Functional_unit (see 4.2.400) for the Design_composition_path. There shall be one or more Functional_unit for a Design_composition_path.

NOTE EXPRESS specification:

```

*)
ENTITY design_composition_path
  SUBTYPE OF (managed_design_object);
  path_element      : SET [1:?] OF functional_unit;

4.2.263 Design_functional_unit_allocation_to_assembly_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_functional_unit_allocation_to_assembly_component is a type of Managed_design_object (see 4.2.524). A Design_functional_unit_allocation_to_assembly_component may be a Transmission_line_functional_unit_to_routed_printed_component_allocation (see 4.2.932). A Design_functional_unit_allocation_to_assembly_component is the relationship between the Design_composition_path (see 4.2.262) and the Assembly_component (see 4.2.34) that performs the required function.

The data associated with a Design_functional_unit_allocation_to_assembly_component are the following:

- functional_design_definition_path;
- global_swappable;
- implementation;
- local_swappable;
- of_property;
- path_alias;
- swap_code.

NOTE Frozen_assignment (see 4.2.394) is used to indicate that the Design_functional_unit_allocation_to_assembly_component relationship is approved and can not be changed during further design activity without additional formal action.

4.2.263.1 functional_design_definition_path

The functional_design_definition_path specifies the role of the Design_composition_path (see 4.2.262) for the Design_functional_unit_allocation_to_assembly_component.

4.2.263.2 **global_swappable**

The `global_swappable` specifies a boolean value that indicates if occurrences of the associated path can be exchanged within the context of an `Ee_product` being designed.

4.2.263.3 **implementation**

The `implementation` specifies the role of the `Assembly_component` (see 4.2.34) for the `Design_functional_unit_allocation_to_assembly_component`.

NOTE A `Design_functional_unit_allocation_to_assembly_component` approval may be indicated by including a complex instance consisting of `Design_functional_unit_allocation_to_assembly_component` and `Frozen_assignment` (see 4.2.394).

4.2.263.4 **local_swappable**

The `local_swappable` specifies a boolean value that indicates if occurrences of the associated path can be exchanged within the context of an `Assembly_component`.

4.2.263.5 **of_property**

The `of_property` specifies the role of the `Coordinated_characteristic` for the `Design_functional_unit_allocation_to_assembly_component`. There may be more than one `of_property` for a `Design_functional_unit_allocation_to_assembly_component`. The `of_property` need not be specified for a particular `Design_functional_unit_allocation_to_assembly_component`.

4.2.263.6 **path_alias**

The `path_alias` specifies the string that is the identifier in the context of the implementation for the `Design_functional_unit_allocation_to_assembly_component`.

EXAMPLE 1 "A", "B", "C", "D", are typical `path_alias` for a quad NAND gate part.

4.2.263.7 **swap_code**

The `swap_code` specifies the string that is the type of replacement that is valid.

Constraints:

UR1: The combination of `implementation` and `path_alias` shall be unique within a population of `Design_functional_unit_allocation_to_assembly_component`.

NOTE EXPRESS specification:

```

*)

4.2.264 Design_functional_unit_allocation_to_assembly_joint

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_functional_unit_allocation_to_assembly_joint is a type of Managed_design_object (see 4.2.524).
 A Design_functional_unit_allocation_to_assembly_joint is an assignment of a Functional_unit (see 4.2.400)
 in a Design_composition_path (see 4.2.262) to its implementation in an Assembly_joint (see 4.2.41).

The data associated with a Design_functional_unit_allocation_to_assembly_joint are the following:

- functional_design_definition_path;
- implementation.

4.2.264.1 functional_design_definition_path

The functional_design_definition_path specifies the role of the Design_composition_path (see 4.2.262) for the Design_functional_unit_allocation_to_assembly_joint.

4.2.264.2 implementation

The implementation specifies the role of the Assembly_joint (see 4.2.41) for the Design_functional_unit_allocation_to_assembly_joint.

NOTE This application object is included to support detailed analysis of product design.

Constraints:

UR1: The functional_design_definition_path shall be unique within a population of Design_functional_unit_allocation_to_assembly_joint.

NOTE EXPRESS specification:

```

*)
ENTITY design_functional_unit_allocation_to_assembly_joint
  SUBTYPE OF (managed_design_object);
    functional_design_definition_path : design_composition_path;
    implementation                     : assembly_joint;

  UR1: functional_design_definition_path;
END_ENTITY; -- design_functional_unit_allocation_to_assembly_joint

( *
```

4.2.265 Design_functional_unit_allocation_to_fabrication_joint

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_functional_unit_allocation_to_fabrication_joint is a type of Managed_design_object (see 4.2.524).
 A Design_functional_unit_allocation_to_fabrication_joint is an assignment of a Functional_unit (see 4.2.400) in a Design_composition_path (see 4.2.262) to its implementation in a Fabrication_joint (see 4.2.368).

The data associated with a Design_functional_unit_allocation_to_fabrication_joint are the following:

- functional_design_definition_path;
- implementation.

4.2.265.1 functional_design_definition_path

The functional_design_definition_path specifies the role of the Design_composition_path (see 4.2.262) for the Design_functional_unit_allocation_to_fabrication_joint.

4.2.265.2 implementation

The implementation specifies the role of the Fabrication_joint (see 4.2.368) for the Design_functional_unit_allocation_to_fabrication_joint.

NOTE This application object is included to support detailed analysis of product design.

Constraints:

UR1: The functional_design_definition_path shall be unique within a population of Design_functional_unit_allocation_to_fabrication_joint.

NOTE EXPRESS specification:

```

*)
ENTITY design_functional_unit_allocation_to_fabrication_joint
  SUBTYPE OF (managed_design_object);
    functional_design_definition_path : design_composition_path;
    implementation                     : fabrication_joint;

  UR1: functional_design_definition_path;
END_ENTITY; -- design_functional_unit_allocation_to_fabrication_joint

( *
```

4.2.266 Design_functional_unit_allocation_to_reference_functional_unit

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_functional_unit_allocation_to_reference_functional_unit is a type of Managed_design_object (see 4.2.524). A Design_functional_unit_allocation_to_reference_functional_unit is an assignment of a Functional_unit (see 4.2.400) in a Design_composition_path (see 4.2.262) to a Functional_unit in a Reference_composition_path (see 4.2.764) for the functional definition of a product.

NOTE 1 This provides the capability to exchange a functional decomposition that an enterprise reuses in multiple designs.

NOTE 2 The library functional hierarchy, if provided, is required to be a network definition with the constraint that only external references on the root node of the network structure will be mapped to physical terminals of the reused product design.

NOTE 3 The allocation relationship in this Application Object is critical in mapping between a functional design and a physical implementation of that design, because this part of ISO 10303 relies on the reference mapping between a functional definition in a library and the physical implementation of that functional definition in that library, usually in a packaged part, to identify the necessary definitions that need to be instantiated in the physical design.

The data associated with a Design_functional_unit_allocation_to_reference_functional_unit are the following:

- design_definition_path;
- reference_definition_path.

4.2.266.1 design_definition_path

The design_definition_path specifies the role of the Design_composition_path (see 4.2.262) for the Design_functional_unit_allocation_to_reference_functional_unit.

4.2.266.2 reference_definition_path

The reference_definition_path specifies the role of the Reference_composition_path (see 4.2.764) for the Design_functional_unit_allocation_to_reference_functional_unit.

Constraints:

WR1: The functional_unit_definition that defines the leaf node of the reference_definition_path and the functional_unit_definition that defines the leaf node of the design_definition_path shall be the same definition.

NOTE EXPRESS specification:

```
*)
ENTITY design_functional_unit_allocation_to_reference_functional_unit
  SUBTYPE OF (managed_design_object);
    reference_definition_path : reference_composition_path;
    design_definition_path   : design_composition_path;
END_ENTITY; -- design_functional_unit_allocation_to_reference_functional_unit

( *
```

4.2.267 Design_intent_modification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_intent_modification is a type of Managed_design_object (see 4.2.524). A Design_intent_modification may be one of Material_addition_feature (see 4.2.528), Material_removal_feature (see 4.2.533), or Material_shape_modification (see 4.2.536). A Design_intent_modification provides capabilities to archive design intent along with constraint based modifications so that if a constraint is removed the original design intent, or a part thereof, may be restored.

EXAMPLE 1 This example shows how this part of ISO 10303 may be used to exchange or archive design intent for the case of a power plane where there is penetration of the power plane by other signals. Figure 35 is the original design intent for Power Plane 1 that is captured in a member of Connected_filled_area (see 4.2.184)(#1).

Figure 36 is the original design intent for Power Plane 2 that is captured in a member of Connected_filled_area (#2).

Figure 35 – Power Plane 1 design intent

Figure 36 – Power Plane 2 design intent

Figure 37 is the original design intent for Signal (see 4.2.823) 3 that is captured in a member of Conductor (see 4.2.176)(#3). In order to accomplish the embedding of Power Plane 2 into Power Plane 1 and in order to accomplish the embedding of Signal 3 into the result of the previous embedding, a sequence is followed. In order to meet requirements, constraints must be satisfied regarding spacing of conductive areas. These constraints are specified by the `Ee_requirement_occurrence` (see 4.2.330). Note that the following method is based on the relative priority of the signal and the two power planes. This example assumes that the conductor has the highest priority for area, followed by Power Plane 2 followed by Power Plane 1 which has the lowest priority.

Figure 37 – Signal 3 design intent

Step 1: Create three "design intent" `Stratum_features` as above. Note that these features are a permanent part of the design.

Step 2: Create a member of `Material_removal_stratum_feature_template` (see figure 38) for the spacing requirement to be met between Power Plane 2 and Power Plane 1. This template shape is dependent on the voltage between Power Plane 2 and Power Plane 1. The distance between the outer extent of Power Plane 2 and the outer extent of the template shape is explicitly stated in the `electrical_isolation_spacing_requirement` between the Power Plane 2 and Power Plane 1. Populate member of `Electrical_isolation_material_removal_structure` to capture the stated relationships and properties. For further reference in this example, this member will be called 1.

Figure 38 – Power Plane 1 to 2 Material removal template

Step 3: Create a `Material_removal_stratum_feature_template` (see figure 39) for the spacing requirement to be met between Signal 3 and Power Plane 1. This template shape is dependent on the voltage between Signal 3 and Power Plane 1. The distance between the outer extent of Signal 3 and the outer extent of the template shape is explicitly stated in the `electrical_isolation_spacing_requirement` between the Signal 3 and Power Plane 1. Populate a member of `Electrical_isolation_material_removal_structure` to capture the stated relationships and properties. For further reference in the example, this member will be called 2.

Figure 39 – Power Plane 1 to Signal 3 Material removal template

Step 4: Create a `Material_removal_stratum_feature_template` (see figure 40) for the spacing requirement to be met between Signal 3 and Power Plane 2. This template shape is dependent on the voltage between Signal 3 and Power Plane 2. The distance between the outer extent of Signal 3 and the outer extent of the template shape is explicitly stated in the `electrical_isolation_spacing_requirement` between the Signal 3 and Power Plane 2. Populate a member of `Electrical_isolation_material_removal_structure` to capture the stated relationships and properties. For further reference in the example, this member will be called 3. As a summary at this point, all the design intent shapes are defined; all the electrical isolation shapes are defined.

Figure 40 – Power Plane 2 to Signal 3 Material removal template

See figure 41 for the result achieved by a processor in conformance with this part of ISO 10303, in support of a CAD application, or in support of a manufacturing application.

Since Signal 3 has a higher priority than Power Plane 2, the `precedent_modification` attribute specifies `Electrical_isolation_material_removal_structure #1` and the `subsequent_modification` specifies `Electrical_isolation_material_removal_structure #2`

The data associated with a `Design_intent_modification` are the following:

- `design_intent`;
- `modification_causal_item`.

Figure 41 – Final shape for the combined signals

4.2.267.1 design_intent

The `design_intent` specifies the `Stratum_feature` (see 4.2.851) that is changed by the `Design_intent_modification`.

4.2.267.2 modification_causal_item

The `modification_causal_item` specifies one of either an `Assembly_component` (see 4.2.34), a `Component_external_reference` (see 4.2.117), a `Component_feature` (see 4.2.118), or a `Component_feature_external_reference` (see 4.2.119), or one of an `Ee_requirement_occurrence` (see 4.2.330), a `Stratum` (see 4.2.845), or one of an `Inter_stratum_feature` (see 4.2.432), a `Laminate_component` (see 4.2.483), a `Stratum_feature` (see 4.2.851), or a `Stratum_surface` (see 4.2.868) that is the cause of the `Design_intent_modification`.

Constraints:

WR1: A processor reading an exchange file based on this part of ISO 10303 shall interpret the lack of member of `Design_intent_modification_sequence` as meaning that there are no conflicting members of `Electrical_isolation_material_removal_structure` in the exchange file, and that they may be applied in any sequence.

NOTE EXPRESS specification:

4.2.268 Design_intent_modification_3d_position

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_intent_modification_3d_position is a type of Managed_design_object (see 4.2.524). A Design_intent_modification_in_stratum_3d_position is the three dimensional position and orientation of a three dimensional model of a Design_intent_modification (see 4.2.267) in the three dimensional model of the Stratum (see 4.2.845).

The data associated with a Design_intent_modification_3d_position are the following:

- feature_shape;
- stratum_shape;
- transformation.

4.2.268.1 feature_shape

The feature_shape specifies the role of either the Design_intent_modification_3d_shape (see 4.2.269) or of the Design_intent_modification_non_planar_2d_shape (see 4.2.270) for the Design_intent_modification_3d_position.

4.2.268.2 stratum_shape

The stratum_shape specifies the role of the Stratum_3d_shape (see 4.2.846) for the Design_intent_modification_3d_position.

4.2.268.3 transformation

The transformation specifies the role of the Axis_placement_3d (see 4.2.58) for the Design_intent_modification_3d_position.

NOTE EXPRESS specification:

```

*)
ENTITY design_intent_modification_3d_position

--tt tc1 wd8 changed name, geometric context
( *
```

4.2.269 Design_intent_modification_3d_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_intent_modification_3d_shape is a type of Bound_volume_shape (see 4.2.76) and a type of Feature_shape_definition (see 4.2.372). A Design_intent_modification_3d_shape is the representation of a Design_intent_modification (see 4.2.267) by a Bound_volume_shape (see 4.2.76).

The data associated with a Design_intent_modification_3d_shape are the following:

- represented_design_intent_modification;
- shape_representation.

4.2.269.1 represented_design_intent_modification

The represented_design_intent_modification specifies the Design_intent_modification (see 4.2.267) that is to be characterized by the Design_intent_modification_3d_shape.

4.2.269.2 shape_representation

The shape_representation specifies the Bound_volume_shape (see 4.2.76) for the representation of the Design_intent_modification (see 4.2.267).

NOTE EXPRESS specification:

```

*)
ENTITY design_intent_modification_3d_shape
  SUBTYPE OF (bound_volume_shape, feature_shape_definition);

--tt tc1 wd8 changed name, geometric context
(*
```

4.2.270 Design_intent_modification_non_planar_2d_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_intent_modification_non_planar_2d_shape is a type of Managed_design_object (see 4.2.524). A Design_intent_modification_non_planar_2d_shape is the representation of a Design_intent_modification (see 4.2.267) by a Open_shell_based_surface (see 4.2.566).

The data associated with a `Design_intent_modification_non_planar_2d_shape` are the following:

- `represented_design_intent_modification`;
- `shape_representation`.

4.2.270.1 `represented_design_intent_modification`

The `represented_design_intent_modification` specifies the `Design_intent_modification` (see 4.2.267) that is to be characterized by the `Design_intent_modification_non_planar_2d_shape`.

4.2.270.2 `shape_representation`

The `shape_representation` specifies the `Open_shell_based_surface` (see 4.2.566) for the representation of the `Design_intent_modification` (see 4.2.267).

NOTE EXPRESS specification:

```

*)
ENTITY design_intent_modification_non_planar_2d_shape

```

4.2.271 `Design_intent_modification_planar_position`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Design_intent_modification_planar_position` is a type of `Managed_design_object` (see 4.2.524). A `Design_intent_modification_in_stratum_planar_position` is the two dimensional position and orientation of a two dimensional model of a `Design_intent_modification` (see 4.2.267) in the two dimensional model of the Stratum (see 4.2.845).

The data associated with a `Design_intent_modification_planar_position` are the following:

- `feature_shape`;
- `stratum_shape`;
- `transformation`.

4.2.271.1 feature_shape

The feature_shape specifies either a Design_intent_modification_planar_shape (see 4.2.272) or a Design_intent_modification_styled_area_representation (see 4.2.274) for the Design_intent_modification_planar_position.

4.2.271.2 stratum_shape

The stratum_shape specifies the role of the Stratum_planar_shape (see 4.2.867) for the Design_intent_modification_planar_position.

4.2.271.3 transformation

The transformation specifies the role of the Axis_placement_2d (see 4.2.57) for the Design_intent_modification_planar_position.

NOTE EXPRESS specification:

```

*)
ENTITY design_intent_modification_planar_position
  SUBTYPE OF (managed_design_object);

END_ENTITY; -- design_intent_modification_planar_position

( *
```

4.2.272 Design_intent_modification_planar_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_intent_modification_planar_shape is a type of Managed_design_object (see 4.2.524). A Design_intent_modification_planar_shape is the representation of a Design_intent_modification (see 4.2.267) by a Planar_projected_shape (see 4.2.677).

The data associated with a Design_intent_modification_planar_shape are the following:

- represented_design_intent_modification;
- shape_representation.

4.2.272.1 represented_design_intent_modification

The represented_design_intent_modification specifies the Design_intent_modification (see 4.2.267) that is to be characterized by the Design_intent_modification_planar_shape.

4.2.272.2 shape_representation

The shape_surface_representation specifies the Planar_projected_shape (see 4.2.677) for the representation of the Design_intent_modification (see 4.2.267).

NOTE EXPRESS specification:

```

*)
ENTITY design_intent_modification_planar_shape
  SUBTYPE OF (planar_projected_shape);
    represented_design_intent_modification : design_intent_modification;
(* tt tc1 wd9 deleted
    shape_representation                  : planar_projected_shape;
*)
END_ENTITY; -- design_intent_modification_planar_shape

( *
```

4.2.273 Design_intent_modification_sequence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_intent_modification_sequence is a type of Managed_design_object (see 4.2.524). A Design_intent_modification_sequence is a link in a sequence of design modifications that results in the completed design.

The data associated with a Design_intent_modification_sequence are the following:

- precedent_modification;
- subsequent_modification.

4.2.273.1 precedent_modification

The precedent_modification specifies the previous Design_intent_modification (see 4.2.267) or the previous Material_removal_laminate_component (see 4.2.535) for the Design_intent_modification_sequence.

4.2.273.2 subsequent_modification

The subsequent_modification specifies the subsequent Design_intent_modification (see 4.2.267) or the subsequent Material_removal_laminate_component (see 4.2.535) for the Design_intent_modification_sequence.

Constraints:

UR1: The combination of the precedent_modification and the subsequent_modification shall be unique within a population of Design_intent_modification_sequences.

NOTE EXPRESS specification:

```

*)
ENTITY design_intent_modification_sequence
  SUBTYPE OF (managed_design_object);

    UR1 : precedent_modification, subsequent_modification;
END_ENTITY; -- design_intent_modification_sequence

( *
```

4.2.274 Design_intent_modification_styled_area_representation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_intent_modification_styled_area_representation is a type of Managed_design_object (see 4.2.524). A Design_intent_modification_styled_area_representation is the representation of one or more Design_intent_modification (see 4.2.267) as one of a Fill_area_occurrence (see 4.2.377), or a Styled_curve_occurrence (see 4.2.875). A Design_intent_modification_styled_area_representation is parametric data provided to support an algorithm that calculates explicit geometry. Since the geometry may be discontinuous (fill may include dashed lines), more than one Design_intent_modification (see 4.2.267) may be referenced by Design_intent_modification_styled_area_representation as the resulting product data of the algorithm execution. The geometric data resulting from execution of the algorithm shall be included in Design_intent_modification_planar_shape (see 4.2.272) if it is not desired to exchange the Design_intent_modification_styled_area_representation. Exchanging or sharing both the Design_intent_modification_styled_area_representation and the Design_intent_modification_planar_shape that result from execution of the algorithm may be appropriate. Therefore an optional attribute that specifies the planar shapes that are derived from the Design_intent_modification_styled_area_representation is to be included in an exchange if both the planar shape and the styled area representation is included. The units used in the Design_intent_modification_styled_area_representation shall be those specified in the global geometric context for the Interconnect_module (see 4.2.440) design as specified by Cartesian_coordinate_system (see 4.2.86). If the geometry is contiguous, there shall be only one Design_intent_modification referenced.

The data associated with a `Design_intent_modification_styled_area_representation` are the following:

- `derived_planar_shape`;
- `represented_design_intent_modification`;
- `shape_styled_area_representation`.

4.2.274.1 `derived_planar_shape`

The `derived_planar_shape` specifies the `Design_intent_modification_planar_shape` for the `Design_intent_modification_styled_area_representation`. There may be more than one `Design_intent_modification_planar_shape` for the `Design_intent_modification_styled_area_representation`. A `Design_intent_modification_planar_shape` need not be provided for the `Design_intent_modification_styled_area_representation`.

4.2.274.2 `represented_design_intent_modification`

The `represented_design_intent_modification` specifies the `Design_intent_modification` that is characterized by this `Design_intent_modification_styled_area_representation`. There may be more than one `Design_intent_modification` for the `Design_intent_modification_styled_area_representation`.

4.2.274.3 `shape_styled_area_representation`

The `shape_styled_area_representation` specifies one of a `Fill_area_occurrence` (see 4.2.377), or a `Styled_curve_occurrence` (see 4.2.875) that represents the modification in the `Design_intent`.

NOTE EXPRESS specification:

```

*)
ENTITY design_intent_modification_styled_area_representation
  SUBTYPE OF (managed_design_object);
    derived_planar_shape          : OPTIONAL SET [1:?] OF
                                   design_intent_modification_planar_shape;
    represented_design_intent_modification : design_intent_modification;
    shape_styled_area_representation : styled_area_representation;
END_ENTITY; -- design_intent_modification_styled_area_representation

( *
```

4.2.275 `Design_layer_stratum`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Design_layer_stratum` is a type of `Stratum` (see 4.2.845) incorporated into an `Interconnect_module` (see 4.2.440) for the purpose of realizing a physical network in one material.

NOTE `Design_layer_stratum` are usually described as a signal layer or a power or ground plane.

The data associated with a `Design_layer_stratum` are the following:

- `existence_dependence`;
- `of_technology`;
- `primary_design_layer_stratum`.

4.2.275.1 `existence_dependence`

The `existence_dependence` is an inverse relationship that specifies that the existence of the `Design_layer_stratum` is dependent on the existence of the `Layer_connection_point` (see 4.2.499) that specifies the `Design_layer_stratum` as its `resident_design_layer_stratum`. There shall be one or more `Layer_connection_point` for a `Design_layer_stratum`.

4.2.275.2 `of_technology`

The `of_technology` specifies the role of the `Design_layer_technology` (see 4.2.276) for the `Design_layer_stratum`.

4.2.275.3 `primary_design_layer_stratum`

The `primary_design_layer_stratum` specifies whether or not the `Design_layer_stratum` is the `primary_stratum` of the product. The value of `TRUE` indicates that the `Design_layer_stratum` is the `primary_design_layer_stratum`, meaning that it is the stratum occupying the side of the product that has been arbitrarily chosen to be the primary side. The value of `FALSE` indicates that the `Design_layer_stratum` is not the `primary_design_layer_stratum`.

NOTE Usual industry practice is to specify the primary stratum as that which has more components or more active components on it, but this part of ISO 10303 does not enforce that practice.

Constraints:

WR1: The value of `TRUE` for the `primary_design_layer_stratum` shall be specified for exactly one member of `Design_layer_stratum` in the design.

NOTE This constraint is formally defined in the `Interconnect_module` AO.

WR2: The value of `TRUE` for the `primary_design_layer_stratum` shall be specified if and only if the `Design_layer_stratum` is assigned to the `Interconnect_module_primary_surface`. The `Design_layer_stratum` shall be assigned to the `Interconnect_module_primary_surface` if and only if the `primary_design_layer_stratum` is `TRUE`.

NOTE EXPRESS specification:

```

*)
ENTITY design_layer_stratum
  SUBTYPE OF (stratum);
    primary_design_layer_stratum : BOOLEAN;
    SELF\stratum.of_technology    : design_layer_technology;
  INVERSE
    existence_dependence : SET [1:?] OF layer_connection_point FOR
      resident_design_layer_stratum;
WHERE
  WR1: (NOT(primary_design_layer_stratum) AND
    (SIZEOF(QUERY(imps &#60;* USEDIN(SELF,
      'AP210_ARM.STRATUM_CONCEPT_TO_PHYSICAL_USAGE_VIEW_ASSIGNMENT.' +
      'ASSIGNED_DESIGN_OBJECT') |
      ('AP210_ARM.INTERCONNECT_MODULE_PRIMARY_SURFACE' IN
      TYPEOF(imps.defined_part_feature)))) = 0)) OR
    ((primary_design_layer_stratum) AND
    (SIZEOF(QUERY(imps &#60;* USEDIN(SELF,
      'AP210_ARM.STRATUM_CONCEPT_TO_PHYSICAL_USAGE_VIEW_ASSIGNMENT.' +
      'ASSIGNED_DESIGN_OBJECT') |
      ('AP210_ARM.INTERCONNECT_MODULE_PRIMARY_SURFACE' IN
      TYPEOF(imps.defined_part_feature)))) = 1)));
END_ENTITY; -- design_layer_stratum
( *

```

4.2.276 Design_layer_technology

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_layer_technology is a type of Stratum_technology (see 4.2.871). The Design_layer_technology is a technology specification tailored for those materials intended to be used to implement the direct connectivity as described in a design. The same Design_layer_technology may be used in multiple designs for multiple products, since there is no dependence of the Design_layer_technology on the design referencing it.

The data associated with a Design_layer_technology are the following:

- design_layer_purpose;
- minimum_finished_feature_size;
- minimum_finished_feature_spacing.

4.2.276.1 design_layer_purpose

The design_layer_purpose specifies one of the lands_only, other_signal, or power_or_ground purpose of the Design_layer_stratum (see 4.2.275) for the Design_layer_technology.

4.2.276.2 minimum_finished_feature_size

The `minimum_finished_feature_size` specifies the `Length_data_element` (see 4.2.511) of the smallest permissible extent of a feature for the `Design_layer_technology`.

4.2.276.3 minimum_finished_feature_spacing

The `minimum_finished_feature_spacing` specifies the `Length_data_element` (see 4.2.511) of the smallest permissible distance between features for the `Design_layer_technology`.

NOTE EXPRESS specification:

```
*)
ENTITY design_layer_technology
  SUBTYPE OF (stratum_technology);
    design_layer_purpose : layer_purpose;
    SELF\stratum_technology.minimum_finished_feature_size : length_data_element;
    SELF\stratum_technology.minimum_finished_feature_spacing : length_data_element;
END_ENTITY; -- design_layer_technology

(*
```

4.2.277 Padstack_definition

A `Design_layer_type_specific_padstack_definition` is a type of `Padstack_definition` (see 4.2.595) that applies to all design layers in a design to which it is applied.

NOTE EXPRESS specification:

```
*)
ENTITY design_layer_type_specific_padstack_definition
  SUBTYPE OF (padstack_definition);
END_ENTITY; -- padstack_definition

(*
```

4.2.278 Design_object_management_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Design_object_management_relationship` is one of an `Add_design_object_management_relationship` (see 4.2.3), a `Change_design_object_management_relationship` (see 4.2.95), or a `Delete_design_object_management_relationship` (see 4.2.257). A `Design_object_management_relationship` is the association between the `Ee_product_definition` (see 4.2.323) changed from to the `Ee_product_definition` changed to.

The data associated with a Design_object_management_relationship are the following:

- current_design;
- previous_design.

4.2.278.1 current_design

The current_design specifies the current Ee_product_definition (see 4.2.323), after the change, for the Design_object_management_relationship.

4.2.278.2 previous_design

The previous_design specifies the Ee_product_definition (see 4.2.323), before the change, for the Design_object_management_relationship.

Constraints:

WR1: The current_design shall not be the previous_design.

WR2: The type of both Ee_product_definitions shall be the same (e.g., both assembly_module).

NOTE EXPRESS specification:

```

*)
ENTITY design_object_management_relationship
  ABSTRACT SUPERTYPE OF (ONEOF (
    change_design_object_management_relationship,
    delete_design_object_management_relationship,
    add_design_object_management_relationship));
  previous_design : ee_product_definition;
  current_design  : ee_product_definition;
END_ENTITY; -- design_object_management_relationship

( *
```

4.2.279 Design_requirement_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_requirement_occurrence is a type of Ee_requirement_occurrence (see 4.2.330). A Design_requirement_occurrence may be an Interface_requirement_occurrence (see 4.2.471).

NOTE EXPRESS specification:

```
*)
ENTITY design_requirement_occurrence
  SUPERTYPE OF (interface_requirement_occurrence)
  SUBTYPE OF (ee_requirement_occurrence);
END_ENTITY; -- design_requirement_occurrence

( *
```

4.2.280 Design_specification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_specification is a type of Ee_specification (see 4.2.338) that establishes the design specifications of products. A Design_specification may be an Interface_specification (see 4.2.472). These specifications are not determined by other design or construction features or by referenced data.

NOTE EXPRESS specification:

```
*)
ENTITY design_specification
  SUPERTYPE OF (interface_specification)
  SUBTYPE OF (ee_specification);
END_ENTITY; -- design_specification

( *
```

4.2.281 Design_view_connection_zone_position_relationship

A Design_view_connection_zone_position_relationship is a type of Managed_design_object (see 4.2.524). A Design_view_connection_zone_position_relationship is the association between a Physical_unit_design_view (see 4.2.667), as a target and a Connection_zone (see 4.2.185) as the source. This relationship positions and orients the geometric model of the source into the model of the target using a transformation.

NOTE There can be only one terminal that uses the Connection_zone related so there is no need to reference the terminal in this relationship.

The data associated with a `Design_view_connection_zone_position_relationship` are the following:

- `associating_design_view_shape`;
- `associated_usage`;
- `associated_connection_zone_shape_definition`;
- `associated_usage_placement`;
- `associating_design_view`.

4.2.281.1 associating_design_view_shape

The `associating_design_view_shape` specifies the `Feature_shape_definition` (see 4.2.372), that is the shape that contains the target for the `Design_view_connection_zone_position_relationship`.

4.2.281.2 associated_usage

The `associated_usage` specifies the `Connection_zone` (see 4.2.185), that is the source item for the `Design_view_connection_zone_position_relationship`.

4.2.281.3 associated_connection_zone_shape_definition

The `associated_connection_zone_shape_definition` specifies the `Connection_zone_shape` (see ??), that is the source shape for the `Design_view_connection_zone_position_relationship`.

4.2.281.4 associated_usage_placement

The `associated_usage_placement` specifies the `Axis_placement` (see 4.2.56) that is the target item in the coordinate system of the terminal shape for the `Design_view_connection_zone_position_relationship`, including any transformation required.

4.2.281.5 associating_design_view

The `associating_design_view` specifies the `Physical_unit_design_view` (see 4.2.667) for which the shape is composed for the `Design_view_connection_zone_position_relationship`.

Constraints:

IP1: The `feature_shape_definition` of the `associating_design_view` shall be the `associating_design_view_shape`.

IP2: The `associated_usage connection_zone` shall be a `connection_zone` in the scope of the `associating_design_view`.

NOTE EXPRESS specification:

```

*)
ENTITY design_view_connection_zone_position_relationship
  SUBTYPE OF (managed_design_object);
    associating_design_view_shape          : feature_shape_definition;
    associated_usage                        : connection_zone;
    associated_connection_zone_shape_definition : feature_shape_definition;
    associated_usage_placement              : axis_placement;
    associating_design_view                 : physical_unit_design_view;
END_ENTITY; -- design_view_connection_zone_position_relationship
( *
```

4.2.282 Design_view_terminal_component_shape_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Design_view_terminal_component_shape_relationship is a type of Managed_design_object (see 4.2.524). A Design_view_terminal_component_shape_relationship is the association between a Conductive_interconnect_element_terminal (see 4.2.172), or an Interconnect_component_join_terminal (see 4.2.439), or an Interconnect_component_interface_terminal (see 4.2.438), or a Movable_packaged_component_join_terminal (see 4.2.572) as a source and either a Conductive_interconnect_element (see 4.2.171) or a Physical_component (see 4.2.648) or a Packaged_component (see 4.2.585) as the target, respectively. This relationship positions and orients the geometric model of the source into the model of the target using a transformation. A Conductive_interconnect_element_terminal shall not be associated with a Physical_component or with a Packaged_component. An Interconnect_component_join_terminal shall not be associated with a Conductive_interconnect_element or a Packaged_component. An Interconnect_component_interface_terminal shall not be associated with a Conductive_interconnect_element or a Packaged_component. A Movable_packaged_component_join_terminal shall only be associated with a Packaged_component.

The data associated with a Design_view_terminal_component_shape_relationship are the following:

- associating_component_shape;
- associated_usage;
- associated_terminal_shape_definition;
- associated_usage_placement.

4.2.282.1 associating_component_shape

The associating_component_shape specifies the Feature_shape_definition (see 4.2.372), that is the component shape for the Design_view_terminal_component_shape_relationship.

4.2.282.2 associated_usage

The `associated_usage` specifies the `Interconnect_component_join_terminal` (see 4.2.439), or the `Movable_packaged_component_join_terminal` (see 4.2.572), or the `Conductive_interconnect_element_terminal` (see 4.2.172), or the `Interconnect_component_interface_terminal` (see 4.2.438) that is the source item for the `Design_view_terminal_component_shape_relationship`.

4.2.282.3 associated_terminal_shape_definition

The `associated_terminal_shape_definition` specifies the `Feature_shape_definition` (see 4.2.372) that is the source shape for the `Design_view_terminal_component_shape_relationship`.

4.2.282.4 associated_usage_placement

The `associated_usage_placement` specifies the `Axis_placement` (see 4.2.56) that is the target for the `Design_view_terminal_component_shape_relationship`.

NOTE EXPRESS specification:

```

*)
ENTITY design_view_terminal_component_shape_relationship
  SUBTYPE OF (managed_design_object);
    associating_component_shape          : feature_shape_definition;
    associated_usage                      :
      conductive_interconnect_terminal_or_interconnect_component_join_terminal;
    associated_terminal_shape_definition : feature_shape_definition;
    associated_usage_placement           : axis_placement;
END_ENTITY; -- Design_view_terminal_component_shape_relationship
( *
```

4.2.283 Device_2d_position

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Device_2d_position` is a type of `Managed_design_object` (see 4.2.524). A `Device_2d_position` is the location in two dimensions of a `Part_device` (see 4.2.606) within a `Packaged_part` (see 4.2.591).

The data associated with a `Device_2d_position` are the following:

- `device_shape`;
- `part_shape`;
- `placed_device`;
- `transformation`.

4.2.283.1 device_shape

The device_shape specifies the Physical_unit_planar_shape (see 4.2.670) of the Part_device (see 4.2.606) for the Device_2d_position.

4.2.283.2 part_shape

The part_shape specifies the Physical_unit_planar_shape (see 4.2.670) of the Packaged_part (see 4.2.591) for the Device_2d_position.

4.2.283.3 placed_device

The placed_device specifies the role of the Part_device (see 4.2.606) for the Device_2d_position.

4.2.283.4 transformation

The transformation specifies the role of the Axis_placement_2d (see 4.2.57) for the Device_2d_position.

NOTE EXPRESS specification:

```

*)
ENTITY device_2d_position
  SUBTYPE OF (managed_design_object);
    placed_device : part_device;
    transformation : axis_placement_2d;
    part_shape    : physical_unit_planar_shape;
    device_shape  : physical_unit_planar_shape;
END_ENTITY; -- device_2d_position

```

(*

4.2.284 Device_3d_position

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Device_3d_position is a type of Managed_design_object (see 4.2.524). A Device_3d_position is the location in three dimensions of a Part_device (see 4.2.606) within a Packaged_part (see 4.2.591).

The data associated with a Device_3d_position are the following:

- device_shape;
- part_shape;
- placed_device;
- transformation.

4.2.284.1 device_shape

The device_shape specifies the Physical_unit_3d_shape (see 4.2.666) of the Part_device (see 4.2.606) for the Device_3d_position.

4.2.284.2 part_shape

The part_shape specifies the Physical_unit_3d_shape (see 4.2.666) of the Packaged_part (see 4.2.591) for the Device_3d_position.

4.2.284.3 placed_device

The placed_device specifies the role of the Part_device (see 4.2.606) for the Device_3d_position.

4.2.284.4 transformation

The transformation specifies the role of the Axis_placement_3d (see 4.2.58) for the Device_3d_position.

NOTE EXPRESS specification:

```

*)
ENTITY device_3d_position
  SUBTYPE OF (managed_design_object);
    placed_device : part_device;
    transformation : axis_placement_3d;
    part_shape : physical_unit_3d_shape;
    device_shape : physical_unit_3d_shape;
END_ENTITY; -- device_3d_position

```

(*

4.2.285 Device_terminal_map

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Device_terminal_map is a type of Managed_design_object (see 4.2.524). A Device_terminal_map is the association between a Part_device_terminal (see 4.2.607) and a Packaged_part_terminal (see 4.2.594). A Device_terminal_map provides the topological equivalent of a bond wire from the package terminal to the terminal of the installed Part_device (see 4.2.606).

The data associated with a Device_terminal_map are the following:

- mapped_device_terminal;
- target_terminal.

4.2.285.1 mapped_device_terminal

The mapped_device_terminal specifies the Part_device_terminal (see 4.2.607) from which the association is made to the target_terminal by the Device_terminal_map.

4.2.285.2 target_terminal

The target_terminal specifies the targeted Packaged_part_terminal (see 4.2.594) for the Device_terminal_map.

Constraints:

UR1: The combination of the target_terminal and mapped_device_terminal shall be unique within a population of Device_terminal_map.

WR1: The mapped_device_terminal and the target_terminal shall be in the context of the same Packaged_part.

NOTE Reference Part_device_terminal_model_port_assignment for Analytical_model_port_assignment.

NOTE EXPRESS specification:

```
*)
ENTITY device_terminal_map
  SUBTYPE OF (managed_design_object);
    target_terminal      : packaged_part_terminal;
    mapped_device_terminal : part_device_terminal;
  UNIQUE
    UR1 : mapped_device_terminal, target_terminal;
END_ENTITY; -- device_terminal_map

(*
```

4.2.286 Device_terminal_map_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Device_terminal_map_relationship is a type of Managed_design_object (see 4.2.524). A Device_terminal_map_relationship is the association of one Device_terminal_map (see 4.2.285) to another.

The data associated with a Device_terminal_map_relationship are the following:

- related_device_terminal_map;
- relating_device_terminal_map.

4.2.286.1 related_device_terminal_map

The related_device_terminal_map specifies the target Device_terminal_map (see 4.2.285) in the Device_terminal_map_relationship.

4.2.286.2 relating_device_terminal_map

The relating_device_terminal_map specifies the source Device_terminal_map (see 4.2.285) in the Device_terminal_map_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY device_terminal_map_relationship
  SUBTYPE OF (managed_design_object);
    related_device_terminal_map : device_terminal_map;
    relating_device_terminal_map : device_terminal_map;

```

4.2.287 Diametrical_boundary_size_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Diametrical_boundary_size_characteristic is a type of Boundary_size_characteristic (see 4.2.78) that defines the diameter of a Tolerance_zone_circular_or_cylindrical_or_spherical_boundary (see 4.2.919).

The data associated with a Diametrical_boundary_size_characteristic are the following:

— sized_boundary.

4.2.287.1 sized_boundary

The sized_boundary specifies the Tolerance_zone_circular_or_cylindrical_or_spherical_boundary (see 4.2.919), the diameter of which is defined by the Diametrical_boundary_size_characteristic.

Constraints:

WR1: The Tolerance_zone_boundary specified by the sized_boundary shall be the same instance of Tolerance_zone_boundary as specified by the defined_zone_boundary of the Boundary_zone_definition_with_specified_size that is specified as the boundary_definition.

NOTE The attribute boundary_definition is declared in the Boundary_size_characteristic entity of which this entity is a subtype.

NOTE EXPRESS specification:

```

*)
ENTITY diametrical_boundary_size_characteristic
  SUBTYPE OF (boundary_size_characteristic);
    sized_boundary : tolerance_zone_circular_or_cylindrical_or_spherical_boundary;
END_ENTITY; -- diametrical_boundary_size_characteristic

( *

```

4.2.288 Dielectric_crossover_area

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Dielectric_crossover_area is a type of Stratum_concept_relationship (see 4.2.849) that relates one Stratum_feature (see 4.2.851) with another that results in the creation of a dielectric crossover feature in a dielectric Stratum (see 4.2.845).

The data associated with a Dielectric_crossover_area are the following:

- related_concept;
- relating_concept;
- resulting_dielectric_crossover.

4.2.288.1 related_concept

The related_concept specifies the source Stratum_feature (see 4.2.851) for the Dielectric_crossover_area.

4.2.288.2 relating_concept

The relating_concept specifies the target Stratum_feature (see 4.2.851) for the Dielectric_crossover_area.

4.2.288.3 resulting_dielectric_crossover

The resulting_dielectric_crossover specifies the Stratum_feature (see 4.2.851) in a stratum of dielectric material for the Dielectric_crossover_area.

Constraints:

WR1: The Stratum on which the Stratum_features reside related to this Dielectric_crossover_area shall be arranged such that the resulting_dielectric_crossover is between the relating_concept and the related_concept.

NOTE There is no directionality implied by the use of "related", "relating" in the attribute names.

WR2: The relating_concept shall not be the related_concept.

NOTE EXPRESS specification:

```
*)
ENTITY dielectric_crossover_area
  SUBTYPE OF (stratum_concept_relationship);
    related_concept          : stratum_feature;
    relating_concept         : stratum_feature;
    resulting_dielectric_crossover : stratum_feature;
END_ENTITY; -- dielectric_crossover_area

( *
```

4.2.289 Dielectric_material_passage

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Dielectric_material_passage is a type of Inter_stratum_feature (see 4.2.432) that contains dielectric material. The extent of the Dielectric_material_passage is between the boundary defined by the shape_definition of this Dielectric_material_passage and the shape of the Cutout that is to be filled with dielectric material during manufacture.

EXAMPLE 1 Figure 42 illustrates an exploded, stylized, detail of a Dielectric_material_passage as it appears in two sequential stages of the fabrication process.

The data associated with a Dielectric_material_passage are the following:

- feature_material;
- precedent_passage.

EXAMPLE 2 A Dielectric_material_passage is used, for example, in printed circuit boards with metal core Stratum for thermal conductivity, that have oversized passages created through the metal Stratum before bonding. These oversized passages in the metal Stratum are filled with dielectric material during the bonding process for later machining to suit the eventual purpose for the passage at that location. These smaller passages are often plated for electrical continuity among Design_layer_stratums on either side of the metal core, but there must be electrical isolation between the plating in the passage and the metal thermal conductive Stratum. The dielectric fill material provides that isolation.

4.2.289.1 feature_material

The feature_material specifies either the Ee_material (see 4.2.318) or the Ee_requirement_occurrence (see 4.2.330) that defines the dielectric material contained in the Dielectric_material_passage. The feature_material need not be specified for a particular Dielectric_material_passage.

Figure 42 – Dielectric_material_passage exploded view

4.2.289.2 precedent_passage

The precedent_passage specifies the Cutout (see 4.2.208) that defines the outer boundary of the Dielectric_material_passage before it is filled with the specified non-conductive Ee_material (see 4.2.318).

Constraints:

WR1: The same material shall exist throughout the extent of the passage.

NOTE EXPRESS specification:

```
*)
ENTITY dielectric_material_passage
  SUBTYPE OF (inter_stratum_feature);
    feature_material : OPTIONAL material_or_specification;
    precedent_passage : cutout;
END_ENTITY; -- dielectric_material_passage
```

(*

4.2.290 Digital_analytical_model_port

A Digital_analytical_model_port is a type of Analytical_model_port (see 4.2.17) that defines a digital context.

The data associated with a Digital_analytical_model_port are the following:

— nominal_signal_flow_direction.

4.2.290.1 nominal_signal_flow_direction

The nominal_signal_flow_direction specifies either BIDIRECTIONAL, INPUT_DIRECTION, NOT_APPLICABLE, OUTPUT_DIRECTION, or UNKNOWN_DIRECTION for the Digital_analytical_model_port.

Constraints:

WR1: "NOT_APPLICABLE" is not an allowed value.

NOTE EXPRESS specification:

```
*)
ENTITY digital_analytical_model_port
  SUBTYPE OF (analytical_model_port);
WHERE
  WR1: not_applicable &#60;&#62;
    SELF\analytical_model_port.nominal_signal_flow_direction;
END_ENTITY; -- digital_analytical_model_port
```

4.2.291 Dimension_along_curve

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Dimension_along_curve` is a type of `Dimensional_location` (see 4.2.300) that defines the location of a `Shape_element` (see 4.2.810) in relationship to another `Shape_element` and in which a `Shape_element` is specified as the path along which the `Dimension_along_curve` characterizes this relationship.

The data associated with a `Dimension_along_curve` are the following:

— `path`.

4.2.291.1 `path`

The path specifies the `Shape_element` (see 4.2.810) along which the relationship between the two `Shape_element`s is characterized by the `Dimension_along_curve`.

Constraints:

UR1: The combination of `located_elements` inherited from `Dimensional_location` and `path` shall be unique within a population of `Dimension_along_curve`.

WR1: The `dimension_type` of the `Dimension_location_with_direction_vector` shall be either "arc_length", or "linear".

NOTE The attribute `dimension_type` is declared in the `Dimensional_characteristic` entity of which this entity is a subtype.

NOTE EXPRESS specification:

```
*)
ENTITY dimension_along_curve
  SUBTYPE OF (dimensional_location);
  path : shape_element;
  UNIQUE
    UR1 : located_elements, path;
END_ENTITY; -- dimension_along_curve
```

(*

4.2.292 `Dimension_location_with_direction_vector`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Dimension_location_with_direction_vector` is a type of `Dimensional_location` (see 4.2.300) in which the characterization of the relationship between the two `Shape_element`s (see 4.2.810) is dependent on a vector that establishes a measurement direction.

The data associated with a `Dimension_location_with_direction_vector` are the following:

— `measurement_direction`.

4.2.292.1 `measurement_direction`

The `measurement_direction` either specifies the `Datum_based_vector_orientation` (see 4.2.220) or the `Axis_placement` (see 4.2.56) that establishes the measurement direction. If the `measurement_direction` specifies a `Datum_based_vector_orientation`, the measurement direction is established from Datum (see 4.2.214). If the `measurement_direction` specifies an `Axis_placement`, the measurement direction is based on the `Axis_placement` and the representation of the `Shape_elements` whose relationship is characterized by the `Dimension_location_with_direction_vector`.

Constraints:

UR1: The combination of `located_elements` inherited from `Dimensional_location` and `measurement_direction` shall be unique within a population of `Dimension_location_with_direction_vector`.

NOTE The attribute `located_elements` is declared in the `Dimensional_location` entity of which this entity is a subtype.

WR1: The `dimension_type` of the `Dimension_location_with_direction_vector` shall be "linear".

NOTE The attribute `dimension_type` is declared in the `Dimensional_characteristic` entity of which this entity is a subtype.

IP1: If the `measurement_direction` specifies an `Axis_placement`, the `Axis_placement` shall be in the same context as the representation of the two `Shape_elements` that are located relative to each other by the `Dimension_location_with_direction_vector`.

NOTE EXPRESS specification:

```
*)
ENTITY dimension_location_with_direction_vector

    SUBTYPE OF (dimensional_location);
        measurement_direction : axis_placement_or_datum_based_vector_orientation_select;
    UNIQUE
        UR1 : located_elements, measurement_direction;
END_ENTITY; -- dimension_location_with_direction_vector

( *
```

4.2.293 `Dimension_location_with_specified_datum_system`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Dimension_location_with_specified_datum_system` is a type of `Dimensional_location` (see 4.2.300) that is related to a `Datum_reference_frame` (see 4.2.235).

The data associated with a `Dimension_location_with_specified_datum_system` are the following:

— `referenced_datum_system_defining_conditions`.

4.2.293.1 `referenced_datum_system_defining_conditions`

The `referenced_datum_system_defining_conditions` specifies the `Datum_system_defining_conditions_without_material_conditions` (see 4.2.239) that defines the order of precedence for the datums of a `Datum_system` (see 4.2.236) which in turn establishes the `Datum_reference_frame` (see 4.2.235) to which the `Dimension_location_with_specified_datum_system` is related.

NOTE The specification of the relationship between linear and angular dimensions to a datum reference frame is discussed in 4.4 of ASME Y14.5M.

NOTE EXPRESS specification:

```
*)
ENTITY dimension_location_with_specified_datum_system
  SUBTYPE OF (dimensional_location);
    referenced_datum_system_defining_conditions :
    datum_system_defining_conditions_without_material_conditions;
END_ENTITY; -- dimension_location_with_specified_datum_system

( *
```

4.2.294 `Dimension_qualifier`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Dimension_qualifier` is a type of `Managed_design_object` (see 4.2.524). A `Dimension_qualifier` is either a `Pre_defined_dimension_qualifier` (see 4.2.707) or a `User_defined_dimension_qualifier` (see 4.2.944). A `Dimension_qualifier` is a description that qualifies one or more `Dimensional_characteristic` (see 4.2.298).

NOTE Qualifying notes are described in 5.3 of ISO/DIS 1101.

The data associated with a `Dimension_qualifier` are the following:

— `qualified_dimensions`.

4.2.294.1 qualified_dimensions

The qualified_dimensions specifies the Dimensional_characteristic (see 4.2.298) to which the Dimension_qualifier applies. There shall be one or more Dimensional_characteristic specified as the qualified_dimensions for a Dimension_qualifier.

NOTE EXPRESS specification:

```
*)
ENTITY dimension_qualifier
  ABSTRACT SUPERTYPE OF (ONEOF (pre_defined_dimension_qualifier,
    user_defined_dimension_qualifier))
  SUBTYPE OF (managed_design_object);

( *
```

4.2.295 Dimension_related_positional_boundary

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Dimension_related_positional_boundary is a type of Positional_boundary (see 4.2.698) that is a theoretical boundary that is composed of a set of one or more Positional_boundary_member (see 4.2.701). Each Positional_boundary_member is defined by a separate Boundary_based_position_tolerance (see 4.2.77) in conjunction with a Dimensional_size (see 4.2.301).

The data associated with a Dimension_related_positional_boundary are the following:

- boundary_members;
- constrained_physical_feature.

4.2.295.1 boundary_members

The boundary_members specifies the Positional_boundary_member (see 4.2.701) that comprise the Dimension_related_positional_boundary. There shall be one or more Positional_boundary_member specified as the boundary_members for the Dimension_related_positional_boundary.

4.2.295.2 constrained_physical_feature

The constrained_physical_feature specifies the Physical_feature_or_part_template (see 4.2.658) that is to be constrained by the Dimension_related_positional_boundary.

Constraints:

WR1: The Positional_boundary_definition specified as the boundary_definition shall be a Dimension_related_positional_boundary_definition.

NOTE The attribute boundary_definition is declared in the Positional_boundary entity of which this entity is a subtype.

NOTE EXPRESS specification:

```

*)
ENTITY dimension_related_positional_boundary
  SUBTYPE OF (positional_boundary);
    boundary_members      : SET [1:?] OF positional_boundary_member;
    constrained_physical_feature : physical_feature_or_part_template;
END_ENTITY; -- dimension_related_positional_boundary

( *

```

4.2.296 Dimension_related_positional_boundary_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Dimension_related_positional_boundary_definition is a type of Positional_boundary_definition (see 4.2.700) that characterizes a Dimension_related_positional_boundary (see 4.2.295).

The data associated with a Dimension_related_positional_boundary_definition are the following:

- characterized_boundary_member_definitions;
- defined_positional_boundary.

4.2.296.1 characterized_boundary_member_definitions

The characterized_boundary_member_definitions specifies the Positional_boundary_member_definition (see 4.2.702) that characterize each Positional_boundary_member (see 4.2.701) that comprise the Dimension_related_positional_boundary (see 4.2.295). There shall be one or more Positional_boundary_member_definition specified as the characterized_boundary_member_definitions for the Dimension_related_positional_boundary_definition.

4.2.296.2 defined_positional_boundary

The defined_positional_boundary specifies the Dimension_related_positional_boundary (see 4.2.295) that is characterized by the Dimension_related_positional_boundary_definition.

Constraints:

WR1: Each `Boundary_based_position_tolerance` that defines a `Positional_boundary_member_definition` of the `Positional_boundary_definition` shall reference the same instance of `Datum_system_defining_conditions`.

WR2: Each `Boundary_based_position_tolerance` that defines a `Positional_boundary_member_definition` of the `Positional_boundary_definition` shall have the same value for the `applied_material_condition_property_name`.

NOTE EXPRESS specification:

```

*)
ENTITY dimension_related_positional_boundary_definition
  SUBTYPE OF (positional_boundary_definition);
  SELF\positional_boundary_definition.defined_positional_boundary :
dimension_related_positional_boundary;
  characterized_boundary_member_definitions :
SET [1:?] OF positional_boundary_member_definition;
END_ENTITY; -- dimension_related_positional_boundary_definition

( *
```

4.2.297 Dimension_set

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Dimension_set` is a type of `Managed_design_object` (see 4.2.524). A `Dimension_set` is a set of `Dimensional_characteristic` (see 4.2.298) that specify the theoretically exact shape of a `Physical_feature_or_part_template` (see 4.2.658).

The data associated with a `Dimension_set` are the following:

— `associated_dimensions`.

4.2.297.1 associated_dimensions

The `associated_dimensions` specifies the `Dimensional_characteristic` (see 4.2.298) that are associated with the `Dimension_set`. There shall be one or more `Dimensional_characteristic` specified as the `associated_dimensions` for the `Dimension_set`.

Constraints:

WR1: The `Dimension_set` shall be specified as the `profile_representation` by at least one `True_profile`.

NOTE EXPRESS specification:

```

*)
ENTITY dimension_set
  SUBTYPE OF (managed_design_object);
  associated_dimensions : SET [1:?] OF dimensional_characteristic;
END_ENTITY; -- dimension_set

( *

```

4.2.298 Dimensional_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Dimensional_characteristic is a type of Managed_design_object (see 4.2.524). A Dimensional_characteristic is either a Dimensional_location (see 4.2.300) or a Dimensional_size (see 4.2.301) that characterizes either the spatial constraints between two Shape_element (see 4.2.810) or the size of a Shape_element. Additionally, a Dimensional_characteristic may be a Statistical_dimensional_tolerance (see 4.2.840).

The data associated with a Dimensional_characteristic are the following:

— dimension_type.

4.2.298.1 dimension_type

The dimension_type specifies the label by which the Dimensional_characteristic is known. The dimension_type shall be one of "angular", "arc_length", "controlled_radius", "diameter", "linear", or "radius".

NOTE A description of controlled radius is given in 2.15.2 of ASME Y14.5M.

Constraints:

WR1: The Dimensional_characteristic shall be specified as the dimension by at most one Dimensional_characteristic_representation that specifies a value of FALSE for the auxiliary_dimension_representation.

WR2: If the dimension_type is "angular" and the Dimensional_characteristic is represented by a Shape_dimension_representation that specifies one or more Data_element, each Data_element shall be an Angle_data_element.

WR3: The Dimensional_characteristic shall either be a Dimensional_size or a Dimensional_location.

WR4: If the dimension_type is other than "angular" and the Dimensional_characteristic is represented by a Shape_dimension_representation that specifies one or more Data_element, each Data_element shall be a Length_data_element.

WR5: There shall be exactly one Ee_requirement_occurrence with the description of "Geometric Dimensioning and Tolerancing Reference" that specifies at least one Ee_specification as the requirement_specification.

IP1: There shall be exactly one Ee_requirement_occurrence with the description of "Geometric Dimensioning and Tolerancing Reference" that specifies at least one Ee_specification as the requirement_specification. The Ee_specification shall reference those standards by which the geometric dimensioning and tolerancing data is to be interpreted.

NOTE EXPRESS specification:

```

*)
ENTITY dimensional_characteristic
  ABSTRACT SUPERTYPE OF (ONEOF (dimensional_location,dimensional_size)
    ANDOR statistical_dimensional_tolerance)
  SUBTYPE OF (managed_design_object);
    dimension_type : dimensional_types;
END_ENTITY; -- dimensional_characteristic

( *
```

4.2.299 Dimensional_characteristic_representation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Dimensional_characteristic_representation is a type of Managed_design_object (see 4.2.524). A Dimensional_characteristic_representation is an association between a Dimensional_characteristic (see 4.2.298) and the Shape_dimension_representation (see 4.2.809) that represents the Dimensional_characteristic.

The data associated with a Dimensional_characteristic_representation are the following:

- auxiliary_dimension_representation;
- dimension;
- representation.

4.2.299.1 auxiliary_dimension_representation

The auxiliary_dimension_representation specifies the boolean value that indicates whether the associated Shape_dimension_representation (see 4.2.809) is to be considered a requirement for the associated Dimensional_characteristic (see 4.2.298) or is specified for informational purposes only. A value of TRUE indicates that the associated Shape_dimension_representation is for informational purposes only. A value of FALSE indicates that the associated Shape_dimension_representation is to be considered a requirement.

NOTE Auxiliary dimension is defined in 3.1.1.3 of ISO 129.

4.2.299.2 dimension

The dimension specifies either a Dimensional_location (see 4.2.300) or a Dimensional_size (see 4.2.301) that is represented by the specified Shape_dimension_representation (see 4.2.809) for the Dimensional_characteristic_representation.

4.2.299.3 representation

The representation specifies the Shape_dimension_representation (see 4.2.809) that represents the specified Dimensional_characteristic (see 4.2.298) for the Dimensional_characteristic_representation.

NOTE EXPRESS specification:

```

*)
ENTITY dimensional_characteristic_representation
  SUBTYPE OF (managed_design_object);
    representation          : shape_dimension_representation;
    dimension                : dimensional_location_or_dimensional_size;
    auxiliary_dimension_representation : BOOLEAN;
END_ENTITY; -- dimensional_characteristic_representation

( *
```

4.2.300 Dimensional_location

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Dimensional_location is a type of Dimensional_characteristic (see 4.2.298) that defines the location of a Shape_element (see 4.2.810) relative to another Shape_element. A Dimensional_location may be one of an Angular_dimension_with_direction_vector (see 4.2.24), a Dimension_along_curve (see 4.2.291), or a Dimension_location_with_direction_vector (see 4.2.292). Additionally, the Dimensional_location may be a Dimension_location_with_specified_datum_system (see 4.2.293).

The data associated with a Dimensional_location are the following:

- directed;
- located_elements.

4.2.300.1 directed

The directed specifies the boolean value that indicates whether there is significance to the direction of measure of the Dimensional_location. A value of TRUE indicates that the measurement direction shall be from the Shape_element (see 4.2.810) specified as the locating_shape_element to the Shape_element specified as the located_shape_element by the Shape_element_locating_relationship (see 4.2.815) that is characterized by the Dimensional_location. A value of FALSE indicates that there is no significance placed on the direction of measure.

4.2.300.2 located_elements

The located_elements specifies the Shape_element_locating_relationship (see 4.2.815) that specifies the two Shape_elements for which the relationship is characterized by the Dimensional_location.

Constraints:

WR1: The dimension_type of the Dimensional_location shall not be "diameter".

NOTE The attribute dimension_type is declared in the Dimensional_characteristic entity of which this entity is a subtype.

NOTE EXPRESS specification:

```

*)
ENTITY dimensional_location
  SUPERTYPE OF (dimension_location_with_specified_datum_system ANDOR
    ONEOF (dimension_along_curve,
      angular_dimension_with_direction_vector,
      dimension_location_with_direction_vector))
  SUBTYPE OF (dimensional_characteristic);
    located_elements : shape_element_locating_relationship;
    directed          : BOOLEAN;
END_ENTITY; -- dimensional_location

( *
```

4.2.301 Dimensional_size

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Dimensional_size is a type of Dimensional_characteristic (see 4.2.298) that defines the size of a Shape_element (see 4.2.810). A Dimensional_size is either a Dimensional_size_based_on_opposing_boundaries (see 4.2.302), or a Single_boundary_dimension (see 4.2.827). Additionally, a Dimensional_size may be an Angular_size_dimension (see 4.2.25).

The data associated with a `Dimensional_size` are the following:

- `envelope`;
- `size_of`.

4.2.301.1 `envelope`

The `envelope` specifies the boolean value that indicates whether or not the `Shape_element` (see 4.2.810) for which the size is characterized by the `Dimensional_size` has the additional requirement that it shall not violate the envelope of perfect form at the maximum material size of the `Shape_element`. A value of `TRUE` indicates that the requirement is in effect. A value of `FALSE` indicates that the requirement is not in effect.

NOTE The envelope requirement is described in 6.1 of ISO 8015.

4.2.301.2 `size_of`

The `size_of` specifies the `Shape_element` (see 4.2.810) for which the size is characterized by the `Dimensional_size`.

NOTE EXPRESS specification:

```

*)
ENTITY dimensional_size
  ABSTRACT SUPERTYPE OF (ONEOF (
    dimensional_size_based_on_opposing_boundaries,
    single_boundary_dimension) ANDOR angular_size_dimension)
  SUBTYPE OF (dimensional_characteristic);
  size_of : shape_element;
  envelope : BOOLEAN;
END_ENTITY; -- dimensional_size

( *
```

4.2.302 `Dimensional_size_based_on_opposing_boundaries`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Dimensional_size_based_on_opposing_boundaries` is a type of `Dimensional_size` (see 4.2.301) that characterizes the size of a `Composite_unit_shape_element` (see 4.2.167) as well as characterizing the relationship between two opposing `Shape_element` (see 4.2.810) from which the `Composite_shape_element` (see 4.2.162) is composed.

The data associated with a Dimensional_size_based_on_opposing_boundaries are the following:

- boundary_separation;
- size_of.

4.2.302.1 boundary_separation

The boundary_separation specifies the Shape_element_locating_relationship (see 4.2.815) that specifies the two Shape_elements that are on the boundary of the Composite_unit_shape_element (see 4.2.167) for which the separation is characterized by the Dimensional_size_based_on_opposing_boundaries and is the basis for the size of the Composite_unit_shape_element.

4.2.302.2 size_of

The size_of specifies the Composite_unit_shape_element (see 4.2.167) for which the size is characterized by the Dimensional_size_based_on_opposing_boundaries.

NOTE The attribute size_of is declared in the Dimensional_size (see 4.2.301) entity of which this entity is a subtype.

EXAMPLE 1 The size of a Shape_element (see 4.2.810) that consists of two opposing surfaces of a notch would be characterized by a Dimensional_size_based_on_opposing_boundaries.

Constraints:

WR1: The Shape_element that is specified as the located_shape_element by the Shape_element_locating_relationship specified as the boundary_separation shall be specified as the related_shape_element by a Shape_element_composing_relationship that specifies the Composite_unit_shape_element that is specified as the size_of as the relating_shape_element.

WR2: The Shape_element that is specified as the locating_shape_element by the Shape_element_locating_relationship specified as the boundary_separation shall be specified as the related_shape_element by a Shape_element_composing_relationship that specifies the Composite_unit_shape_element that is specified as the size_of as the relating_shape_element.

WR3: The dimension_type shall be either "angular" or "linear".

NOTE The attribute dimension_type is declared in the Dimensional_characteristic entity of which this entity is a subtype.

IP1: The two shape elements that correspond to the Shape_elements that compose the Composite_unit_shape_element to which the Dimensional_size_based_on_opposing_boundaries is applied shall be opposite each other.

NOTE EXPRESS specification:

```

*)
ENTITY dimensional_size_based_on_opposing_boundaries
  SUBTYPE OF (dimensional_size);
    boundary_separation      : shape_element_locating_relationship;
    SELF\dimensional_size.size_of : composite_unit_shape_element;
END_ENTITY; -- dimensional_size_based_on_opposing_boundaries

( *
```

4.2.303 Directed_axis

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Directed_axis is a type of Non_feature_shape_element (see 4.2.560) that is an axis in which a direction is defined. A Directed_axis is defined by a base Centre_axis (see 4.2.90), with which the Directed_axis is congruent, and two Shape_element (see 4.2.810) through which the base Centre_axis passes or would pass if the Shape_elements were extended. One of the two Shape_elements is specified as the start_shape_element and the other one specified as the end_shape_element.

The data associated with a Directed_axis are the following:

- axis_to_be_oriented;
- end_shape_element;
- start_shape_element.

4.2.303.1 axis_to_be_oriented

The axis_to_be_oriented specifies the Centre_axis (see 4.2.90) that serves as a base axis by which the Directed_axis is defined.

4.2.303.2 end_shape_element

The end_shape_element specifies the Shape_element (see 4.2.810) through which the Directed_axis passes or would pass if the Shape_element were extended. The Shape_element specified by the end_shape_element is in the positive direction from the Shape_element specified by the start_shape_element.

4.2.303.3 start_shape_element

The start_shape_element specifies the Shape_element (see 4.2.810) through which the Directed_axis passes or would pass if the Shape_element were extended. The Shape_element specified by the start_shape_element is in the negative direction from the Shape_element specified by the end_shape_element.

Constraints:

UR1: The combination of `axis_to_be_oriented` and `start_shape_element` shall be unique within a population of `Directed_axis`.

WR1: The `Shape_element` specified by the `start_shape_element` shall not be the same `Shape_element` as specified by the `end_shape_element`.

IP1: The base `Centre_axis` shall pass through or would pass through the `Shape_elements` specified by the `start_shape_element` and `end_shape_element` if the `Shape_elements` were extended.

NOTE EXPRESS specification:

```
*)
ENTITY directed_axis
  SUBTYPE OF (non_feature_shape_element);
    axis_to_be_oriented : centre_axis;
    start_shape_element : shape_element;
    end_shape_element   : shape_element;
  UNIQUE
    UR1 : axis_to_be_oriented, start_shape_element;
END_ENTITY; -- directed_axis
```

(*

4.2.304 Direction

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Direction` is a type of `Managed_design_object`. A `Direction` shall be interpreted as a general direction vector in two-dimensional or three-dimensional space. The actual magnitudes of the components of the vector have no significance; only the ratios among the components are significant.

NOTE This `Application_object` does not provide the details of direction.

NOTE EXPRESS specification:

```
*)
ENTITY direction
  SUBTYPE OF (managed_design_object);
END_ENTITY; -- direction
( *
```

4.2.305 Direction_element

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Direction_element` is a type of `Managed_design_object` (see 4.2.524). A `Direction_element` is a definition of a shape element that has the form of a half-plane and is used in conjunction with the definition of another half-plane shape element to define a `Datum_based_vector_orientation` (see 4.2.220). In this instance a half-plane has the form of a plane except it is bounded on one side by a straight line. The half-plane shape element that the `Direction_element` defines is oriented with respect to three `Datum_plane` (see 4.2.232).

The data associated with a `Direction_element` are the following:

- `angle_value`;
- `base_datum_plane`;
- `direction`;
- `direction_of_half_datum_plane`;
- `elements_of`.

4.2.305.1 `angle_value`

The `angle_value` specifies the `Angle_data_element` (see 4.2.23) that represents the magnitude of the angle between the half-plane shape element defined by the `Direction_element` and half of the `Datum_plane` (see 4.2.232) specified as the `base_datum_plane`.

4.2.305.2 `base_datum_plane`

The `base_datum_plane` specifies the `Datum_plane` (see 4.2.232) from which the half-plane shape element defined by the `Direction_element` is oriented.

4.2.305.3 `direction`

The `direction` specifies the `Datum_based_direction_vector` (see 4.2.218) that defines the orientation of the angle between the half-plane shape element defined by the `Direction_element` and half of the `Datum_plane` (see 4.2.232) specified by the `base_datum_plane`. The angle is measured from half of the base `Datum_plane` to the defined half-plane shape element in a clockwise direction when viewed in the direction of the `Datum_based_direction_vector`.

4.2.305.4 `direction_of_half_datum_plane`

The `direction_of_half_datum_plane` specifies the `Datum_based_direction_vector` (see 4.2.218) of a `Datum_plane` (see 4.2.232) that intersects the base `Datum_plane` and indicates the half of the base `Datum_plane` from which the half-plane shape element defined by the `Direction_element` is oriented.

4.2.305.5 elements_of

The elements_of is an inverse relationship that specifies that the existence of the Direction_element is dependent on the existence of one or more Datum_based_vector_orientation (see 4.2.220) that specifies the Direction_element as one of their direction_components.

Constraints:

WR1: The Datum_plane specified as the base_datum_plane, the Datum_plane specified as the vector_of by the Datum_based_direction_vector that is specified as the direction, the Datum_plane specified as the vector_of by the Datum_based_direction_vector that is specified as the direction_of_half_datum_plane shall be different.

WR2: The Datum_plane specified as the base_datum_plane, and the Datum_plane specified as the vector_of by the Datum_based_direction_vector that is specified as the direction, and the Datum_plane specified as the vector_of by the Datum_based_direction_vector that is specified as the direction_of_half_datum_plane shall be Datum_planes of the same Datum_reference_frame.

4.2.306 Documentation_layer_stratum

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Documentation_layer_stratum is a type of Stratum (see 4.2.845) used to describe patterns and other artwork information needed to manufacture a Stratum from materials which are not independently implementing a Physical_network (see 4.2.660) in the printed circuit board.

EXAMPLE 1 A Documentation_layer_stratum generally refers to those layers in domain terms for which there is a specifically designed shape other than, or in addition to, that of the printed circuit board edge, and for which the CAD systems traditionally output a separate master artwork pattern or file, but for which the resulting pattern is not for an independent conductive layer. For a "six layer pcb", in domain terms, there are six independently conductive design layers. This part of ISO 10303 allows the "outer layers" to be described by several Stratum to accommodate the different metallurgies that are found on electroless copper plated, electrolytic copper plated, and solder plated or solder coated Stratum on the primary and secondary sides of the Interconnect_module (see 4.2.440). The usual design view of the shape of these "outer layers" is that the shapes are identical for all practical purposes and the required shape is the cumulative shape that will appear after all the manufacturing processes are completed. A Stratum of conductive material, such as solder paste, is not an independently conductive layer in this context, since its shape is usually dependent upon the independently conductive layer over which it is applied through openings in solder mask or another Documentation_layer_stratum.

NOTE The general case of dielectric layers such as the adhesive Stratum, or the Stratum consisting of the dielectric substrate between two copper foil Stratum in a printed circuit board, is that they are neither a Documentation_layer_stratum nor a Design_layer_stratum. Their shapes are totally dependent upon the overall shape of the printed circuit board and its various passages.

EXAMPLE 2 If the stratum purpose is that of a coverlay, the insulating sheet on the outer surface of a flexible printed harness and the die-cut passages in the dielectric material of the coverlay are defined as Inter_stratum_features. A Stratum is used to describe the presence of the material. This Stratum in this context is neither a Design_layer_stratum (see 4.2.275) nor a Documentation_layer_stratum.

EXAMPLE 3 A Documentation_layer_stratum differs from a Design_layer_stratum in that its Ee_materials include such materials as solder maskant, epoxy ink, or dielectric materials; or materials such as solder paste that are described as conductive by the Ee_material (see 4.2.318) of the Stratum but whose shape is dependent upon that of an independently described Stratum.

EXAMPLE 4 An example of the shape of an independently described Stratum of conductive materials is that of the copper to be found in the traces and lands on the printed circuit board. The shape of a Stratum of solder paste is often dependent upon the shape of the Stratum of solder mask that in turn is dependent upon the shape of the circuitry on the primary and secondary sides of the Interconnect_module over which the solder mask and solder paste are applied.

The data associated with a Documentation_layer_stratum are the following:

— of_technology.

4.2.306.1 of_technology

The of_technology specifies the role of the Documentation_layer_technology (see 4.2.307) for the Documentation_layer_stratum.

NOTE EXPRESS specification:

```

4.2.307 Documentation_layer_technology

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Documentation_layer_technology is a type of Stratum_technology (see 4.2.871) that defines the purpose for the Documentation_layer_stratum (see 4.2.306).

The data associated with a Documentation_layer_technology are the following:

— documentation_layer_purpose.

4.2.307.1 documentation_layer_purpose

The documentation_layer_purpose specifies the string that describes the purpose for the Documentation_layer_technology.

EXAMPLE 1 Examples of these purposes are "Silkscreen", "Solder Mask", and "Solder Paste".

4.2.314 Ee_approval

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_approval is a type of Managed_design_object (see 4.2.524). An Ee_approval is the dated indication that an Organization (see 4.2.569) or a Person_and_organization (see 4.2.647) has reviewed and approved an occurrence of something.

The data associated with an Ee_approval are the following:

- approval_status;
- authorizer;
- purpose;
- signoff_date.

4.2.314.1 approval_status

The approval_status specifies either approved, disapproved, not_yet_approved, or withdrawn as the state of consent applied to an aspect of product data as indicated by the Ee_approval.

4.2.314.2 authorizer

The authorizer specifies either a Person_and_organization (see 4.2.647) or an Organization (see 4.2.569) that authorizes the Ee_approval. There shall be one or more Person_and_organization or Organization for an Ee_approval.

4.2.314.3 purpose

The purpose specifies the text that provides the reason for the Ee_approval.

EXAMPLE 1 Typical values include "preliminary", "detailed", or "final".

4.2.314.4 signoff_date

The signoff_date specifies either the Date (see 4.2.212) or the Date_and_time (see 4.2.213) of the Ee_approval.

Constraints:

WR1: There shall be something to approve for approval to exist.

NOTE EXPRESS specification:

4.2.316 Ee_document

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_document is a type of Managed_design_object (see 4.2.524). An Ee_document may be an Ee_specification (see 4.2.338). An Ee_document is a set of detailed information that describes a product or aspect of a product in detail. The information is in the form of text, tables, and graphics in a human readable language, although the hard copy may be a report from computer interpretable files.

The data associated with an Ee_document are the following:

- author;
- base_identifier;
- change_date;
- creation_date;
- document_approval;
- document_name;
- key_phrase;
- publisher;
- revision;
- security_code;
- text_usage.

4.2.316.1 author

The author specifies the Person (see 4.2.646) who creates an Ee_document. The author need not be specified for a particular Ee_document. There may be more than one Person for an Ee_document.

4.2.316.2 base_identifier

The base_identifier specifies the role of the Ee_document_identifier (see 4.2.317) for the Ee_document.

4.2.316.3 change_date

The change_date specifies the unique Date_and_time (see 4.2.213) when updates are made to an Ee_document. The change_date need not be specified for a particular Ee_document. There may be more than one Date_and_time for an Ee_document.

4.2.316.4 creation_date

The creation_date specifies the Date_and_time (see 4.2.213) when an Ee_document was created.

4.2.316.5 document_approval

The document_approval specifies the Ee_approval (see 4.2.314) of the Ee_document. The document_approval need not be specified for a particular Ee_document.

4.2.316.6 document_name

The document_name specifies the string identifying the Ee_document.

4.2.316.7 key_phrase

The key_phrase specifies the Structured_text (see 4.2.874) that details specific aspects within the text. The key_phrase need not be specified for a particular Ee_document. There may be more than one Structured_text for an Ee_document.

4.2.316.8 publisher

The publisher specifies the Organization (see 4.2.569) or the Person_and_organization (see 4.2.647) responsible for the Ee_document.

4.2.316.9 revision

The revision specifies the string identifying the configuration controlled version of the Ee_document.

NOTE If the originating organization does not configuration control documents, it is recommended to supply the value 'not used'.

4.2.316.10 security_code

The security_code specifies the Security_classification (see 4.2.804) of a particular Ee_document. The security_code need not be specified for a particular Ee_document.

4.2.316.11 text_usage

The text_usage specifies either the Ee_text (see 4.2.339) or the Structured_text (see 4.2.874) for an Ee_document. The text_usage need not be specified for a particular Ee_document. There may be more than one Ee_text or Structured_text for an Ee_document.

NOTE EXPRESS specification:

```

*)
ENTITY ee_document
  SUPERTYPE OF (ee_specification)
  SUBTYPE OF (managed_design_object);
    publisher      : person_organization;

4.2.317 Ee_document_identifier

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_document_identifier is a type of Managed_design_object (see 4.2.524). An Ee_document_identifier is the combination of an identifier name and an assigned value.

EXAMPLE 1 An example of an Ee_document_identifier is an International Serial Book Number, ISBN, as the identifier_name, and the number associated with a specific publication as the assigned_value. Other examples may be found in the Library of Congress system and the Dewey Decimal System.

The data associated with an Ee_document_identifier are the following:

- assigned_value;
- identifier_name.

4.2.317.1 assigned_value

The assigned_value specifies a string identifying the content of the Ee_document_identifier.

4.2.317.2 identifier_name

The identifier_name specifies the string that establishes the context or type for the Ee_document_identifier.

Constraints:

UR1: The combination of the identifier_name and assigned_value shall be unique within a population of Ee_document_identifiers.

NOTE EXPRESS specification:

```
*)
ENTITY ee_document_identifier
  SUBTYPE OF (managed_design_object);
  identifier_name : ee_name;

UNIQUE
  UR1: identifier_name, assigned_value;
END_ENTITY; -- ee_document_identifier

( *
```

4.2.318 Ee_material

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_material is a type of Managed_design_object (see 4.2.524). An Ee_material is the tangible nature of a manufactured or natural product.

The data associated with an Ee_material are the following:

- material_name;
- registration_document;
- electrical_conductivity_classification;
- optical_conductivity_classification;
- thermal_conductivity_classification.

4.2.318.1 material_name

The material_name specifies the descriptive label that is registered for the Ee_material in the registration_document, and that represents the name of the Ee_material.

4.2.318.2 registration_document

The registration_document specifies a dictionary of registered materials in which the material_name is found.

4.2.318.3 electrical_conductivity_classification

The electrical_conductivity_classification specifies either conductive, non_conductive, resistive, semi_conductive. The electrical_conductivity_classification need not be specified for a particular Ee_material.

4.2.318.4 optical_conductivity_classification

The optical_conductivity_classification specifies either conductive, non_conductive, resistive, or semi_conductive. The optical_conductivity_classification need not be specified for a particular Ee_material.

4.2.318.5 thermal_conductivity_classification

The thermal_conductivity_classification specifies either conductive, non_conductive, resistive, or semi_conductive. The thermal_conductivity_classification need not be specified for a particular Ee_material.

Constraints:

UR1: The combination of material_name and registration_document shall be unique within a population of Ee_materials.

WR1: At least one of the following shall be provided: electrical_conductivity_classification, optical_conductivity_classification, thermal_conductivity_classification.

NOTE EXPRESS specification:

*)

```

4.2.319 Ee_product

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_product is a type of Managed_design_object (see 4.2.524). An Ee_product is an item that is intended to be produced by or employed in a process. For the purposes of this part of ISO 10303, an Ee_product may be the result of a human endeavour that is not necessarily a manufacturing process. This standard predefines a small number of product classes for standardization purposes.

The data associated with an Ee_product are the following:

- design_owner;
- product_classification;
- product_nomenclature;
- part_number;
- product_version;
- standard_product_indicator.

4.2.319.1 design_owner

The design_owner specifies either the Organization (see 4.2.569) or the Person_and_organization (see 4.2.647) that is responsible for the Ee_product.

4.2.319.2 product_classification

The product_classification is an inverse relationship that specifies that the existence of the Ee_product is dependent on the existence of the Ee_product_related_product_category (see 4.2.326) that specifies the Ee_product as its of_product. The classifications specified by this Application Object are considered to be predefined in this standard. The predefined classifications are assembly, bare_die, functionality, interconnect, material, package, physical network design, piece part, printed part, requirements model, simulation model, standard part, technology specific model, and template model.

NOTE Those classifications may be related to specific types of Ee_product_definition that are technology specific, or for which there are no commonly understood domain term, or where there are many domain terms that may apply.

4.2.319.3 product_nomenclature

The product_nomenclature specifies the name by which the Ee_product is commonly known within an organization.

4.2.319.4 part_number

The part_number specifies the name used as the specific identification of an Ee_product for a particular organization.

4.2.319.5 product_version

The product_version is an inverse relationship that specifies that the existence of the Ee_product is dependent on the existence of the Ee_product_version (see 4.2.328) that specifies the Ee_product as its versioned_item. There shall be one or more Ee_product_version for an Ee_product.

4.2.319.6 standard_product_indicator

The standard_product_indicator specifies whether or not an Ee_product is considered to be a standard Product for a company, industry or other organization.

Constraints:

UR1: The combination of design_owner and part_number shall be unique within a population of Ee_products.

WR1: Each product that is referenced by a predefined product category shall be a product for the required subtype of Ee_product_definition.

EXAMPLE 1 If a product is classified as a package, there shall be an Ee_product_definition (see 4.2.323) that references the Ee_product through the version.versioned_item path.

NOTE EXPRESS specification:

*)

ENTITY ee_product

(*

4.2.320 Ee_product_category

An Ee_product_category is a type of Managed_design_object (see 4.2.524). An Ee_product_category is a class in a class hierarchy for the purpose of categorizing products according to their characteristics. An Ee_product_category may be an Ee_product_related_product_category (see 4.2.326).

The data associated with an Ee_product_category are the following:

- category_parameter;
- category_specific_values;
- description;
- name;
- reference_document.

4.2.320.1 category_parameter

The category_parameter specifies the Model_parameter (see 4.2.549) assigned to this Ee_product_category for categorization purposes. All sub-categories of this Ee_product_category shall inherit the category_parameter. There shall be one or more Model_parameter for an Ee_product_category.

4.2.320.2 category_specific_values

The category_specific_values specifies the Parameter_assignment (see 4.2.603) that assigns a specific value to a specific Model_parameter (see 4.2.549) for this Ee_product_category. All sub-categories of this Ee_product_category shall inherit the category_specific_values. There shall be one or more Parameter_assignment for an Ee_product_category.

4.2.320.3 description

The description specifies one role of a string for the Ee_product_category.

4.2.320.4 name

The name specifies the string for the identifier for the Ee_product_category.

4.2.320.5 reference_document

The reference_document specifies the Ee_document (see 4.2.316) that is the reference for the Ee_product_category. The reference_document establishes the scope for the name. All Ee_product_category names defined in this standard shall use this standard as the reference_document.

NOTE The use of reference_document allows organizations to resolve name clashes between Ee_product_category instances.

EXAMPLE 1 This standard pre-defines the name 'assembly' while an organization might use 'PWA' for that purpose. The inclusion of the reference_document permits both to be in a product category tree and pointing to the same products. An application conformant to this standard looking for pre-defined names would use the reference_document as a filter and ignore 'PWA'.

Constraints:

UR1: The name in combination with the reference_document shall be unique within a population of Ee_product_categories within an enterprise.

WR1: Each category_specific_value shall be assigned to one member of Model_parameter that is in the role of category_parameter in a higher level category of this Ee_product_category.

WR2: All Ee_product_category names defined in this standard shall use this standard as the reference_document.

NOTE EXPRESS specification:

```

*)

4.2.321 Ee_product_category_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_product_category_relationship is a type of Managed_design_object (see 4.2.524). An Ee_product_category_relationship establishes an inheritance relationship that is a parent-child relationship between two classes in a class hierarchy of Ee_product_category (see 4.2.320).

The data associated with an Ee_product_category_relationship are the following:

- category;
- sub_category.

4.2.321.1 category

The category specifies the Ee_product_category (see 4.2.320) that is in the role of higher level category in the classification structure.

4.2.321.2 sub_category

The sub_category specifies the Ee_product_category (see 4.2.320) that inherits properties from the higher level category in the classification structure.

Constraints:

WR1: The Ee_product_category_relationship shall not establish a cyclic path in the classification structure it is a member of.

NOTE EXPRESS specification:

```
*)  
ENTITY ee_product_category_relationship  
  SUBTYPE OF (managed_design_object);  
    sub_category : ee_product_category;  
    category      : ee_product_category;  
END_ENTITY; -- ee_product_category_relationship

```

4.2.322 Ee_product_configuration

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_product_configuration is a type of Managed_design_object (see 4.2.524). An Ee_product_configuration is the association of a product version with a model name that enterprise marketing provides to a customer.

The data associated with an Ee_product_configuration are the following:

- configuration_manager;
- item_id;
- model_of_product;
- phase_of_product;
- product_configuration_approval;
- satisfying_product.

4.2.322.1 configuration_manager

The configuration_manager specifies either the Organization (see 4.2.569) or the Person_and_organization (see 4.2.647) that manages the Ee_product_configuration.

4.2.322.2 item_id

The item_id specifies the identification of an Ee_product_configuration.

4.2.322.3 model_of_product

The model_of_product specifies the role of the Ee_product_model (see 4.2.325) for the Ee_product_configuration.

4.2.322.4 phase_of_product

The phase_of_product specifies the string that defines the life cycle phase of the Ee_product_configuration.

EXAMPLE 1 Examples of phase_of_product include "Preliminary design", "Prototype", "Released for Production", "Obsolete for New Manufacture", and "Retired".

4.2.322.5 product_configuration_approval

The product_configuration_approval specifies the Ee_approval (see 4.2.314) that is associated with the Ee_product_configuration.

4.2.322.6 satisfying_product

The satisfying_product specifies the Ee_product_version (see 4.2.328) that has been selected to satisfy a real or perceived customer need for the Ee_product_configuration. The satisfying_product need not be specified for a particular Ee_product_configuration. There may be more than one Ee_product_version for an Ee_product_configuration.

NOTE In some enterprises the marketing department selects product model nomenclature independent of the existence of actual product versions to satisfy the marketing requirements. This object permits the enterprise to explicitly manage the relationship between model nomenclature and the product version.

Constraints:

UR1: The combination of item_id and satisfying_product shall be unique within a population of Ee_product_configurations.

NOTE EXPRESS specification:

```

*)
ENTITY ee_product_configuration
  SUBTYPE OF (managed_design_object);
    satisfying_product      : OPTIONAL SET [1:?] OF ee_product_version;
    configuration_manager   : person_organization;
    item_id                 : STRING;
    product_configuration_approval : ee_approval;
    model_of_product        : ee_product_model;
    phase_of_product        : STRING;
  UNIQUE
    UR1 : item_id, satisfying_product;
END_ENTITY; -- ee_product_configuration

--tt tc1 wd9 modified
( *
```

4.2.323 Ee_product_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_product_definition is a type of Managed_design_object (see 4.2.524). An Ee_product_definition is either a Functional_unit_definition (see 4.2.401) or a Physical_unit (see 4.2.664) or additionally may be an Externally_defined_ee_product_definition (see 4.2.364) or additionally may be a Library_ee_product_definition (see 4.2.513).

The data associated with an Ee_product_definition are the following:

- cad_filename;
- context_description;
- creation_date;
- creator;
- discipline_id;
- documentation;
- product_definition_approval;
- product_definition_id;
- security_code;
- version.

NOTE This entity may be used to capture the definition of a particular Ee_product_version at any intermediate stage of its development where the definition is not formally tracked by an organization at the Ee_product_version level. It may be used to capture the various stages in the definition cycle of a product.

4.2.323.1 cad_filename

The cad_filename specifies the name of the file or data repository that contains the detailed Ee_product_definition in a computer aided design system. The reference is interpreted to be to an external definition of the details of the Ee_product_definition that is meaningful only within the organization that designed the product. The cad_filename need not be specified for a particular Ee_product_definition.

NOTE The data contained in the cad_filename may include more information to allow the enterprise to identify the originating system in addition to a simple name.

EXAMPLE 1 As an example, the following information may be included: operating system supplier name = "xxx", operating system name = "xxx", operating system version = "xxx", cad tool supplier name = "xxx", cad tool name = "xxx", cad tool version = "xxx", cad filename = "xxx", cad filename date stamp = "xxx" where "xxx" is the value information.

4.2.323.2 context_description

The context_description specifies the Ee_text (see 4.2.339) that is the purpose for a particular definition of the Ee_product_definition. The context_description is optional and need not be supplied.

4.2.323.3 creation_date

The creation_date specifies the Date_and_time (see 4.2.213) at which the Ee_product_definition was first defined.

4.2.323.4 creator

The creator specifies the Person_and_organization (see 4.2.647) or the Organization (see 4.2.569) that initially created the Ee_product_definition. There shall be one or more Person_and_organization or Organization for an Ee_product_definition.

4.2.323.5 discipline_id

The discipline_id specifies the name of the discipline that creates the Ee_product_definition.

EXAMPLE 1 Typical usage may include one of the following as the last item in a comma separated list: analysis, synthesis.

4.2.323.6 documentation

The documentation specifies the role of the Ee_document (see 4.2.316) for the Ee_product_definition. The documentation need not be specified for a particular Ee_product_definition. There may be more than one Ee_document for an Ee_product_definition.

4.2.323.7 product_definition_approval

The product_definition_approval specifies the role of an Ee_approval (see 4.2.314) for the Ee_product_definition.

4.2.323.8 product_definition_id

The product_definition_id specifies the name used for identification of the Ee_product_definition so that users of the information can reference it.

4.2.323.9 security_code

The security_code specifies the role of the Security_classification (see 4.2.804) for the Ee_product_definition. The security_code is optional and need not be supplied for the Ee_product_definition.

4.2.323.10 version

The version specifies the role of the Ee_product_version (see 4.2.328) for the Ee_product_definition.

Constraints:

UR1: The combination of the product_definition_id and the version shall be unique within a population of Ee_product_definitions.

UR2: The combination of the discipline_id and the version shall be unique within a population of Ee_product_definitions.

NOTE EXPRESS specification:

```

4.2.324 Ee_product_definition_based_constraint_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Ee_product_definition_based_constraint_occurrence` is a type of `Constraint_occurrence` (see 4.2.193) that has a basis in the characteristics of an `Ee_product_definition` (see 4.2.323) and that identifies the basis definition. An `Ee_product_definition_based_constraint_occurrence` may be a `Shape_and_ee_product_definition_based_constraint_occurrence` (see 4.2.806).

The data associated with an `Ee_product_definition_based_constraint_occurrence` are the following:

— `constraining_definition`.

4.2.324.1 **constraining_definition**

The `constraining_definition` specifies the role of the `Ee_product_definition` (see 4.2.323) for the `Ee_product_definition_based_constraint_occurrence`.

NOTE EXPRESS specification:

```
*)
ENTITY ee_product_definition_based_constraint_occurrence
  SUPERTYPE OF (shape_and_ee_product_definition_based_constraint_occurrence)
  SUBTYPE OF (constraint_occurrence);
  constraining_part : ee_product_definition;
END_ENTITY; -- ee_product_definition_based_constraint_occurrence
```

(*

4.2.325 **Ee_product_model**

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Ee_product_model` is a type of `Managed_design_object` (see 4.2.524). An `Ee_product_model` is the nomenclature that an enterprise marketing function assigns for purposes of communication with customers.

The data associated with an `Ee_product_model` are the following:

— `model_name`.

4.2.325.1 **model_name**

The `model_name` specifies the `Ee_text` (see 4.2.339) identifier of the `Ee_product_model`.

Constraints:

UR1: The `model_name` shall be unique within a population of `Ee_product_models`.

NOTE EXPRESS specification:

```

*)
ENTITY ee_product_model
  SUBTYPE OF (managed_design_object);
  model_name : ee_text;
  UNIQUE
  UR1 : model_name;
END_ENTITY; -- ee_product_model

( *

```

4.2.326 Ee_product_related_product_category

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_product_related_product_category is a type of Ee_product_category (see 4.2.320). An Ee_product_related_product_category relates one or more products to the specific characteristics associated with the category.

The data associated with an Ee_product_related_product_category are the following:

— of_product.

4.2.326.1 of_product

The of_product specifies the Ee_product (see 4.2.319) assigned to this Ee_product_related_product_category. There shall be one or more Ee_product for an Ee_product_related_product_category.

NOTE EXPRESS specification:

```

*)
ENTITY ee_product_related_product_category
  SUBTYPE OF (ee_product_category);
  of_product : SET [1:?] OF ee_product;
END_ENTITY; -- ee_product_related_product_category

( *

```

4.2.327 Ee_product_specific_parameter_value_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_product_specific_parameter_value_assignment is a type of Managed_design_object (see 4.2.524). An Ee_product_specific_parameter_value_assignment is the assignment of a specific value to a specific characteristic of an Ee_product_category for a specific product.

The data associated with an Ee_product_specific_parameter_value_assignment are the following:

- assigned_parameter;
- associated_product_category;
- of_product.

4.2.327.1 assigned_parameter

The assigned_parameter specifies the Parameter_assignment (see 4.2.603) that is assigning the specific value for this Ee_product_specific_parameter_value_assignment.

4.2.327.2 associated_product_category

The associated_product_category specifies the Ee_product_related_product_category (see 4.2.326) that includes the characteristic being assigned a value with this Ee_product_specific_parameter_value_assignment.

4.2.327.3 of_product

The of_product specifies the Ee_product (see 4.2.319) assigned a characteristic value by this Ee_product_specific_parameter_value_assignment.

Constraints:

WR1: Each Model_parameter in the role of assigned_parameter.assigned_parameter shall be in the role of category_parameter for the Ee_product_related_product_category specified by associated_product_category.

WR2: Each Ee_product in the role of of_product shall be in the role of of_product for the Ee_product_related_product_category specified by associated_product_category.

NOTE EXPRESS specification:

```

*)
ENTITY ee_product_specific_parameter_value_assignment
  SUBTYPE OF (managed_design_object);
    associated_product_category : ee_product_related_product_category;
    of_product                  : ee_product;
    assigned_parameter          : parameter_assignment;
END_ENTITY; -- ee_product_specific_parameter_value_assignment

( *
```

4.2.328 Ee_product_version

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_product_version is a type of Managed_design_object (see 4.2.524). An Ee_product_version is the identification of the representation of a product after its design has reached a point of control or has undergone a formal release or change.

The data associated with an Ee_product_version are the following:

- authorizing_agreement;
- creator;
- product_definition;
- product_version_approval;
- revision_code;
- security_code;
- versioned_item.

4.2.328.1 authorizing_agreement

The authorizing_agreement specifies the role of the Contract (see 4.2.196) for the Ee_product_version. The authorizing_agreement need not be provided for a specific Ee_product_version.

4.2.328.2 creator

The creator specifies the Organization (see 4.2.569) or the Person_and_organization (see 4.2.647) responsible for the Ee_product_version.

4.2.328.3 product_definition

The product_definition is an inverse relationship that specifies that the existence of the Ee_product_version is dependent on the existence of the Ee_product_definition (see 4.2.323) that specifies the Ee_product_version as its version. There shall be one or more Ee_product_definition for an Ee_product_version.

4.2.328.4 product_version_approval

The product_version_approval specifies the Ee_approval (see 4.2.314) associated with the Ee_product_version.

4.2.328.5 revision_code

The revision_code specifies the string identifying an Ee_product_version.

4.2.328.6 security_code

The security_code specifies the Security_classification (see 4.2.804) of an Ee_product_version and is used to control access to design and other information about the Ee_product_version. The security_code is optional and need not be supplied.

4.2.328.7 versioned_item

The versioned_item specifies the Ee_product (see 4.2.319) of which the Ee_product_version identifies the version.

Constraints:

UR1: The combination of the versioned_item and the revision_code shall be unique within a population of Ee_product_versions.

NOTE EXPRESS specification:

```

*)
ENTITY ee_product_version
  SUPERTYPE OF (ee_rule_version)
  SUBTYPE OF (managed_design_object);
  creator                : person_organization;
  authorizing_agreement  : OPTIONAL contract;
  revision_code          : ee_name;

4.2.329 Ee_product_version_supersedence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Ee_product_version_supersedence is a type of Managed_design_object (see 4.2.524).

The data associated with an Ee_product_version_supersedence are the following:

- superseded_product_version;
- superseding_product_version.

4.2.329.1 superseded_product_version

The superseded_product_version specifies an Ee_product_version (see 4.2.328) for the Ee_product_version_supersedence.

4.2.329.2 superseding_product_version

The superseding_product_version specifies an Ee_product_version (see 4.2.328) for the Ee_product_version_supersedence.

Constraints:

UR1: The combination of superseded_product_version and superseding_product_version shall be unique within a population of Ee_product_version_supersedence.

NOTE EXPRESS specification:

```

*)
ENTITY ee_product_version_supersedence

4.2.330 Ee_requirement_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Ee_requirement_occurrence` is a type of `Managed_design_object` (see 4.2.524). An `Ee_requirement_occurrence` may be a `Requirement_group_occurrence` (see 4.2.772), and additionally may be one of a `Constraint_occurrence` (see 4.2.193), a `Design_characteristic_occurrence` (see 4.2.261), a `Design_requirement_occurrence` (see 4.2.279), a `Inspection_requirement_occurrence` (see 4.2.430), a `Test_requirement_occurrence` (see 4.2.896), or a `Purpose_occurrence` (see 4.2.757) and additionally may be one of an `Electrical_requirement_occurrence` (see 4.2.346), an `Mechanical_requirement_occurrence` (see 4.2.544), an `Electromagnetic_requirement_occurrence` (see 4.2.348) or a `Thermal_requirement_occurrence` (see 4.2.908), and additionally may be one of an `Item_restricted_requirement_occurrence` (see 4.2.478) or a `Layout_spacing_requirement_occurrence` (see 4.2.509). An `Ee_requirement_occurrence` is a statement of criteria for design or manufacturing that may be derived from more abstract criteria or may be a decomposition of a technical parameter associated with a product structure. Complex requirements may be associated with a product specifically for the purpose of managing the requirements.

NOTE This part of ISO 10303 provides generic categories for enterprise classification of requirements and includes some domain classified requirements.

EXAMPLE 1 An inspection requirement may be derived from an electromagnetic requirement.

The data associated with an `Ee_requirement_occurrence` are the following:

- `required_analytical_representation`;
- `required_functional_specification`;
- `description`;
- `name`;
- `hierarchy_context`;
- `required_characteristic`;
- `required_coordinated_characteristic`;
- `required_material`;
- `required_part`;
- `requirement_specification`.

4.2.330.1 `required_analytical_representation`

The `required_analytical_representation` specifies the role of the `Analytical_representation` for the `Ee_requirement_occurrence`. There may be more than one `Analytical_representation` for an `Ee_requirement_occurrence`. The `required_analytical_representation` need not be specified for a particular `Ee_requirement_occurrence`.

4.2.330.2 required_functional_specification

The `required_functional_specification` specifies the role of the `Functional_specification` for the `Ee_requirement_occurrence`. There may be more than one `Functional_specification` for an `Ee_requirement_occurrence`. The `required_functional_specification` need not be specified for a particular `Ee_requirement_occurrence`.

4.2.330.3 description

The `description` specifies the `Ee_text` (see 4.2.339) of details of the `Ee_requirement_occurrence` in a natural language. The `description` need not be specified for a particular `Ee_requirement_occurrence`.

4.2.330.4 name

The `name` specifies the unique string that identifies the `Ee_requirement_occurrence`.

NOTE The `name` should include information identifying the source of the requirement.

4.2.330.5 hierarchy_context

The `hierarchy_context` is an inverse relationship that specifies the `Requirement_composition` (see 4.2.770) that specifies the `Ee_requirement_occurrence` as its element. There shall be no more than one `Requirement_composition` for an `Ee_requirement_occurrence`.

4.2.330.6 required_characteristic

The `required_characteristic` specifies the role of the `Characteristic` (see 4.2.98) for the `Ee_requirement_occurrence`. The `required_characteristic` need not be specified for a particular `Ee_requirement_occurrence`. There may be more than one `Characteristic` for an `Ee_requirement_occurrence`.

4.2.330.7 required_coordinated_characteristic

The `required_coordinated_characteristic` specifies the role of the `Coordinated_characteristic` (see 4.2.197) for an `Ee_requirement_occurrence`. The `required_coordinated_characteristic` need not be specified for a particular `Ee_requirement_occurrence`. There may be more than one `Coordinated_characteristic` for an `Ee_requirement_occurrence`.

4.2.330.8 required_material

The `required_material` specifies the role of the `Ee_material` (see 4.2.318) for the `Ee_requirement_occurrence`. The `required_material` need not be specified for a particular `Ee_requirement_occurrence`.

4.2.330.9 required_part

The required_part specifies the role of the Ee_product (see 4.2.319) for the Ee_requirement_occurrence. The required_part need not be specified for a particular Ee_requirement_occurrence. There may be more than one Ee_product for an Ee_requirement_occurrence.

4.2.330.10 requirement_specification

The requirement_specification specifies the Ee_specification (see 4.2.338) for the source of the Ee_requirement_occurrence. There shall be one or more Ee_specification for an Ee_requirement_occurrence.

Constraints:

UR1: The associated_definition shall be unique within the population of Ee_requirement_occurrence.

NOTE EXPRESS specification:

```

*)

4.2.331 Ee_rule_complex_clause

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

The Ee_rule_complex_clause is a type of Managed_design_object (see 4.2.524). An Ee_rule_complex_clause consist of one or more simple clauses that are ANDed together. The AND operator is provided by the SET aggregation in this application object.

The data associated with an Ee_rule_complex_clause are the following:

- conjunctive_content;
- identifier.

4.2.331.1 conjunctive_content

The conjunctive_content specifies the Ee_rule_simple_clause (see 4.2.336) for the Ee_rule_complex_clause. There shall be one or more conjunctive_content specified for an Ee_rule_complex_clause.

4.2.331.2 identifier

The identifier specifies the name for the Ee_rule_complex_clause.

Constraints:

UR1: The identifier shall be unique within a population of Ee_rule_complex_clause.

NOTE EXPRESS specification:

```

*)
ENTITY ee_rule_complex_clause

```

4.2.332 Ee_rule_conclusion_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_rule_conclusion_definition is a type of Managed_design_object (see 4.2.524). An Ee_rule_conclusion_definition provides the conclusion part of a rule construct.

The data associated with an Ee_rule_conclusion_definition are the following:

- rule_definition;
- identifier;
- conjunctive_content.

4.2.332.1 rule_definition

The rule_definition specifies the Ee_rule_definition (see 4.2.333) for the Ee_rule_conclusion_definition. The rule_definition is the rule being composed by this Ee_rule_conclusion_definition.

4.2.332.2 identifier

The identifier specifies the name for the Ee_rule_conclusion_definition.

4.2.332.3 conjunctive_content

The conjunctive_content specifies specifies the Ee_rule_simple_clause for the Ee_rule_conclusion_definition. There shall be one or more conjunctive_content specified for an Ee_rule_conclusion_definition.

Constraints:

UR1: The combination of the rule_definition and the identifier shall be unique within a population of Ee_rule_conclusion_definition.

NOTE EXPRESS specification:

```

*)
ENTITY ee_rule_conclusion_definition
  SUBTYPE OF ( managed_design_object );
    rule_definition      : ee_rule_definition;
    identifier           : STRING ;
    conjunctive_content  : SET [1:?] OF ee_rule_simple_clause;
  UNIQUE
    UR1 : rule_definition, identifier;
END_ENTITY; -- ee_rule_conclusion_definition

( *
```

4.2.333 Ee_rule_definition

An Ee_rule_definition is a type of Ee_product_definition (see 4.2.323). An Ee_rule_definition is a formal specification that defines a constraint by relating two elements based upon characteristics of a design, one as premise and one as conclusion. The Ee_rule_definition is for one version of a rule only.

The data associated with an Ee_rule_definition are the following:

- conclusion;
- defined_versioned_rule;
- premise.

4.2.333.1 conclusion

The conclusion specifies the role of the ee_rule_conclusion_definition for the Ee_rule_definition.

4.2.333.2 defined_versioned_rule

The version specifies the role of the Ee_rule_version (see 4.2.337) for the Ee_rule_definition.

4.2.333.3 premise

The premise specifies the role of the ee_rule_premise_definition for the Ee_rule_definition.

NOTE EXPRESS specification:

```
*)
ENTITY ee_rule_definition

  SELF\ee_product_definition.version : ee_rule_version;
  INVERSE
    premise      : ee_rule_premise_definition FOR rule_definition;
    conclusion   : ee_rule_conclusion_definition FOR rule_definition;
END_ENTITY; -- ee_rule_definition
(*
```

4.2.334 Ee_rule_function

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_rule_function is a type of Managed_design_object (see 4.2.524). An Ee_rule_function is a formal specification for a process that includes the source code and instance values for the process. An Ee_rule_function has a unique combination of identifier and reference_document. An Ee_rule_function shall have at least one parameter.

NOTE Source code is the computer-interpretable expressions that form a part of the Ee_rule_function. The attribute source_code is the relationship of these expressions to the Ee_rule_function.

The data associated with an Ee_rule_function are the following:

- identifier;
- parameter;
- reference_document;
- source_code.

4.2.334.1 identifier

The identifier specifies the name for the Ee_rule_function.

4.2.334.2 parameter

The parameter specifies the role of the Model_parameter (see 4.2.549) for an Ee_rule_function. There shall be one or more Model_parameter specified for a particular Ee_rule_function.

4.2.334.3 reference_document

The reference_document specifies the role of the Ee_document (see 4.2.316) for an Ee_rule_function.

4.2.334.4 source_code

The source_code specifies the role of the Ee_specification (see 4.2.338) for an Ee_rule_function.

Constraints:

UR1: The combination of the identifier and the reference_document shall be unique within a population of Ee_rule_functions.

NOTE EXPRESS specification:

```

*)
ENTITY ee_rule_function
  SUBTYPE OF (managed_design_object);
  identifier      : STRING;
  parameter       : SET [1:?] OF model_parameter;
  reference_document : ee_document;
  source_code     : ee_specification;
  UNIQUE
    UR1 : identifier, reference_document;
END_ENTITY; -- ee_rule_function

```

(*

4.2.335 Ee_rule_premise_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

The Ee_rule_premise_definition is a type of Managed_design_object (see 4.2.524). An Ee_rule_premise_definition is the premise for a rule construct. The Ee_rule_premise_definition uses an 'OR' construct so that if any of the parts of the premise are true, the rule will fire.

The data associated with an Ee_rule_premise_definition are the following:

- rule_definition;
- identifier;
- disjunctive_content.

4.2.335.1 rule_definition

The rule_definition specifies the Ee_rule_definition (see 4.2.333) for the Ee_rule_premise_definition. The rule_definition is the Ee_rule_definition this Ee_rule_premise_definition is helping to compose.

4.2.335.2 identifier

The identifier specifies the name for the Ee_rule_premise_definition.

4.2.335.3 disjunctive_content

The disjunctive_content specifies an Ee_rule_complex_clause (see 4.2.331). There shall be one or more disjunctive_content specified for an Ee_rule_premise_definition.

Constraints:

UR1: The combination of rule_definition and identifier shall be unique within a population of Ee_rule_- conclusion_definition.

NOTE EXPRESS specification:

```

*)
ENTITY ee_rule_premise_definition
  SUBTYPE OF ( managed_design_object );
    rule_definition      : ee_rule_definition;
    identifier           : STRING ;
    disjunctive_content  : SET [1:?] OF ee_rule_complex_clause;
  UNIQUE
    UR1 : rule_definition, identifier;
END_ENTITY; -- ee_rule_premise_definition

```

(*

4.2.336 Ee_rule_simple_clause

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

The Ee_rule_simple_clause is a type of Managed_design_object (see 4.2.524). An Ee_rule_simple_clause assigns data specific to the rule definition to the generic algorithm specified by rule_function.

NOTE This data is not product instance data, but is categorical data helping to compose this definition.

EXAMPLE 1 An example of this type of data would be "all tracks less than 5 mils."

The data associated with an Ee_rule_simple_clause are the following:

- rule_function;
- parameters;
- identifier.

4.2.336.1 rule_function

The rule_function specifies the Ee_rule_definition (see 4.2.333) of the Ee_rule_simple_clause. The rule_function is the rule to which the Ee_simple_clause is assigning parameters.

4.2.336.2 parameters

The parameters specifies the Parameter_assignment (see 4.2.603) for an Ee_rule_simple_clause. There shall be one or more parameters specified for an Ee_rule_simple_clause.

4.2.336.3 identifier

The identifier specifies the name for the Ee_rule_simple_clause.

Constraints:

UR1: The identifier shall be unique within a population of Ee_rule_simple_clause.

NOTE EXPRESS specification:

```

*)
ENTITY ee_rule_simple_clause
  SUBTYPE OF ( managed_design_object );
  rule_function : ee_rule_function;
  parameter      : SET [1:?] OF parameter_assignment;
  identifier      : STRING ;
  UNIQUE
    UR1: identifier;
END_ENTITY; -- ee_rule_simple_clause

( *
```

4.2.337 Ee_rule_version

An Ee_rule_version is a type of Ee_product_version (see 4.2.328). An Ee_rule_version is the management of the assignment of Ee_rule_definition (see 4.2.333) to Ee_rule (see ??). An Ee_rule may evolve with usage for any number of reasons.

The data associated with an Ee_rule_version are the following:

— management_action.

4.2.337.1 management_action

The management_action is an inverse relationship that specifies that the existence of the Ee_rule_version is dependent on the existence of the Rule_action (see 4.2.780) that specifies the Ee_rule_version as its subject_rule. There shall be one or more Rule_action for an Ee_rule_version.

NOTE EXPRESS specification:

```

*)
ENTITY ee_rule_version
  SUBTYPE OF (ee_product_version);
  INVERSE
    management_action : SET [1:?] OF rule_action FOR subject_rule;
END_ENTITY; -- ee_rule_version
( *

```

4.2.338 Ee_specification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_specification is a type of Ee_document (see 4.2.316). An Ee_specification may be either a Design_specification (see 4.2.280), a Language_reference_manual (see 4.2.497), a Material_specification (see 4.2.537), a Process_specification (see 4.2.740), or a Test_specification (see 4.2.898).

The data associated with an Ee_specification are the following:

— source.

4.2.338.1 source

The source specifies the Organization (see 4.2.569) or the Person_and_organization (see 4.2.647) responsible for the information of an Ee_specification.

NOTE EXPRESS specification:

```

*)
ENTITY ee_specification
  SUPERTYPE OF (ONEOF (design_specification, process_specification,
    material_specification, test_specification, language_reference_manual))
  SUBTYPE OF (ee_document);
  source : person_organization;
END_ENTITY; -- ee_specification
( *

```

4.2.339 Ee_text

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Ee_text is a type of Managed_design_object (see 4.2.524). An Ee_text is a string used to convey information.

The data associated with an Ee_text are the following:

— content.

4.2.339.1 content

The content specifies the organized list of one or more words that comprise a message.

NOTE EXPRESS specification:

```
*)  
ENTITY ee_text  
  SUBTYPE OF (managed_design_object);  
  content : STRING;  
END_ENTITY; -- ee_text

4.2.342 Electrical_isolation_laminate_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Electrical_isolation_laminate_component is a type of Filled_area_material_removal_laminate_component (see 4.2.384) that indicates that material is to be removed in the realization of the feature that is in the role of design_intent inherited from Filled_area_material_removal_laminate_component. The requirement shall be interpreted mathematically as a requirement for application of the regularized Boolean subtraction operation.

The data associated with an Electrical_isolation_laminate_component are the following:

— usage_definition.

4.2.342.1 usage_definition

The usage_definition specifies the role of the Electrical_isolation_removal_template (see 4.2.344) for the Electrical_isolation_laminate_component.

NOTE EXPRESS specification:

```

*)
ENTITY electrical_isolation_laminate_component
  SUBTYPE OF (filled_area_material_removal_laminate_component);
  SELF\assembly_component.usage_definition : electrical_isolation_removal_template;
END_ENTITY; -- electrical_isolation_laminate_component

( *

```

4.2.343 Electrical_isolation_removal_structure

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Electrical_isolation_removal_structure is a type of Filled_area_material_removal_structure (see 4.2.385) that has specific materials removed from specific subsets of the filled area for the purpose of electrical isolation.

The data associated with an Electrical_isolation_removal_structure are the following:

— electrical_isolation_spacing_requirement.

4.2.343.1 electrical_isolation_spacing_requirement

The electrical_isolation_spacing_requirement specifies the Ee_requirement_occurrence (see 4.2.330) of electrical isolation for the Electrical_isolation_removal_structure.

NOTE EXPRESS specification:

```

*)
ENTITY electrical_isolation_removal_structure
  SUBTYPE OF (filled_area_material_removal_structure);
  electrical_isolation_spacing_requirement : ee_requirement_occurrence;
END_ENTITY; -- electrical_isolation_removal_structure

( *

```

4.2.344 Electrical_isolation_removal_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Electrical_isolation_removal_template is a type of Material_removal_feature_template (see 4.2.534) that describes the shape of material to be removed from a feature. The purposes predefined in this part of ISO 10303 include electrical and thermal isolation.

EXAMPLE 1 Figure 108 illustrates a template and associated parameters designed for electrical isolation. For a specific template, values will be assigned for the parameters and the explicit geometry will be representative of the assigned parameter values.

EXAMPLE 2 Figure 109 illustrates a template and associated parameters designed for thermal isolation. For a specific template, values will be assigned for the parameters and the explicit geometry will be representative of the assigned parameter values. In this example, an instance would be a complex instance including Composite_unit_shape_element (see 4.2.167) and Electrical_isolation_removal_template.

Physical characteristics are inherited from Part_template.

Reference_document is : IEC 61182-1

Note : Electrical Isolation

Figure 43 – Electrical_isolation_removal_template supports electrical isolation

Physical characteristics are inherited from Part_template.

Reference_document is : IEC 61182-1

Note : Thermal isolation

Figure 44 – Electrical_isolation_removal_template supports thermal isolation and electrical conduction

The data associated with an `Electrical_isolation_removal_template` are the following:

— `electrical_isolation_spacing_requirement`.

4.2.344.1 `electrical_isolation_spacing_requirement`

The `electrical_isolation_spacing_requirement` specifies the role of the `Layout_spacing_requirement_occurrence` (see 4.2.509) for the `Add_design_object_management_relationship`.

NOTE EXPRESS specification:

```
*)
ENTITY electrical_isolation_removal_template

4.2.350 Elliptic_area

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Elliptic_area is a type of Primitive_2d (see 4.2.720).

The data associated with an Elliptic_area are the following:

— position;

— semi_axis_1;

— semi_axis_2.

4.2.350.1 position

The position specifies an Axis_placement_2d (see 4.2.57) for the Elliptic_area.

4.2.350.2 semi_axis_1

The semi_axis_1 specifies a Length_data_element (see 4.2.511) for the Elliptic_area.

4.2.350.3 semi_axis_2

The semi_axis_2 specifies a Length_data_element (see 4.2.511) for the Elliptic_area.

NOTE EXPRESS specification:

```
*)
ENTITY elliptic_area
  SUBTYPE OF (primitive_2d);

END_ENTITY; -- elliptic_area

( *
```

4.2.351 Embedded_component_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Embedded_component_terminal is a type of Laminate_join_terminal (see ??) included in the design to mate directly with a terminal of a fabricated feature by use of a Fabrication_joint (see 4.2.368) internally in a layout. An Embedded_component_terminal is a model specifically included to bridge between the discrete purchased items used in a design and the custom fabricated interconnect patterns in a substrate design. An Embedded_component_terminal is an instance of a usage definition for access to a discrete component in the context of a substrate design. An Embedded_component_terminal is included to support using Physical_network to define the implementation connections to the associated component.

NOTE The modeling approach used here does not imply that Embedded_component_terminal is created as part of the wet or dry chemistr process used to create the patterns on the substrate. It is merely identifying a functional role of a terminal of a discrete part when it is embedded in a substrate. By implication, it is also identifying the role of the associated component, i.e. that the associated component is embedded in the substrate. The method or process of achieving this is not defined in this standard. The Embedded_component_terminal will not be included in a Physical_connectivity_definition and is treated herein similarly to the Printed_component terminals. A Fabrication_joint is required to connect the terminal to the Land_join_terminal adjacent to satisfy functional connectivity requirements.

The data associated with an Embedded_component_terminal are the following:

- associated_component;
- definition.

4.2.351.1 associated_component

The associated_component specifies the role of the Bare_die_component (see 4.2.61) or the role of the Packaged_component (see 4.2.585) for the Embedded_component_terminal.

4.2.351.2 definition

The definition specifies the role of the Bare_die_terminal (see 4.2.66) or the role of the Packaged_part_terminal (see 4.2.594) for the Embedded_component_terminal.

Constraints:

WR1: An Embedded_component_terminal shall participate in a relationship with a Fabrication_joint as a fabrication_features.

NOTE EXPRESS specification:

```
*)
ENTITY embedded_component_terminal
  SUBTYPE OF (laminate_component_join_terminal);
  SELF\component_feature.definition      : bare_die_terminal_or_packaged_part_termi

4.2.353 Engineering_make_from

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Engineering_make_from is a type of Managed_design_object (see 4.2.524). An Engineering_make_from is the relationship between two products in which one product is used as the basis for the design of the other product.

EXAMPLE 1 Engineering_make_from may be mask programmed processors, enterprise programmed digital devices, or field programmable or field reprogrammable arrays or modems that are updateable by downloading new firmware from a central source.

NOTE This facility is not limited to packaged parts but may be applied to any product.

EXAMPLE 2 A mask programmed processor would be a 'mask programmable processor' before programming and would be a 'Yaw rate processor' after programming.

The data associated with an Engineering_make_from are the following:

- base_design;
- resultant_design.

4.2.353.1 base_design

The base_design specifies the Ee_product_definition (see 4.2.323) to be used as the basis for the design of another Ee_product (see 4.2.319) for the Engineering_make_from.

4.2.353.2 resultant_design

The resultant_design specifies the Ee_product_definition (see 4.2.323) that results from basing the design upon the design of another Ee_product (see 4.2.319) for the Engineering_make_from.

NOTE EXPRESS specification:

```

*)
ENTITY engineering_make_from

4.2.354 Equivalent_functional_terminals_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Equivalent_functional_terminals_assignment is a type of Managed_design_object (see 4.2.524). An Equivalent_functional_terminals_assignment is the assignment that a set of terminals are equivalent in a Functional_unit_usage_view (see 4.2.410).

The data associated with an Equivalent_functional_terminals_assignment are the following:

- equivalent_terminals;
- name.

4.2.354.1 equivalent_terminals

The equivalent_terminals specify the equivalent Functional_unit_usage_view_terminal_definition (see 4.2.411) for the Equivalent_functional_terminals_assignment. There shall be at least two Functional_unit_usage_view_terminal_definition for the Equivalent_functional_terminals_assignment.

4.2.354.2 name

The name specifies the string that is the identifier for the Equivalent_functional_terminals_assignment.

Constraints:

WR1: One member of equivalent_functional_terminals_assignment shall establish equivalency only between members of functional_unit_usage_view_terminal_definition that are terminals of the same functional_unit_definition.

NOTE EXPRESS specification:

```

*)
ENTITY equivalent_functional_terminals_assignment
  SUBTYPE OF (managed_design_object);
    equivalent_terminals : SET [2:?] OF functional_unit_usage_view_terminal_definition;

```

4.2.355 Equivalent_functional_unit_definition_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Equivalent_functional_unit_definition_assignment is a type of Managed_design_object (see 4.2.524). An Equivalent_functional_unit_definition_assignment is the association between at least two Functional_unit_definition (see 4.2.401) that are equivalent.

The data associated with an Equivalent_functional_unit_definition_assignment are the following:

- equivalent_functional_unit_definitions;
- name.

4.2.355.1 equivalent_functional_unit_definitions

The equivalent_functional_unit_definitions specify the Functional_unit_definition (see 4.2.401) for the Equivalent_functional_unit_definition_assignment. There shall be at least two but may be more than two Functional_unit_definition for the Equivalent_functional_unit_definition_assignment.

4.2.355.2 name

The name specifies the string that is the identifier for the Equivalent_functional_unit_definition_assignment.

NOTE EXPRESS specification:

```

*)
ENTITY equivalent_functional_unit_definition_assignment
  SUBTYPE OF (managed_design_object);
    equivalent_functional_unit_definitions : SET [2:?] OF functional_unit_definition;

```

4.2.356 Evaluated_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Evaluated_characteristic is a type of Managed_design_object (see 4.2.524). The Evaluated_characteristic provides a mechanism to validate or evaluate a Planned_characteristic (see 4.2.679).

The data associated with an Evaluated_characteristic are the following:

- planned_product_data;
- product_characterization_data;
- product_data_status.

4.2.356.1 planned_product_data

The planned_product_data specifies the role of the Planned_characteristic (see 4.2.679) for an Evaluated_characteristic.

4.2.356.2 product_characterization_data

The product_characterization_data specifies one or more Coordinated_characteristic (see 4.2.197) for an Evaluated_characteristic. The product_characterization_data need not be provided for a specific Evaluated_characteristic.

4.2.356.3 product_data_status

The product_data_status provides a status of valid, invalid, not_evaluable, or to_be_evaluated for an Evaluated_characteristic.

NOTE EXPRESS specification:

```

*)
ENTITY evaluated_characteristic
  SUPERTYPE OF (rule_based_evaluated_characteristic)

4.2.359 Expanded_uncertainty

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Expanded_uncertainty is a type of Standard_uncertainty (see 4.2.837). The uncertainty is defined in clause 2 of "The Guide to the Expression of Uncertainty in Measurement".

NOTE EXPRESS specification:

```
*)
ENTITY expanded_uncertainty
  SUBTYPE OF (standard_uncertainty);
  coverage_factor : REAL;
END_ENTITY;
( *
```

4.2.360 Explicitly_located_layer_connection_point

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Explicitly_located_layer_connection_point is a type of Layer_connection_point (see 4.2.499) that is not a Dependently_located_layer_connection_point (see 4.2.259). An Explicitly_located_layer_connection_point may be referenced by a Junction_vertex_allocation to help define a topological structure.

EXAMPLE 1 Figure 45 illustrates a detail of a layout drawing that shows the Explicitly_located_layer_connection_points that are included in the design due to internal layout considerations.

The data associated with an Explicitly_located_layer_connection_point are the following:

— location.

"+" Explicitly_located_layer_connection_point

Figure 45 – Explicitly_located_layer_connection_point

4.2.360.1 location

The location specifies the Cartesian_point (see 4.2.87) relative to the Cartesian_point origin of the Interconnect_module (see 4.2.440) at which the Explicitly_located_layer_connection_point resides.

Constraints:

UR1: The combination of location, and resident_design_layer_stratum inherited from the supertype Layer_connection_point shall be unique within a population of Explicitly_located_layer_connection_point.

WR1: The location shall be in the extent of the resident_design_layer_stratum.

NOTE EXPRESS specification:

```

*)
ENTITY explicitly_located_layer_connection_point
  SUBTYPE OF (layer_connection_point);
(*
--tt tc1 wd9 moved to supertype
  location : cartesian_point;
  UNIQUE
    UR1 : location, SELF\layer_connection_point.resident_design_layer_stratum;
*)
END_ENTITY; -- explicitly_located_layer_connection_point

(*

```

4.2.361 External_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An External_definition is a type of Managed_design_object (see 4.2.524). An External_definition is a definition that is supported externally to this part of ISO 10303.

The data associated with an External_definition are the following:

- code;
- code_value;
- reference_document.

4.2.361.1 code

The code specifies the string as the identifier of the type of the External_definition.

4.2.361.2 code_value

The code_value specifies the text as the content of the External_definition.

4.2.361.3 reference_document

The reference_document specifies either the Ee_document (see 4.2.316) or a string referred to as a standard document identification string, registered by IEC or ISO for the purpose of unambiguously identifying a document published by the respective organization, as the code definition document used by application programmers for the External_definition.

NOTE The reference_document includes a data dictionary that defines the allowed types that may be used as identifiers.

Constraints:

IP1: The string specified by code shall not appear more than once in the reference_document. This constraint is to be interpreted as a requirement against the implementation of document when that implementation is to support External_definition.

NOTE EXPRESS specification:

```
*)
ENTITY external_definition
  SUBTYPE OF (managed_design_object);
  code          : STRING;
  code_value    : STRING;
  reference_document : standard_or_reference_document;
END_ENTITY; -- external_definition
```

(*

4.2.362 Externally_defined_curve_font

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Externally_defined_curve_font is a type of Managed_design_object (see 4.2.524). An Externally_defined_curve_font is a curve font that is defined in an external computer interpretable system.

NOTE EXPRESS specification:

```
*)
ENTITY externally_defined_curve_font
  SUBTYPE OF (managed_design_object);
END_ENTITY; -- externally_defined_curve_font
```

(*

4.2.363 Externally_defined_dimension_representation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Externally_defined_dimension_representation is a type of Shape_dimension_representation (see 4.2.809) the interpretation of which is dependent on definitions supported externally to this part of ISO 10303.

The data associated with an Externally_defined_dimension_representation are the following:

- definitions;
- dimension_value.

4.2.363.1 definitions

The definitions specify the External_definition (see 4.2.361) that represents the Dimensional_characteristic (see 4.2.298). There shall be one or more External_definition specified as definitions for an Externally_defined_dimension_representation.

4.2.363.2 dimension_value

The dimension_value specifies the Data_element (see 4.2.211) that in conjunction with the External_definition (see 4.2.361), that are specified as the definitions, represent the associated Dimensional_characteristic (see 4.2.298). The dimension_value need not be specified for an Externally_defined_dimension_representation.

EXAMPLE 1 The system of limits and fits specifies a way in which to represent dimensions and is defined in ISO 286.

NOTE EXPRESS specification:

```
*)
ENTITY externally_defined_dimension_representation
  SUBTYPE OF (shape_dimension_representation);
  definitions      : SET [1:?] OF external_definition;
  dimension_value : OPTIONAL data_element;
END_ENTITY; -- externally_defined_dimension_representation

( *
```

4.2.364 Externally_defined_ee_product_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Externally_defined_ee_product_definition is a type of Ee_product_definition (see 4.2.323) that is defined in an external computer interpretable system.

The data associated with an Externally_defined_ee_product_definition are the following:

— source.

4.2.364.1 source

The source specifies the name of the source of the Externally_defined_ee_product_definition.

NOTE EXPRESS specification:

```
*)  
ENTITY externally_defined_ee_product_definition  
  SUBTYPE OF (ee_product_definition);  
  source : ee_name;  
END_ENTITY; -- externally_defined_ee_product_definition  
  
(*
```

4.2.365 Externally_defined_hatch_style

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Externally_defined_hatch_style is a type of Managed_design_object (see 4.2.524). An Externally_defined_hatch_style is a hatch style that is defined in an external computer interpretable system.

NOTE EXPRESS specification:

```
*)  
ENTITY externally_defined_hatch_style  
  SUBTYPE OF (managed_design_object);  
END_ENTITY; -- externally_defined_hatch_style  
  
(*
```

4.2.366 Externally_defined_tile

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Externally_defined_tile is a type of Managed_design_object (see 4.2.524). An Externally_defined_tile is a tile that is defined in an external computer interpretable system.

NOTE EXPRESS specification:

```
*)  
ENTITY externally_defined_tile  
  SUBTYPE OF (managed_design_object);  
END_ENTITY; -- externally_defined_tile  
  
(*
```

4.2.367 Externally_defined_tile_style

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Externally_defined_tile_style` is a type of `Managed_design_object` (see 4.2.524). An `Externally_defined_tile_style` is a tile style that is defined in an external computer interpretable system.

NOTE EXPRESS specification:

```
*)
ENTITY externally_defined_tile_style
  SUBTYPE OF (managed_design_object);
END_ENTITY; -- externally_defined_tile_style

( *
```

4.2.368 Fabrication_joint

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Fabrication_joint` is a type of `Managed_design_object` (see 4.2.524). A `Fabrication_joint` is a joint that is created in the fabrication of a `Interconnect_module` (see 4.2.440).

EXAMPLE 1 Figure 46 is a plan view of the construction of a `Fabrication_joint` between a `Land` (see 4.2.490) and a `Conductive_interconnect_element` (see 4.2.171) that results in a `Conductor` (see 4.2.176) segment. This figure illustrates the geometric relationship of the element terminals in the construction of the segment.

EXAMPLE 2 Figure 47 is a cross-sectional view of the construction of a `Fabrication_joint` between a `Land` and a `Component_termination_passage` (see 4.2.143).

The data associated with a `Fabrication_joint` are the following:

- `auxiliary_joint_material`;
- `fabrication_features`.

4.2.368.1 auxiliary_joint_material

The `auxiliary_joint_material` specifies the `Stratum_feature_template_component` (see 4.2.862) for the `Fabrication_joint`. The `auxiliary_joint_material` need not be specified for a particular `Fabrication_joint`.

4.2.368.2 fabrication_features

The `fabrication_features` specify exactly two from among the following: a `Component_termination_passage_join_terminal`, a `Conductive_interconnect_element_terminal` (see 4.2.172), a `Land_join_terminal` (see 4.2.492), a `Non_functional_land_join_terminal` (see 4.2.564), a `Printed_component_join_terminal` (see 4.2.722), or a `Via_terminal` (see 4.2.954) for the `Fabrication_joint`.

Conductor segment resulting from Fabrication_joint.

* Step 1 : relate 2 terminals (of already placed components)

* Step 2 : relate a Stratum_feature_template_component to the joint

Note : 1) This supports filleting and keyholing at the intersection of Land and trace
Reference IPC-D-275.

2) The design view is the Interconnect_module.

Figure 46 – Land to Conductive_interconnect_element Fabrication_joint exploded view

Figure 47 – Land to Component_termination_passage exploded view

Constraints:

WR1: A member of `Conductive_interconnect_element_terminal` and a member of `Non_functional_land_join_terminal` shall not be in the same set of `fabrication_features`.

NOTE EXPRESS specification:

```
*)
ENTITY fabrication_joint
  SUBTYPE OF (managed_design_object);
    fabrication_features_1 : fabricated_feature_select;
    fabrication_features_2 : fabricated_feature_select;
    auxiliary_joint_material : OPTIONAL stratum_feature_template_component;
    associated_interconnect_module : interconnect_module;
END_ENTITY; -- fabrication_joint

(*

4.2.369 Fabrication_technology_specification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Fabrication_technology_specification` is a type of `Process_specification` (see 4.2.740) that describes the technology used for parts and part families.

NOTE EXPRESS specification:

```
*)
ENTITY fabrication_technology_specification
  SUBTYPE OF (process_specification);
END_ENTITY; -- fabrication_technology_specification
```

(*

4.2.370 Fabrication_thickness_requirement_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Fabrication_thickness_requirement_occurrence` is a type of `Inspection_requirement_occurrence` (see 4.2.430) that characterizes the interconnect thickness range over metallic material or dielectric material and assigns a tolerance to that range for fabrication purposes.

The data associated with a `Fabrication_thickness_requirement_occurrence` are the following:

- `characterized_class`;
- `characterized_class_range`;
- `tolerance`.

4.2.370.1 `characterized_class`

The `characterized_class` specifies either "over_finished_conductor" or "over_finished_dielectric" for the `Fabrication_thickness_requirement_occurrence`. This is the class to which the range and tolerance is applied.

4.2.370.2 `characterized_class_range`

The `characterized_class_range` specifies the role of the `Range_characteristic` (see 4.2.760) for the `Fabrication_thickness_requirement_occurrence`. The `characterized_class_range` specifies the set of measurements to which the tolerance applies.

4.2.370.3 `tolerance`

The `tolerance` specifies the role of the `Tolerance_characteristic` (see 4.2.911) for the `Fabrication_thickness_requirement_occurrence`. The tolerance is applicable over the range specified by the `characterized_class_range`.

NOTE EXPRESS specification:

```
*)
ENTITY fabrication_thickness_requirement_occurrence
  SUBTYPE OF (inspection_requirement_occurrence);
    characterized_class      : metal_or_dielectric;
    characterized_class_range : range_characteristic;
    tolerance                 : tolerance_characteristic;
END_ENTITY; -- fabrication_thickness_requirement_occurrence
(*
```

4.2.371 `Feature_group_relationship`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Feature_group_relationship` is a type of `Managed_design_object` (see 4.2.524). A `Feature_group_relationship` is the association of one or more `Part_feature` (see 4.2.609) and a `Part_group_feature` (see 4.2.613) that are used in the composition of that `Part_group_feature`.

The data associated with a Feature_group_relationship are the following:

- related_feature;
- relating_feature.

4.2.371.1 related_feature

The related_feature specifies the Part_feature (see 4.2.609) used in the Feature_group_relationship.

4.2.371.2 relating_feature

The relating_feature specifies the Part_group_feature (see 4.2.613) in the Feature_group_relationship.

NOTE EXPRESS specification:

```
*)  
ENTITY feature_group_relationship  
  SUBTYPE OF (managed_design_object);  
    relating_feature : part_group_feature;  
    related_feature  : part_feature;  
END_ENTITY; -- feature_group_relationship
```

(*

4.2.372 Feature_shape_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Feature_shape_definition is a type of Shape_definition (see 4.2.808). A Feature_shape_definition represents real features in the product model. A member of Feature_shape_definition shall be also be a member of another subtype of Shape_definition.

NOTE The type constraint stated is supported by the information requirements described in the Shape_definition Application Object.

NOTE EXPRESS specification:

```
*)  
ENTITY feature_shape_definition  
  SUBTYPE OF (shape_definition);  
END_ENTITY; -- feature_shape_definition  
( *
```

4.2.373 Fiducial

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Fiducial is a type of Laminate_component (see 4.2.483) that is a basis of measurement with respect to other Assembly_components. A Fiducial is used for accurate alignment of one item with another. Another type of Laminate_component may play the role of Fiducial in a design.

NOTE EXPRESS specification:

```
*)
ENTITY fiducial
  SUBTYPE OF (laminate_component);
END_ENTITY; -- fiducial

(*
```

4.2.376 Fill_area

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Fill_area is a type of Managed_design_object (see 4.2.524). A Fill_area is the area bounded by a Curve (see 4.2.203) that is defined to be filled with material using a pattern. Each Curve shall be an outer or inner boundary. Each boundary shall be closed. There shall be no more than one outer boundary. No boundary shall self-intersect or intersect with any other boundary.

NOTE This Application Object is describing geometric patterns. The association of material with the patterns occurs elsewhere, for instance in the Design_intent_modification_styled_area_representation (see 4.2.274).

The data associated with a Fill_area are the following:

— boundary.

4.2.376.1 boundary

The boundary specifies the Closed_curve (see 4.2.104) that describes the outline of the Fill_area. There shall be one or more Curve for a Fill_area. The curves shall be non-self intersecting and non-overlapping.

NOTE EXPRESS specification:

```
*)
ENTITY fill_area
  SUBTYPE OF (managed_design_object);
  boundaries : SET [1:?] OF closed_curve;
END_ENTITY; -- fill_area

(*
```

4.2.377 Fill_area_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Fill_area_occurrence is a type of Managed_design_object (see 4.2.524). A Fill_area_occurrence is an instantiation of a Fill_area (see 4.2.376). The boundary_style shall be applied to each boundary of the instance of the Fill_area. A zero width boundary_style shall be interpreted as using the boundaries of the Fill_area as clipping regions. A non-zero width boundary_style shall be interpreted as the regularized Boolean "OR" operation on the instance of the Fill_area, applied at each boundary after the clip operation required by the zero width boundary style. The orientation of the Fill_area instances shall be parallel with the orientation of the Fill_area.

The data associated with a Fill_area_occurrence are the following:

- boundary_style;
- filled_area;
- fill_style_target;
- style.

4.2.377.1 boundary_style

The boundary_style specifies the role of the Curve_style (see 4.2.205) for the Fill_area_occurrence. The boundary_style is applied to each instance of the Fill_area boundaries individually. The boundary_style end parameters shall be ignored. The boundary_style curve_font shall not be specified.

4.2.377.2 filled_area

The filled_area specifies the role of the Fill_area (see 4.2.376) for the Fill_area_occurrence. The Fill_area provides shape and orientation information for the Fill_area_occurrence.

4.2.377.3 fill_style_target

The fill_style_target specifies the Cartesian_point (see 4.2.87) that defines the location of the Fill_area_style (see 4.2.378) for the Fill_area_occurrence.

4.2.377.4 style

The style specifies the role of the Fill_area_style (see 4.2.378) for the Fill_area_occurrence. There shall be one or more Fill_area_style for a Fill_area_occurrence.

NOTE EXPRESS specification:

```
*)  
ENTITY fill_area_occurrence  
  SUBTYPE OF (managed_design_object);  
    style          : SET [1:?] OF fill_area_style;  
    filled_area     : fill_area;  
    fill_style_target : cartesian_point;  
    boundary_style  : curve_style;  
END_ENTITY; -- fill_area_occurrence  
  
(*
```

4.2.378 Fill_area_style

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Fill_area_style is a type of Managed_design_object (see 4.2.524). A Fill_area_style is the selected style used in a Fill_area (see 4.2.376).

The data associated with a Fill_area_style are the following:

- fill_style;
- name.

4.2.378.1 fill_style

The fill_style specifies either an Externally_defined_hatch_style (see 4.2.365), an Externally_defined_tile_style (see 4.2.367), a Fill_area_style_hatching (see 4.2.379), a Fill_area_style_tile (see 4.2.380), or a Solid_fill_style (see 4.2.832) for the Fill_area_style.

4.2.378.2 name

The name specifies the string for the identifier for the Fill_area_style.

Constraints:

UR1: The name shall be unique within a population of Fill_area_style.

NOTE EXPRESS specification:

```

*)
ENTITY fill_area_style
  SUBTYPE OF (managed_design_object);
    name      : STRING;
    fill_style : fill_style_select;
  UNIQUE
    UR1: name;
END_ENTITY; -- fill_area_style

( *
```

4.2.379 Fill_area_style_hatching

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Fill_area_style_hatching is a type of Managed_design_object (see 4.2.524). A Fill_area_style_hatching is the parallel line hatch style of a Fill_area (see 4.2.376). All units associated with Fill_area_style_hatching are defined in the global units for the Interconnect_module (see 4.2.440) being designed. The geometric reference for Fill_area_style_hatching shall be the origin of the Interconnect_module being designed. When this Application Object is used to help compose a Design_intent_modification_styled_area_representation (see 4.2.274) or to help compose a Stratum_feature_styled_area_representation (see 4.2.860), only the Curve_style_font (see 4.2.206) shall be referenced by the curve_font attribute of the Curve_style Application Object referenced by hatch_line_appearance.

NOTE In order to obtain cross-hatch, two instances of Fill_area_style_hatching are required, with complementary angles.

The data associated with a Fill_area_style_hatching are the following:

- hatch_line_angle;
- hatch_line_appearance;
- pattern_start;
- point_of_reference_hatch_line;
- start_of_next_hatch_line.

4.2.379.1 hatch_line_angle

The hatch_line_angle specifies the role of the Angle_data_element (see 4.2.23) for the Fill_area_style_hatching.

4.2.379.2 hatch_line_appearance

The hatch_line_appearance specifies the role of the Curve_style (see 4.2.205) for the Fill_area_style_hatching.

NOTE The curve style may include a discontinuous geometric shape, in which case the hatch cannot be used to represent product data which is contiguous in nature.

EXAMPLE 1 The curve style may be a dashed line and in that case each of the dashes would correspond to a different Stratum_feature (see 4.2.851).

4.2.379.3 pattern_start

The pattern_start specifies the Cartesian_point (see 4.2.87) for the beginning of the pattern of Fill_area_style_hatching.

4.2.379.4 point_of_reference_hatch_line

The point_of_reference_hatch_line specifies the Cartesian_point (see 4.2.87) for the point of reference and located on the initial hatch line for the Fill_area_style_hatching.

4.2.379.5 start_of_next_hatch_line

The start_of_next_hatch_line specifies the Vector (see 4.2.946) from the end Cartesian_point of the present hatch line to the beginning Cartesian_point of the next hatch line for the Fill_area_style_hatching.

NOTE EXPRESS specification:

```
*)
ENTITY fill_area_style_hatching
  SUBTYPE OF (managed_design_object);
    hatch_line_appearance      : curve_style;
    start_of_next_hatch_line   : vector;
    point_of_reference_hatch_line : cartesian_point;
    pattern_start              : cartesian_point;
    hatch_line_angle           : angle_data_element;
END_ENTITY; -- fill_area_style_hatching
```

(*

4.2.380 Fill_area_style_tile

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Fill_area_style_tile is a type of Managed_design_object (see 4.2.524). A Fill_area_style_tile is the definition of the tile for a Fill_area_style (see 4.2.378).

The data associated with a `Fill_area_style_tile` are the following:

- `tile`;
- `tiling_pattern`;
- `tiling_scale`.

4.2.380.1 `tile`

The `tile` specifies either an `Externally_defined_tile` (see 4.2.366), a `Fill_area_style_tile_curve_with_style` (see 4.2.381), a `Fill_area_style_tile_solid_region` (see 4.2.382), or a `Fill_area_style_tile_symbol_with_style` (see 4.2.383) for the `Fill_area_style_tile`.

4.2.380.2 `tiling_pattern`

The `tiling_pattern` specifies two `Vector` (see 4.2.946) for the `Fill_area_style_tile`. There shall be exactly two `Vector` for a `Fill_area_style_tile`.

4.2.380.3 `tiling_scale`

The `tiling_scale` specifies the role of the `Positive_ratio_measure` (see ??) for a `Fill_area_style_tile`.

NOTE EXPRESS specification:

```

*)
ENTITY fill_area_style_tile
  SUBTYPE OF (managed_design_object);
  --tt tc1 wd11 modified
    first_direction_repeat_factor : vector;
  --tt tc1 wd11 added
    second_direction_repeat_factor : vector;

    tiling_scale : positive_ratio_measure;
END_ENTITY; -- fill_area_style_tile

( *
```

4.2.381 `Fill_area_style_tile_curve_with_style`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Fill_area_style_tile_curve_with_style` is a type of `Managed_design_object` (see 4.2.524). A `Fill_area_style_tile_curve_with_style` is the definition of the tiling of a `Fill_area` (see 4.2.376).

NOTE EXPRESS specification:

```
*)  
ENTITY fill_area_style_tile_curve_with_style  
  SUBTYPE OF (managed_design_object);  
END_ENTITY; -- fill_area_style_tile_curve_with_style  
  
( *
```

4.2.382 Fill_area_style_tile_solid_region

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Fill_area_style_tile_solid_region is a type of Managed_design_object (see 4.2.524). A Fill_area_style_tile_solid_region is the definition of a region that shall be filled solidly with tiles.

NOTE EXPRESS specification:

```
*)  
ENTITY fill_area_style_tile_solid_region  
  SUBTYPE OF (managed_design_object);  
END_ENTITY; -- fill_area_style_tile_solid_region  
  
( *
```

4.2.383 Fill_area_style_tile_symbol_with_style

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Fill_area_style_tile_symbol_with_style is a type of Managed_design_object (see 4.2.524). A Fill_area_style_tile_symbol_with_style is the definition of a tile symbol with a specified style.

NOTE EXPRESS specification:

```
*)  
ENTITY fill_area_style_tile_symbol_with_style  
  SUBTYPE OF (managed_design_object);  
END_ENTITY; -- fill_area_style_tile_symbol_with_style

4.2.384 Filled_area_material_removal_laminate_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Filled_area_material_removal_laminate_component` is a type of `Material_removal_laminate_component` (see 4.2.535) that indicates that material is to be removed in the realization of the feature that is in the role of `design_intent` inherited from `Material_removal_laminate_component`. A `Filled_area_material_removal_laminate_component` is either an `Electrical_isolation_laminate_component` (see 4.2.342) or a `Thermal_isolation_laminate_component` (see 4.2.902). The requirement shall be interpreted mathematically as a requirement for application of the regularized Boolean subtraction operation. The `design_intent` inherited from `Material_removal_laminate_component` shall not be a `Conductor` (see 4.2.176).

NOTE In some cases, the isolation may be accomplished by complete removal, as in a dielectric removal from a dielectric layer or layers.

The data associated with a `Filled_area_material_removal_laminate_component` are the following:

— `description`.

4.2.384.1 description

The `reference_padstack` specifies the role of the `Padstack_definition` (see 4.2.595) for the `Filled_area_material_removal_laminate_component`.

NOTE EXPRESS specification:

```

*)
ENTITY filled_area_material_removal_laminate_component
  SUPERTYPE OF (ONEOF(electrical_isolation_laminate_component,
    thermal_isolation_laminate_component))
  SUBTYPE OF (material_removal_laminate_component);
  reference_padstack : padstack_definition;
WHERE
  WR1: NOT('AP210_ARM.CONDUCTOR' IN TYPEOF(SELF\material_removal_laminate_component.design_intent));
END_ENTITY; -- filled_area_material_removal_laminate_component

( *
```

4.2.385 Filled_area_material_removal_structure

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Filled_area_material_removal_structure` is a type of `Material_removal_feature` (see 4.2.533). A `Filled_area_material_removal_structure` is either an `Electrical_isolation_removal_structure` (see 4.2.343) or a `Thermal_isolation_removal_structure` (see 4.2.903).

The data associated with a `Filled_area_material_removal_structure` are the following:

— `design_intent`.

4.2.385.1 design_intent

The design_intent specifies the Conductive_filled_area (see 4.2.170) for the requirement for the Filled_area_material_removal_structure.

NOTE EXPRESS specification:

```

*)
ENTITY filled_area_material_removal_structure
  ABSTRACT SUPERTYPE OF (ONEOF (electrical_isolation_removal_structure,
    thermal_isolation_removal_structure))
  SUBTYPE OF (material_removal_feature);
  SELF\design_intent_modification.design_intent : conductive_filled_area;
END_ENTITY; -- filled_area_material_removal_structure

( *
```

4.2.386 Flatness_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Flatness_tolerance is a type of Geometric_tolerance_without_referenced_datum_system (see 4.2.423) that specifies or partially specifies the design requirement on the flatness of the Physical_feature_or_part_template (see 4.2.658) to which the Flatness_tolerance is applied.

NOTE Flatness tolerance is defined in terms of tolerance zone definitions in 14.2 of ISO 1101.

Constraints:

WR1: The Shape_element specified by the toleranced_shape_element shall be a Physical_feature_or_part_template.

NOTE The attribute toleranced_shape_element is declared in the Geometric_tolerance entity of which this entity is a subtype.

WR2: The Flatness_tolerance shall not be a Geometric_tolerance_with_applied_material_condition_property.

WR3: The Flatness_tolerance shall specify a Tolerance_zone_definition as its tolerance_zone_or_boundary_definition; and that Tolerance_zone_definition shall specify a Tolerance_zone_boundary_definition_with_specified_size as its boundary_definition; and that Tolerance_zone_boundary_definition_with_specified_size shall specify an Opposing_boundary_set_size_characteristic as its specified_boundary_size.

WR4: If the Flatness_tolerance specifies a Tolerance_zone_definition_with_per_unit_size_specification as the tolerance_zone_or_boundary_definition, there shall be exactly two Length_data_element specified as the per_unit_size by the Tolerance_zone_per_unit_size_specification that is specified as the per_unit_size_specification by the Tolerance_zone_definition_with_per_unit_size_specification.

IP1: The form of the toleranced Shape_element shall be consistent with the form of a shape element for which the application of a flatness tolerance is sensible.

NOTE EXPRESS specification:

```
*)
ENTITY flatness_tolerance
  SUBTYPE OF (geometric_tolerance_without_referenced_datum_system);
END_ENTITY; -- flatness_tolerance

( *
```

4.2.387 Font_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Font_definition is a type of Managed_design_object (see 4.2.524). A Font_definition is the definition of a font. Font support shall include outlines using glyphs, as well as font and font family.

NOTE 1 This description is intended to be a complete reference to a font definition. Items to be included are usually font size, aspect ratio, type, etc.

NOTE 2 Font_description supports Part_text_template.

NOTE EXPRESS specification:

```
*)
ENTITY font_definition
  SUBTYPE OF (managed_design_object);
END_ENTITY; -- font_definition

--tt tc1 wd9 added
( *
```

4.2.388 Footprint_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Footprint_definition is a type of Ee_product_definition (see 4.2.323). A Footprint_definition is a mating reference layout item for a specific Package shape. It identifies the reference Package shape, and a reference breakout. The reference breakout is only significant for the metal pattern that is on the top layer. The specific Stratum stackup for the reference breakout is of no significance. The Package is identified by a query on shape and then on the Physical_unit_planar_shape that references a Package.

NOTE It is expected that Vias and Via_dependent_land and Land will be used to support the reference layout, as well as copper shapes to support getting from the mating contact to the breakout terminal. In the case of top surface breakout patterns, the join terminals of the reference layout which are typically Via terminals provide the capability to define the standard connection to the pattern. It is the usual case that there is only layout metal on the top layer.

NOTE EXPRESS specification:

```
*)
ENTITY footprint_definition
  SUBTYPE OF (ee_product_definition);
  reference_breakout : OPTIONAL SET [1:?] OF assembly_group_component;
INVERSE
  padstack : SET [1:?] OF padstack_location_in_footprint_definition FOR footprint;
  shape : footprint_definition_shape FOR shape_characterized_footprint_definition;
WHERE
  WR1: SIZEOF (QUERY( prpc &#60;*
    USEDIN(SELF\ee_product_definition.version.versioned_item,
      'AP210_ARM.EE_PRODUCT_RELATED_PRODUCT_CATEGORY.OF_PRODUCT') |
      (prpc.name = 'template model')
    )) &#62;= 0;
END_ENTITY; -- footprint_definition

(*
```

4.2.389 Footprint_definition_planar_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Footprint_definition_planar_shape is a type of Managed_design_object (see 4.2.524). A Footprint_definition_planar_shape is the planar shape of a Footprint_definition (see 4.2.388).

The data associated with a Footprint_definition_planar_shape are the following:

- shape_characterized_footprint_definition;
- shape_environment;
- shape_material_condition;
- shape_representation.

4.2.389.1 shape_characterized_footprint_definition

The shape_characterized_footprint_definition specifies the role of the Footprint_definition (see 4.2.388) for the Footprint_definition_planar_shape.

4.2.389.2 shape_environment

The shape_environment specifies either manufacturing or an end_user_application as the valid environment for the Footprint_definition_planar_shape. The shape_environment need not be specified for a particular Footprint_definition_planar_shape.

4.2.389.3 shape_material_condition

The shape_material_condition specifies either the maximum_material_condition, the minimum_material_condition, or the nominal_material_condition as the material condition for the Footprint_definition_planar_shape.

4.2.389.4 shape_representation

The shape_representation specifies the Planar_projected_shape (see 4.2.677) that is the model for the Footprint_definition_planar_shape.

NOTE EXPRESS specification:

```
*)
ENTITY footprint_definition_shape
  SUBTYPE OF (planar_projected_shape);
    shape_characterized_footprint_definition : footprint_definition;
    shape_environment                        : OPTIONAL environment;
    shape_material_condition                : material_condition;
END_ENTITY; -- footprint_definition_shape
(*
```

4.2.390 Footprint_occurrence

A Footprint_occurrence is a type of Assembly_group_component (see 4.2.40). A Footprint_occurrence references a Footprint_definition as a usage_definition. A Footprint_occurrence is not a Physical_component, nor is it a Printed_component, nor is it a Laminate_component. A Footprint_occurrence is specifically provided to eliminate redundant location information for Lands on different layers and at different x,y locations and other layered concepts that are typically grouped to support the placement of a component.

NOTE 1 This Application Object is provided for high density array footprint occurrences.

NOTE 2 This Application Object should not be used to relate Padstack_occurrences. The structure is provided in Footprint_definition to relate a Padstack_definition to a Footprint_definition in a geometric context. Further relationships in the design view will be redundant.

NOTE 3 A Footprint_occurrence_sub_assembly_relationship should be used to related a Land to this Application Object since that relationship contains sufficient information to query the Footprint_definition unambiguously for the Land definition detailed information.

The data associated with a Footprint_occurrence are the following:

— usage_definition.

4.2.390.1 usage_definition

The usage_definition specifies the Footprint_definition (see 4.2.388) for the Footprint_occurrence.

NOTE EXPRESS specification:

```

*)
ENTITY footprint_occurrence
  SUBTYPE OF (assembly_group_component);
  SELF\assembly_component.usage_definition : footprint_definition;
WHERE
  WR1: SIZEOF(USEDIN(SELF,
    'AP210_ARM.COMPONENT_MAKE_FROM_RELATIONSHIP.RESULTANT_COMPONENT')) &#60;= 1;
  WR2: NOT(SIZEOF(USEDIN(SELF,
    'AP210_ARM.COMPONENT_MAKE_FROM_RELATIONSHIP.RESULTANT_COMPONENT')) = 1) OR
    (SIZEOF(QUERY( cmfr &#60;* USEDIN(SELF,
    'AP210_ARM.COMPONENT_MAKE_FROM_RELATIONSHIP.RESULTANT_COMPONENT') |
    'AP210_ARM.ASSEMBLY_GROUP_COMPONENT' IN TYPEOF(cmfr.reusable_component))) = 1);
  WR3: SIZEOF(TYPEOF(SELF) * [
    'AP210_ARM.PRINTED_COMPONENT',
    'AP210_ARM.LAMINATE_COMPONENT',
    'AP210_ARM.PHYSICAL_COMPONENT']) = 0;
END_ENTITY; -- footprint_occurrence
(

```

4.2.391 Footprint_occurrence_sub_assembly_relationship

A Footprint_occurrence_sub_assembly_relationship is a type of Managed_design_object (see 4.2.524). A Footprint_occurrence_sub_assembly_relationship is an association that specifies a subassembly constraint among two or more Land (see 4.2.490) that is aggregated into an Footprint_occurrence (see 4.2.390). A Footprint_occurrence_sub_assembly_relationship does not directly reference the Application Object that is the definition for the Land. Instead, it uses an indexing mechanism provided by terminal_location and sub_assembly_reference_designation to locate the padstack in the Footprint_definition and the land template location in that Padstack_definition.

EXAMPLE 1 A Land may participate in a Footprint_occurrence. In that case, there is no need to populate a separate Assembly_composition_relationship between the Land and the Pcb, since the Assembly_composition_relationship between the Footprint_occurrence and the Pcb establishes the required association.

The data associated with a Footprint_occurrence_sub_assembly_relationship are the following:

- terminal_location;
- sub_assembly_reference_designation;
- related_component;
- relating_component.

4.2.391.1 terminal_location

The terminal_location specifies the string which is the identifier for the Padstack_location_in_footprint which this Footprint_occurrence_sub_assembly_relationship references in the context of the definition of the relating_component.

4.2.391.2 sub_assembly_reference_designation

The sub_assembly_reference_designation specifies the string which is the identifier for the Land in the context of the Padstack_definition specified by the definition of the relating_component.

4.2.391.3 related_component

The related_component specifies the dependent Land (see 4.2.490) for the Footprint_occurrence_sub_assembly_relationship.

4.2.391.4 relating_component

The relating_component specifies the independent Footprint_occurrence (see 4.2.390) which is the aggregation of two or more Assembly_component (see 4.2.34) specified by related_component.

Constraints:

UR1: The combination of relating_component, terminal_location, and sub_assembly_reference_designation shall be unique in a population of Footprint_occurrence_sub_assembly_relationship.

NOTE EXPRESS specification:

```
*)
ENTITY footprint_occurrence_sub_assembly_relationship
  SUBTYPE OF (managed_design_object);

4.2.394 Frozen_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Frozen_assignment is a type of Managed_design_object (see 4.2.524). A Frozen_assignment is the specification that one or more Frozen_design_object (see 4.2.395) must be unchanged during further design activity.

The data associated with a Frozen_assignment are the following:

— assigned_approval;

— frozen_item.

4.2.394.1 assigned_approval

An assigned_approval specifies the role of the Ee_approval (see 4.2.314) for the Frozen_assignment.

4.2.394.2 frozen_item

The frozen_item specifies a Frozen_design_object (see 4.2.395) for which the design is to remain unchanged in the Frozen_assignment. There shall be one or more Frozen_design_object for a Frozen_assignment.

Constraints:

WR1: Each Frozen_assignment shall not be referenced by any Frozen_assignment.

NOTE EXPRESS specification:

```

*)
ENTITY frozen_assignment
  SUBTYPE OF (managed_design_object);
    frozen_item      : SET [1:?] OF frozen_design_object;
    assigned_approval : ee_approval;
END_ENTITY; -- frozen_assignment

( *
```

4.2.395 Frozen_design_object

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Frozen_design_object is a type of Managed_design_object (see 4.2.524). A Frozen_design_object identifies the Managed_design_object which participates in the Frozen_assignment (see 4.2.394).

NOTE The purpose of Frozen_design_object is for approval of design aspects. The typical use is to freeze allocations between the functional and physical design aspects. This use includes gate swapping and terminal swapping.

Constraints:

IP1: Each member of Frozen_design_object shall not be a member of any of the following: Certification, Contract, Ee_approval, Ee_product_configuration, Ee_product_definition, Ee_product_version, Planned_effectivity, Security_classification, Supplied_product_version, Work_order, or Work_request.

NOTE EXPRESS specification:

4.2.396 Functional_specification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Functional_specification is a type of Managed_design_object (see 4.2.524). A Functional_specification is the information that characterizes the behaviour of a Functional_unit (see 4.2.400) under controlled circumstances using stimulus-response test methods. Detailed properties of the relationship between the reference and characterizing signals define the behaviour.

NOTE The evaluation or categorization of this relationship is not standardized in this document.

The data associated with a Functional_specification are the following:

- associated_definition;
- characteristic_category;
- characterizing_signal;
- reference_signal.

4.2.396.1 associated_definition

The associated_definition specifies the role of a Functional_specification_definition (see 4.2.397) for the Functional_specification. The associated_definition is an aggregation of all the Functional_specification with which it is associated.

4.2.396.2 characteristic_category

The characteristic_category specifies the External_definition (see 4.2.361) of the category for the Functional_specification.

4.2.396.3 characterizing_signal

The characterizing_signal specifies the response Signal_specification (see 4.2.825) for the Functional_specification.

4.2.396.4 reference_signal

The reference_signal specifies the reference or stimulus Signal_specification (see 4.2.825) for the Functional_specification.

NOTE EXPRESS specification:

```

*)
ENTITY functional_specification
  SUBTYPE OF (managed_design_object);
    associated_definition    : functional_specification_definition;

4.2.398 Functional_terminal_group

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Functional_terminal_group is a type of a Managed_design_object (see 4.2.524). A Functional_terminal_group is a group of terminals that have common characteristics and can be acted upon as a group.

The data associated with a Functional_terminal_group are the following:

- group_definition;
- group_type;
- name.

4.2.398.1 group_definition

The group_definition specifies the string that provides the meaning for the Functional_terminal_group.

4.2.398.2 group_type

The group_type specifies the string that is the class for the Functional_terminal_group.

4.2.398.3 name

The name specifies the string that is the identifier for the Functional_terminal_group.

Constraints:

UR1: The name shall be unique within a population of Functional_terminal_group.

NOTE EXPRESS specification:

```
*)
ENTITY functional_terminal_group
  SUBTYPE OF (managed_design_object);
  name          : ee_name;

  UR1: name;
END_ENTITY; -- functional_terminal_group

( *
```

4.2.399 Functional_terminal_group_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Functional_terminal_group_assignment` is a type of `Managed_design_object` (see 4.2.524). A `Functional_terminal_group_assignment` allocates a `Scalar_terminal_definition` to the `Functional_terminal_group`. This is the mechanism that provides members of the `Functional_terminal_group`.

The data associated with a `Functional_terminal_group_assignment` are the following:

- `composed_group`;
- `functional_usage_view_terminal`.

4.2.399.1 `composed_group`

The `composed_group` specifies the role of the `Functional_terminal_group` for the `Functional_terminal_group_assignment`. The `composed_group` specifies the group that the terminal is a member.

4.2.399.2 `functional_usage_view_terminal`

The `functional_usage_view_terminal` specifies the role of the `Scalar_terminal_definition` for the `Functional_terminal_group_assignment`. The `functional_usage_view_terminal` specifies the terminal that is a member of the group.

NOTE EXPRESS specification:

```
*)
ENTITY functional_terminal_group_assignment
  SUBTYPE OF (managed_design_object);
    composed_group          : functional_terminal_group;
    functional_usage_view_terminal : scalar_terminal_definition;
END_ENTITY; -- functional_terminal_group_assignment

( *
```

4.2.400 `Functional_unit`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Functional_unit` is a type of `Managed_design_object` (see 4.2.524). A `Functional_unit` is an occurrence of a `Functional_unit_definition` (see 4.2.401) in the composition of a `Functional_unit_network_definition` (see 4.2.402).

EXAMPLE 1 Figure 48 is a schematic of a network definition showing hierarchical relationships, as well as the usage view and network definition for a functional block.

The data associated with a Functional_unit are the following:

- access_mechanisms;
- composed_network;
- definition;
- functional_property;
- reference_designation.

4.2.400.1 access_mechanisms

The access_mechanisms is an inverse relationship that specifies that the existence of the Functional_unit is dependent on the existence of the Functional_unit_terminal (see 4.2.407) that specifies the Functional_unit as its accessed_functional_unit. There shall be one or more Functional_unit_terminal for a Functional_unit.

4.2.400.2 composed_network

The composed_network specifies the role of the Functional_unit_network_definition (see 4.2.402) for the Functional_unit.

4.2.400.3 definition

The definition specifies the role of the Functional_unit_definition (see 4.2.401) for the Functional_unit.

4.2.400.4 functional_property

The functional_property specifies the role of the Parameter_assignment (see 4.2.603) for the Functional_unit. There may be more than one Parameter_assignment for the Functional_unit. The functional_property need not be provided for a particular Functional_unit. The functional_property shall be interpreted as overriding the properties supplied as Parameter_assignment for the Functional_unit_definition in the role of definition when the assigned_parameter are identical.

4.2.400.5 reference_designation

The reference_designation specifies the name that identifies the Functional_unit, in the context of the Functional_unit_network_definition (see 4.2.402).

NOTE: This example ignores the difference between the symbol of something, and the thing itself, for presentation purposes.

Figure 48 – Schematic presentation of network definition with Functional_units

Constraints:

UR1: The combination of the reference_designation and the composed_network shall be unique within a population of Functional_units.

WR1: A network definition shall not define itself.

WR2: Considering the functional_unit_definition entities as nodes in a structural graph, and the functional_unit entity as the links of the graph, the graph thus composed shall be directed and acyclic.

NOTE A node that is a Functional_unit_definition may be a Functional_unit_network_definition.

NOTE EXPRESS specification:

```

*)
ENTITY functional_unit
  SUBTYPE OF (managed_design_object);
    definition          : functional_unit_definition;
    reference_designation : ee_name;

  INVERSE
    access_mechanisms : SET [1:?] OF functional_unit_terminal FOR
                          accessed_functional_unit;
  UNIQUE
    UR1 : reference_designation, composed_network;
END_ENTITY; -- functional_unit

( *
```

4.2.401 Functional_unit_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Functional_unit_definition is a type of Ee_product_definition (see 4.2.323). A Functional_unit_definition is one of a Functional_unit_network_definition (see 4.2.402), or a Functional_unit_usage_view (see 4.2.410). A Functional_unit_definition is the characterization of behaviour realized by one or more versions of a part or a product, or a subset of a product. This characterization is applicable to every occurrence of the element modelled.

NOTE This part of ISO 10303 explicitly supports requirements traceability from a functional definition to a physical definition by providing application objects with the semantics of a forward design flow (i.e., from functional definition to physical definition). In order to use the standard to exchange functional definitions created only to support analysis of existing physical definitions, it is necessary to populate the discipline_id attribute of the supertype Ee_product_definition. The discipline_id of Ee_product_definition specifies the usage of the Functional_unit_definition. Two possible values are "Analysis", "Synthesis". It may not be possible to correlate each Functional_unit to a corresponding Assembly_component when the value is "Analysis". The value of "Synthesis" is suggested when the purpose is not analysis.

The data associated with a Functional_unit_definition are the following:

— analytical_functional_unit_representation.

4.2.401.1 analytical_functional_unit_representation

The analytical_functional_unit_representation specifies the Analytical_representation (see 4.2.22) for the computer-interpretable model whose contents are not defined in this part of ISO 10303 for the Functional_unit_definition. The analytical_functional_unit_representation need not be specified for a particular Functional_unit_definition. There may be more than one Analytical_representation for an Functional_unit_definition.

NOTE EXPRESS specification:

```

*)
ENTITY functional_unit_definition
  ABSTRACT SUPERTYPE OF (ONEOF (functional_unit_network_definition,
functional_unit_usage_view))
  SUBTYPE OF (ee_product_definition);
    analytical_functional_unit_representation : OPTIONAL SET [1:?] OF
                                                analytical_representation;
END_ENTITY; -- functional_unit_definition

( *
```

4.2.402 Functional_unit_network_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Functional_unit_network_definition is a type of Functional_unit_definition (see 4.2.401). A Functional_unit_network_definition may be either one or more of an Electrical_network_definition (see 4.2.345) or a Thermal_network_definition (see 4.2.906) or a Functional_specification_definition (see 4.2.397).

The data associated with a Functional_unit_network_definition are the following:

— usage_view.

4.2.402.1 usage_view

The usage_view specifies the role of the Functional_unit_usage_view (see 4.2.410) for the Functional_unit_network_definition.

Constraints:

WR1: The member of Functional_unit_usage_view specified as a usage_view by this member of functional_unit_network_definition shall be an Ee_product_definition of the same version of the product for which this member of Functional_unit_network_definition is an Ee_product_definition.

NOTE EXPRESS specification:

```

*)
ENTITY functional_unit_network_definition
  SUPERTYPE OF (thermal_network_definition ANDOR
    electrical_network_definition ANDOR functional_specification_definition)
  SUBTYPE OF (functional_unit_definition);
  usage_view : functional_unit_usage_view;
END_ENTITY; -- functional_unit_network_definition

( *
```

4.2.403 Functional_unit_network_node_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Functional_unit_network_node_definition is a type of Managed_design_object (see 4.2.524). A Functional_unit_network_node_definition is the definition of a node in the Functional_unit_network_definition (see 4.2.402).

The data associated with a Functional_unit_network_node_definition are the following:

- associated_functional_unit_definition;
- external_node_access;
- functional_unit_network_node_name.

4.2.403.1 associated_functional_unit_definition

The associated_functional_unit_definition specifies the Functional_unit_network_definition (see 4.2.402) that the Functional_unit_network_node_definition is helping to compose.

4.2.403.2 external_node_access

The external_node_access is an inverse relationship that specifies the Functional_unit_network_terminal_definition_node_assignment (see 4.2.405) that specifies the Functional_unit_network_node_definition as its composed_node. There shall be no more than one Functional_unit_network_terminal_definition_node_assignment for a Functional_unit_network_node_definition.

4.2.403.3 functional_unit_network_node_name

The functional_unit_network_node_name identifies the Functional_unit_network_node_definition in the context of the associated_functional_unit_definition.

Constraints:

UR1: The combination of the functional_unit_network_node_name and the associated_functional_unit_definition shall be unique within a population of Functional_unit_network_node_definitions.

WR1: A member of Functional_unit_network_node_definition shall be referenced by no more than one member of Functional_unit_network_terminal_definition_node_assignment.

IP1: A member of Functional_unit_network_node_definition that is helping to compose an approved electrical or thermal network definition shall be referenced by at least one of the following: a member of Bus_element_link; a member of Functional_unit_terminal_node_assignment.

IP2: A member of Functional_unit_network_node_definition that is helping to compose an approved electrical or thermal network definition shall be referenced by at least two of the following: a member of Bus_element_link; a member of Functional_unit_terminal_node_assignment; no more than one member of Functional_unit_network_terminal_definition_node_assignment.

IP3: Each member of Functional_unit_network_node_definition shall be referenced by no more than one member of Aggregate_connectivity_requirement for a specific physical partition.

NOTE Some nodes are not connected to external terminals.

NOTE EXPRESS specification:

```

*)
ENTITY functional_unit_network_node_definition
  SUBTYPE OF (managed_design_object);
    associated_functional_unit_definition : functional_unit_network_definition;
    functional_unit_network_node_name      : ee_name;

```

4.2.404 Functional_unit_network_terminal_definition_bus_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

Functional_unit_network_terminal_definition_bus_assignment is a type of Managed_design_object (see 4.2.524). A Functional_unit_network_terminal_definition_bus_assignment is the relationship between the structural definition of a bus and the terminal definition of a network to which the bus is assigned.

The data associated with a Functional_unit_network_terminal_definition_bus_assignment are the following:

- connected_bus;
- connected_terminal.

4.2.404.1 connected_bus

The connected_bus specifies the role of the Bus_structural_definition (see 4.2.83) for the Functional_unit_network_terminal_definition_bus_assignment.

4.2.404.2 connected_terminal

The `connected_terminal` specifies the role of the `Functional_unit_usage_view_terminal_definition` (see 4.2.411) for the `Functional_unit_network_terminal_definition_bus_assignment`.

NOTE EXPRESS specification:

```
*)
ENTITY functional_unit_network_terminal_definition_bus_assignment
  SUBTYPE OF (managed_design_object);
    connected_bus      : bus_structural_definition;
    connected_terminal : functional_unit_usage_view_terminal_definition;
END_ENTITY; -- functional_unit_network_terminal_definition_bus_assignment

( *
```

4.2.405 Functional_unit_network_terminal_definition_node_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Functional_unit_network_terminal_definition_node_assignment` is a type of `Managed_design_object` (see 4.2.524). A `Functional_unit_network_terminal_definition_node_assignment` is the assignment relationship between a node definition of the functional unit network definition and a terminal definition of that network definition. This assignment provides visibility into the node definition from higher levels in the functional decomposition.

The data associated with a `Functional_unit_network_terminal_definition_node_assignment` are the following:

- `composed_node`;
- `connected_terminal`.

4.2.405.1 composed_node

The `composed_node` specifies the role of the `Functional_unit_network_node_definition` (see 4.2.403) for the `Functional_unit_network_terminal_definition_node_assignment`.

4.2.405.2 connected_terminal

The `connected_terminal` specifies the role of the `Functional_unit_usage_view_terminal_definition` (see 4.2.411) for the `Functional_unit_network_terminal_definition_node_assignment`.

NOTE EXPRESS specification:

```

*)
ENTITY functional_unit_network_terminal_definition_node_assignment
  SUBTYPE OF (managed_design_object);
    composed_node      : functional_unit_network_node_definition;
    connected_terminal : functional_unit_usage_view_terminal_definition;
END_ENTITY; -- functional_unit_network_terminal_definition_node_assignment

( *
```

4.2.406 Functional_unit_requirement_allocation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Functional_unit_requirement_allocation is a type of Managed_design_object (see 4.2.524). A Functional_unit_requirement_allocation is the relationship between the Ee_requirement_occurrence (see 4.2.330) and the Functional_unit (see 4.2.400) that satisfies the Ee_requirement_occurrence.

The data associated with a Functional_unit_requirement_allocation are the following:

- functional_requirement;
- functional_unit_assignment.

4.2.406.1 functional_requirement

The functional_requirement specifies the role of the Ee_requirement_occurrence (see 4.2.330) for the Functional_unit_requirement_allocation.

4.2.406.2 functional_unit_assignment

The functional_unit_assignment specifies the Functional_unit (see 4.2.400) that satisfies the Ee_requirement_occurrence (see 4.2.330) for the Functional_unit_requirement_allocation.

NOTE EXPRESS specification:

```

*)
ENTITY functional_unit_requirement_allocation
  SUBTYPE OF (managed_design_object);
    functional_requirement : ee_requirement_occurrence;
    functional_unit_assignment : functional_unit;
END_ENTITY; -- functional_unit_requirement_allocation

( *
```

4.2.407 Functional_unit_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Functional_unit_terminal is a type of Managed_design_object (see 4.2.524). A Functional_unit_terminal is an access mechanism for a Functional_unit (see 4.2.400).

The data associated with a Functional_unit_terminal are the following:

- accessed_functional_unit;
- bus_assignment;
- definition;
- node_assignment.

4.2.407.1 accessed_functional_unit

The accessed_functional_unit specifies the Functional_unit (see 4.2.400) whose functionality is accessed by the Functional_unit_terminal.

4.2.407.2 bus_assignment

The bus_assignment is an inverse relationship that specifies the Functional_unit_terminal_bus_assignment (see 4.2.408) that specifies the Functional_unit_terminal as its connected_terminal. There shall be no more than one Functional_unit_terminal_bus_assignment for a Functional_unit_terminal.

4.2.407.3 definition

The definition specifies the role of the Functional_unit_usage_view_terminal_definition (see 4.2.411) for the Functional_unit_terminal.

4.2.407.4 node_assignment

The node_assignment is an inverse relationship that specifies the Functional_unit_terminal_node_assignment (see 4.2.409) that specifies the Functional_unit_terminal as its connected_terminal. There shall be no more than one Functional_unit_terminal_node_assignment for a Functional_unit_terminal.

Constraints:

WR1: The definition of the Functional_unit this Functional_unit_terminal is associated with shall be either a Functional_unit_network_definition or a Functional_unit_usage_view.

WR2: Each Functional_unit_terminal shall not be assigned to a bus and to a node simultaneously.

NOTE EXPRESS specification:

```

*)
ENTITY functional_unit_terminal
  SUBTYPE OF (managed_design_object);
    accessed_functional_unit : functional_unit;
    definition                : functional_unit_usage_view_terminal_definition;
  INVERSE
    bus_assignment  : SET [0:1] OF
                      functional_unit_terminal_bus_assignment FOR
                      connected_terminal;
    node_assignment : SET [0:1] OF
                      functional_unit_terminal_node_assignment FOR
                      connected_terminal;
END_ENTITY; -- functional_unit_terminal

( *

```

4.2.408 Functional_unit_terminal_bus_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Functional_unit_terminal_bus_assignment is a type of Managed_design_object (see 4.2.524). A Functional_unit_terminal_bus_assignment is the relationship between the structural definition of a bus and a terminal that is assigned to the bus. The members of Functional_unit_terminal (see 4.2.407) that are assigned to the same bus by this application object are defined to be connected to each other.

NOTE There are cardinality constraints levied to ensure that the cardinality as resolved through all the references is identical.

The data associated with a Functional_unit_terminal_bus_assignment are the following:

- connected_bus;
- connected_terminal.

4.2.408.1 connected_bus

The connected_bus specifies the role of the Bus_structural_definition (see 4.2.83) for the Functional_unit_terminal_bus_assignment.

4.2.408.2 connected_terminal

The connected_terminal specifies the role of the Functional_unit_terminal (see 4.2.407) for the Functional_unit_terminal_bus_assignment.

NOTE EXPRESS specification:

```

*)
ENTITY functional_unit_terminal_bus_assignment
  SUBTYPE OF (managed_design_object);
    connected_bus      : bus_structural_definition;
    connected_terminal : functional_unit_terminal;
END_ENTITY; -- functional_unit_terminal_bus_assignment

( *
```

4.2.409 Functional_unit_terminal_node_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Functional_unit_terminal_node_assignment is a type of Managed_design_object (see 4.2.524). A Functional_unit_terminal_node_assignment is the assignment relationship between a Functional_unit_network_node_definition (see 4.2.403) and a Functional_unit_terminal (see 4.2.407).

The data associated with a Functional_unit_terminal_node_assignment are the following:

- composed_node;
- connected_terminal.

4.2.409.1 composed_node

The composed_node specifies the role of the Functional_unit_network_node_definition (see 4.2.403) for the Functional_unit_terminal_node_assignment.

4.2.409.2 connected_terminal

The connected_terminal specifies the role of the Functional_unit_terminal (see 4.2.407) for the Functional_unit_terminal_node_assignment.

NOTE EXPRESS specification:

```

*)
ENTITY functional_unit_terminal_node_assignment
  SUBTYPE OF (managed_design_object);
    composed_node      : functional_unit_network_node_definition;
    connected_terminal : functional_unit_terminal;
END_ENTITY; -- functional_unit_terminal_node_assignment

( *
```

4.2.410 Functional_unit_usage_view

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Functional_unit_usage_view is a type of Functional_unit_definition (see 4.2.401) that describes the usage of the Functional_unit (see 4.2.400) in a Functional_unit_definition.

NOTE In the case where the Functional_unit_usage_view is an Ee_product_definition for a 'functionality' product, the name of the function being represented by this Functional_unit_usage_view is represented by the Ee_product.nomenclature. In the case where the Functional_unit_usage_view is an Ee_product_definition for a physical product, e.g., a netlist, there is no need for a separate name for the netlist since it is identified by the product_definition_id inherited from Ee_product_definition. In fact, product_definition_id always identifies the Functional_unit_usage_view.

The data associated with a Functional_unit_usage_view are the following:

— access_mechanism.

4.2.410.1 access_mechanism

The access_mechanism is an inverse relationship that specifies that the existence of the Functional_unit_usage_view is dependent on the existence of the Functional_unit_usage_view_terminal_definition (see 4.2.411) that specifies the Functional_unit_usage_view as its associated_functional_unit_definition. There shall be one or more Functional_unit_usage_view_terminal_definition for a Functional_unit_usage_view.

NOTE EXPRESS specification:

```

*)
ENTITY functional_unit_usage_view
  SUBTYPE OF (functional_unit_definition);
  INVERSE
    access_mechanism : SET [1:?] OF functional_unit_usage_view_terminal_definition FOR
                        associated_functional_unit_definition;
END_ENTITY; -- functional_unit_usage_view

( *
```

4.2.411 Functional_unit_usage_view_terminal_definition

A Functional_unit_usage_view_terminal_definition is a type of Managed_design_object (see 4.2.524). A Functional_unit_usage_view_terminal_definition may be a Scalar_terminal_definition (see 4.2.799). A Functional_unit_usage_view_terminal_definition is the definition of a Functional_unit_terminal (see 4.2.407).

The data associated with a Functional_unit_usage_view_terminal_definition are the following:

- associated_functional_unit_definition;
- bus_assignment;
- node_assignment;
- signal_name.

4.2.411.1 associated_functional_unit_definition

The associated_functional_unit_definition specifies the role of the Functional_unit_usage_view (see 4.2.410) for the Functional_unit_usage_view_terminal_definition.

4.2.411.2 bus_assignment

The bus_assignment is an inverse relationship that specifies the Functional_unit_network_terminal_definition_bus_assignment (see 4.2.404) that specifies the Functional_unit_terminal (see 4.2.407) as its connected_terminal. There shall be no more than one Functional_unit_network_terminal_definition_bus_assignment for a Functional_unit_usage_view_terminal_definition.

4.2.411.3 node_assignment

The node_assignment is an inverse relationship that specifies the Functional_unit_network_terminal_definition_node_assignment (see 4.2.405) that specifies the Functional_unit_terminal (see 4.2.407) as its connected_terminal. There shall be no more than one Functional_unit_network_terminal_definition_node_assignment for a Functional_unit_usage_view_terminal_definition.

4.2.411.4 signal_name

The signal_name identifies the Functional_unit_usage_view_terminal_definition in the context of the Functional_unit_usage_view (see 4.2.410).

Constraints:

UR1: The combination of the signal_name and the associated_functional_unit_definition shall be unique within a population of Functional_unit_usage_view_terminal_definitions.

WR1: Each Functional_unit_usage_view_terminal_definition shall not be assigned to a bus and to a node simultaneously.

NOTE EXPRESS specification:

```

*)
ENTITY functional_unit_usage_view_terminal_definition
  SUPERTYPE OF (scalar_terminal_definition)
  SUBTYPE OF (managed_design_object);
  associated_functional_unit_definition : functional_unit_usage_view;

  UNIQUE
    UR1: reusable_feature, resultant_feature;
  WHERE
    WR1: reusable_feature :&#60;&#62;; resultant_feature;
    WR2: reusable_feature.associated_functional_unit_definition :&#60;&#62;;
          resultant_feature.associated_functional_unit_definition;
END_ENTITY; -- functional_unit_usage_view_terminal_definition_make_from_relationship
( *

```

4.2.413 Functional_usage_view_to_part_terminal_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Functional_usage_view_to_part_terminal_assignment is a type of Managed_design_object (see 4.2.524). A Functional_usage_view_to_part_terminal_assignment is the association between a Scalar_terminal_definition (see 4.2.799) and a Part_terminal (see 4.2.630). This is the fundamental mechanism for mapping between the functional view and the physical view of a design or library item.

The data associated with a Functional_usage_view_to_part_terminal_assignment are the following:

- functional_usage_view_terminal;
- physical_usage_view_terminal.

4.2.413.1 functional_usage_view_terminal

The functional_usage_view_terminal specifies the role of the Scalar_terminal_definition (see 4.2.799) for the Functional_usage_view_to_part_terminal_assignment.

4.2.413.2 physical_usage_view_terminal

The physical_usage_view_terminal specifies the role of the Part_terminal (see 4.2.630) for the Functional_usage_view_to_part_terminal_assignment.

Constraints:

UR1: The combination of functional_usage_view_terminal and physical_usage_view_terminal shall be unique within a population of Functional_usage_view_to_part_terminal_assignment.

WR1: The members of functional_usage_view_to_part_terminal_assignment that specify the same member of physical_unit_usage_view through the path physical_usage_view_terminal.associated_definition shall all specify the same member of functional_unit_definition through the path functional_usage_view_terminal.associated_functional_unit_definition.

NOTE EXPRESS specification:

```

*)
ENTITY functional_usage_view_to_part_terminal_assignment
  SUBTYPE OF (managed_design_object);
    physical_usage_view_terminal : part_terminal;
    functional_usage_view_terminal : scalar_terminal_definition;
  UNIQUE
    UR1 : functional_usage_view_terminal, physical_usage_view_terminal;
END_ENTITY; -- functional_usage_view_to_part_terminal_assignment

( *

```

4.2.414 Functional_usage_view_to_printed_part_template_terminal_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Functional_usage_view_to_printed_part_template_terminal_assignment is a type of Managed_design_object (see 4.2.524). A Functional_usage_view_to_printed_part_template_terminal_assignment is the association between a functional terminal definition and a terminal of a Printed_part_template (see 4.2.730).

EXAMPLE 1 It is permissible for one functional_usage_view_terminal to be assigned to more than one physical_usage_view_terminal, for example, VCC.

The data associated with a Functional_usage_view_to_printed_part_template_terminal_assignment are the following:

- functional_usage_view_terminal;
- physical_usage_view_terminal.

4.2.414.1 functional_usage_view_terminal

The functional_usage_view_terminal specifies the role of the Scalar_terminal_definition (see 4.2.799) for the Functional_usage_view_to_printed_part_template_terminal_assignment.

4.2.414.2 physical_usage_view_terminal

The physical_usage_view_terminal specifies the role of the Printed_part_template_terminal (see 4.2.737) for the Functional_usage_view_to_printed_part_template_terminal_assignment.

Constraints:

UR1: The combination of functional_usage_view_terminal and physical_usage_view_terminal shall be unique within a population of Functional_usage_view_to_printed_part_template_terminal_assignment.

WR1: The members of functional_usage_view_to_printed_part_template_terminal_assignment that specify the same member of physical_unit_usage_view through the path physical_usage_view_terminal.associated_definition shall all specify the same member of functional_unit_definition through the path functional_usage_view_terminal.associated_functional_unit_definition.

NOTE EXPRESS specification:

```

*)
ENTITY functional_usage_view_to_printed_part_template_terminal_assignment
  SUBTYPE OF (managed_design_object);
    physical_usage_view_terminal : printed_part_template_terminal;
    functional_usage_view_terminal : scalar_terminal_definition;
  UNIQUE
    UR1 : functional_usage_view_terminal, physical_usage_view_terminal;
END_ENTITY; -- functional_usage_view_to_printed_part_template_terminal_assignment

( *
```

4.2.415 Gate_path_swap_specification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Gate_path_swap_specification is a type of Change_design_object_management_relationship (see 4.2.95). This entity explicitly states that a path to a functional unit in a design shall be changed to a new path in the library of functional unit definitions.

NOTE Normally the new path is based on the same root functional unit definition in the library, leading to a different path in the same technology, but there is no restriction in the standard that prohibits switching to a different functional unit definition in the library. If there is a new functional unit definition as root, other design changes will likely need to occur, but the mapping to identify those explicitly and relate them to this entity is not standardized, except through the use of the requirement_occurrence concept. Specifically, this entity needs to be used in conjunction with the component swap specification to swap between components if the path in the library is also changing.

EXAMPLE 1 An example is in the case where a change is being made from one microcircuit and its terminal, U1-A, to another microcircuit and terminal, U2-C.

The data associated with a Gate_path_swap_specification are the following:

- current_design_object;
- previous_design_object.

4.2.415.1 current_design_object

The `current_design_object` specifies the `Design_functional_unit_allocation_to_reference_functional_unit` (see 4.2.266) that results from the swap in the `Gate_path_swap_specification`.

4.2.415.2 previous_design_object

The `previous_design_object` specifies the `Design_functional_unit_allocation_to_reference_functional_unit` (see 4.2.266) from which the swap was made in the `Gate_path_swap_specification`.

NOTE EXPRESS specification:

```

*)
ENTITY gate_path_swap_specification
  SUBTYPE OF (change_design_object_management_relationship);
    SELF\change_design_object_management_relationship.current_design_object :
design_functional_unit_allocation_to_reference_functional_unit;
    SELF\change_design_object_management_relationship.previous_design_object :
design_functional_unit_allocation_to_reference_functional_unit;
END_ENTITY; -- gate_path_swap_specification

( *
```

4.2.416 Geometric_alignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Geometric_alignment` is a type of `Derived_shape_element` (see 4.2.260) that is a linear or planar `Shape_element` (see 4.2.810) that is established to contain two or more aligned `Shape_element`. The `Shape_element` from which the `Geometric_alignment` is established are associated with the `Geometric_alignment` by the `Shape_element_deriving_relationship` (see 4.2.814) that are specified as the deriving-relationships.

NOTE The attribute `deriving_relationships` is declared in the `Derived_shape_element` entity of which this entity is a subtype.

EXAMPLE 1 A `Geometric_alignment` that is derived from the `Centre_axis` of a circular hole pattern and a `Centre_axis` of one of the holes of the pattern is a plane to which a `Dimensional_location` might be applied.

Constraints:

WR1: The `Geometric_alignment` shall be derived from two or more `Shape_element`.

IP1: In the case of a planar `Derived_shape_element`, at least one of the aligned `Shape_element` shall be a linear `Shape_element`.

NOTE EXPRESS specification:

```
*)
ENTITY geometric_alignment
  SUBTYPE OF (derived_shape_element);
END_ENTITY; -- geometric_alignment

( *
```

4.2.417 Geometric_intersection

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Geometric_intersection is a type of Derived_shape_element (see 4.2.260) that is the common intersection of two or more Shape_element (see 4.2.810). The Shape_element from which the Geometric_intersection is derived are associated with the Geometric_intersection by the Shape_element_deriving_relationship (see 4.2.814) that are specified as the deriving_relationships.

NOTE The attribute deriving_relationships is declared in the Derived_shape_element entity of which this entity is a subtype.

Constraints:

WR1: The Geometric_intersection shall be derived from two or more Shape_element.

IP1: The Shape_element from which the Geometric_intersection is derived shall intersect.

NOTE EXPRESS specification:

4.2.418 Geometric_representation_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Geometric_representation_relationship is a type of Managed_design_object (see 4.2.524). A Geometric_representation_relationship may be a Shape_composition_relationship (see 4.2.807), or a Component_part_2d_geometric_relationship or a Component_part_3d_relationship or a Component_part_non_planar_relationship. A Geometric_representation_relationship is the association between a Shape_definition (see 4.2.808) and another Shape_definition (see 4.2.808) for predefined purposes.

NOTE The purposes are described in the subtypes of this Application Object.

The data associated with a Geometric_representation_relationship are the following:

- shape_1;
- shape_2.

4.2.418.1 shape_1

The shape_1 specifies one role of the Shape_definition (see 4.2.808) for the Geometric_representation_relationship.

4.2.418.2 shape_2

The shape_1 specifies one role of the Shape_definition (see 4.2.808) for the Geometric_representation_relationship.

NOTE EXPRESS specification:

```

4.2.419 Geometric_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Geometric_tolerance` is a type of `Managed_design_object` (see 4.2.524). A `Geometric_tolerance` is one of a `Geometric_tolerance_without_referenced_datum_system` (see 4.2.423) or a `Geometric_tolerance_with_referenced_datum_system` (see 4.2.422). Additionally a `Geometric_tolerance` may be one of a `Position_tolerance` (see 4.2.695), a `Profile_of_any_line_tolerance` (see 4.2.744), or a `Profile_of_any_surface_tolerance` (see 4.2.747). A `Geometric_tolerance` may be `Geometric_tolerance_with_applied_material_condition_property` (see 4.2.421). Additionally, a `Geometric_tolerance` may be a `Statistical_geometric_tolerance` (see 4.2.841).

A `Geometric_tolerance` is a specification or partial specification of a design requirement on one or more of the form, location, or orientation characteristics of a `Shape_element` (see 4.2.810). This type of design requirement is specified in terms of a `Tolerance_zone` (see 4.2.913) within which the toleranced `Shape_element` must reside; or in the case of a `Boundary_based_position_tolerance` (see 4.2.77), a boundary that the toleranced `Shape_element` must not violate.

A `Geometric_tolerance_with_referenced_datum_system` participates in specifying a design requirement when the requirement is on one or more characteristics such as location of the toleranced `Shape_element` in relation to a `Datum_system` (see 4.2.236). In such cases, the `Tolerance_zone` is located and/or oriented, and thus the toleranced `Shape_element` is located and/or oriented, in relation to the `Datum_system`.

In some cases the design requirement is such that the boundary of the `Tolerance_zone` is on a per unit basis.

EXAMPLE 1 The design requirement on the flatness of a surface is such that the surface should not deviate by more than 0.5 mm in any 10 mm by 10 mm area. A `Geometric_tolerance` that defines a `Tolerance_zone_definition_with_per_unit_size_specification` (see 4.2.921) participates in specifying this type of requirement.

In some cases a design requirement on the geometric characteristic or characteristics of a `Shape_element` is such that it is dependent upon the produced size of the `Shape_element`, or upon the produced size of the `Shape_element` from which it is derived. A `Geometric_tolerance_with_applied_material_condition_property` specifies this type of requirement.

The data associated with a `Geometric_tolerance` are the following:

- `tolerance_zone_or_boundary_definition`;
- `toleranced_shape_element`.

4.2.419.1 tolerance_zone_or_boundary_definition

The `tolerance_zone_or_boundary_definition` specifies either a `Conical_tolerance_zone_boundary_diametrical_size_characteristic`, a `Positional_boundary_member_definition` (see 4.2.702), a `Profile_related_positional_boundary_definition` (see 4.2.751), or a `Tolerance_zone_definition` (see 4.2.920) that defines the constraints placed on the `Shape_element` (see 4.2.810) specified as the `toleranced_shape_element`.

4.2.419.2 toleranced_shape_element

The `toleranced_shape_element` specifies either a `Centre_Axis`, `Centre_plane` (see 4.2.92), `Centre_point` (see 4.2.93), `Physical_feature_or_part_template` (see 4.2.658), or `Tangent_plane` (see 4.2.884) to which the `Geometric_tolerance` is applied.

Constraints:

WR1: The `Geometric_tolerance` shall either be a `Geometric_tolerance_with_referenced_datum_system` or a `Geometric_tolerance_without_referenced_datum_system`.

WR2: The `Geometric_tolerance` shall be specified by at most one `Simultaneous_geometric_tolerance_-requirement` as one of the `grouped_geometric_tolerances`.

WR3: There shall be exactly one `Ee_requirement_occurrence` with the description of "Geometric Dimensioning and Tolerancing Reference" that specifies at least one `Ee_specification` as the `requirement_specification`.

IP1: There shall be exactly one `Ee_requirement_occurrence` with the description of "Geometric Dimensioning and Tolerancing Reference" that specifies at least one `Ee_specification` as the `requirement_specification`. The `Ee_specification` shall reference those standards by which the geometric dimensioning and tolerancing data is to be interpreted.

EXAMPLE 1 An `Ee_requirement_occurrence` with a description of "Geometric Dimensioning and Tolerancing Reference" specifies an `Ee_specification` as the `requirement_specification`. The `Ee_specification` may specify "Technical drawings – Geometrical tolerancing – Tolerancing of form, orientation, location and run-out – Generalities, definitions, symbols, indications on drawings" as the `document_name`, 1995 as the `year_of_the_creation_date`, "ISO" as the `publisher`, and an `Ee_document_identifier` as the `base_identifier` that has an `assigned_value` of "1101" and an `identifier_name` of "document number".

NOTE EXPRESS specification:

4.2.420 Geometric_tolerance_qualifier

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Geometric_tolerance_qualifier is a type of Managed_design_object (see 4.2.524). A Geometric_tolerance_qualifier is either a Pre_defined_geometric_tolerance_qualifier (see 4.2.708) or a User_defined_geometric_tolerance_qualifier (see 4.2.945). A Geometric_tolerance_qualifier is a description that qualifies one or more Geometric_tolerance (see 4.2.419).

NOTE Qualifying notes are described in 5.3 of ISO/DIS 1101.

The data associated with a Geometric_tolerance_qualifier are the following:

— qualified_geometric_tolerances.

4.2.420.1 qualified_geometric_tolerances

The qualified_geometric_tolerances specifies the Geometric_tolerance (see 4.2.419) to which the Geometric_tolerance_qualifier applies. There shall be one or more Geometric_tolerance for a Geometric_tolerance_qualifier.

NOTE EXPRESS specification:

```
*)
ENTITY geometric_tolerance_qualifier

```

4.2.421 Geometric_tolerance_with_applied_material_condition_property

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Geometric_tolerance_with_applied_material_condition_property` is a type of `Geometric_tolerance` (see 4.2.419) that specifies or partially specifies the design requirement on one or more geometric characteristics of the toleranced `Shape_element` (see 4.2.810) in which the restrictiveness of the requirement is dependent on the actual size of the produced `Shape_element` or the actual size of the produced `Shape_element` from which the toleranced `Shape_element` is derived. A `Geometric_tolerance_with_applied_material_condition_property` in which the `applied_material_condition_property_name` is "maximum_material_principle" participates in specifying a requirement that is less stringent as the produced `Shape_element` deviates from its maximum material condition towards its least material condition. In this case, the specified size of the `Tolerance_zone_boundary` (see 4.2.915) is the base size from which it is increased by the amount the produced `Shape_element` deviates from its maximum material condition towards its least material condition. A `Geometric_tolerance_with_applied_material_condition_property` in which the `applied_material_condition_property_name` is "least_material_requirement" participates in specifying a requirement that is less stringent as the produced `Shape_element` deviates from its least material condition towards its maximum material condition. In this case the specified size of the `Tolerance_zone_boundary` is the base size from which it is increased by the amount the produced `Shape_element` deviates from its least material condition towards its maximum material condition. A `Geometric_tolerance_with_applied_material_condition_property` may be a `Boundary_based_position_tolerance` (see 4.2.77).

The data associated with a `Geometric_tolerance_with_applied_material_condition_property` are the following:

— `applied_material_condition_property_name`.

4.2.421.1 `applied_material_condition_property_name`

The `applied_material_condition_property_name` specifies the type of the applied material condition property, either "least_material_requirement" or "maximum_material_principle" for the `Geometric_tolerance_with_applied_material_condition_property`.

Constraints:

WR1: The `Shape_element` specified as the `toleranced_shape_element` shall either be a `Centre_axis`, `Centre_plane`, `Centre_point`, or `Physical_feature_or_part_template`.

NOTE The attribute `toleranced_shape_element` is declared in the `Geometric_tolerance` entity of which this entity is a subtype.

WR2: If the `Shape_element` specified as the `toleranced_shape_element` is a `Physical_feature_or_part_template`, the `Geometric_tolerance_with_applied_material_condition_property` shall also be a `Boundary_based_position_tolerance`.

NOTE EXPRESS specification:

  applied_material_condition_property_name : material_condition_property_names;
END_ENTITY; -- geometric_tolerance_with_applied_material_condition_property

( *

```

4.2.422 Geometric_tolerance_with_referenced_datum_system

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Geometric_tolerance_with_referenced_datum_system` is a type of `Geometric_tolerance` (see 4.2.419) that specifies or partially specifies the design requirement on one or more geometric characteristics, such as orientation, of the toleranced `Shape_element` (see 4.2.810) in relation to the `Datum_system` (see 4.2.236) defined by the `Datum_system_defining_conditions` (see 4.2.237) that is specified as the `datum_system_definition`. In such cases, the `Tolerance_zone` (see 4.2.913) is located and/or oriented; and thus the toleranced `Shape_element` is located and/or oriented; in relation to the `Datum_system`. A `Geometric_tolerance_with_referenced_datum_system` is one of an `Angularity_tolerance` (see 4.2.26), a `Circular_runout_tolerance` (see 4.2.102), a `Concentricity_and_coaxiality_tolerance` (see 4.2.168), a `Parallelism_tolerance` (see 4.2.602), a `Perpendicularity_tolerance` (see 4.2.645), a `Profile_of_any_line_tolerance_with_referenced_datum_system` (see 4.2.745), a `Profile_of_any_surface_tolerance_with_referenced_datum_system` (see 4.2.748), a `Position_tolerance_with_referenced_datum_system` (see 4.2.696), a `Symmetry_tolerance` (see 4.2.883), or a `Total_runout_tolerance` (see 4.2.929).

The data associated with a `Geometric_tolerance_with_referenced_datum_system` are the following:

— `datum_system_definition`.

4.2.422.1 datum_system_definition

The `datum_system_definition` specifies the `Datum_system_defining_conditions` (see 4.2.237) that define the `Datum_system` (see 4.2.236) that in relation to which the `Geometric_tolerance_with_referenced_datum_system` specifies or partially specifies design requirements.

Constraints:

WR1: The `Geometric_tolerance_with_referenced_datum_system` shall be specified by at most one `Separate_geometric_tolerance_requirement` as one of the `separated_geometric_tolerances`.

NOTE EXPRESS specification:

```

*)
ENTITY geometric_tolerance_with_referenced_datum_system

4.2.431 Inter_stratum_extent

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Inter_stratum_extent is a type of Managed_design_object (see 4.2.524). An Inter_stratum_extent is the extent of Stratum (see 4.2.845) specified for a design purpose. The extent includes the from_stratum and to_stratum.

The data associated with an Inter_stratum_extent are the following:

- from_stratum;
- to_stratum.

4.2.431.1 from_stratum

The from_stratum specifies the Stratum (see 4.2.845) at one end of the Inter_stratum_extent. This Stratum is the Stratum closer to the Design_layer_stratum (see 4.2.275) whose primary_design_layer_stratum attribute value is TRUE than is the to_stratum.

NOTE The from_stratum by convention is closest to the primary side of the assembly and furthest from the secondary side of the assembly.

4.2.431.2 to_stratum

The to_stratum specifies the Stratum (see 4.2.845) at one end of the Inter_stratum_extent. This Stratum is further from the Design_layer_stratum (see 4.2.275) whose primary_design_layer_stratum attribute value is TRUE than is the from_stratum.

NOTE The to_stratum by convention is furthest from the primary side of the assembly, and closest to the secondary side of the assembly.

Constraints:

WR1: The members of stratum specified by from_stratum and to_stratum shall be associated with the same definition of the same product.

NOTE When the from_stratum and to_stratum are the same Stratum the extent of the Inter_stratum_extent is that Stratum.

NOTE EXPRESS specification:

```
*)
ENTITY inter_stratum_extent
  SUBTYPE OF (managed_design_object);
    from_stratum : stratum;
    to_stratum   : stratum;
END_ENTITY; -- inter_stratum_extent

( *
```

4.2.432 Inter_stratum_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Inter_stratum_feature is a type of Laminate_component (see 4.2.483). An Inter_stratum_feature is one of a Cutout (see 4.2.208), a Cutout_edge_segment (see 4.2.209), a Dielectric_material_passage (see 4.2.289), an Interconnect_module_edge (see 4.2.449), an Interconnect_module_edge_segment (see 4.2.450), a Plated_inter_stratum_feature (see 4.2.687), or an Unsupported_passage (see 4.2.939). An Inter_stratum_feature spans one or more Stratum (see 4.2.845).

NOTE 1 An Inter_stratum_feature may be realized by removal of material by drilling, routing, punching, chemically etching, laser burning, or otherwise penetrating one or more sequential Stratum; by the addition of material; or by combining both removal and addition of material in the fabrication process.

NOTE 2 Keep out or keep in regions can be specified by populating Interconnect_module_constraint_region and its optional set of Interconnect_module_design_object_select. The Interconnect_module_design_object_select can select an Inter_startum_feature as the design feature of interest.

The data associated with an `Inter_stratum_feature` are the following:

- `feature_of_size`;
- `usage_definition`.

NOTE Minimum and maximum material conditions are related to `Inter_stratum_feature` by its attribute `usage_definition`. The maximum and minimum material conditions established keep-out areas. Since these maximum and minimum conditions reflect a fabrication process, the designer does not have this area to locate other features. A situation such as tight spacing of conductors on a PWB must take into account the maximum and minimum material condition or the design will not be optimally realized through the fabrication process.

4.2.432.1 `feature_of_size`

The `feature_of_size` specifies whether or not the `Inter_stratum_feature` interfaces with a feature of another product in an assembly context. A value of `TRUE` specifies that it interfaces. A value of `FALSE` specifies that it does not interface.

NOTE Certain tolerance information depends on knowledge of a particular feature interfacing with features of a mating product. The maximum material conditions of the `Inter_stratum_feature` and of the feature of the mating product are taken into consideration for calculating the fit at assembly.

4.2.432.2 `usage_definition`

The `usage_definition` specifies the role of the `Inter_stratum_feature_template` (see 4.2.435) for the `Inter_stratum_feature`.

NOTE EXPRESS specification:

```

*)
ENTITY inter_stratum_feature

4.2.433 `Inter_stratum_feature_edge_segment_template`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Inter_stratum_feature_edge_segment_template` is a type of `Inter_stratum_feature_template` (see 4.2.435).

The data associated with an `Inter_stratum_feature_edge_segment_template` are the following:

- `composed_edge`;
- `end_vertex`;
- `start_vertex`.

4.2.433.1 composed_edge

The `composed_edge` specifies the role of the `Inter_stratum_feature_edge_template` (see 4.2.434) the `Inter_stratum_feature_edge_segment_template` is helping to compose.

4.2.433.2 end_vertex

The `end_vertex` specifies one role of the `Edge_segment_vertex` (see 4.2.312) for the `Inter_stratum_feature_edge_segment_template`.

4.2.433.3 start_vertex

The `start_vertex` specifies one role of the `Edge_segment_vertex` (see 4.2.312) for the `Inter_stratum_feature_edge_segment_template`.

Constraints:

WR1: The `end_vertex` shall not be the `start_vertex`.

NOTE EXPRESS specification:

```

```

4.2.434 Inter_stratum_feature_edge_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Inter_stratum_feature_edge_template is a type of Inter_stratum_feature_template (see 4.2.435).

The data associated with an Inter_stratum_feature_edge_template are the following:

— edges.

4.2.434.1 edges

The edges is an inverse relationship that specifies that the existence of the Inter_stratum_feature_edge_template is dependent on the existence of the Inter_stratum_feature_edge_segment_template (see 4.2.433) that specifies the Inter_stratum_feature_edge_template as its composed_edge. There shall be two or more Inter_stratum_feature_edge_segment_template for an Inter_stratum_feature_edge_template.

NOTE EXPRESS specification:

```

*)
ENTITY inter_stratum_feature_edge_template
  SUBTYPE OF (inter_stratum_feature_template);

  edges : SET [2:?] OF inter_stratum_feature_edge_segment_template for composed_edge;
END_ENTITY; -- inter_stratum_feature_edge_template

( *

```

4.2.435 Inter_stratum_feature_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Inter_stratum_feature_template is a type of Part_template (see 4.2.620). An Inter_stratum_feature_template may be one of a Component_termination_passage_template (see 4.2.150), an Unsupported_passage_template (see 4.2.941), or a Via_template (see 4.2.952). An Inter_stratum_feature_template is a definitional construct that defines the cross-section shape of layered constructs.

The data associated with an Inter_stratum_feature_template are the following:

— of_passage_technology.

4.2.435.1 of_passage_technology

The of_passage_technology specifies the role of the Passage_technology (see 4.2.638) for the Inter_stratum_feature_template. The op_passage_technology specifies the material and layered properties for the Inter_stratum_feature_template.

NOTE EXPRESS specification:

```

*)
ENTITY inter_stratum_feature_template

  of_passage_technology : passage_technology;
END_ENTITY; -- inter_stratum_feature_template

( *

```

4.2.436 Inter_stratum_join_implementation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Inter_stratum_join_implementation` is a type of `Managed_design_object` (see 4.2.524). An `Inter_stratum_join_implementation` is one of a `Physical_network_supporting_inter_stratum_feature` (see 4.2.661) or a `Physical_network_supporting_stratum_feature_conductive_join` (see 4.2.662). An `Inter_stratum_join_implementation` is a physical feature helping to implement a `Physical_network` (see 4.2.660). An `Inter_stratum_join_implementation` is not intended to be implemented alone. It is one of several Application Objects that together form the physical network implementation model.

NOTE 1 The types of `Inter_stratum_join_implementation` correspond to two physical implementation mechanisms.

NOTE 2 The first mechanism consists of creating a passage or edge in the material and then adding conductive material to the passage or edge wall and features on the `to_stratum` and `from_stratum` of the `Inter_stratum_extent` (see 4.2.431). This mechanism results in a connection between the required features implemented with the passage or edge wall.

NOTE 3 The second mechanism does not result in a conducting passage, but relies on a bond (achieved either by direct deposition or some other means) between the features related to the specified `layer_connection_points`. The second mechanism usually relies on a passage in only the dielectric material separating the bonded materials. A cross-sectional view of the pcb may show a vertical displacement of strata in the area of this object, due to the fact that the dielectric Stratum (see 4.2.845) is much thicker than the conductive Stratum. The shape of the vertical displacement is not a part of the definition of the `Inter_stratum_join_implementation` when the second mechanism is used.

The data associated with an `Inter_stratum_join_implementation` are the following:

— `topological_requirement`.

4.2.436.1 topological_requirement

The `topological_requirement` specifies the role of the `Inter_stratum_join_relationship` (see 4.2.437) for the `Inter_stratum_join_implementation`.

NOTE The following is a description of a realization of an `Inter_stratum_join_implementation` appropriate for some technologies. Features that implement inter layer connection are realized by forming passages in the sequence of stratum that define the extent of the passage. The passage has a nominally uniform cross-section and has a direction normal to the surface specified as the `from_stratum`. If that surface is not planar, then the surface coordinates of the layer connection points vary layer to layer to account for the finite thickness of the stratum comprising the Stratum.

NOTE EXPRESS specification:

```

*)
ENTITY inter_stratum_join_implementation
  ABSTRACT SUPERTYPE OF (ONEOF (
    physical_network_supporting_stratum_feature_conductive_join,
    physical_network_supporting_inter_stratum_feature))
  SUBTYPE OF (managed_design_object);
  topological_requirement : inter_stratum_join_relationship;
END_ENTITY; -- inter_stratum_join_implementation

--tt tc1 wd8 modified
( *

```

4.2.437 Inter_stratum_join_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Inter_stratum_join_relationship is a type of Join_relationship (see 4.2.479), in which the elements to be joined, Layer_connection_point (see 4.2.499), shall be on different Design_layer_stratum (see 4.2.275). An Inter_stratum_join_relationship is a requirement for a Inter_stratum_join_implementation (see 4.2.436).

NOTE In order for a design to be complete the Inter_stratum_join_implementation that specifies Inter_stratum_join_relationship in the role of topological_requirement must be populated.

Constraints:

WR1: No member of Design_layer_stratum shall be the resident_stratum for more than one member of Layer_connection_point that is joined by the same member of the Inter_stratum_join_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY inter_stratum_join_relationship
  SUBTYPE OF (join_relationship);
  points_to_be_connected : SET [2:?] OF layer_connection_point;
END_ENTITY; -- inter_stratum_join_relationship

```

4.2.438 Interconnect_component_interface_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Interconnect_component_interface_terminal` is a type of `Component_interface_terminal` (see 4.2.125) that is some aspect of a generic `Assembly_component` (see 4.2.34) participate in a connection for a `Pca` (see 4.2.639). The `Interconnect_component_interface_terminal` is defined in-situ. There is no `Part_feature` (see 4.2.609) associated with it.

EXAMPLE 1 An example of an `Interconnect_component_interface_terminal` is a mechanical conductive fastener that attaches a flexible wire lead lug to the pcb. Current flows through the fastener because it is part of the conduction path for a signal.

EXAMPLE 2 A plain wire is considered to be an interconnect component as well. This `Interconnect_component_interface_terminal` is defined in-situ. There is no `Part_feature` (see 4.2.609) associated with it. This is the opposite end of the wire from that defined for the same wire in `Interconnect_component_join_terminal` (see 4.2.439).

The data associated with an `Interconnect_component_interface_terminal` are the following:

- `connection`;
- `name`.

4.2.438.1 connection

The `connection` specifies the role of the `Connection_zone` (see 4.2.185) for the `Interconnect_component_interface_terminal`. The `connection` is optional and need not be supplied if the source system does not contain the data. If the source system contains the data, then the data shall be provided.

4.2.438.2 name

The `name` specifies the string for the human-interpretable identifier for this `Interconnect_component_interface_terminal`.

Constraints:

UR1: The combination of the `name` and the inherited `associated_component` shall be unique within a population of `Interconnect_component_interface_terminal`.

WR1: The shapes that describe the `connection_zone` specified by `connections` shall reside on one or more surfaces of the `assembly_component` in the role of `associated_component` specified by the super-type `component_feature`.

WR2: An `Interconnect_component_interface_terminal` shall participate in only one `Assembly_joint` (see 4.2.41).

NOTE EXPRESS specification:

```

*)
ENTITY interconnect_component_interface_terminal
  SUBTYPE OF (component_interface_terminal);
  connection : OPTIONAL connection_zone;
UNIQUE
  UR1 : SELF\shape_element.name, SELF\component_feature.associated_component;
END_ENTITY; -- interconnect_component_interface_terminal

( *

```

4.2.439 Interconnect_component_join_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interconnect_component_join_terminal is a type of Component_terminal (see 4.2.137) that is some aspect of a generic Assembly_component (see 4.2.34) participating in connectivity for a Pca (see 4.2.639). This Interconnect_component_join_terminal is defined in-situ.

EXAMPLE 1 An example of an Interconnect_component_join_terminal is a mechanical conductive fastener that attaches a flexible wire lead lug to the pcb. Current flows through the fastener because it is part of the conduction path for a signal.

EXAMPLE 2 A plain wire is considered to be a mechanical component as well. There is no Part_feature (see 4.2.609) associated with it. This is the opposite end of the wire from that defined for the same wire in Interconnect_component_interface_terminal (see 4.2.438).

The data associated with an Interconnect_component_join_terminal are the following:

- connection;
- name.

4.2.439.1 connection

The connection specifies the role of the Connection_zone (see 4.2.185) for the Interconnect_component_join_terminal. The connection is optional and need not be supplied if the source system does not contain the data. If the source system contains the data, then the data shall be provided.

4.2.439.2 name

The name specifies the string for the human-interpretable identifier for this Interconnect_component_join_terminal.

Constraints:

UR1: The combination of the name and the inherited associated_component shall be unique within a population of Interconnect_component_join_terminal.

WR1: The shapes that describe the connection_zone specified by connections shall reside on one or more surfaces of the assembly_component in the role of associated_component specified by the super-type Component_feature of this terminal.

WR2: Interconnect_component_join_terminal shall participate in no more than one Assembly_joint.

NOTE EXPRESS specification:

```

*)
ENTITY interconnect_component_join_terminal
  SUBTYPE OF (physical_component_terminal);
  connection : OPTIONAL connection_zone;
  SELF\component_feature.associated_component : physical_component;
  UNIQUE
    UR1 : SELF\shape_element.name,

```

4.2.440 Interconnect_module

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interconnect_module is a type of Physical_unit_design_view (see 4.2.667). An Interconnect_module may be a Pcb (see 4.2.642). An Interconnect_module is a design view of a product. An Interconnect_module may be an aggregation of Stratum (see 4.2.845). An Interconnect_module may be an aggregation of Interconnect_module_component (see 4.2.442) An Interconnect_module features are defined by Stratum_feature (see 4.2.851), within the bounds established by Inter_stratum_feature (see 4.2.432).

NOTE Not all products defined by this design view are classified in general as interconnect substrates.

EXAMPLE 1 A package may be defined by the design owners using the Interconnect_module design view.

EXAMPLE 2 A ribbon cable, minus the connectors, may be defined by the design owners using the Interconnect_module design view. Complex 3d arrangements of the ribbon may be supported.

EXAMPLE 3 Figure 49 illustrates two categories of complex land patterns. For a specific technology implementation in an Interconnect_module, all parameters would be assigned specific values, in addition to the explicit geometry and material descriptions otherwise provided.

EXAMPLE 4 Figure 50 illustrates two categories of simple land patterns. For a specific technology implementation in an Interconnect_module, all parameters would be assigned specific values, in addition to the explicit geometry and material descriptions otherwise provided.

Figure 49 – Complex technology specific land pattern definition

Reference document is : IEC 61182-1

Figure 50 – Simple technology specific land pattern definition

The data associated with an Interconnect_module are the following:

— assembly_design_requirement.

4.2.440.1 assembly_design_requirement

The assembly_design_requirement specifies the Assembly_module (see 4.2.43) for the Interconnect_module as a specified source of requirements not otherwise explicitly allocated to the Interconnect_module. This requirement shall be interpreted as establishing a direct relationship to the assembly or assemblies that define data that may be used as requirements for the Interconnect_module. There may be more than one Assembly_module for a Interconnect_module. The assembly_design_requirement is optional and need not be supplied.

NOTE This relationship is provided so that design requirements may be traced to the original source even though an Interconnect_module may be designed into many subsequent assembly designs.

NOTE Explicit data requirements may be contained in one or more assembly design views. These multiple requirements can be specified by the the `Component_external_reference` and `Component_feature_external_reference` application objects. Component features which are contained in one design view may be associated to layout features that are contained in another design view. `Component_external_reference` and `Component_feature_external_reference` maintain this association while also maintaining the completeness of the design view.

EXAMPLE 1 If the attribute name specified by `Ee_product_category` (see 4.2.320) that is in the role of `product_classification` specified by `Ee_product` (see 4.2.319) that is in the role of `versioned_item` specified by `Ee_product_version` (see 4.2.328) that is in the role of `version` specified by the supertype `Ee_product_definition` is "Interconnect module", and if the sub category of the `Ee_product_category` is "land pattern", then the purpose for inclusion is to provide land pattern source data that may be manufacturer specific or industry standard. The attribute `standard_product_indicator` specified by the same member of `Ee_product` shall be true for industry standard pattern and material designation. The material designations, arrangement, etc., are included as part of this definition since this application object is a design view. The instantiation of the land pattern into the design is accomplished using the `Component_make_from_relationship` (see 4.2.126) to specify each component of the land pattern as it is reused in the design. The Application Objects `Padstack_definition` (see 4.2.595) and `Footprint_definition` (see 4.2.388) are provided to allow specific usages of patterns generally understood in industry to be exchanged. It is suggested to use a `Footprint_definition` to exchange land patterns instead of the generic mechanism.

Constraints:

WR1: `Interconnect_module.usage_view` (this is an inherited attribute from `Physical_unit_design_view`) shall be either an `Interconnect_module_usage_view` or a `Package`.

WR2: There shall be exactly one primary design layer stratum in the `Interconnect_module`.

NOTE EXPRESS specification:

```

*)
ENTITY interconnect_module
  SUPERTYPE OF (ONEOF(
    pcb,
    reference_packaged_part_interconnect_implementation))
  SUBTYPE OF (physical_unit_design_view);
  assembly_design_requirement : OPTIONAL SET [1:?] OF assembly_module;

```

4.2.441 Interconnect_module_cavity_surface

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Interconnect_module_cavity_surface is a type of Interconnect_module_surface_feature (see 4.2.462).

The data associated with an Interconnect_module_cavity_surface are the following:

— reference_surface.

4.2.441.1 reference_surface

The reference_surface specifies an Interconnect_module_surface_feature (see 4.2.462) for the Interconnect_module_cavity_surface.

Constraints:

WR1: The reference_surface shall not be this Interconnect_module_cavity_surface.

NOTE EXPRESS specification:

```

*)
ENTITY interconnect_module_cavity_surface
  SUBTYPE OF (interconnect_module_surface_feature);
  reference_surface : interconnect_module_surface_feature;
WHERE
  WR1: SELF :&#60;&#62;; reference_surface;
END_ENTITY; -- interconnect_module_cavity_surface

( *

```

4.2.442 Interconnect_module_component

An `Interconnect_module_component` is a type of `Assembly_component` (see 4.2.34). An `Interconnect_module_component` is an instance of an `Interconnect_module_usage_view`.

NOTE The `Interconnect_module_component` can be, for example, a circuit board in an assembly. Alternatively, it could be the substrate for a multi-chip module. This entity is included specifically so that the assembly design definition can be queried directly to determine which component in the assembly is the substrate. The `Interconnect_module_component` is likely the target of connectivity requirement information as allocated to various components. An `Interconnect_module_component` does not include all the internal details of the design of the `Interconnect_module` (see 4.2.440).

The data associated with an `Interconnect_module_component` are the following:

— `usage_definition`.

4.2.442.1 usage_definition

The `usage_definition` specifies the role of the `Interconnect_module_usage_view` (see 4.2.465) for the `Interconnect_module_component`.

NOTE The `usage_view` specifies the definitions of the terminals and other interface elements of the `Interconnect_module` (see 4.2.440).

Constraints:

WR1: An `Interconnect_module_component` shall not be mounted onto itself.

NOTE EXPRESS specification:

```
*)
ENTITY interconnect_module_component
  SUPERTYPE OF(interconnect_module_macro_component)
  SUBTYPE OF (physical_component);
  SELF\assembly_component.usage_definition : interconnect_module_usage_view;
END_ENTITY; -- interconnect_module_component
(*
```

4.2.443 Interconnect_module_component_stratum_based_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interconnect_module_component_stratum_based_terminal is a type of Interconnect_module_component_terminal (see 4.2.445) included to support the case where explicit Interconnect_module_component_terminals are being connected by an Interconnect_module_product_assembly_view_fabrication_joint (see 4.2.458) as part of a sequential laminate assembly view for design or analysis purposes.

NOTE A sequential laminate assembly description may be necessary to support embedded discrete components.

The data associated with an Interconnect_module_component_stratum_based_terminal are the following:

— definition.

4.2.443.1 definition

The definition specifies the role of the Interconnect_module_stratum_based_terminal (see 4.2.461) for the Interconnect_module_component_stratum_based_terminal.

NOTE EXPRESS specification:

```
*)
ENTITY interconnect_module_component_stratum_based_terminal
  SUBTYPE OF (interconnect_module_component_terminal);
  SELF\component_feature.definition : interconnect_module_stratum_based_terminal;
END_ENTITY; -- interconnect_module_component_stratum_based_terminal
(*
```

4.2.444 Interconnect_module_component_surface_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Interconnect_module_component_surface_feature` is a type of `Component_feature` (see 4.2.118). An `Interconnect_module_component_surface_feature` is a surface or a segment of the edge of the `Interconnect_module_component` (see 4.2.442) identified for assembly purposes. The definition attribute inherited from `Component_feature` (see 4.2.118) shall specify a type of `Interconnect_module_surface_feature` (see 4.2.462). The associated_component attribute inherited from `Component_feature` shall specify a member of `Interconnect_module_component` (see 4.2.442). An `Interconnect_module_component_surface_feature` may also be an `Interconnect_module_component_terminal` (see 4.2.445), but shall not be any other type of `Component_feature`.

NOTE The entire primary or secondary surface of the `Interconnect_module_component` may be considered to be a feature in this usage.

NOTE EXPRESS specification:

```
*)
ENTITY interconnect_module_component_surface_feature
  SUBTYPE OF (physical_component_feature);
--tt tc1 wd11 modify
  SELF\component_feature.definition : interconnect_module_surface_feature;

--tt tc1 wd9 modify
(*
```

4.2.445 `Interconnect_module_component_terminal`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Interconnect_module_component_terminal` is a type of `Component_terminal` (see 4.2.137). An `Interconnect_module_component_terminal` may be an `Interconnect_module_component_stratum_based_terminal` (see 4.2.443). A member of `Interconnect_module_component_terminal` may be referenced by a member of `Assembly_joint` to describe the partial or complete implementation of a connection defined as a requirement by a member of `Physical_connectivity_definition`.

EXAMPLE 1 Figure 51 illustrates the relationship between an `Interconnect_module_component_terminal` and its mating feature in an assembly.

The data associated with an `Interconnect_module_component_terminal` are the following:

- associated_component;
- definition.

Note : The design view associated with this data is the Assembly_module

Figure 51 – Interconnect_module_component_terminal in an assembly

4.2.445.1 associated_component

The associated_component specifies the role of the Interconnect_module_component (see 4.2.442) for the Interconnect_module_component_terminal.

4.2.445.2 definition

The definition specifies the role of the Interconnect_module_terminal (see 4.2.463) for the Interconnect_module_component_terminal.

NOTE EXPRESS specification:

```

*)
ENTITY interconnect_module_component_terminal
  SUPERTYPE OF ((interconnect_module_component_stratum_based_terminal)
                ANDOR (interconnect_module_macro_component_join_terminal))
  SUBTYPE OF (physical_component_terminal);
  SELF\component_feature.definition          : interconnect_module_terminal;
  SELF\component_feature.associated_component : interconnect_module_component;
END_ENTITY; -- interconnect_module_component_terminal

( *

```

4.2.446 Interconnect_module_constraint_region

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interconnect_module_constraint_region is a type of Non_feature_shape_element (see 4.2.560). An Interconnect_module_constraint_region is a region within an Interconnect_module (see 4.2.440) in which a placement constraint on some category of design object is to be met by the design. An Interconnect_module_constraint_region may overlap other Interconnect_module_constraint_regions.

The data associated with an Interconnect_module_constraint_region are the following:

- associated_stratum_extent;
- constrained_design_object_category;
- design_specific_purpose;
- keepout;
- non_conformant_interconnect_module_design_object;
- precedent_version_constraint_region;
- requirement;
- scope.

4.2.446.1 associated_stratum_extent

The associated_stratum_extent specifies the Inter_stratum_extent (see 4.2.431) as the extent of Stratum (see 4.2.845) for the Interconnect_module_constraint_region. There shall be one or more Inter_stratum_extent for an Interconnect_module_constraint_region. The Inter_stratum_extent shall all be for the same scope.

4.2.446.2 **constrained_design_object_category**

The `constrained_design_object_category` specifies either an `interconnect_module_cutout`, an `interconnect_module_fill_area`, an `interconnect_module_inter_stratum_feature`, an `interconnect_module_stratum_feature`, or an `interconnect_module_via` as a category for the `Interconnect_module_constraint_region`. There may be more than one `interconnect_module_cutout`, `interconnect_module_fill_area`, `interconnect_module_inter_stratum_feature`, or `interconnect_module_via` for an `Interconnect_module_constraint_region`. The names shall be interpreted as the identification of Application Object categories to be constrained.

4.2.446.3 **design_specific_purpose**

The `design_specific_purpose` identifies the purpose the enterprise defined for the `Interconnect_module_constraint_region`.

4.2.446.4 **keepout**

The `keepout` specifies if the meaning of the `Interconnect_module_constraint_region` is to describe that items shall be in the interior of the `element_shape` or shall be on the exterior of the `element_shape`. The value of `TRUE` states that objects in the `constrained_design_object_category` are not to be within the `element_shape`. The value of `FALSE` states that objects in the `constrained_design_object_category` are to be only within the `element_shape`.

4.2.446.5 **non_conformant_interconnect_module_design_object**

The `non_conformant_interconnect_module_design_object` specifies either a `Component_termination_passage` (see 4.2.143), a `Conductive_filled_area` (see 4.2.170), a `Conductor` (see 4.2.176), a `Cutout` (see 4.2.208), an `Inter_stratum_feature` (see 4.2.432), a `Laminate_component` (see 4.2.483), a `Land` (see 4.2.490), a `Non_functional_land` (see 4.2.562), a `Stratum_feature` (see 4.2.851), or a `Via` (see 4.2.947) for the `Interconnect_module_constraint_region`. There may be more than one `Component_termination_passage`, `Conductive_filled_area`, `Conductor`, `Cutout`, `Inter_stratum_feature`, `Laminate_component`, `Land`, `Non_functional_land`, `Stratum_feature` (see 4.2.851), or `Via` for an `Interconnect_module_constraint_region`.

4.2.446.6 **precedent_version_constraint_region**

The `precedent_version_constraint_region` is an inverse relationship that specifies that the `Interconnect_module_constraint_region` is existence dependent on a specific `Interconnect_module_constraint_region` as a precedent region. The usage of this relationship is to enable traceability to original `Interconnect_module_constraint_region` during design iterations.

NOTE Since the `Interconnect_module_constraint_region` is dependent on a specific `Interconnect_module`, it is not possible to use the mechanism of associating one `Interconnect_module_constraint_region` with several `Interconnect_module`, each of which is for a different design version. In addition, the `non_conformant_interconnect_module_design_object` is for objects within the scope, which also precludes direct re-use of the same `Interconnect_module_constraint_region`. It is expected that only the first `Interconnect_module_constraint_region` populated would have an associated shape to eliminate the need for carrying redundant shape data.

4.2.446.7 requirement

The requirement specifies the role of the Ee_requirement_occurrence (see 4.2.330) for the Interconnect_module_constraint_region.

4.2.446.8 scope

The scope specifies the Interconnect_module (see 4.2.440) for the Interconnect_module_constraint_region.

Constraints:

WR1: The element_shape shall be a Csg_2d_shape.

NOTE EXPRESS specification:

```

4.2.447 Interconnect_module_cutout_segment_surface

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Interconnect_module_cutout_segment_surface` is a type of `Interconnect_module_surface_feature` (see 4.2.462). An `Interconnect_module_cutout_segment_surface` identifies a segment of the cutout surface of the `Interconnect_module` (see 4.2.440) for fabrication and assembly purposes.

NOTE This data is usage view contextual data.

If a design view is provided and this member of `Interconnect_module_cutout_segment_surface` is specified by a member of `Stratum_concept_to_physical_usage_view_assignment` (see 4.2.850) in the role of `defined_part_feature`, a member of `Interconnect_module_cutout_segment` (see ??) or a member of `Plated_interconnect_module_cutout_segment` (see ??) shall be the only possibilities permitted to be specified for the role of `assigned_design_object` for that member of `Stratum_concept_to_physical_usage_view_assignment`.

The data associated with an `Interconnect_module_cutout_segment_surface` are the following:

- `composed_surface`;
- `end_vertex`;
- `start_vertex`.

4.2.447.1 composed_surface

The `composed_surface` specifies an `Interconnect_module_cutout_surface` for an `Interconnect_module_cutout_segment` (see ??).

4.2.447.2 end_vertex

The `end_vertex` specifies one role of an `Edge_segment_surface` for an `Interconnect_module_cutout_segment_surface`.

4.2.447.3 start_vertex

The `end_vertex` specifies one role of an `Edge_segment_surface` for an `Interconnect_module_cutout_segment_surface`.

Constraints:

WR1: The `end_vertex` shall not be the `start_vertex`.

NOTE EXPRESS specification:

```

*)
ENTITY interconnect_module_cutout_segment_surface
  SUBTYPE OF (interconnect_module_surface_feature);
    composed_surface : interconnect_module_cutout_surface;
    start_vertex      : edge_segment_vertex;
    end_vertex        : edge_segment_vertex;
WHERE
  WR1: start_vertex :&#60;&#62;; end_vertex;
END_ENTITY; -- interconnect_module_cutout_segment_surface

( *

```

4.2.448 Interconnect_module_cutout_surface

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Interconnect_module_cutout_surface is a type of a Interconnect_module_surface_feature (see 4.2.462).

NOTE EXPRESS specification:

```

*)
ENTITY interconnect_module_cutout_surface
  SUBTYPE OF (interconnect_module_surface_feature);
END_ENTITY; -- interconnect_module_cutout_surface

( *

```

4.2.449 Interconnect_module_edge

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interconnect_module_edge is a type of Inter_stratum_feature (see 4.2.432). When this information is represented by a planar shape, the interpretation is to be that the planar shape represents a projection of the maximum extent of the Interconnect_module_edge onto the planar shape. The Interconnect_module_edge forms an outer physical boundary of the interconnect substrate.

Constraints:

WR1: Each member of Interconnect_module_edge shall only be an external feature of the Interconnect_module.

WR2: Any geometry representing a member of Interconnect_module_edge shall be interpreted by a receiving system as a closed curve or a closed volume, depending on the dimensionality of the geometry.

NOTE EXPRESS specification:

```

*)
ENTITY interconnect_module_edge
  SUPERTYPE OF (ONEOF(partially_plated_interconnect_module_edge,
    plated_interconnect_module_edge))
  SUBTYPE OF (inter_stratum_feature);

--tt tc1 wd9 modified
( *
```

4.2.450 Interconnect_module_edge_segment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interconnect_module_edge_segment is a type of Inter_stratum_feature (see 4.2.432). The Interconnect_module_edge_segment is an entity with a uniquely specified shape that makes up part of the edge of an interconnect module.

EXAMPLE 1 Usually each side of a four-sided board is an Interconnect_module_edge_segment, or if a board is a round board, one of the Interconnect_module_edge_segment's may be a notch for orientation purposes. The set of Interconnect_module_edge_segment's together make up the total edge.

The data associated with an Interconnect_module_edge_segment are the following:

- composed_edge;
- end_vertex;
- start_vertex.

4.2.450.1 composed_edge

The composed_edge specifies the role of the Interconnect_module_edge (see 4.2.449) for the Interconnect_module_edge_segment.

4.2.450.2 end_vertex

The end_vertex specifies one role of an Edge_segment_vertex for an Interconnect_module_edge_segment.

4.2.450.3 start_vertex

The start_vertex specifies one role of an Edge_segment_vertex for an Interconnect_module_edge_segment.

Constraints:

WR1: The end_vertex shall not be the start_vertex.

NOTE EXPRESS specification:

```

*)
ENTITY interconnect_module_edge_segment
  SUPERTYPE OF (plated_interconnect_module_edge_segment)
  SUBTYPE OF (inter_stratum_feature);
    composed_edge                : interconnect_module_edge;
    start_vertex                 : edge_segment_vertex;
    end_vertex                   : edge_segment_vertex;
    SELF\inter_stratum_feature.usage_definition :
      inter_stratum_feature_edge_segment_template;
WHERE
  WR1: start_vertex :&#60;&#62;: end_vertex;
END_ENTITY; -- interconnect_module_edge_segment

--tt tc1 wd9 modified
(

```

4.2.451 Interconnect_module_edge_segment_surface

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interconnect_module_edge_segment_surface is a type of Interconnect_module_surface_feature (see 4.2.462). An Interconnect_module_edge_segment_surface identifies a segment of the edge surface of the Interconnect_module (see 4.2.440) for fabrication and assembly purposes.

NOTE This data is usage view contextual data.

If a design view is provided and this member of Interconnect_module_edge_segment_surface is specified by a member of Stratum_concept_to_physical_usage_view_assignment (see 4.2.850) in the role of defined_part_feature, a member of Interconnect_module_edge_segment (see 4.2.450) or a member of Plated_interconnect_module_edge_segment (see 4.2.689) shall be the only possibilities permitted to be specified for the role of assigned_design_object for that member of Stratum_concept_to_physical_usage_view_assignment.

The data associated with an Interconnect_module_edge_segment_surface are the following:

- composed_surface;
- end_vertex;
- start_vertex.

4.2.451.1 composed_surface

The composed_surface specifies an Interconnect_module_edge_surface for an Interconnect_module_edge_segment (see 4.2.450).

4.2.451.2 end_vertex

The end_vertex specifies one role of an Edge_segment_surface for an Interconnect_module_edge_segment_surface.

4.2.451.3 start_vertex

The end_vertex specifies one role of an Edge_segment_surface for an Interconnect_module_edge_segment_surface.

Constraints:

WR1: The end_vertex shall not be the start_vertex.

NOTE EXPRESS specification:

```

*)
ENTITY interconnect_module_edge_segment_surface
  SUBTYPE OF (interconnect_module_surface_feature);

(*

```

4.2.455 Interconnect_module_macro_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Interconnect_module_macro_component is a type of Assembly_component (see 4.2.34).

The data associated with an Interconnect_module_macro_component are the following:

- access_mechanisms;
- usage_definition;
- usage_view_definition.

4.2.455.1 access_mechanisms

The access_mechanisms is an inverse relationship that specifies that the existence of the Interconnect_module_macro_component is dependent on the existence of the Interconnect_module_component_terminal (see 4.2.445) that specifies the Interconnect_module_macro_component as its associated_component. There shall be two or more Interconnect_module_component_terminal for an Interconnect_module_macro_component.

4.2.455.2 usage_definition

The usage_definition specifies the role of an Interconnect_module (see 4.2.440) for the Interconnect_module_macro_component.

4.2.455.3 usage_view_definition

The usage_view_definition is a derived role of an Interconnect_module_usage_view (see 4.2.465) which specifies the specifies the Assembly_module_usage_view that is identified via the path SELF\assembly_component.usage_definition\physical_unit_design_view.usage_view.

Constraints:

WR1: The Interconnect_module_usage_view (see 4.2.465) referenced by the usage_view_definition shall be the same Interconnect_module_usage_view referenced by the associated_definition which is referenced by the definition which is referenced by the access_mechanisms.

NOTE EXPRESS specification:

END_ENTITY; -- interconnect_module_macro_component_join_terminal

( *

```

4.2.457 Interconnect_module_primary_surface

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interconnect_module_primary_surface is a type of Interconnect_module_surface_feature (see 4.2.462). An Interconnect_module_primary_surface identifies the primary surface of the Interconnect_module (see 4.2.440) for fabrication and assembly purposes. A member of Stratum_concept_to_physical_usage_view_assignment (see 4.2.850) shall be populated in order to associate this object to the primary Stratum (see 4.2.845) if a design view of the substrate is included in the data. An Interconnect_module_primary_surface is an approximation of the real primary surface.

NOTE It is not usually the case that the physical material visible on the surface of the substrate or pcb is the same material as that of the primary Stratum. The level of information provided by this object is usually sufficient for assembly purposes, but will be in error by the thickness of the Stratum above the primary Stratum. If more accuracy is desired, the population of Adjacent_stratum_surface_definition (see 4.2.5) may be queried to determine the Stratum that is specified by only the precedent_surface attribute. That Stratum will be the material of at least part of the surface of the substrate. Full three-dimensional representation capability and location of individual Interconnect_module_component_terminal (see 4.2.445) associated by Assembly_joint (see 4.2.41) to the component feature being assembled to the substrate is required to represent exactly the mating conditions.

NOTE EXPRESS specification:

```

*)
ENTITY interconnect_module_primary_surface
  SUBTYPE OF (interconnect_module_surface_feature);
END_ENTITY; -- interconnect_module_primary_surface

( *

```

4.2.458 Interconnect_module_product_assembly_view_fabrication_joint

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Interconnect_module_product_assembly_view_fabrication_joint` is a type of `Managed_design_object` (see 4.2.524). It specifies the bond among `Interconnect_module_component_stratum_based_terminal` (see 4.2.443) which is created during an assembly process. The detailed process description of how to create the bond is not included.

NOTE This Application Object is intended to support a limited view of an interconnect product where the vertical or sequential arrangement of intermediate assemblies is of interest, and the detailed information available in `Stratum` (see 4.2.845) is not of interest.

The data associated with an `Interconnect_module_product_assembly_view_fabrication_joint` are the following:

— `joined_terminal`.

4.2.458.1 `joined_terminal`

A `joined_terminal` specifies one or more `Interconnect_module_component_stratum_based_terminal` (see 4.2.443) for the `Interconnect_module_product_assembly_view_fabrication_joint`.

NOTE EXPRESS specification:

```
*)
ENTITY interconnect_module_product_assembly_view_fabrication_joint
  SUBTYPE OF (managed_design_object);
    joined_terminal :
SET [1:?] OF interconnect_module_component_stratum_based_terminal;
END_ENTITY; -- interconnect_module_product_assembly_view_fabrication_joint

( *
```

4.2.459 `Interconnect_module_secondary_surface`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Interconnect_module_secondary_surface` is a type of `Interconnect_module_surface_feature` (see 4.2.462). An `Interconnect_module_secondary_surface` identifies the secondary surface of the `Interconnect_module` (see 4.2.440) for fabrication and assembly purposes. If a design view is populated, and correlation to a `Stratum` (see 4.2.845) is provided, the `Stratum` associated with this member of `Interconnect_module_primary_surface` (see 4.2.457) shall be the last `Stratum` in the design.

NOTE The `Stratum_concept_to_physical_usage_view_assignment` (see 4.2.850), `Adjacent_stratum_surface_definition` (see 4.2.5), and `Stratum_surface` (see 4.2.868) provide supporting data needed to resolve the position of the `Stratum` in the design. Because the secondary surface is derived structurally from the primary `Stratum`, there is no approximation made in the description.

NOTE EXPRESS specification:

```
*)
ENTITY interconnect_module_secondary_surface
  SUBTYPE OF (interconnect_module_surface_feature);
END_ENTITY; -- interconnect_module_secondary_surface

( *
```

4.2.460 Interconnect_module_stratum_assembly_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interconnect_module_stratum_assembly_relationship is a type of Managed_design_object (see 4.2.524). An Interconnect_module_stratum_assembly_relationship is the composition association between an Interconnect_module (see 4.2.440) and the Stratum (see 4.2.845) helping to compose it.

The data associated with an Interconnect_module_stratum_assembly_relationship are the following:

- assembly;
- component;
- reference_designation;
- stratum_3d_position;
- stratum_planar_position.

4.2.460.1 assembly

The assembly specifies the role of the Interconnect_module (see 4.2.440) for the Interconnect_module_stratum_assembly_relationship. There shall be one or more Interconnect_module for the Interconnect_module_stratum_assembly_relationship.

4.2.460.2 component

The component specifies the role of the Stratum (see 4.2.845) for the Interconnect_module_stratum_assembly_relationship.

4.2.460.3 reference_designation

The reference_designation specifies the string for the human-interpretable identifier for the Interconnect_module_stratum_assembly_relationship.

4.2.460.4 stratum_3d_position

The stratum_3d_position is an inverse relationship that specifies the Stratum_interconnect_module_-3d_position (see 4.2.863) that specifies the Interconnect_module_stratum_assembly_relationship as its stratum_component. There shall be no more than one Stratum_interconnect_module_3d_position for an Interconnect_module_stratum_assembly_relationship.

4.2.460.5 stratum_planar_position

The stratum_planar_position is an inverse relationship that specifies the Stratum_interconnect_module_-planar_position (see 4.2.864) that specifies the Interconnect_module_stratum_assembly_relationship as its stratum_component. There shall be no more than one Stratum_interconnect_module_planar_position for an Interconnect_module_stratum_assembly_relationship.

Constraints:

UR1: The combination of the assembly and the reference_designation shall be unique within a population of Interconnect_module_stratum_assembly_relationship.

WR1: The members of assembly shall all be for the same product.

WR2: Each member of assembly shall be for a separate product version.

NOTE EXPRESS specification:

```

*)
ENTITY interconnect_module_stratum_assembly_relationship
  SUBTYPE OF (managed_design_object);
    assembly          : interconnect_module;

    UR1 : assembly, reference_designation;
END_ENTITY; -- interconnect_module_stratum_assembly_relationship

```

(*

4.2.461 Interconnect_module_stratum_based_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Interconnect_module_stratum_based_terminal` is a type of `Interconnect_module_terminal` (see 4.2.463). An `Interconnect_module_stratum_based_terminal` identifies both the design object and the stratum surface related to the object in the design organization. This allows the use of the terminal in a component instance where surfaces are joined. It also supports placement of embedded components. An `Interconnect_module_stratum_based_terminal` includes the identification of a reference surface to support the sequence of application of an embedded component or of material buildup.

NOTE The `Interconnect_module_stratum_based_terminal` is an artifact that is defined in the design organization but generally will be assigned to only those lands or `non_functional_lands` that are intended to be penetrated with plated passages in the final product. This is only used in the case where sequential stackups are defined, and is derived from knowledge of the substrate design and intended lamination sequence. The other usage is for support of embedded components being connected into the succeeding stratum.

Constraints:

WR1: An `Interconnect_module_stratum_based_terminal` shall not be an assignment of an `Inter_stratum_feature` by a member of `Stratum_concept_to_physical_usage_view_assignment`.

WR2: An `Interconnect_module_stratum_based_terminal` shall be an assignment of a `Land` or `Non_functional_land` in the case where a member of `Stratum_concept_to_physical_usage_view_assignment` references the `Interconnect_module_stratum_based_terminal`.

NOTE EXPRESS specification:

```

*)
ENTITY interconnect_module_stratum_based_terminal
  SUBTYPE OF (interconnect_module_terminal);
WHERE
  WR1: SIZEOF(QUERY( imtscr &#60;* USEDIN(SELF,

```

4.2.463 Interconnect_module_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Interconnect_module_terminal` is a type of `Part_terminal` (see 4.2.630). The `Interconnect_module_terminal` shall be one of either an `Interconnect_module_interface_terminal` (see 4.2.453) or an `Interconnect_module_join_terminal` (see 4.2.454). The `Interconnect_module_terminal` identification is provided by the name attribute inherited from `Shape_element` (see 4.2.810). The string may include a substring that indicates to a person the connector the `Interconnect_module_terminal` is associated with. An `Interconnect_module_terminal` may be referenced by a member of `Part_connected_terminals_definition` (see 4.2.605) to identify a connection requirement for the `Interconnect_module`.

NOTE The `Interconnect_module_terminal` may be an `Interconnect_module_stratum_based_terminal` (see 4.2.461) but this fact is not structurally captured in this application object due to the need to require that the `Interconnect_module_terminal` shall be one of the two specified subtypes.

NOTE This part of ISO 10303 does not explicitly model, in a usage view, the relationship of a printed connector to an `Interconnect_module` in addition to the `associated_definition` relationship provided in this Application Object.

EXAMPLE 1 Figure 52 illustrates a detail of a usage view that shows an `Interconnect_module_terminal` that is a part of a edge finger connector.

The data associated with an `Interconnect_module_terminal` are the following:

- `associated_definition`;
- `feature_shape` ;
- `terminal_connection_zone` .

Figure 52 – Interconnect_module_terminal

4.2.463.1 associated_definition

The `associated_definition` specifies the role of the `Interconnect_module_usage_view` (see 4.2.465) for the `Interconnect_module_terminal`.

4.2.463.2 feature_shape

The `feature_shape` specifies the role of the `Feature_shape_occurrence` (see ??) for the `Interconnect_module_terminal`. There shall be one or more `Feature_shape_occurrence` for an `Interconnect_module_terminal`.

4.2.463.3 terminal_connection_zone

The `terminal_connection_zone` specifies the role of the `Connection_zone` (see 4.2.185) for the `Interconnect_module_terminal`. There may be more than one `Connection_zone` for an `Interconnect_module_terminal`. The `terminal_connection_zone` is optional and need not be supplied if the source system does not contain the data. If the source system contains the data, then the data shall be provided.

NOTE The `Feature_shape_occurrence` (see ??) specified by the terminal or mounting feature may be the same `Feature_shape_occurrence` that is specified by the associated `Connection_zone` (see 4.2.185). In this case the whole terminal is the `Connection_zone`.

NOTE EXPRESS specification:

```

*)
ENTITY interconnect_module_terminal
  SUPERTYPE OF (ONEOF(
    interconnect_module_interface_terminal,
    interconnect_module_join_terminal))
  SUBTYPE OF (part_terminal);
  terminal_connection_zone : OPTIONAL SET [1:?] OF connection_zone;
  SELF\part_feature.associated_definition : interconnect_module_usage_view;
INVERSE
  SELF\part_feature.feature_shape : SET [1:?] OF usage_concept_usage_relationship;
  associated_usage;
END_ENTITY; -- interconnect_module_terminal
( *

```

4.2.464 Interconnect_module_terminal_surface_constituent_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interconnect_module_terminal_surface_constituent_relationship is a type of Shape_element_constituent_relationship (see 4.2.813).

The data associated with an Interconnect_module_terminal_surface_constituent_relationship are the following:

- relating_shape_element;
- related_shape_element.

4.2.464.1 relating_shape_element

The relating_shape_element specifies the role of the Interconnect_module_surface_feature (see 4.2.462) for the Interconnect_module_terminal_surface_constituent_relationship.

4.2.464.2 related_shape_element

The related_shape_element specifies the role of the Interconnect_module_terminal (see 4.2.463) for the Interconnect_module_terminal_surface_constituent_relationship.

NOTE EXPRESS specification:

*)

```
ENTITY interconnect_module_terminal_surface_constituent_relationship
  SUBTYPE OF (shape_element_constituent_relationship);
  SELF\shape_element_relationship.relatng_shape_element : interconnect_module_surface_fea
  SELF\shape_element_relationship.related_shape_element : interconnect_module_terminal;
END_ENTITY; -- interconnect_module_terminal_surface_constituent_relationship
```

(*

4.2.465 Interconnect_module_usage_view

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interconnect_module_usage_view is a type of Physical_unit_usage_view (see 4.2.672). An Interconnect_module_usage_view may be a Pcb_usage_view (see 4.2.643). Either the maximum_thickness_over_dielectric_requirement or the maximum_thickness_over_metal_requirement shall be provided. If both the maximum_thickness_over_dielectric_requirement and the maximum_thickness_over_metal_requirement are provided, the maximum_thickness_over_metal_requirement shall be greater than the maximum_thickness_over_dielectric_requirement.

The data associated with an Interconnect_module_usage_view are the following:

- implemented_function;
- located_thickness_requirement;
- maximum_thickness_over_dielectric_requirement;
- maximum_thickness_over_metal_requirement;
- measurement_condition;
- minimum_thickness_over_dielectric_requirement;
- minimum_thickness_over_metal_requirement.

4.2.465.1 implemented_function

The implemented_function specifies the role of the Functional_unit_usage_view (see 4.2.410) for the Interconnect_module_usage_view. The implemented_function need not be specified for a particular Interconnect_module_usage_view.

4.2.465.2 located_thickness_requirement

The located_thickness_requirement specifies the role of the Located_interconnect_module_thickness_requirement (see 4.2.519) for the Interconnect_module_usage_view. A Located_interconnect_module_thickness_requirement need not be specified for an Interconnect_module_usage_view.

4.2.465.3 maximum_thickness_over_dielectric_requirement

The maximum_thickness_over_dielectric_requirement specifies the role of the Length_data_element (see 4.2.511) for the Interconnect_module_usage_view. The maximum_thickness_over_dielectric_requirement need not be specified for a particular Interconnect_module_usage_view. The maximum_thickness_over_dielectric_requirement references a base dielectric and not final finish dielectrics.

4.2.465.4 maximum_thickness_over_metal_requirement

The maximum_thickness_over_metal_requirement specifies the role of the Length_data_element (see 4.2.511) for the Interconnect_module_usage_view. The maximum_thickness_over_metal_requirement need not be specified for a particular Interconnect_module_usage_view.

4.2.465.5 measurement_condition

The measurement_condition specifies the role of the Restraint_condition (see 4.2.774) for the Interconnect_module_usage_view. The measurement_condition need not be specified for a particular Interconnect_module_usage_view.

4.2.465.6 minimum_thickness_over_dielectric_requirement

The minimum_thickness_over_dielectric_requirement specifies the role of the Length_data_element (see 4.2.511) for the Interconnect_module_usage_view. The minimum_thickness_over_dielectric_requirement need not be specified for a particular Interconnect_module_usage_view. The minimum_thickness_over_dielectric_requirement references a base dielectric and not final finish dielectrics.

4.2.465.7 minimum_thickness_over_metal_requirement

The minimum_thickness_over_metal_requirement specifies the role of the Length_data_element (see 4.2.511) for the Interconnect_module_usage_view. The minimum_thickness_over_metal_requirement need not be specified for a particular Interconnect_module_usage_view.

Constraints:

WR1: At least one thickness property shall be provided.

NOTE EXPRESS specification:

*)

(*)

```

4.2.466 Interface_access_material_removal_laminate_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interface_access_material_removal_laminate_component is a type of Material_removal_laminate_component (see 4.2.535) that indicates that material is to be removed in the realization of access to the Laminate_component_interface_terminal.

EXAMPLE 1 If a passage in a silkscreen layer is necessary to gain access to a `Laminate_component_interface_terminal` and it is desire to record the reason for the passage, this Application Object provides that capability.

The data associated with an `Interface_access_material_removal_laminate_component` are the following:

— `accessed_interface`.

4.2.466.1 `accessed_interface`

The `accessed_interface` specifies the role of the `Laminate_component_interface_terminal` (see 4.2.485) for the `Interface_access_material_removal_laminate_component`.

NOTE EXPRESS specification:

```
*)
ENTITY interface_access_material_removal_laminate_component
  SUBTYPE OF (material_removal_laminate_component);
  accessed_interface : laminate_component_interface_terminal;
END_ENTITY; -- interface_access_material_removal_laminate_component

( *
```

4.2.467 `Interface_access_stratum_feature_template_component`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Interface_access_stratum_feature_template_component` is a type of `Stratum_feature_template_component` (see 4.2.862) provided to provide access to a `Laminate_component_interface_terminal` where auxiliary processes would prohibit direct access to the terminal and where it is necessary to record the explicit relationship.

NOTE A solderpaste may cover the terminal and in some cases it is necessary to denote the fact that the terminal is below the solderpaste. If it is not necessary to explicitly identify the fact that the solderpaste covers the terminal, this Application Object would not be populated. Those cases would occur where geometry queries are sufficient. The `Interface_access_stratum_feature_template_component` is not on the same `Stratum` as the terminal being accessed.

NOTE EXPRESS specification:

```
*)
ENTITY interface_access_stratum_feature_template_component
  SUBTYPE OF (stratum_feature_template_component);
  accessed_interface : laminate_component_interface_terminal;
END_ENTITY; -- interface_access_stratum_feature_template_component

( *
```

4.2.468 Interface_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interface_component is a type of Assembly_component (see 4.2.34) used to provide an identified interface in the assembly.

EXAMPLE 1 Figure 53 illustrates an Interface_component and its role in the assembly, and that there may be multiple Interface_component in sequence.

NOTE The interface provided by the Interface_component is usually included in the design to provide an interface between the component providing the primary interconnect functionality and other components or to the next level of assembly.

EXAMPLE 2 A bond wire that attaches a die terminal to a substrate terminal is an Interface_component. The logic behind this is the the bond wire is an electrical interface between the die instance and the substrate instance, and that it is separate from the die and from the substrate. If the routing is unique, the bond wire may also be a Routed_interconnect_component. In the case of a bond wire, only one terminal would be a Component_interface_-terminal. The second terminal would be an Interconnect_component_join_terminal.

The data associated with an Interface_component are the following:

— access_mechanism.

Note - the insulated bus wires are, individually, Assembly_component that is a Routed_interconnect_component and is also an Interface_component

Figure 53 – Interface_component

4.2.468.1 access_mechanism

The `access_mechanism` is an inverse relationship that specifies that the existence of the `Interface_component` is dependent on the existence of the `Component_interface_terminal` (see 4.2.125) that specifies the `Interface_component` as its `associated_component`. There shall be one or more `Component_interface_terminal` for an `Interface_component`.

NOTE EXPRESS specification:

```
*)
ENTITY interface_component
  SUPERTYPE OF (packaged_connector_component)
  SUBTYPE OF (physical_component);
  INVERSE
    access_mechanism : SET [1:?] OF
                                component_interface_terminal FOR associated_component;
END_ENTITY; -- interface_component

(*
```

4.2.469 Interface_component_allocation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Interface_component_allocation` is a type of `Managed_design_object` (see 4.2.524). An `Interface_component_allocation` is the assignment relationship between an `Interface_component` (see 4.2.468) on an assembly and the `Mating_connector_component` (see 4.2.538) to which the `Interface_component` must mechanically and electrically mate in the next assembly level.

The data associated with an `Interface_component_allocation` are the following:

- `mating_requirement`;
- `mating_solution`.

4.2.469.1 mating_requirement

The `mating_requirement` specifies the role of the `Mating_connector_component` (see 4.2.538) for the `Interface_component_allocation`.

4.2.469.2 mating_solution

The `mating_solution` specifies the role of the `Interface_component` (see 4.2.468) for the `Interface_component_allocation`.

NOTE EXPRESS specification:

```

*)
ENTITY interface_component_allocation
  SUBTYPE OF (managed_design_object);
    mating_solution      : interface_component;
    mating_requirement : mating_connector_component;
END_ENTITY; -- interface_component_allocation

( *
```

4.2.470 Interface_mounted_join

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interface_mounted_join is a type of Managed_design_object (see 4.2.524). An Interface_mounted_join is the relationship that specifies the connectivity between a terminal on a component and the terminal on a socket in the assembly that directly mates with that component terminal.

EXAMPLE 1 An example of this relation is pin 1, a Component_terminal (see 4.2.137), on U1, an integrated circuit and a component, that is connected to pin 1, on XU1, a socket and an Interface_component (see 4.2.468), when the IC is inserted into the socket in the assembly.

NOTE This Application object is not referencing the terminal on the socket that mates with the base interconnect substrate. That is referenced by a member of Assembly_joint.

The data associated with an Interface_mounted_join are the following:

- access_to_interface_mounted_component;
- connection_to_interconnect_module_component.

4.2.470.1 access_to_interface_mounted_component

The access_to_interface_mounted_component specifies the Component_terminal (see 4.2.137) of the Assembly_component (see 4.2.34) being interfaced to the assembly by the Interface_component (see 4.2.468) specified by connection_to_interconnect_module_component.

4.2.470.2 connection_to_interconnect_module_component

The connection_to_interconnect_module_component specifies the Component_interface_terminal (see 4.2.125) that mates with the Component_terminal (see 4.2.137) specified by access_to_interface_mounted_component. The Component_interface_terminal is a terminal of the Interface_component (see 4.2.468).

Constraints:

WR1: A `Physical_connectivity_definition` shall not specify a `Component_terminal` that participates in an `Interface_mounted_join` relationship as `access_to_interface_mounted_component` if that `Physical_connectivity_definition` specifies the `Component_terminal` of the associated `Interface_component` that completes connectivity to the board from the `interface_mounted_component`.

WR2: All members of `Component_terminal` specified by associated `terminals` shall be in the same design view.

NOTE It is inappropriate to specify both the terminal on an IC plugged into a socket and the socket terminal in the same nodelist. It is unnecessary to specify the interface terminal on a socket in a nodelist, as the socket terminal is referenced by a member of `Interface_mounted_join` (see 4.2.470) that is referenced by a member of `Physical_node_requirement_to_implementing_component_allocation` (see 4.2.663) that references the original nodelist.

WR3: Both components whose terminals are being joined shall be for the same version of the Product.

NOTE EXPRESS specification:

```

*)
ENTITY interface_mounted_join
  SUBTYPE OF (managed_design_object);
  --tt tc1 wd13 modified
    connection_to_interconnect_module_component : packaged_connector_component_interface_t
  --tt tc1 wd12 modified
    access_to_interface_mounted_component      : physical_component_terminal;
END_ENTITY; -- interface_mounted_join

( *
```

4.2.471 Interface_requirement_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Interface_requirement_occurrence` is a type of `Design_requirement_occurrence` (see 4.2.279) in which the assembly interface to the next higher assembly is specified.

The data associated with an `Interface_requirement_occurrence` are the following:

— `interface_to_next_higher_assembly`.

4.2.471.1 interface_to_next_higher_assembly

The `interface_to_next_higher_assembly` specifies the role of the `Next_higher_assembly_interface_requirement` (see 4.2.555) for the `Interface_requirement_occurrence`. This specifies the component in the next assembly that is the interface.

NOTE EXPRESS specification:

```
*)
ENTITY interface_requirement_occurrence
  SUBTYPE OF (design_requirement_occurrence);
  interface_to_next_higher_assembly : next_higher_assembly_interface_requirement;
END_ENTITY; -- interface_requirement_occurrence

( *
```

4.2.472 Interface_specification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interface_specification is a type of Design_specification (see 4.2.280) that describes the characteristics and constraints necessary for correct interoperation between specified units.

NOTE EXPRESS specification:

```
*)
ENTITY interface_specification
  SUBTYPE OF (design_specification);
END_ENTITY; -- interface_specification

( *
```

4.2.473 Interfaced_group_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interfaced_group_component is a type of Assembly_group_component (see 4.2.40). An Interfaced_group_component includes one or more Interface_component (see 4.2.468) that interfaces a subset of that group of components to the assembly.

EXAMPLE 1 A component and a socket are both assigned to an Interfaced_group_component. The socket interfaces the other component to the assembly. Both the component and the socket are separately referenced and placed in the assembly.

The data associated with an Interfaced_group_component are the following:

— group_interface_component.

4.2.473.1 group_interface_component

The group_interface_component specifies the Interface_component (see 4.2.468) that interfaces the Interfaced_group_component to the assembly. There shall be one or more Interface_component for an Interfaced_group_component.

NOTE EXPRESS specification:

```

*)
ENTITY interfaced_group_component
  SUBTYPE OF (assembly_group_component);
  group_interface_component : SET [1:?] OF interface_component;
END_ENTITY; -- interfaced_group_component

( *
```

4.2.474 Interfacial_connection

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Interfacial_connection is a type of Via (see 4.2.947) that has both ends visible in the printed circuit board. Interfacial_connection is defined in IEC 60050-541.

EXAMPLE 1 Figure 54 illustrates an Interfacial_connection in a cross-section view of a substrate.

Figure 54 – Interfacial_connection

NOTE EXPRESS specification:

```
*)
ENTITY interfacial_connection
  SUBTYPE OF (via);
END_ENTITY; -- interfacial_connection

( *
```

4.2.475 Internal_probe_access_area

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Internal_probe_access_area is a type of Probe_access_area (see 4.2.739) included in the design for access to internal conductors for probing purposes.

NOTE This is included explicitly because probe points are not usually included in a functional nodelist.

The data associated with an Internal_probe_access_area are the following:

— stratum_feature_implementation.

4.2.475.1 stratum_feature_implementation

The stratum_feature_implementation specifies the role of the Stratum_feature (see 4.2.851) for the Internal_probe_access_area. This Stratum_feature is included only to support the probe requirements and is not necessarily included in a functional nodelist.

Constraints:

WR1: Each member of Internal_probe_access_area shall be in the role of connected_probe for exactly one member of Inter_stratum_access.

WR2: The Stratum_feature specified by stratum_feature_implementation shall specify an external Stratum as a resident_stratum.

NOTE EXPRESS specification:

```
*)
ENTITY internal_probe_access_area
  SUBTYPE OF (probe_access_area);
  stratum_feature_implementation : stratum_feature;
END_ENTITY; -- internal_probe_access_area

( *
```

4.2.476 Internal_stratum_access

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Internal_stratum_access is a type of Managed_design_object (see 4.2.524). An Internal_stratum_access is a relationship between an Internal_probe_access_area (see 4.2.475) and a Via (see 4.2.947) that provides access to a Stratum_feature (see 4.2.851) on an internal Design_layer_stratum (see 4.2.275). This Application Object is part of a logical structure to identify the special usage of a Via in support of accessing internal conductors in the design.

The data associated with an Internal_stratum_access are the following:

- connected_probe;
- inter_stratum_feature.

4.2.476.1 connected_probe

The connected_probe specifies the Internal_probe_access_area (see 4.2.475) that provides probe access to a Stratum_feature (see 4.2.851) on an internal Design_layer_stratum (see 4.2.275) for the Internal_stratum_access.

4.2.476.2 inter_stratum_feature

The inter_stratum_feature specifies the Via (see 4.2.947) that provides electrical connectivity to the Stratum_feature (see 4.2.851) to be probed for the Internal_stratum_access. The external surface of the Via is the area the test probe mates with in a test setup.

Constraints:

UR1: The combination of the connected_probe and the inter_stratum_feature shall be unique within a population of Internal_stratum_accesses.

NOTE EXPRESS specification:

```

*)
ENTITY internal_stratum_access
  SUBTYPE OF (managed_design_object);
    connected_probe      : internal_probe_access_area;
    inter_stratum_feature : via;
  UNIQUE
    UR1 : connected_probe, inter_stratum_feature;
END_ENTITY; -- internal_stratum_access

--tt tc1 wd8 modified
( *
```

4.2.477 Intra_stratum_join_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Intra_stratum_join_relationship is a type of Join_relationship (see 4.2.479) in which all joins occur on one Design_layer_stratum (see 4.2.275).

The data associated with an Intra_stratum_join_relationship are the following:

- ordered_implementation;
- random_implementation.

4.2.477.1 ordered_implementation

The ordered_implementation is an inverse relationship that specifies the Conductor (see 4.2.176) that specifies the Intra_stratum_join_relationship as its implementation_requirement. There shall be no more than one Conductor for an Intra_stratum_join_relationship. The use of "ordered" in this context shall be interpreted as "having a distinct structure by design". It does not indicate a strictly linear sequence.

4.2.477.2 random_implementation

The random_implementation is an inverse relationship that specifies the Connected_filled_area (see 4.2.184) that specifies the Intra_stratum_join_relationship as its implementation_requirement. There shall be no more than one Connected_filled_area for an Intra_stratum_join_relationship. The use of "random" in this context shall be interpreted as "having no intrinsic structure by design".

Constraints:

WR1: All Layer_connection_points specified shall be on the same Design_layer_stratum.

WR2: At least one ordered_implementation or random_implementation shall exist for a population of Intra_stratum_join_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY intra_stratum_join_relationship
  SUBTYPE OF (join_relationship);
  points_to_be_connected : SET [2:?] OF layer_connection_point;
  INVERSE
    ordered_implementation : SET [0:1] OF conductor FOR implementation_requirement;
    random_implementation  : SET [0:1] OF connected_filled_area FOR
      implementation_requirement;
--tt tc1 wd9 added
WHERE
  WR1: (EXISTS(ordered_implementation)) XOR (EXISTS(random_implementation));
END_ENTITY; -- intra_stratum_join_relationship

( *

```

4.2.478 Item_restricted_requirement_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Item_restricted_requirement_occurrence is a type of Ee_requirement_occurrence (see 4.2.330). The Item_restricted_requirement_occurrence provides the ability for a design organization to track the dependency of a requirement on a specific design object.

EXAMPLE 1 Thermal requirements may, for example, be dependent on the processor module or the drive motor.

The data associated with an Item_restricted_requirement_occurrence are the following:

— basis.

4.2.478.1 basis

The basis specifies the role of one of an Assembly_component (see 4.2.34), a Component_external_reference (see 4.2.117), a Component_feature (see 4.2.118); or a Component_feature_external_reference (see 4.2.119); or one of an Ee_requirement_occurrence (see 4.2.330), a Stratum (see 4.2.845); or one of an Inter_stratum_feature (see 4.2.432), a Laminate_component (see 4.2.483), a Stratum_feature (see 4.2.851), or a Stratum_surface (see 4.2.868) for the Item_restricted_requirement_occurrence. The basis is the reference design object for the requirement.

NOTE EXPRESS specification:

```

*)
ENTITY item_restricted_requirement_occurrence
  SUBTYPE OF (ee_requirement_occurrence);
    basis : restriction_basis_item;
END_ENTITY; -- item_restricted_requirement_occurrence

( *

```

4.2.479 Join_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Join_relationship is a type of Managed_design_object (see 4.2.524). A Join_relationship is either an Inter_stratum_join_relationship (see 4.2.437) or an Intra_stratum_join_relationship (see 4.2.477). A Join_relationship identifies a strict subset of the Layer_connection_point (see 4.2.499) identified by Physical_network (see 4.2.660) topology. This subset is then inherited by both types of Join_relationship to ensure topological integrity.

The data associated with a Join_relationship are the following:

- associated_layout;
- network_topology;
- points_to_be_connected.

4.2.479.1 associated_layout

The associated_layout specifies the Interconnect_module (see 4.2.440) that is the design in which the Join_relationship is contained.

4.2.479.2 network_topology

The network_topology is an inverse relationship that specifies that the existence of the Join_relationship is dependent on the existence of the Physical_network (see 4.2.660) that specifies the Join_relationship as its interconnect_module_network_topology.

4.2.479.3 points_to_be_connected

The points_to_be_connected specifies the role of the Layer_connection_point (see 4.2.499) for the Join_relationship. There shall be at least two Layer_connection_point in a Join_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY join_relationship
  ABSTRACT SUPERTYPE OF (ONEOF (inter_stratum_join_relationship,
    intra_stratum_join_relationship,
    unrouted_join_relationship))
  SUBTYPE OF (managed_design_object);

END_ENTITY; -- join_relationship
( *

```

4.2.480 Join_two_physical_connectivity_definition_supporting_inter_stratum_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Join_two_physical_connectivity_definition_supporting_inter_stratum_feature is a type of Physical_network_supporting_inter_stratum_feature (see 4.2.661).

The data associated with a Join_two_physical_connectivity_definition_supporting_inter_stratum_feature are the following:

— joined_definitions.

4.2.480.1 joined_definitions

The joined_definitions specifies the role of a Physical_connectivity_definition (see 4.2.652) for the Join_two_physical_connectivity_definition_supporting_inter_stratum_feature. There shall be exactly two Physical_connectivity_definition for a Join_two_physical_connectivity_definition_supporting_inter_stratum_feature.

NOTE EXPRESS specification:

```

*)
ENTITY join_two_physical_connectivity_definition_supporting_inter_stratum_feature
  SUBTYPE OF (physical_network_supporting_inter_stratum_feature);
  joined_definitions : SET [2:2] OF physical_connectivity_definition;
END_ENTITY; -- join_two_physical_connectivity_definition_
  -- supporting_inter_stratum_feature

--tt tc1wd8 modified
--tt tc1wd2 correct interpretation error
( *

```

4.2.481 Join_two_physical_connectivity_definition_supporting_printed_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Join_two_physical_connectivity_definition_supporting_printed_component is a type of Printed_component (see 4.2.721). The Join_two_physical_connectivity_definition_supporting_printed_component is included specifically for cases in which analog and digital grounds are kept topologically and physically separate completely through the design process to minimize noise but need to be physically connected for reference voltage purposes.

NOTE This connections is usually required to be at one and only one location.

The data associated with a Join_two_physical_connectivity_definition_supporting_printed_component are the following:

— joined_definitions.

4.2.481.1 joined_definitions

The joined_definitions specify the roles of exactly two Physical_connectivity_definition (see 4.2.652) for the Join_two_physical_connectivity_definition_supporting_printed_component.

NOTE EXPRESS specification:

```
* )
ENTITY join_two_physical_connectivity_definition_supporting_printed_component
  SUBTYPE OF (conductive_interconnect_element_with_pre_defined_transitions);
  joined_definitions : SET [2:2] OF physical_connectivity_definition;
END_ENTITY; -- join_two_physical_connectivity_definition_supporting_printed_component

( *
```

4.2.482 Junction_vertex_allocation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Junction_vertex_allocation` is a type of `Managed_design_object` (see 4.2.524). A `Junction_vertex_allocation` is the relationship that specifies one or more `Layer_connection_point` (see 4.2.499) to which a `Topological_junction` (see 4.2.928) is mapped during the layout routing process. A `Junction_vertex_allocation` is the result of an assignment process by a designer or a layout routing process that defines the location of `Inter_stratum_join_relationship` (see 4.2.437) or `Explicitly_located_layer_connection_point` (see 4.2.360). A `Junction_vertex_allocation` maps a node of a `Physical_network` which may be only partially ordered into a network description which is highly ordered using a tree. A `Junction_vertex_allocation` associates two `Ee_product_definitions`, one an `Interconnect_module` and the other a `Physical_unit_network_definition`. The `Physical_unit_network_definition` may be populated for the express purpose of representing the tree structure of the `Physical_network` in the `Interconnect_module`, and therefore the version of the design would be the same for both.

The data associated with a `Junction_vertex_allocation` are the following:

- `implementation_point`;
- `required_vertex`.

4.2.482.1 implementation_point

The `implementation_point` specifies either the `Inter_stratum_join_relationship` (see 4.2.437) or `Explicitly_located_layer_connection_point` (see 4.2.360) that, individually, maps the requirement that a junction participates in a connectivity onto points on conducting Stratum (see 4.2.845) for the `Junction_vertex_allocation`.

NOTE 1 This construct allows the `Junction_vertex_allocation` to consider an `Inter_stratum_join_relationship` to be a vertex.

NOTE 2 The `Junction_vertex_allocation` allows for the specification of the location of the connections between physical traces and connected areas. It is common practice for the point where a trace, via, pad, etc., connects with other features to be specified by the designer interactively during layout. This location may be constrained for fabrication, layout, or signal integrity purposes. The `Junction_vertex_allocation` specifies these relationships.

4.2.482.2 required_vertex

The `required_vertex` specifies the `Topological_junction` (see 4.2.928), as a vertex of a `Physical_connectivity_definition` (see 4.2.652), that is to be mapped to an `implementation_point` by the `Junction_vertex_allocation`.

Constraints:

UR1: The `required_vertex` shall be unique within a population of `Junction_vertex_allocations`.

WR1: The `implementation_point` and `required_vertex` shall be for the same product.

NOTE EXPRESS specification:

```

*)
ENTITY junction_vertex_allocation
  SUBTYPE OF (managed_design_object);
    implementation_point : trace_junction_or_via;
    required_vertex      : topological_junction;
  UNIQUE
    UR1 : required_vertex;
END_ENTITY; -- junction_vertex_allocation

( *
```

4.2.483 Laminate_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Laminate_component is a type of Assembly_component (see 4.2.34). A Laminate_component may be one of a Conductive_interconnect_element (see 4.2.171), an Inter_stratum_feature (see 4.2.432), a Laminate_text_component (see 4.2.488), a Laminate_text_string_component (see 4.2.489), a Material_removal_laminate_component (see 4.2.535), a Probe_access_area (see 4.2.739), a Special_symbol_laminate_component (see 4.2.834) or a Stratum_feature_template_component (see 4.2.862), or additionally may be a Fiducial (see 4.2.373), or additionally may be a Physical_laminate_component (see 4.2.659). All types of Laminate_component are realized as part of the manufacturing process that produces the interconnect.

The data associated with a Laminate_component are the following:

- cad_layer;
- usage_definition.

NOTE Complex multi-layered components should be described by using the Assembly_group_component and Sub_assembly_component_relationship. These relationships will be created from occurrences of Stratum_feature_template_component or other Printed_component occurrences.

4.2.483.1 cad_layer

The cad_layer specifies the role of the External_definition (see 4.2.361) for the Laminate_component. The cad_layer need not be specified for a Laminate_component.

NOTE The cad_layer attribute is provided to support design archival within an enterprise.

4.2.483.2 usage_definition

The usage_definition specifies the role of the Part_template (see 4.2.620) for the Laminate_component.

NOTE EXPRESS specification:

```

*)
ENTITY laminate_component
  SUPERTYPE OF ((ONEOF (conductive_interconnect_element,
    material_removal_laminate_component,

4.2.487 Laminate_group_component_make_from_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Laminate_group_laminate_group_component_make_from_relationship is a type of Component_make_from_relationship (see 4.2.126). A Laminate_group_laminate_group_component_make_from_relationship is the association between one Assembly_group_component (see 4.2.40) and another Assembly_group_component, where one Assembly_group_component from full or partial reuse of the other. A Laminate_group_laminate_group_component_make_from_relationship also supports mapping of a Stratum in the reference design to a Stratum in this design.

NOTE The main use of this concept is use of multi-layer breakout definitions for complex integrated circuits where there is a mapping from a Stratum in the reference_footprint.reference_layout to a stratum in this layout.

The data associated with a Laminate_group_component_make_from_relationship are the following:

- resultant_component;
- reusable_component.

4.2.487.1 resultant_component

The resultant_component specifies the Assembly_group_component (see 4.2.40) that results from the reuse in the Laminate_group_laminate_group_component_make_from_relationship.

4.2.487.2 reusable_component

The reusable_component specifies the Assembly_group_component (see 4.2.40) that is reused to create the resultant_component in the Laminate_group_laminate_group_component_make_from_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY laminate_group_component_make_from_relationship
  SUBTYPE OF (component_make_from_relationship);
    SELF\component_make_from_relationship.reusable_component : assembly_group_component;

  WR2: SIZEOF(QUERY( sar &#60;* SELF\component_make_from_relationship.resultant_component
    NOT('AP210_ARM.LAMINATE_COMPONENT' IN TYPEOF(sar.related_component))
    )) = 0;
END_ENTITY; -- laminate_group_component_make_from_relationship

( *

```

4.2.488 Laminate_text_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Laminate_text_component` is a type of `Laminate_component` (see 4.2.483) that is designed to be interpreted as a single character portion of a text message by a human or by an artificial vision system. A `Laminate_text_component` may be used to help compose a `Laminate_text_string_component` (see 4.2.489) to form a complete message. The composition will be defined by an instance of `Assembly_group_component` (see 4.2.40) that relates all necessary members of `Laminate_component` to compose the message embodied in the instance of `Laminate_text_string_component`. Each `Stratum_feature` referenced by the `stratum_feature_implementation` shall be on the same `Stratum` (see 4.2.845).

EXAMPLE 1 Figure 55 illustrates possible arrangements and orientation of the `Laminate_text_string_component` in the material of the `Stratum` (see 4.2.845). The figure includes multiple `Laminate_text_component` members presenting characters.

The data associated with a `Laminate_text_component` are the following:

- `of_character`;
- `stratum_feature_implementation`;
- `usage_definition`.

4.2.488.1 of_character

The `of_character` specifies the message content, a character, for the `Laminate_text_component`.

Figure 55 – Laminate_text_component

4.2.488.2 stratum_feature_implementation

The stratum_feature_implementation specifies the role of the Stratum_feature (see 4.2.851) for the Laminate_text_component. There may be more than one Stratum_feature for the Laminate_text_component.

NOTE Multiple Stratum_feature may exist in the case that the shape of the character is disjoint, but they are all on the same Stratum.

4.2.488.3 usage_definition

The usage_definition specifies the Part_text_template (see 4.2.632) that contains the font definition and associated parameters to be used for the Laminate_text_component.

NOTE EXPRESS specification:

```

*)
ENTITY laminate_text_component
  SUBTYPE OF (laminate_component);
    of_character                      : STRING (1) FIXED;
    SELF\assembly_component.usage_definition : part_text_template;
    stratum_feature_implementation      : SET [1:?] OF stratum_feature;
END_ENTITY; -- laminate_text_component

( *
```

4.2.489 Laminate_text_string_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Laminate_text_string_component is a type of Laminate_component (see 4.2.483) and is a type of Array_placement_group (see 4.2.29). A Laminate_text_string_component conveys a complete one line message to the viewer. A Laminate_text_string_component is composed by associating one or more individual instances of Laminate_text_component (see 4.2.488) to the Laminate_text_string_component using one instance of Sub_assembly_relationship (see 4.2.877). The Laminate_text_string_component itself does not directly refer to a font definition. The usage_definition inherited from the supertype Assembly_component (see 4.2.34) is unnecessary since this Application Object is defined by the composition of Laminate_text_component contributing to it. The position of the Laminate_text_string_component shall be interpreted as a constraint on the position of the individual components contributing to it. The position of the Laminate_text_string_component shall be interpreted as the insertion point for the message. The Laminate_text_string_component may have an orientation with respect to the design coordinate system, in which case the components composing the Laminate_text_string_component shall have a corresponding orientation. The Axis_placement (see 4.2.56) or Cartesian_transformation_operator_2d (see 4.2.88) which locates the Laminate_text_string_component shall be interpreted as a local coordinate system in order that any orientation shall be applied consistently to all components. An implementation shall ensure that adjacent characters that use different fonts still meet the requirement that Stratum_feature (see 4.2.851) instances are disjoint.

NOTE If multi-line messages are required, multiple instances of `Laminate_text_string_component` will be needed, one for each line of the message.

The data associated with a `Laminate_text_string_component` are the following:

- `message`;
- `of_horizontal_justification`;
- `of_vertical_justification`.

4.2.489.1 message

The message specifies the message content, a string, for the `Laminate_text_string_component`.

4.2.489.2 of_horizontal_justification

The `horizontal_justification` specifies either "left", "right", or "centre" for the beginning point of the message with respect to the position of the `Axis_placement` (see 4.2.56) or `Cartesian_transformation_operator_2d` (see 4.2.88) that is the insertion point for the text. The "left" indicates that the left edge of the bounding box of the first character of the message is aligned with the 'Y' axis of the `Axis_placement`. The "right" indicates that the right edge of the bounding box of the last character of the message is aligned with the 'Y' axis of the `Axis_placement`. The "centre" indicates that the left edge of the bounding box of the first character of the message and the right edge of the bounding box of the last character of the message are equally displaced on either side of the 'Y' axis of the `Axis_placement`.

4.2.489.3 of_vertical_justification

The `vertical_justification` specifies either "top", "bottom", or "centre" for the beginning point of the message with respect to the position of the `Axis_placement` (see 4.2.56) or `Cartesian_transformation_operator_2d` (see 4.2.88) that is the insertion point for the text. The "top" indicates that the top edge of the bounding box of the first character of the message is aligned with the 'X' axis of the `Axis_placement`. The "bottom" indicates that the bottom edge of the bounding box of the last character of the message is aligned with the 'X' axis of the `Axis_placement`. The "centre" indicates that the top edge of the bounding box of the first character of the message and the bottom edge of the bounding box of the last character of the message are equally displaced on either side of the 'X' axis of the `Axis_placement`.

NOTE EXPRESS specification:

```

*)
ENTITY laminate_text_string_component
  SUBTYPE OF (array_placement_group, laminate_component);

```

4.2.490 Land

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Land is a type of Stratum_feature_template_component (see 4.2.862). A Land may be a Component_termination_passage_and_contact_size_dependent_land (see 4.2.144), a Component_termination_passage_dependent_land (see 4.2.146), a Contact_size_dependent_land (see 4.2.194), a Via_dependent_land (see 4.2.950), or a Via_and_contact_size_dependent_land (see 4.2.948). A Land helps compose a Conductor or a Conductive_filled_area.

NOTE In the context of this standard, a Land may be external or internal to the interconnect.

EXAMPLE 1 Figure 56 illustrates the relationship of a Land to the other elements of a construction known in the domain as a padstack.

The data associated with a Land are the following:

- access_mechanism;
- alternate_land_definition;
- usage_definition.

4.2.490.1 access_mechanism

The access_mechanism is an inverse relationship that specifies that the existence of the Land is dependent on the existence of the Land_join_terminal (see 4.2.492) that specifies the Land as its associated_component. There shall be one or more Land_join_terminal for a Land. This relationship is for internal access only.

4.2.490.2 alternate_land_definition

The alternate_land_definition specifies one role of the Land_physical_template (see 4.2.493) for the Land. The alternate_land_definition need not be specified for a particular Land.

**Figure 56 – Land**

4.2.490.3 usage_definition

The usage_definition specifies the primary role of the Land_physical_template (see 4.2.493) for the Land. The usage_definition need not be specified for a particular Land.

NOTE The Land_join_terminal allows an application to discover the usage_definition for the Land through the Land_join_terminal.definition.associated_definition path.

Constraints:

WR1: A member of land shall be directly connected to a member of conductive_interconnect_element or to a member of conductive_area.

WR2: When an alternate_land_definition is present it overrides the usage_definition for the Land.

NOTE EXPRESS specification:

```

*)
ENTITY land
  SUPERTYPE OF (ONEOF (via_dependent_land,
    component_termination_passage_dependent_land,
    contact_size_dependent_land,
    component_termination_passage_and_contact_size_dependent_land,
    via_and_contact_size_dependent_land))
  SUBTYPE OF (stratum_feature_template_component);
  alternate_land_definition          : OPTIONAL land_physical_template;
  SELF\assembly_component.usage_definition : OPTIONAL land_physical_template;
  INVERSE
    access_mechanism                : SET [1:?] OF

END_ENTITY; -- land

( *
```

4.2.491 Land_interface_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Land_interface_terminal is a type of Component_feature (see 4.2.118) included to identify the interface available to be fastened to in the next level of assembly.

The data associated with a Land_interface_terminal are the following:

- associated_component;
- definition.

4.2.491.1 associated_component

The associated_component specifies the role of the Land (see 4.2.490) for the Land_interface_terminal. Only the following types of Land shall be referenced: Contact_size_dependent_land; Component_termination_passage_and_contact_size_dependent_land; Via_and_contact_size_dependent_land.

4.2.491.2 definition

The definition specifies the role of the Land_template_interface_terminal (see 4.2.494) for the Land_interface_terminal.

NOTE Use of this capability occurs when a member of Component_feature_to_physical_usage_view_assignment references a member of Land_interface_terminal to define a traceability relationship to an Interconnect_module_terminal.

NOTE EXPRESS specification:

```

*)
ENTITY land_interface_terminal
  SUBTYPE OF (laminar_component_interface_terminal);
    SELF\component_feature.definition      : land_template_interface_terminal;
    SELF\component_feature.associated_component : land;

                'AP210_ARM.VIA_AND_CONTACT_SIZE_DEPENDENT_LAND' ] *
              TYPEOF(SELF\component_feature.associated_component))
    = 1;
END_ENTITY; -- land_interface_terminal

( *
```

4.2.492 Land_join_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Land_join_terminal is a type of Component_terminal (see 4.2.137) included in the design to mate directly with a terminal of another fabricated feature by use of a Fabrication_joint (see 4.2.368) internally in a layout.

The data associated with a Land_join_terminal are the following:

- associated_component;
- definition.

4.2.492.1 associated_component

The associated_component specifies the role of the Land (see 4.2.490) for the Land_join_terminal.

4.2.492.2 definition

The definition specifies the role of the Land_template_join_terminal (see 4.2.495) for the Land_join_terminal.

Constraints:

WR1: A Land_join_terminal shall participate in a relationship with a Fabrication_joint as a fabrication_features.

NOTE EXPRESS specification:

```
*)
ENTITY land_join_terminal
  SUBTYPE OF (laminate_component_join_terminal);
    SELF\component_feature.definition      : land_template_join_terminal;
    SELF\component_feature.associated_component : land;
END_ENTITY; -- land_join_terminal
```

(*

4.2.493 Land_physical_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Land_physical_template is a type of Stratum_feature_template (see 4.2.861). A Land_physical_template may be a Default_land_physical_template (see 4.2.250). If the material the Land_physical_template is composed of is conductive, the Land_physical_template provides the functionality of a short among its terminals.

EXAMPLE 1 Figure 57 illustrates explicit geometry that represents simplified Land_physical_template.

The data associated with a Land_physical_template are the following:

- access_mechanisms;
- pre_defined_classification_code.

typical land shapes as defined in land_physical_template

Figure 57 – Custom designs for Land_physical_template

4.2.493.1 access_mechanisms

The access_mechanisms is an inverse relationship that specifies that the existence of the Land_physical_template is dependent on the existence of the Land_template_join_terminal (see 4.2.495) that specifies the Land_physical_template as its associated_definition. There shall be one or more Land_template_join_terminal for a Land_physical_template. Fabrication and assembly tolerances define the required shapes and variances for the terminal shapes.

4.2.493.2 pre_defined_classification_code

The pre_defined_classification_code specifies the role of the External_definition (see 4.2.361) for the Land_physical_template. The pre_defined_classification_code need not be specified for a specific Land_physical_template.

Variable Octagon

Variable Elongated Octagon

Physical characteristics are inherited from Part_template.
Reference document is : IEC 61182-1

Figure 58 – Complex land template shapes

NOTE 1 IEC 61182-1 provides a set of Land (see 4.2.490) identifiers. See figure 58.

NOTE 2 The Land_template, Usage_concept_usage_relationship (see 4.2.942), and the Geometric Dimensioning and Tolerancing capabilities of this part of ISO 10303 may be used to unambiguously exchange the shape of both pre-defined Land patterns that include only geometry (as from IEC 61182-1) and enterprise defined patterns. When this facility is used to create more than one equivalent Land definition, it may not be possible to maintain knowledge of the connection functionality of the Land definition. This is because Land is an atomic concept in this part of ISO 10303.

NOTE 3 The Assembly_group_component (see 4.2.40), Interconnect_module (see 4.2.440), and the Geometric Dimensioning and Tolerancing capabilities of this part of ISO 10303 may be used to unambiguously exchange both the shape and connection knowledge of Land patterns that include pre-defined geometry (as from IEC 61182-1) and enterprise defined geometry that have explicit definitions of the fabrication and assembly constraints.

NOTE 4 The Land_physical_template inherit material property data from Part_template.

Constraints:

UR1: The pre_defined_classification_code shall be unique within a population of Land_physical_templates.

NOTE EXPRESS specification:

```

*)
ENTITY land_physical_template
  SUPERTYPE OF (default_land_physical_template)
  SUBTYPE OF (stratum_feature_template);
  pre_defined_classification_code : OPTIONAL external_definition;
  INVERSE
    access_mechanisms : SET [1:?] OF land_template_terminal FOR
      associated_definition;
  UNIQUE
    UR1 : pre_defined_classification_code;
WHERE
  WR1: SIZEOF(QUERY(ltjt &#60;* access_mechanisms |
    NOT('AP210_ARM.LAND_TEMPLATE_JOIN_TERMINAL' IN TYPEOF(ltjt))
  )) = 0;

```

4.2.494 Land_template_interface_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Land_template_interface_terminal` is a type of `Land_template_terminal` (see 4.2.496) that has an external access functionality. A `Land_template_interface_terminal` redefines the `associated_definition` attribute inherited from `Land_template_terminal` to only reference a `Default_attachment_size_based_land_physical_template` (see 4.2.247).

EXAMPLE 1 Figure 59 is a plan view that illustrates the geometry that represents the interface terminal for a `Land_physical_template` (see 4.2.493).

Note : The usage view associated with this data is the `Land_template`

Figure 59 – `Land_template_interface_terminal`

NOTE External refers to something that is outside of the product that an occurrence is helping to compose.

NOTE EXPRESS specification:

```

*)
ENTITY land_template_interface_terminal
  SUBTYPE OF (land_template_terminal);
  SELF\land_template_terminal.associated_definition :
    default_attachment_size_based_land_physical_template;
END_ENTITY; -- land_template_interface_terminal

( *

```

4.2.495 Land_template_join_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Land_template_join_terminal is a type of Land_template_terminal (see 4.2.496) that has an internal access functionality.

EXAMPLE 1 Figure 60 is a plan view that illustrates the geometry that represents the join terminal for a Land_physical_template (see 4.2.493). In the plan view, the join terminal is on the periphery.

NOTE Internal refers to something that is intrinsic to the product of which an occurrence is part.

NOTE EXPRESS specification:

```

*)
ENTITY land_template_join_terminal
  SUBTYPE OF (land_template_terminal);
END_ENTITY; -- land_template_join_terminal

( *

```

4.2.496 Land_template_terminal

A Land_template_terminal is a type of Shape_element (see 4.2.810). A Land_template_terminal is either a Land_template_interface_terminal (see 4.2.494) or a Land_template_join_terminal (see 4.2.495). The connection_zone_category shall be supplied if the connection_zone is supplied. Each member of connection_zone_category shall correspond to exactly one member of terminal_connection_zone.

NOTE The binding of a member of connection_zone_category to the member of terminal_connection_zone is formally defined in the mapping table in clause 5.1

Figure 60 – Land_template_join_terminal

The data associated with a Land_template_terminal are the following:

- associated_definition;
- connection_zone_category;
- name;
- terminal_connection_zone.

4.2.496.1 associated_definition

The associated_definition specifies the role of the Land_physical_template (see 4.2.493) for the Land_template_terminal.

4.2.496.2 connection_zone_category

The connection_zone_category specifies either an edge_curve, an edge_point, a surface_area, or a surface_point as a category of the Connection_zone (see 4.2.185) for the Land_template_terminal. The connection_zone_category is optional and need not be supplied. There may be zero or more connection_zone_category. The interpretation of this attribute shall be to the description of the relationship between the terminal and each individual connection zone.

4.2.496.3 name

The name identifies the Land_template_terminal.

4.2.496.4 terminal_connection_zone

The terminal_connection_zone specifies the role of the Connection_zone (see 4.2.185) for the Land_template_terminal. There may be one or more Connection_zone for the Land_template_terminal. The terminal_connection_zone is optional and need not be supplied if the source system does not contain the data. If the source system contains the data, then the terminal_connection_zone shall be supplied.

Constraints:

UR1: The combination of the associated_definition and the name shall be unique within a population of Land_template_terminals.

WR1: The points comprising the terminal_connection_zone must reside in the shape of the electrical device being accessed.

WR2: The points comprising the terminal_connection_zone shall be defined in the coordinate system of the device being accessed.

WR3: The connection_zone_category shall be provided if the terminal_connection_zone is provided.

WR4: The size of connection_zone_category shall be equal to the sizeof terminal_connection_zone if the terminal_connection_zone is provided.

WR5: Each member of connection_zone_category shall be for exactly one member of terminal_connection_zone.

NOTE EXPRESS specification:

```

*)

```

4.2.498 Layer

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Layer is a type of `Managed_design_object` (see 4.2.524). A Layer is an extent of contiguous `Stratum` (see 4.2.845) in a printed circuit board. The `Stratum_feature` (see 4.2.851) of all `Stratum` of a Layer are as alike in shape as process tolerances will allow; the design intent is that the shapes of the `Stratum_features` are to be identical. Standard usage is for exactly one of a `Design_layer_stratum` (see 4.2.275) or `Documentation_layer_stratum` (see 4.2.306) to be included in the `Inter_stratum_extent` (see 4.2.431) referenced by extent.

The data associated with a Layer are the following:

- extent;
- layer_usage;
- name.

4.2.498.1 extent

The extent specifies the role of the `Inter_stratum_extent` (see 4.2.431) for the Layer.

4.2.498.2 layer_usage

The `layer_usage` specifies the `External_definition` (see 4.2.361) that characterizes the purpose for incorporating the Layer into a `Interconnect_module` (see 4.2.440) design. The `layer_usage` need not be specified for a particular Layer.

4.2.498.3 name

The name identifies the Layer within the product.

Constraints:

UR1: The name shall be unique within a population of Layers for a product.

WR1: Each member of `Stratum` specified by Layer shall be represented by the same geometric representation.

WR2: Each member of Layer shall be related to no more than one `Design_layer_stratum` or no more than one `Documentation_layer_stratum`.

NOTE EXPRESS specification:

```

*)
ENTITY layer
  SUBTYPE OF (managed_design_object);
  extent      : inter_stratum_extent;
  layer_usage : OPTIONAL external_definition;
  name        : ee_name;

4.2.499 Layer_connection_point

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Layer_connection_point is a type of Managed_design_object (see 4.2.524). A Layer_connection_point is either a Dependently_located_layer_connection_point (see 4.2.259) or an Explicitly_located_layer_connection_point (see 4.2.360) that resides on the surface of a Design_layer_stratum (see 4.2.275) in the Interconnect_module (see 4.2.440) and is defined in the coordinate system of the Interconnect_module. The Layer_connection_point Application Object is an intersection concept between the topology requirements, placement requirements defined in a geometric coordinate system and the Stratum material definition.

NOTE A Layer_connection_point may be placed in an area where the conductive material is removed since there is no information contained in this Application Object regarding vertical material processes. It is the abstraction in this standard to separate lateral material description from the vertical material modification processes.

The data associated with a Layer_connection_point are the following:

- join_path;
- name;
- resident_design_layer_stratum.

4.2.499.1 join_path

The join_path is an inverse relationship that specifies that the existence of the Layer_connection_point is dependent on the existence of the Join_relationship (see 4.2.479) that specifies the Layer_connection_point as its points_to_be_connected. There shall be one or more Join_relationship for a Layer_connection_point.

4.2.499.2 name

The name identifies a Layer_connection_point.

4.2.499.3 resident_design_layer_stratum

The resident_design_layer_stratum specifies the Design_layer_stratum (see 4.2.275) upon which the Layer_connection_point is located.

Constraints:

UR1: The name, in combination with the resident_design_layer_stratum, shall be unique within a population of Layer_connection_point.

WR1: For each member of Cartesian_point associated with a Design_layer_stratum, there shall be no more than one Layer_connection_point associated with that Cartesian_point.

WR2: Each member of Layer_connection_point shall be specified by no more than one member of Physical_network.

NOTE EXPRESS specification:

```

*)
ENTITY layer_connection_point
  ABSTRACT SUPERTYPE OF (ONEOF (
    explicitly_located_layer_connection_point,
    dependently_located_layer_connection_point))

END_ENTITY; -- layer_connection_point
(

```

4.2.500 Layer_connection_point_link

A Layer_connection_point_link is a type of Managed_design_object (see 4.2.524). A Layer_connection_point_link is a directed link between two Layer_connection_point (see 4.2.499) in order to support the sequence of Layer_connection_point required in Unrouted_conductive_interconnect_element (see 4.2.937).

The data associated with a `Layer_connection_point_link` are the following:

- `associated_stratum`;
- `precedent_point`;
- `subsequent_point`.

4.2.500.1 associated_stratum

An `associated_stratum` specifies the role of the `Stratum` (see 4.2.845) for a `Layer_connection_point_link`.

4.2.500.2 precedent_point

A `precedent_point` specifies one role of the `Layer_connection_point` (see 4.2.499) for a `Layer_connection_point_link`.

4.2.500.3 subsequent_point

A `subsequent_point` specifies one role of the `Layer_connection_point` (see 4.2.499) for a `Layer_connection_point_link`.

Constraints:

- WR1:** The `precedent_point` shall not be the `subsequent_point`.
- WR2:** The `precedent_point` shall be on the `associated_stratum`.
- WR3:** The `subsequent_point` shall be on the `associated_stratum`.

NOTE EXPRESS specification:

```

*)
ENTITY layer_connection_point_link
  SUBTYPE OF (managed_design_object);
    associated_stratum : stratum;
    precedent_point    : layer_connection_point;
    subsequent_point   : layer_connection_point;

  WR2 : associated_stratum = precedent_point.resident_design_layer_stratum;
  WR3 : associated_stratum = subsequent_point.resident_design_layer_stratum;
END_ENTITY; -- layer_connection_point_link

( *

```

4.2.501 Layer_qualified_layout_spacing_requirement_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Layer_qualified_layout_spacing_requirement_occurrence is a type of Layout_spacing_requirement_occurrence (see 4.2.509) that describes the physical spacing between one of an interconnect_module_cutout, an interconnect_module_fill_area, an interconnect_module_inter_stratum_feature, an interconnect_module_stratum_feature, or an interconnect_module_via, and another of these categories of design objects. This Application object qualifies the spacing requirement to apply within a given context as defined by a set of Stratum (see 4.2.845).

The category names correspond to the category of equivalent application object names as described in Layout_spacing_requirement_occurrence. This requirement shall be interpreted as applying to the categories of those objects.

NOTE A pair of categories is used for this requirement occurrence.

EXAMPLE 1 In domain terms, when a Via to Via spacing is to be greater than 5 mm, the encoding will be that the spacing between the reference_design_object_category whose value is interconnect_module_via and the dependent_design_object_category whose value is interconnect_module_via shall be greater than 5 mm.

EXAMPLE 2 In domain terms, when the distance from a cutout to a trace must be greater than 5 mm, the encoding will be that the spacing between the reference_design_object_category whose value is interconnect_module_cutout and the dependent_design_object_category whose value is interconnect_module_stratum_feature shall be greater than 5 mm.

The data associated with a Layer_qualified_layout_spacing_requirement_occurrence are the following:

— layer_context.

4.2.501.1 layer_context

The layer_context specifies an Inter_stratum_extent (see 4.2.431), for the Layer_qualified_layout_spacing_requirement_occurrence. The layer_context establishes a context within which the spacing requirement is to be met. There may be more than one Inter_stratum_extent for a Layer_qualified_layout_spacing_requirement_occurrence. The Inter_stratum_extent may overlap. All Inter_stratum_extent specified shall be in the same design.

NOTE EXPRESS specification:

```
*)
ENTITY layer_qualified_layout_spacing_requirement_occurrence
  SUBTYPE OF (layout_spacing_requirement_occurrence);
    layer_context : SET [1:?] OF inter_stratum_extent;
END_ENTITY; -- layer_qualified_layout_spacing_requirement_occurrence

( *
```

4.2.502 Layout_land_width_tolerance_requirement_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Layout_land_width_tolerance_requirement_occurrence is a type of Inspection_requirement_occurrence (see 4.2.430) that characterizes the land width range that is required to be produced for a particular terminal pitch class of mating components.

The data associated with a Layout_land_width_tolerance_requirement_occurrence are the following:

- mating_feature_pitch_class;
- maximum_negative_deviation.

4.2.502.1 mating_feature_pitch_class

The mating_feature_pitch_class specifies the role of the Pitch_class (see 4.2.673) for the Layout_land_width_tolerance_requirement_occurrence.

4.2.502.2 maximum_negative_deviation

The maximum_negative_deviation specifies the largest negative Length_data_element (see 4.2.511) allowed width deviation for the Layout_land_width_tolerance_requirement_occurrence. The deviation is measured at the surface of the Land that mates with the external device.

NOTE The measurement location deviates from normal fabrication practice of measuring at the base of the Land in order to guarantee successful assembly process.

NOTE EXPRESS specification:

```

*)
ENTITY layout_land_width_tolerance_requirement_occurrence
  SUBTYPE OF (inspection_requirement_occurrence);
    mating_feature_pitch_class      : pitch_class;
    maximum_negative_deviation      : length_data_element;
END_ENTITY; -- layout_land_width_tolerance_requirement_occurrence

( *

```

4.2.503 Layout_line_width_tolerance_requirement_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Layout_line_width_tolerance_requirement_occurrence is a type of Inspection_requirement_occurrence (see 4.2.430) that characterizes the line width range that is expected by the design organization to be manufactured for a particular Stratum_technology.

The data associated with a Layout_line_width_tolerance_requirement_occurrence are the following:

- characterized_stratum_technology;
- maximum_negative_deviation;
- maximum_positive_deviation;
- tolerance_line_width_class.

4.2.503.1 characterized_stratum_technology

The characterized_stratum_technology specifies the role of the Stratum_technology (see 4.2.871) for the Layout_line_width_tolerance_requirement_occurrence.

4.2.503.2 maximum_negative_deviation

The maximum_negative_deviation specifies the largest negative Length_data_element (see 4.2.511) for the Layout_line_width_tolerance_requirement_occurrence.

4.2.503.3 maximum_positive_deviation

The maximum_positive_deviation specifies the largest positive Length_data_element (see 4.2.511) for the Layout_line_width_tolerance_requirement_occurrence.

4.2.503.4 tolerance_line_width_class

The tolerance_line_width_class specifies the role of the Line_width_class (see 4.2.515) for the Layout_line_width_tolerance_requirement_occurrence.

NOTE EXPRESS specification:

```

*)
ENTITY layout_line_width_tolerance_requirement_occurrence
  SUBTYPE OF (inspection_requirement_occurrence);
    characterized_stratum_technology : stratum_technology;
    tolerance_line_width_class       : line_width_class;
    maximum_negative_deviation       : length_data_element;
    maximum_positive_deviation       : length_data_element;
END_ENTITY; -- layout_line_width_tolerance_requirement_occurrence

( *
```

4.2.504 Layout_macro_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Layout_macro_component is a type of Printed_component (see 4.2.721). A Layout_macro_component uses a Layout_macro_floor_plan_template (see 4.2.507) as the usage definition for the shape of the unexpanded macro in the design. The design definition is the contents of the macro to be expanded. A Layout_macro_component may be exchanged as part of a recursive layout definition. A Layout_macro_component itself generates no Stratum_features since it is not expanded. A Layout_macro_component does inherit terminals from the Printed_component. These terminals are used in the floor planning layout process. These terminals may be on any layer necessary in the design.

NOTE The recursive definition must end on a Laminate_component that is not a Layout_macro_component.

The data associated with a Layout_macro_component are the following:

- design_definition;
- usage_definition.

4.2.504.1 design_definition

The design_definition specifies the role of a Layout_macro_definition (see 4.2.505) for the Layout_macro_component.

4.2.504.2 usage_definition

The usage_definition specifies the role of a Layout_macro_floor_plan_template (see 4.2.507) for the Layout_macro_component.

NOTE EXPRESS specification:

```

*)
ENTITY layout_macro_component
  SUBTYPE OF (printed_component);
    design_definition : layout_macro_definition;
    SELF\printed_component.usage_definition : layout_macro_floor_plan_template;
WHERE
WR1: NOT(EXISTS (SELF\printed_component.stratum_feature_implementation))
    AND
    NOT(EXISTS (SELF\printed_component.printed_component_stack))
    AND
    NOT(EXISTS (SELF\printed_component.associated_precedent_link))
    AND
    NOT(EXISTS (SELF\printed_component.associated_subsequent_link))
    AND
    NOT(EXISTS (SELF\printed_component.required_material_stack));
END_ENTITY; -- layout_macro_component
( *
```

4.2.505 Layout_macro_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Layout_macro_definition is a type of Pcb (see 4.2.642). A Layout_macro_definition is a design view of a interconnect structure that is intended to be reused as a structure rather than as a component. A Layout_macro_definition may be an aggregation of Stratum (see 4.2.845). A Layout_macro_definition may be an aggregation of Layout_macro_definition_component (see ??) A Layout_macro_definition shall not be used as a component in a physical assembly.

EXAMPLE 1 A Layout_macro_definition may be used as part of a recursive definition or subroutine layout.

The data associated with a Layout_macro_definition are the following:

— floor_layout_view.

4.2.505.1 floor_layout_view

The floor_layout_view specifies the Layout_macro_floor_plan_template (see 4.2.507) for the Layout_macro_definition as a layout template for the floor planning layout. This template shall provide the terminal definitions for the Layout_macro_definition and a shape for the floor planning layout to enable the layout design without instantiating the design details of the Layout_macro_definition itself.

NOTE The floor_layout_view is a replacement for the usage_view that would be inherited from the Interconnect_module.

Constraints:

WR1: A Layout_macro_definition shall not be referenced in the role of usage_definition.

WR2: Layout_macro_definition.usage_view (this is an inherited attribute from Physical_unit_design_view) shall not exist.

NOTE EXPRESS specification:

```

*)
ENTITY layout_macro_definition
  SUBTYPE OF (pcb);
  floor_layout_view : layout_macro_floor_plan_template;
WHERE
  WR1: NOT(EXISTS(SELF\physical_unit_design_view.usage_view));
  WR2: NOT(EXISTS(SELF\interconnect_module.assembly_design_requirement));
  WR3: SIZEOF(USEDIN(SELF,
    'AP210_ARM.ASSEMBLY_COMPONENT.USAGE_DEFINITION')) = 0;
END_ENTITY; -- layout_macro_definition

( *
```

4.2.506 Layout_macro_definition_terminal_to_usage_terminal_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Layout_macro_definition_terminal_to_usage_terminal_assignment is a type of Managed_design_object (see 4.2.524). A Layout_macro_definition_terminal_to_usage_terminal_assignment is the association between the Printed_part_template_terminal (see 4.2.737) and one of several fabricated features. The purpose for this assignment is to link the product data in the macro definition to the floor planning usage view to support a recursive definition. The Layout_macro_definition_terminal_to_usage_terminal_assignment shall be referenced by one Layout_macro_floor_plan_template.

NOTE 1 In a recursive definition, both a macro definition and the macro interface declaration that is the Layout_macro_floor_plan_template are archived together, with this relationship populated as necessary to provide linkages between the fabricated features in the macro definition and the features in the planning view. Without this linkage populated, there is no way to traverse the recursive definition so as to successfully resolve the terminals at each level of recursion.

NOTE 2 This facility is used to support transport of CAD data where geometric subroutines that include layer data and terminal data are defined.

The data associated with a Layout_macro_definition_terminal_to_usage_terminal_assignment are the following:

- assigned_design_object;
- defined_template_feature.

4.2.506.1 assigned_design_object

The assigned_design_object specifies the role of the Component_termination_passage_join_terminal (see 4.2.149) or of the Via_terminal (see 4.2.954) or of the Printed_component_join_terminal (see 4.2.722) or of the Conductive_interconnect_element_terminal (see 4.2.172) or of the Land_join_terminal (see 4.2.492) or of the Non_functional_land_join_terminal (see 4.2.564) for the Layout_macro_definition_terminal_to_usage_terminal_assignment.

4.2.506.2 defined_template_feature

The defined_template_feature specifies the role of the Printed_part_template_terminal (see 4.2.737) for the Layout_macro_definition_terminal_to_usage_terminal_assignment.

NOTE EXPRESS specification:

```

*)
ENTITY layout_macro_definition_terminal_to_usage_terminal_assignment
  SUBTYPE OF (managed_design_object);
    defined_template_feature : printed_part_template_terminal;
    assigned_design_object   : fabricated_feature_select;
WHERE
  WR1: SIZEOF(USEDIN(SELF,
    'AP210_ARM.LAYOUT_MACRO_FLOOR_PLAN_TEMPLATE.ACCESS_MAPS')) = 1;
END_ENTITY; -- layout_macro_definition_terminal_to_usage_terminal_assignment

( *
```

4.2.507 Layout_macro_floor_plan_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Layout_macro_floor_plan_template` is a type of `Printed_part_template` (see 4.2.730). A `Layout_macro_floor_plan_template` is part of a recursive definition or a geometric subroutine. A `Layout_macro_floor_plan_template` provides a layout shape and a set of terminal definitions for floor planning and layout purposes. The application compiler will replace the layout shape provided by this application object with the detailed definition specified by the `Layout_macro_definition` referenced by the `macro_definition` attribute.

NOTE 1 An occurrence of this object is a `Layout_macro_component` (see 4.2.504) that is instantiated during floor planning layout during the design process for the interconnect substrate.

NOTE 2 The shape of the `Layout_macro_floor_plan_template` should encompass the shape of the macro definition.

The data associated with a `Layout_macro_floor_plan_template` are the following:

- `access_mechanisms`;
- `characterized_material`.

4.2.507.1 access_mechanisms

The `access_maps` specifies the `Layout_macro_definition_terminal_to_usage_terminal_assignment` that relates the `Printed_part_template_terminal` that is an `access_mechanisms` inherited from the `Printed_part_template` with the fabrication features in the detailed definition. There shall be one or more `Layout_macro_definition_terminal_to_usage_terminal_assignment` for a `Layout_macro_floor_plan_template`.

4.2.507.2 characterized_material

The `macro_definition` is an inverse relationship that specifies that the existence of the `Layout_macro_floor_plan_template` is dependent on the existence of a `Layout_macro_definition` that specifies the `Layout_macro_floor_plan_template` as a `floor_layout_view`. There shall be zero or one `Layout_macro_definition` for a `Layout_macro_floor_plan_template`.

NOTE EXPRESS specification:

```

*)
ENTITY layout_macro_floor_plan_template
  SUBTYPE OF (printed_part_template);
    access_maps : SET [1:?] OF
      layout_macro_definition_terminal_to_usage_terminal_assignment;
INVERSE
  macro_definition : SET [0:1] OF layout_macro_definition FOR
    floor_layout_view;
WHERE
WR1: NOT(EXISTS (SELF\printed_part_template.of_stratum_technology))
    AND
    NOT(EXISTS (SELF\printed_part_template.material_stack))
    AND
    NOT(EXISTS (SELF\printed_part_template.printed_part_template_stack));
END_ENTITY; -- layout_macro_floor_plan_template

( *
```

4.2.508 Layout_spacing_requirement_non_conforming_design_object

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Layout_spacing_requirement_non_conforming_design_object is a type of Managed_design_object (see 4.2.524). A Layout_spacing_requirement_non_conforming_design_object specifies one or more design object that does not meet object to object spacing requirements for the printed circuit board layout.

The data associated with a Layout_spacing_requirement_non_conforming_design_object are the following:

- design_requirement;
- non_conformant_design_object;
- reference_design_object.

4.2.508.1 design_requirement

The design_requirement specifies the role of the Layout_spacing_requirement_occurrence (see 4.2.509) for the Layout_spacing_requirement_non_conforming_design_object

4.2.508.2 non_conformant_design_object

The non_conformant_design_object specifies one role of either an Assembly_component (see 4.2.34), a Component_feature (see 4.2.118), or one of a Component_termination_passage (see 4.2.143), a Conductive_filled_area (see 4.2.170), a Conductor (see 4.2.176), a Cutout (see 4.2.208), an Inter_stratum_feature (see 4.2.432), a Laminate_component (see 4.2.483), a Land (see 4.2.490), a Non_functional_land (see 4.2.562), a Stratum_feature (see 4.2.851), or a Via (see 4.2.947) for the Layout_spacing_requirement_non_conforming_design_object. There shall be one or more Assembly_component, Component_feature, Component_termination_passage, Conductive_filled_area, Conductor, Cutout, Inter_stratum_feature, Laminate_component, Land, Non_functional_land, Stratum_feature, or Via for each Layout_spacing_requirement_non_conforming_design_object.

4.2.508.3 reference_design_object

The reference_design_object specifies one role of either an Assembly_component (see 4.2.34), a Component_feature (see 4.2.118), or one of a Component_termination_passage (see 4.2.143), a Conductive_filled_area (see 4.2.170), a Conductor (see 4.2.176), a Cutout (see 4.2.208), an Inter_stratum_feature (see 4.2.432), a Laminate_component (see 4.2.483), a Land (see 4.2.490), a Non_functional_land (see 4.2.562), a Stratum_feature (see 4.2.851), or a Via (see 4.2.947) for the Layout_spacing_requirement_non_conforming_design_object.

NOTE This data is the result of an evaluation of the difference between the board layout and the original spacing requirements.

NOTE EXPRESS specification:

```

*)
ENTITY layout_spacing_requirement_non_conforming_design_object
  SUBTYPE OF (managed_design_object);
  non_conformant_design_object :
SET [1:?] OF assembly_or_interconnect_design_object_select;
  reference_design_object      : assembly_or_interconnect_design_object_select;
  design_requirement           : layout_spacing_requirement_occurrence;
END_ENTITY; -- layout_spacing_requirement_non_conforming_design_object

( *
```

4.2.509 Layout_spacing_requirement_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Layout_spacing_requirement_occurrence` is a type of `Ee_requirement_occurrence` (see 4.2.330) that describes the physical spacing between one of an `assembly_module_assembly_component`, an `assembly_module_component_feature`, an `interconnect_module_cutout`, an `interconnect_module_fill_area`, an `interconnect_module_design_intent_modification`, an `interconnect_module_inter_stratum_feature`, an `interconnect_module_cutout_edge_segment`, an `interconnect_module_interconnect_module_edge`, an `interconnect_module_interconnect_module_edge_segment`, an `interconnect_module_plated_cutout`, an `interconnect_module_plated_cutout_edge_segment`, an `interconnect_module_plated_interconnect_module_edge`, an `interconnect_module_plated_interconnect_module_edge_segment`, an `interconnect_module_plated_passage`, a category consisting of the union of an `interconnect_module_plated_passage` category and an `interconnect_module_plated_unsupported_passage` category, an `interconnect_module_unsupported_passage`, an `interconnect_module_stratum_feature`, or an `interconnect_module_via`, and another of these categories of design objects. A `Layout_spacing_requirement_occurrence` may be a `Layer_qualified_layout_spacing_requirement_occurrence`. The requirement shall be imposed between the boundaries of members of the the relevant categories or between centroids.

The category names correspond to the category of equivalent application object names.

NOTE Support for requirements between boundaries and centroids is not supported by this part of ISO 10303.

EXAMPLE 1 `Assembly_module_assembly_component` corresponds to `Assembly_component` (see 4.2.34) category. `Assembly_module_component_feature` corresponds to `Component_feature` (see 4.2.118) category. `Interconnect_module_cutout` corresponds to `Cutout` (see 4.2.208) category. `Interconnect_module_fill_area` corresponds to `Fill_area` (see 4.2.376) category. `Interconnect_module_inter_stratum_feature` corresponds to `Inter_stratum_feature` (see 4.2.432) category. `Interconnect_module_stratum_feature` corresponds to `Stratum_feature` (see 4.2.851) category. `Interconnect_module_via` corresponds to `Via` (see 4.2.947) category.

Any subtype of an item in a category shall qualify as part of that category.

NOTE 1 This part of ISO 10303 supports several spacing requirements in this Application Object.

NOTE 2 A pair of categories is used for this requirement occurrence.

EXAMPLE 2 In domain terms, when a `Via` to `Via` spacing is to be greater than 5 mm, the encoding will be that the spacing between the `reference_design_object_category` whose value is `interconnect_module_via` and the `dependent_design_object_category` whose value is `interconnect_module_via` shall be greater than 5 mm.

EXAMPLE 3 In domain terms, when the distance from a cutout to a trace must be greater than 5 mm, the encoding will be that the spacing between the `reference_design_object_category` whose value is `interconnect_module_cutout` and the `dependent_design_object_category` whose value is `interconnect_module_stratum_feature` shall be greater than 5 mm.

The data associated with a Layout_spacing_requirement_occurrence are the following:

- dependent_design_object_category;
- required_coordinated_characteristic;
- reference_design_object_category;
- of_spacing_type.

4.2.509.1 dependent_design_object_category

The dependent_design_object_category specifies one role of either an assembly_module_assembly_component, an assembly_module_component_feature, an interconnect_module_cutout, an interconnect_module_fill_area, an interconnect_module_inter_stratum_feature, an interconnect_module_stratum_feature, or an interconnect_module_via, for the Layout_spacing_requirement_occurrence.

4.2.509.2 required_coordinated_characteristic

The required_coordinated_characteristic inherited from the Ee_requirement_occurrence supertype specifies the Tolerance_characteristic for the Layout_spacing_requirement_occurrence.

4.2.509.3 reference_design_object_category

The reference_design_object_category specifies one role of either an assembly_module_assembly_component, an assembly_module_component_feature, an interconnect_module_cutout, an interconnect_module_fill_area, an interconnect_module_inter_stratum_feature, an interconnect_module_stratum_feature, or an interconnect_module_via, for the Layout_spacing_requirement_occurrence.

4.2.509.4 of_spacing_type

The of_spacing_type is either "centroid", or "nearest_boundary", or "furthest_boundary" for the Layout_spacing_requirement_occurrence.

Constraints:

UR1: The combination of the reference_design_object_category and the dependent_design_object_category shall be unique within a population of Layout_spacing_requirement_occurrences.

NOTE EXPRESS specification:

```

*)
ENTITY layout_spacing_requirement_occurrence
  SUPERTYPE OF (layer_qualified_layout_spacing_requirement_occurrence)
  SUBTYPE OF (ee_requirement_occurrence);

```

4.2.510 Lead_form_specification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Lead_form_specification is a type of Process_specification (see 4.2.740) that describes the process to modify the shape property of a Part_terminal (see 4.2.630).

NOTE EXPRESS specification:

```

*)
ENTITY lead_form_specification
  SUBTYPE OF (process_specification);
END_ENTITY; -- lead_form_specification
( *

```

4.2.511 Length_data_element

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Length_data_element is a type of Data_element (see 4.2.211) where the measurement is of distance. A member of Length_data_element may also be a member of Qualified_data_element (see ??) in order to convey uncertainty.

NOTE EXPRESS specification:

```

*)
ENTITY length_data_element
  SUBTYPE OF (data_element);
WHERE
  WR1: SELF\data_element.measure_value &#62;= 0.0;
END_ENTITY; -- length_data_element

( *

```

4.2.512 Length_trimmed_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Length_trimmed_terminal is a type of Altered_package_terminal (see 4.2.9). A Length_trimmed_terminal describes the prepared length of a terminal accomplished prior to its assembly to the printed circuit assembly. The prepared length is equivalent to the as delivered length.

The data associated with a Length_trimmed_terminal are the following:

- maximum_trimmed_length;
- minimum_trimmed_length.

4.2.512.1 maximum_trimmed_length

The maximum_trimmed_length specifies the role of the Length_data_element (see 4.2.511) for the longest finished length of the Length_trimmed_terminal.

4.2.512.2 minimum_trimmed_length

The minimum_trimmed_length specifies the role of the Length_data_element (see 4.2.511) for the shortest finished length of the Length_trimmed_terminal.

NOTE EXPRESS specification:

```

*)
ENTITY length_trimmed_terminal
  SUBTYPE OF (altered_package_terminal);
  maximum_trimmed_length : length_data_element;
  minimum_trimmed_length : length_data_element;
END_ENTITY; -- length_trimmed_terminal

--tt tc1 wd9 modified

```

4.2.513 Library_ee_product_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Library_ee_product_definition is a type of Ee_product_definition (see 4.2.323) and a type of Library_item (see ??). A Library_ee_product_definition may be a Library_model (see ??). This provides the ability to store all design data in a library system for archival purposes.

NOTE EXPRESS specification:

```
*)
ENTITY library_ee_product_definition
-- SUPERTYPE OF (library_model)
  SUBTYPE OF (externally_defined_ee_product_definition);
DERIVE
  library : ee_name :=
    SELF\externally_defined_ee_product_definition.source;
END_ENTITY; -- library_ee_product_definition

(*
```

4.2.514 Limit_dimension_representation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Limit_dimension_representation is a type of Shape_dimension_representation (see 4.2.809) that explicitly describes the maximum and minimum limits of one or more Dimensional_characteristic (see 4.2.298).

The data associated with a Limit_dimension_representation are the following:

- lower_dimension_value;
- upper_dimension_value.

4.2.514.1 lower_dimension_value

The lower_dimension_value specifies the Data_element (see 4.2.211) that describes the minimum limit of the Dimensional_characteristic (see 4.2.298) for which the Limit_dimension_representation is a representation.

4.2.514.2 upper_dimension_value

The upper_dimension_value specifies the Data_element (see 4.2.211) that describes the maximum limit of the Dimensional_characteristic (see 4.2.298) for which the Limit_dimension_representation is a representation.

Constraints:

WR1: The value of the upper_dimension_value shall be greater than the value of the lower_dimension_value.

NOTE EXPRESS specification:

```

*)
ENTITY limit_dimension_representation
  SUBTYPE OF (shape_dimension_representation);
    upper_dimension_value : data_element;
    lower_dimension_value : data_element;
END_ENTITY; -- limit_dimension_representation

( *
```

4.2.515 Line_width_class

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Line_width_class is a type of Managed_design_object (see 4.2.524). A Line_width_class is a category which assigns a name to a length range for classification purposes. The Data_element used as the basis for the range shall be a Length_data_element.

EXAMPLE 1 The Line_width_class may be exchanged so that tolerances may be applied to all members of the same class, and specified only once. E.g., all lines with a design width greater than 50 mils and less than 75 mils are in the 'big' class. All members of 'big' shall have a tolerance of +5/-5 mils. Other Application Objects must be populated in order to apply the tolerances to the class.

The data associated with a Line_width_class are the following:

- class_member;
- class_name.

4.2.515.1 class_member

The class_member specifies the role of the Range_characteristic for the Line_width_class. The Range_characteristic shall provide length data.

4.2.515.2 class_name

The class_name specifies the name for the Line_width_class.

NOTE EXPRESS specification:

```

*)
ENTITY line_width_class
  SUBTYPE OF (managed_design_object);
  class_member : range_characteristic;
  class_name   : ee_name;
WHERE
  WR1: SIZEOF(QUERY( np &#60;* class_member\coordinated_characteristic.component_characteristic
    NOT('AP210_ARM.LENGTH_DATA_ELEMENT' IN TYPEOF(np\characteristic.property_value))
  )) = 0;
END_ENTITY; -- line_width_class

( *

```

4.2.516 Linear_array_placement_group_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Linear_array_placement_group_component is a type of a Array_placement_group (see 4.2.29). The placement_uncertainty relates to the originating CAD system uncertainty, not a material processing tolerance.

The data associated with a Linear_array_placement_group_component are the following:

- element;
- initial_node_positive_x_displacement;
- terminus_node_positive_x_displacement.

4.2.516.1 element

The element specifies the role of an Assembly_component_placement_link (see 4.2.38) for the Linear_array_placement_group_component. There shall be one or more Assembly_component_placement_link for a Linear_array_placement_group_component.

4.2.516.2 initial_node_positive_x_displacement

The initial_node_positive_x_displacement specifies a Length_data_element (see 4.2.511) for the Linear_array_placement_group_component. The initial_node_positive_x_displacement is the offset in the positive x direction from the local origin of the first element of the array.

4.2.516.3 terminus_node_positive_x_displacement

The terminus_node_positive_x_displacement specifies a Length_data_element (see 4.2.511) for the Linear_array_placement_group_component. The terminun_node_positive_x_displacement is the offset in the positive x direction of the last element of the array.

NOTE EXPRESS specification:

```
*)
ENTITY linear_array_placement_group_component
  SUBTYPE OF (array_placement_group);
  element : SET [1:?] OF assembly_component_placement_link;
  initial_node_positive_x_displacement : length_data_element;
  terminus_node_positive_x_displacement : length_data_element;
  location_uncertainty : length_data_element;
END_ENTITY; -- linear_array_placement_group_component
```

(*

4.2.517 Linear_array_placement_group_component_link

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Linear_array_placement_group_component_link is a type of Managed_design_object (see 4.2.524).

The data associated with a Linear_array_placement_group_component_link are the following:

- precedent_element;
- referenced_by;
- subsequent_element.

4.2.517.1 precedent_element

The precedent_element specifies a Linear_array_placement_group_component (see 4.2.516) for the Linear_array_placement_group_component_link.

4.2.517.2 referenced_by

The referenced_by is an inverse relationship that specifies that the existence of the Linear_array_placement_group_component_link is dependent on the existence of the Rectangular_array_placement_group_component (see 4.2.763) that specifies the Linear_array_placement_group_component_link as its element.

4.2.517.3 subsequent_element

The subsequent_element specifies a Linear_array_placement_group_component (see 4.2.516) for the Linear_array_placement_group_component_link.

NOTE EXPRESS specification:

```
*)
ENTITY linear_array_placement_group_component_link

```

4.2.518 Linear_extension

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Linear_extension is a type of Derived_shape_element (see 4.2.260) that is derived by linearly extending a Shape_element (see 4.2.810) that is a curve or surface. The Shape_element of which the Linear_extension is an extension is associated with the Linear_extension by the Shape_element_deriving_relationship (see 4.2.814) that are specified as the deriving_relationships.

NOTE The attribute deriving_relationships is declared in the Derived_shape_element entity of which this entity is a subtype.

Constraints:

WR1: The Linear_extension shall be derived from only one Shape_element.

IP1: The Shape_element from which the Linear_extension is derived shall be a curve or surface.

NOTE EXPRESS specification:

```
*)
ENTITY linear_extension
  SUBTYPE OF (derived_shape_element);
END_ENTITY; -- linear_extension

( *
```

4.2.519 Located_interconnect_module_thickness_requirement

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Located_interconnect_module_thickness_requirement is a type of Managed_design_object (see 4.2.524). A Located_interconnect_module_thickness_requirement is a definition that states, at a specific location, that a thickness requirement exists for an Interconnect_module (see 4.2.440).

The data associated with a Located_interconnect_module_thickness_requirement are the following:

- design;
- reference_location;
- maximum_thickness_requirement;
- minimum_thickness_requirement.

4.2.519.1 design

The design is an inverse relationship that specifies that the existence of the Located_interconnect_module_thickness_requirement is dependent on the existence of the Interconnect_module_usage_view (see 4.2.465) that specifies the Located_interconnect_module_thickness_requirement as its overall_thickness_requirement. There shall be one or more Interconnect_module_usage_view for a Located_interconnect_module_thickness_requirement.

NOTE Multiple versions of a product may have the same thickness requirement.

4.2.519.2 reference_location

The reference_location specifies the role of the Axis_placement (see 4.2.56) for the Located_interconnect_module_thickness_requirement.

4.2.519.3 maximum_thickness_requirement

The maximum_thickness_requirement specifies the Length_data_element (see 4.2.511) that is the upper bound for the Located_interconnect_module_thickness_requirement.

4.2.519.4 minimum_thickness_requirement

The minimum_thickness_requirement specifies the Length_data_element (see 4.2.511) that is the lower bound for the Located_interconnect_module_thickness_requirement.

Constraints:

UR1: The combination of the design and the reference_location shall be unique within a population of Located_interconnect_module_thickness_requirements.

NOTE EXPRESS specification:

```
*)
ENTITY located_interconnect_module_thickness_requirement
  SUBTYPE OF (managed_design_object);

4.2.526 Marking

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Marking is a type of `Managed_design_object` (see 4.2.524). A Marking is the specification of what, where, and how information that is placed on a `Physical_unit` (see 4.2.664) for identification purposes is applied. Marking in this part of ISO 10303 is considered to not be part of the definition of a `Stratum` (see 4.2.845). Marking is text that is applied to a material object. The `message_representation_text` shall be an item in the `message_representation`.

EXAMPLE 1 `Laminate_text_component` is text that is realized through the manufacturing process. Reference designators that are created on the board during etching are members of `Laminate_text_component`.

The data associated with a Marking are the following:

- `marked_device_shape`;
- `marked_message`;
- `marking_material`;
- `marking_specification`;
- `message_representation`;
- `message_representation_text`;
- `placement`.

4.2.526.1 marked_device_shape

The `marked_device_shape` specifies either a `Physical_unit_3d_shape` (see 4.2.666), or a `Physical_unit_planar_shape` (see 4.2.670) that is the shape definition for the physical device that receives the Marking.

4.2.526.2 marked_message

The marked_message specifies either a Configuration_controlled_message (see 4.2.177) or Structured_text (see 4.2.874) for Marking.

4.2.526.3 marking_material

The marking_material specifies the Ee_material (see 4.2.318) used in the Marking.

4.2.526.4 marking_specification

The marking_specification specifies the Ee_specification (see 4.2.338) of the process and format for properly applying the Marking.

4.2.526.5 message_representation

The message_representation specifies role of the Feature_shape_definition (see 4.2.372) for the Marking.

4.2.526.6 message_representation_text

The message_representation_text specifies role of the Styled_text (see 4.2.876) for the Marking.

4.2.526.7 placement

The placement specifies the Axis_placement (see 4.2.56) of the Marking. The placement specifies the placement of the message_representation in the marked_device_shape.

NOTE EXPRESS specification:

```

*)
ENTITY marking
  SUBTYPE OF (managed_design_object);
    marked_message      : marked_message_select;
    marked_device_shape : view_shape_select;

4.2.528 Material_addition_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Material_addition_feature is a type of Design_intent_modification (see 4.2.267) that describes the material that is to be added in the realization of the feature specified by the design_intent attribute inherited from Design_intent_modification. This requirement shall be interpreted as being mathematically equivalent to the application of the regularized Boolean geometric OR operation where the design_intent is OR'd with the shape of the Material_addition_feature.

NOTE EXPRESS specification:

```
*)
ENTITY material_addition_feature
  SUBTYPE OF (design_intent_modification);
  material_addition_shape : material_addition_feature_template;
END_ENTITY; -- material_addition_feature

( *
```

4.2.529 Material_addition_feature_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Material_addition_feature_template is a type of Part_template (see 4.2.620) that describes the shape of material to be added to a design feature.

The data associated with a Material_addition_feature_template are the following:

— of_stratum_technology.

4.2.529.1 of_stratum_technology

The of_stratum_technology specifies the role of the Stratum_technology (see 4.2.871) for the Material_addition_feature_template.

NOTE EXPRESS specification:

```

*)
ENTITY material_addition_feature_template
  SUBTYPE OF (part_template);
  of_stratum_technology : stratum_technology;
END_ENTITY; -- material_addition_feature_template

( *

```

4.2.530 Material_composition_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Material_composition_relationship is a type of Managed_design_object (see 4.2.524). A Material_composition_relationship is the association between one Ee_material (see 4.2.318) and another when describing a composite material.

The data associated with a Material_composition_relationship are the following:

- composition_basis;
- composition_class;
- constituent_amount;
- determination_method;
- related_product;
- relating_product.

4.2.530.1 composition_basis

The composition_basis specifies the string that represents the basis on which a material product is decomposed into its constituents.

4.2.530.2 composition_class

The composition_class specifies the string that represents the category of composition for the Material_composition_relationship.

4.2.530.3 constituent_amount

The constituent_amount specifies the Data_element (see 4.2.211) that represents the amount of material.

4.2.530.4 determination_method

The `determination_method` specifies the string that represents the procedure by which `constituent_amount` is determined.

4.2.530.5 related_product

The `related_product` is `Ee_material` (see 4.2.318) that is the constituent for the `Material_composition_relationship`. There shall be one or more `Ee_material` for the `Material_composition_relationship`.

4.2.530.6 relating_product

The `relating_product` is `Ee_material` (see 4.2.318) that is the composition for which this `Material_composition_relationship` is specifying a constituent.

NOTE This relationship is intended for compounds and simple mixtures only, not for assemblies.

NOTE EXPRESS specification:

```

*)
ENTITY material_composition_relationship
  SUBTYPE OF (managed_design_object);
    composition_basis      : STRING;
    determination_method  : ee_text;
    composition_class      : STRING;
    constituent_amount     : data_element;
    related_product        : ee_material;
    relating_product       : ee_material;
END_ENTITY; -- material_composition_relationship

```

(*

4.2.531 Material_definition

A `Material_definition` is a type of `Ee_product_definition` (see 4.2.323). A `Material_definition` is intended solely to capture a minimal definition and identification of raw material for bill of material or product data purposes.

The data associated with a `Material_definition` are the following:

— `material`.

4.2.531.1 material

The `material` specifies role of the `Ee_material` (see 4.2.318) for the `Material_definition`.

NOTE EXPRESS specification:

```
*)
ENTITY material_definition
  SUBTYPE OF (ee_product_definition);
  material: ee_material;
END_ENTITY; -- material_definition
(*
```

4.2.532 Material_electrical_conductivity_requirement_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Material_electrical_conductivity_requirement_occurrence is a type of Electrical_requirement_occurrence (see 4.2.346) that specifies the requirement for conductive material.

The data associated with a Material_electrical_conductivity_requirement_occurrence are the following:

— electrical_conductivity_characteristic.

4.2.532.1 electrical_conductivity_characteristic

The electrical_conductivity_characteristic specifies either a conductive, a non_conductive, a resistive, or a semi_conductive classification of material conductivity for the Material_electrical_conductivity_classification.

NOTE These are generic category names. If more specific data is required, the characteristics should be associated to the Material_electrical_conductivity_requirement_occurrence using the required_coordinated_characteristic or the required_characteristic inherited from Ee_requirement_occurrence.

NOTE EXPRESS specification:

```
*)
ENTITY material_electrical_conductivity_requirement_occurrence
  SUBTYPE OF (electrical_requirement_occurrence);
  electrical_conductivity_characteristic : material_conductivity_classification;
END_ENTITY; -- material_electrical_conductivity_requirement_occurrence
(*
```

4.2.533 Material_removal_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Material_removal_feature` is a type of `Design_intent_modification` (see 4.2.267) that indicates that material is to be removed in the realization of the feature that is in the role of `design_intent` inherited from `Design_intent_modification`. A `Material_removal_feature` may be a `Filled_area_material_removal_structure` (see 4.2.385). The requirement shall be interpreted mathematically as a requirement for application of the regularized Boolean subtraction operation.

The data associated with a `Material_removal_feature` are the following:

— `material_removal_shape`.

4.2.533.1 `material_removal_shape`

The `material_removal_shape` specifies the role of the `Material_removal_feature_template` (see 4.2.534) for the `Material_removal_feature`.

NOTE EXPRESS specification:

```
*)
ENTITY material_removal_feature
  SUPERTYPE OF (filled_area_material_removal_structure)
  SUBTYPE OF (design_intent_modification);
  material_removal_shape : material_removal_feature_template;
END_ENTITY; -- material_removal_feature

(*
```

4.2.534 `Material_removal_feature_template`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Material_removal_feature_template` is a type of `Part_template` (see 4.2.620) that describes the shape of material to be removed from a feature. A `Material_removal_feature_template` may be an `Electrical_isolation_removal_template` (see 4.2.344) or a `Thermal_isolation_removal_template` (see 4.2.904).

EXAMPLE 1 Figure 108 illustrates a template and associated parameters designed for electrical isolation. For a specific template, values will be assigned for the parameters and the explicit geometry will be representative of the assigned parameter values.

EXAMPLE 2 Figure 109 illustrates a template and associated parameters designed for thermal isolation. For a specific template, values will be assigned for the parameters and the explicit geometry will be representative of the assigned parameter values. In this example, an instance would be a complex instance including `Composite_unit_shape_element` (see 4.2.167) and `Material_removal_feature_template`.

The data associated with a `Material_removal_feature_template` are the following:

— `of_stratum_technology`.

Physical characteristics are inherited from Part_template.

Reference_document is : IEC 61182-1

Note : Electrical Isolation

Figure 61 – Material_removal_feature_template supports electrical isolation

Physical characteristics are inherited from Part_template.

Reference_document is : IEC 61182-1

Note : Thermal isolation

Figure 62 – Material_removal_feature_template supports thermal isolation and electrical conduction

4.2.534.1 of_stratum_technology

The of_stratum_technology specifies the role of the Stratum_technology (see 4.2.871) for the Material_removal_feature_template.

NOTE EXPRESS specification:

```

*)
ENTITY material_removal_feature_template
  SUPERTYPE OF (ONEOF(electrical_isolation_removal_template,
    thermal_isolation_removal_template))
  SUBTYPE OF (part_template);
  of_stratum_technology : stratum_technology;
END_ENTITY; -- material_removal_feature_template

( *
```

4.2.535 Material_removal_laminate_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Material_removal_laminate_component is a type of Laminate_component (see 4.2.483) that indicates that material is to be removed in the realization of the feature that is in the role of design_intent. A Material_removal_laminate_component may be a Filled_area_material_removal_structure (see 4.2.385). The requirement shall be interpreted mathematically as a requirement for application of the regularized Boolean subtraction operation. A Material_removal_laminate_component may participate in a relationship with a Design_intent_modification_sequence (see 4.2.273) in the case of complex layout arrangements to resolve the order of the Boolean operations.

The data associated with a Material_removal_laminate_component are the following:

- design_intent;
- usage_definition.

4.2.535.1 design_intent

The design_intent specifies the role of the Stratum_feature (see 4.2.851) for the Material_removal_laminate_component.

4.2.535.2 usage_definition

The usage_definition specifies the role of the Material_removal_feature_template (see 4.2.534) for the Material_removal_laminate_component.

NOTE EXPRESS specification:

```

*)
ENTITY material_removal_laminate_component
  SUPERTYPE OF (filled_area_material_removal_laminate_component)
  SUBTYPE OF (laminate_component);
  SELF\assembly_component.usage_definition :
    material_removal_feature_template;
  design_intent : stratum_feature;
END_ENTITY; -- material_removal_laminate_component

( *

```

4.2.536 Material_shape_modification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Material_shape_modification is a type of Design_intent_modification (see 4.2.267) that indicates that the shape of material of the feature in the role of design_intent inherited from Design_intent_modification is to be modified to suit the design intent. The mathematical interpretation shall be dependent on the operator instance data in the geometrical representation used in the model. A Material_shape_modification shall be represented only by a geometric representation capable of supporting regularized Boolean operations.

NOTE EXPRESS specification:

```

*)
ENTITY material_shape_modification
  SUBTYPE OF (design_intent_modification);
END_ENTITY; -- material_shape_modification

( *

```

4.2.537 Material_specification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Material_specification is a type of Ee_specification (see 4.2.338) that specifies properties applicable to raw material, mixtures, or semi-fabricated material that are used in the fabrication of a product. A Material_specification may be a Surface_finish_specification (see 4.2.880).

EXAMPLE 1 An example of a semi-fabricated material is the partially cured adhesive sheets which often are composed of a glass fiber mat and "B-stage" epoxy. Semi-fabricated material may be purchased or sold by an enterprise, in the same way that raw materials or mixtures may.

NOTE EXPRESS specification:

```

*)
ENTITY material_specification
  SUPERTYPE OF (surface_finish_specification)
  SUBTYPE OF (ee_specification);
END_ENTITY; -- material_specification

( *

```

4.2.538 Mating_connector_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Mating_connector_component is a type of Managed_design_object (see 4.2.524). A Mating_connector_component is the connector on the next higher assembly with which a connector on the assembly must mate. A Mating_connector_component may be specified in the role of mating_requirement by an Interface_component_allocation (see 4.2.469).

The data associated with a Mating_connector_component are the following:

- definition;
- placement_context;
- reference_designation.

4.2.538.1 definition

The definition specifies the role of either an Ee_specification (see 4.2.338), a Packaged_connector (see 4.2.587), or a Printed_connector_template (see 4.2.726) for the Mating_connector_component.

4.2.538.2 placement_context

The placement_context is an inverse relationship that specifies that the existence of the Mating_connector_component is dependent on the existence of the Mating_connector_placement_relationship (see 4.2.539) that specifies the Mating_connector_component as its placed_connector.

4.2.538.3 reference_designation

The reference_designation specifies the name that serves as the identifier of the location of the Mating_connector_component in the next level of assembly. The reference_designation need not be specified for a particular Mating_connector_component.

NOTE EXPRESS specification:

```

*)
ENTITY mating_connector_component
  SUBTYPE OF (managed_design_object);
  definition          : mating_connector_part;
  reference_designation : OPTIONAL ee_name;
  INVERSE
    placement_context : mating_connector_placement_relationship FOR
                        placed_connector;
END_ENTITY; -- mating_connector_component

( *

```

4.2.539 Mating_connector_placement_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Mating_connector_placement_relationship is a type of Managed_design_object (see 4.2.524). A Mating_connector_placement_relationship is the association between the connector that the interface connector on the assembly must mate with in the next higher assembly, and the resultant placement of that mating connector in the assembly being designed for test and evaluation. The evaluation may include fit checks and evaluation of other material properties. The application of Mating_connector_placement_relationship is limited to three-dimensional geometric systems.

The data associated with a Mating_connector_placement_relationship are the following:

- connector_placement;
- interface_context;
- placed_connector.

4.2.539.1 connector_placement

The connector_placement specifies the role of the Axis_placement (see 4.2.56) for the Mating_connector_placement_relationship. The Axis_placement shall be an Axis2_placement_3d.

4.2.539.2 interface_context

The interface_context specifies the role of the Next_higher_assembly_interface_requirement (see 4.2.555) for the Mating_connector_placement_relationship. The coordinated system of the shape representing the Next_higher_assembly_interface_requirement shall be congruent with the coordinate system of the assembly being designed.

4.2.539.3 placed_connector

The placed_connector specifies the role of the Mating_connector_component (see 4.2.538) for the Mating_connector_placement_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY mating_connector_placement_relationship
  SUBTYPE OF (managed_design_object);
    placed_connector      : mating_connector_component;
    interface_context     : next_higher_assembly_interface_requirement;
    connector_placement   : axis_placement;
END_ENTITY; -- mating_connector_placement_relationship

( *
```

4.2.540 Mating_connector_termination

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Mating_connector_termination is a type of Managed_design_object (see 4.2.524). A Mating_connector_termination is a single terminal of a Mating_connector_component.

The data associated with a Mating_connector_termination are the following:

- accessed_connector;
- definition;
- name;
- signal_definition.

4.2.540.1 accessed_connector

The accessed_connector specifies the role of the Mating_connector_component (see 4.2.538) for the Mating_connector_termination.

4.2.540.2 definition

The definition specifies either a Packaged_part_terminal (see 4.2.594) or a Printed_part_template_terminal (see 4.2.737) for the Mating_connector_termination.

4.2.540.3 name

The name specifies the identifier for the Mating_connector_termination.

4.2.540.4 signal_definition

The signal_definition specifies the role of the Ee_requirement_occurrence (see 4.2.330) for the Mating_connector_termination. The signal_definition need not be specified for a particular Mating_connector_termination.

Constraints:

UR1: The combination of the accessed_connector and the definition shall be unique within a population of Mating_connector_termination.

NOTE EXPRESS specification:

```

*)
ENTITY mating_connector_termination
  SUBTYPE OF (managed_design_object);
    definition      : packaged_or_printed_terminal;
    accessed_connector : mating_connector_component;
    name            : ee_name;
    signal_definition : OPTIONAL ee_requirement_occurrence;
  UNIQUE
    UR1 : definition, accessed_connector;
END_ENTITY; -- mating_connector_termination

( *
```

4.2.541 Maximum_dimension_representation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Maximum_dimension_representation is a type of Singular_dimension_representation (see 4.2.829) that explicitly describes the maximum limit of one or more Dimensional_characteristic (see 4.2.298) and in which the minimum limit is not specified as it is determined by other elements of the design.

NOTE Maximum dimensions are discussed in 4.4 of ISO 406.

NOTE EXPRESS specification:

```
*)
ENTITY maximum_dimension_representation
  SUBTYPE OF (singular_dimension_representation);
END_ENTITY; -- maximum_dimension_representation

( *
```

4.2.542 Maximum_tolerance_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Maximum_tolerance_characteristic is a type of Tolerance_characteristic (see 4.2.911). The Maximum_tolerance_characteristic indicates the maximum allowed value for the parameter specified.

The data associated with a Maximum_tolerance_characteristic are the following:

— component_characteristic.

4.2.542.1 component_characteristic

The component_characteristic specifies the maximum value of the Numeric_parameter (see 4.2.565) for the Maximum_tolerance_characteristic.

NOTE EXPRESS specification:

```
*)
ENTITY maximum_tolerance_characteristic
  SUBTYPE OF (tolerance_characteristic);
  SELF\coordinated_characteristic.component_characteristic :
SET [1:1] OF numeric_parameter;
END_ENTITY; -- maximum_tolerance_characteristic

( *
```

4.2.543 Measure_qualification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Measure_qualification is a type of Managed_design_object (see 4.2.524) in which there is an associated uncertainty. The uncertainty may be specified as precision, qualitative uncertainty, or expanded uncertainty, and the type of the related datum shall be included. The uncertainty is defined in clause 2 of "The Guide to the Expression of Uncertainty in Measurement".

NOTE EXPRESS specification:

```
*)
ENTITY measure_qualification
  SUBTYPE OF (managed_design_object);
    name : text;
    description : text;
    qualified_measure : data_element;
    qualifiers : SET [1:?] OF value_qualifier;
END_ENTITY; -- measure_qualification

```

4.2.544 Mechanical_requirement_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Mechanical_requirement_occurrence is a type of Ee_requirement_occurrence (see 4.2.330) that specifies a mechanical domain related requirement.

NOTE EXPRESS specification:

```
*)
ENTITY mechanical_requirement_occurrence
  SUBTYPE OF (ee_requirement_occurrence);
END_ENTITY; -- mechanical_requirement_occurrence
(*
```

4.2.545 Minimally_defined_bare_die_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Minimally_defined_bare_die_terminal is a type of Part_terminal (see 4.2.630). A Minimally_defined_bare_die_terminal may be either a Guided_wave_bare_die_terminal (see 4.2.426) or a Bare_die_terminal (see 4.2.66). The associated_definition specifies the Bare_die (see 4.2.59) to which the Bare_die_terminal provides electrical access. A Minimally_defined_bare_die_terminal does not include location or shape information

NOTE EXPRESS specification:

```

*)
ENTITY minimally_defined_bare_die_terminal
  SUPERTYPE OF (guided_wave_bare_die_terminal ANDOR bare_die_terminal)
  SUBTYPE OF (part_terminal);
  SELF\part_feature.associated_definition : bare_die;
END_ENTITY; -- minimally_defined_bare_die_terminal

( *

```

4.2.546 Minimally_defined_component_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Minimally_defined_component_terminal` is a type of `Component_terminal` (see 4.2.137) that is included to permit references to terminals without including geometric representations of the terminals.

The data associated with a `Minimally_defined_component_terminal` are the following:

— definition.

4.2.546.1 definition

The definition specifies the role of the `Part_terminal_external_reference` (see 4.2.631) for the `Minimally_defined_component_terminal`.

NOTE EXPRESS specification:

```

*)
ENTITY minimally_defined_component_terminal
  SUBTYPE OF (physical_component_terminal);
  SELF\component_feature.definition : part_terminal_external_reference;
END_ENTITY; -- minimally_defined_component_terminal

( *

```

4.2.547 Minimum_dimension_representation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Minimum_dimension_representation` is a type of `Singular_dimension_representation` (see 4.2.829) that explicitly describes the minimum limit of one or more `Dimensional_characteristic` (see 4.2.298) and in which the maximum limit is not specified as it is determined by other elements of the design.

NOTE Minimum dimensions are discussed in 4.4 of ISO 406.

NOTE EXPRESS specification:

```
*)
ENTITY minimum_dimension_representation
  SUBTYPE OF (singular_dimension_representation);
END_ENTITY; -- minimum_dimension_representation

( *
```

4.2.548 Minimum_tolerance_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Minimum_tolerance_characteristic is a type of Tolerance_characteristic (see 4.2.911). The Minimum_tolerance_characteristic indicates the minimum allowed value for the parameter specified.

The data associated with a Minimum_tolerance_characteristic are the following:

— component_characteristic.

4.2.548.1 component_characteristic

The component_characteristic specifies the minimum value of the Numeric_parameter (see 4.2.565) for the Minimum_tolerance_characteristic.

NOTE EXPRESS specification:

```
*)
ENTITY minimum_tolerance_characteristic

  SUBTYPE OF (tolerance_characteristic);
  SELF\coordinated_characteristic.component_characteristic :
  SET [1:1] OF numeric_parameter;
END_ENTITY; -- minimum_tolerance_characteristic

( *
```

4.2.549 Model_parameter

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Model_parameter is a type of Managed_design_object (see 4.2.524). A Model_parameter is a formally declared variable of the Analytical_model (see 4.2.14) provided for an external application to populate at execution time in a computing environment. The base type of the variable is defined by the base type of the default_value or valid_range data.

EXAMPLE 1 In Spice, temperature is a Model_parameter that may be set at the execution time.

The data associated with a Model_parameter are the following:

- default_value;
- reference_document;
- type_name;
- unit_of_measure;
- valid_range.

4.2.549.1 default_value

The default_value specifies either a Characteristic (see 4.2.98) or a Coordinated_characteristic (see 4.2.197) for the parameter. The default_value need not be specified for a particular Model_parameter. When a collection of data types needs to be defined, so that an instance of the collection may be referenced, the Coordinated_characteristic is used. The External_definition (see 4.2.361) specifies the reference_document to define the semantics of the collection.

4.2.549.2 reference_document

The reference_document specifies either an Ee_document (see 4.2.316) or an identifier for the standard document that contains the reference for the Model_parameter. The reference_document shall define the mapping between the parameter_type string values and the semantics to be applied by a simulator, except for the case of physical_property_type which is predefined in this part of ISO 10303.

4.2.549.3 type_name

The type_name specifies the string used as the human-interpretable type name for the Model_parameter.

4.2.549.4 unit_of_measure

The unit_of_measure specifies the string used as the descriptive label for the unit of measure associated with the Model_parameter. The unit_of_measure need not be specified for a particular Model_parameter. The representation of units described in ISO 10303-41 shall be used.

4.2.549.5 valid_range

The valid_range specifies the Coordinated_characteristic (see 4.2.197) of the Model_parameter. The valid_range need not be specified for a particular Model_parameter. There may be more than one Coordinated_characteristic for a Model_parameter. The valid_ranges need not be contiguous.

NOTE The base units of the valid_range and default_value are the same type.

Constraints:

UR1: The combination of the reference_document and the type_name shall be unique within a population of Model_parameter.

NOTE EXPRESS specification:

```

*)
ENTITY model_parameter
  SUPERTYPE OF (datum_difference_based_model_parameter)
  SUBTYPE OF (managed_design_object);
  type_name          : STRING;
  unit_of_measure    : OPTIONAL STRING;
  reference_document : ee_document;
  valid_range        : OPTIONAL SET [1:?] OF coordinated_characteristic;
  default_value      : OPTIONAL scalar_or_coordinated_characteristics;
UNIQUE
  UR1: type_name, reference_document;
END_ENTITY; -- model_parameter

( *
```

4.2.550 Mounting_restriction_area

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Mounting_restriction_area is a type of Non_feature_shape_element (see 4.2.560). A Mounting_restriction_area is the region on an Interconnect_module_component (see 4.2.442) where mounting restrictions for components exist. The shape representing the Mounting_restriction_region shall have an origin that is congruent with the origin of the shape representing the Interconnect_module_component. This congruency shall be accomplished using concepts equivalent to the Application objects Component_2d_position or Component_3d_position. The shape representing the Mounting_restriction_area is itself in the shape of the assembly, as is the shape of the Interconnect_module_component. The congruency requirement is established so that an application interface can more unambiguously import the Mounting_restriction_area into a CAD layout tool. Mounting_restriction_area is part of a design requirement for an interconnect that is established in the assembly or assemblies in which the interconnect is used. The interconnect shall specify the assembly or assemblies it is designed to support by the assembly_design_requirement attribute of Interconnect_module (see 4.2.440) if the attribute is present.

The data associated with a Mounting_restriction_area are the following:

- mounting_surface;
- scope.

4.2.550.1 mounting_surface

The mounting_surface specifies the role of the Interconnect_module_component_surface_feature (see 4.2.444) for the Mounting_restriction_area. There shall be one surface in the role of mounting_surface for a Mounting_restriction_area. The type of surface is determined by the definition of the Interconnect_module_component_surface_feature specified by mounting_surface. The mounting_surface conveys design intent to identify the component that implements the connectivity prescribed by the relevant member of Physical_connectivity_definition (see 4.2.652).

4.2.550.2 scope

The scope specifies the role of the Assembly_module (see 4.2.43) for the Mounting_restriction_area. The element_shape is within the Assembly_module geometric model coordinate system.

Constraints:

WR1: The component associated with the mounting_surface shall be a component in the scope.

NOTE EXPRESS specification:

```

*)
ENTITY mounting_restriction_area
  SUBTYPE OF (non_feature_shape_element);
    mounting_surface : interconnect_module_component_surface_feature;
    SELF\non_feature_shape_element.scope : assembly_module;
WHERE
  WR1: 'AP210_ARM.CSG_2D_SHAPE' IN
    TYPEOF(SELF\non_feature_shape_element.element_shape);
END_ENTITY; -- mounting_restriction_area
( *
```

4.2.551 Mounting_restriction_volume

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Mounting_restriction_volume` is a type of `Non_feature_shape_element` (see 4.2.560). A `Mounting_restriction_volume` is the region on an `Interconnect_module_component` (see 4.2.442) where mounting restrictions for components exist. The shape representing the `Mounting_restriction_region` shall have an origin that is congruent with the origin of the shape representing the `Interconnect_module_component`. This congruency shall be accomplished using concepts equivalent to the Application objects `Component_2d_position` or `Component_3d_position`. The shape representing the `Mounting_restriction_volume` is itself in the shape of the assembly, as is the shape of the `Interconnect_module_component`. The congruency requirement is established so that an application interface can more unambiguously import the `Mounting_restriction_volume` into a CAD layout tool. `Mounting_restriction_volume` is part of a design requirement for an interconnect that is established in the assembly or assemblies in which the interconnect is used. The interconnect shall specify the assembly or assemblies it is designed to support by the `assembly_design_requirement` attribute of `Interconnect_module` (see 4.2.440) if the attribute is present.

The data associated with a `Mounting_restriction_volume` are the following:

- `volume`;
- `mounting_surface`;
- `scope`.

4.2.551.1 **volume**

The `volume` is an inverse attribute that specifies the `Shape_definition` the `Mounting_restriction_volume` is dependent on for existence.

4.2.551.2 **mounting_surface**

The `mounting_surface` specifies the role of the `Interconnect_module_component_surface_feature` (see 4.2.444) for the `Mounting_restriction_volume`. There shall be one surface in the role of `mounting_surface` for a `Mounting_restriction_volume`. The type of surface is determined by the definition of the `Interconnect_module_component_surface_feature` specified by `mounting_surface`. The `mounting_surface` conveys design intent to identify the component that implements the connectivity prescribed by the relevant member of `Physical_connectivity_definition` (see 4.2.652).

4.2.551.3 **scope**

The `scope` specifies the role of the `Assembly_module` (see 4.2.43) for the `Mounting_restriction_volume`. The `volume` is within the `Assembly_module` geometric model coordinate system.

Constraints:

WR1: The component associated with the `mounting_surface` shall be a component in the `scope`.

NOTE EXPRESS specification:

```

*)
ENTITY mounting_restriction_volume
  SUBTYPE OF (non_feature_shape_element);
    mounting_surface : interconnect_module_component_surface_feature;
    SELF\non_feature_shape_element.scope : assembly_module;
INVERSE
  volume : non_feature_shape_definition for associated_element;
WHERE
  WR1: 'AP210_ARM.BOUND_VOLUME_SHAPE' IN TYPEOF(volume);
( *
  WR1: dimensionality (volume) = 3;
*)
END_ENTITY; -- mounting_restriction_volume

( *

```

4.2.552 Multi_layer_material_removal_laminate_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Multi_layer_material_removal_laminate_component is a type of Material_removal_laminate_component (see 4.2.535) that indicates that material is to be removed in multiple layers based on the same explicit geometry. The geometric transformations between the Stratum are used to position the geometry on the dependent Stratum.

NOTE This Application Object is not intended to be used in place of Cutout.

The data associated with a Multi_layer_material_removal_laminate_component are the following:

— derived_geometry.

4.2.552.1 derived_geometry

The derived_geometry specifies the role of the Layer (see 4.2.498) for the Multi_layer_material_removal_laminate_component. Each Stratum referenced by Layer receives the same material shape to within process tolerances.

NOTE EXPRESS specification:

```
*)
ENTITY multi_layer_material_removal_laminate_component
  SUBTYPE OF (material_removal_laminate_component);
  derived_layer_geometry : layer;
END_ENTITY; -- multi_layer_material_removal_laminate_component

( *
```

4.2.553 Multi_layer_stratum_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Multi_layer_stratum_feature is a type of Stratum_feature (see 4.2.851). A Multi_layer_stratum_feature causes shapes to be realized in the material of multiple sequential Stratum (see 4.2.845) which are all bases on the geometry for the feature. Each shape is effectively a Stratum_feature in that Stratum, but due to the identical nature of the geometry, there is no need to separately model the geometry. Each shape in the sequential Stratum is isolated from other shapes in that Stratum.

EXAMPLE 1 Gold plating on Conductors that is based directly on the underlying Copper shape is an example of this Application Object.

The data associated with a Multi_layer_stratum_feature are the following:

— derived_layer_geometry.

4.2.553.1 derived_layer_geometry

The derived_layer_geometry specifies the role of the Stratum (see 4.2.845) for the Multi_layer_stratum_feature.

NOTE EXPRESS specification:

```
*)
ENTITY multi_layer_stratum_feature
  SUBTYPE OF (stratum_feature);
  derived_layer_geometry : layer;
END_ENTITY; -- multi_layer_stratum_feature

( *
```

4.2.554 Multi_layer_stratum_feature_template_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Multi_layer_stratum_feature_template_component` is a type of `Stratum_feature_template_component` (see 4.2.862). A `Multi_layer_stratum_feature_template_component` is included to allow the creation of shapes on sequential `Stratum` where those shapes are identical to the shape that references the `Multi_layer_stratum_feature_template_component`.

EXAMPLE 1 The domain feature known as "edge finger connector" consists of multiple `Stratum` of Copper, Nickel, Gold and each material shape is based on the shape of the underlying `Stratum_feature_template_component` in the Copper `Stratum`.

The data associated with a `Multi_layer_stratum_feature_template_component` are the following:

— `derived_layer_geometry`.

4.2.554.1 `derived_layer_geometry`

The `derived_layer_geometry` specifies the role of the `Layer` (see 4.2.498) for the `Multi_layer_stratum_feature_template_component`.

NOTE EXPRESS specification:

```
*)
ENTITY multi_layer_stratum_feature_template_component
  SUBTYPE OF (stratum_feature_template_component);
    derived_layer_geometry : layer;
END_ENTITY; -- multi_layer_stratum_feature_template_component

( *
```

4.2.555 `Next_higher_assembly_interface_requirement`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Next_higher_assembly_interface_requirement` is a type of `Managed_design_object` (see 4.2.524). A `Next_higher_assembly_interface_requirement` is the association between the version of the next higher assembly and a shape that simulates the fit characteristics of the next higher assembly. The coordinate system of the shape is congruent with the coordinate system of the current design. The shape simulates a maximum material condition state of the next higher assembly.

The data associated with a `Next_higher_assembly_interface_requirement` are the following:

— `shape`;

— `version_of_next_higher_assembly`.

4.2.555.1 shape

The shape specifies the Bound_volume_shape (see 4.2.76) for the model for the Next_higher_assembly_interface_requirement.

4.2.555.2 version_of_next_higher_assembly

The version_of_next_higher_assembly specifies the Ee_product_version (see 4.2.328) of the Next_higher_assembly_interface_requirement.

NOTE EXPRESS specification:

```

*)
ENTITY next_higher_assembly_interface_requirement
  SUBTYPE OF (managed_design_object);
    shape : bound_volume_shape;
    version_of_next_higher_assembly : ee_product_version;
END_ENTITY; -- next_higher_assembly_interface_requirement

( *
```

4.2.556 Next_higher_assembly_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Next_higher_assembly_relationship is a type of Assembly_composition_relationship (see 4.2.39). A Next_higher_assembly_relationship is the association of a component to the assembly it helps to compose.

EXAMPLE 1 Figure 63 illustrates roles of several components in the related assembly.

The data associated with a Next_higher_assembly_relationship are the following:

- assembly_position_2d;
- assembly_position_3d;
- quantity;
- reference_designation.

4.2.556.1 assembly_position_2d

The assembly_position_2d is an inverse relationship that specifies the Component_assembly_2d_position (see 4.2.112) that specifies the Next_higher_assembly_relationship as its component. There shall be no more than one Component_assembly_2d_position for a Next_higher_assembly_relationship.

Figure 63 – Next_higher_assembly_relationship

4.2.556.2 assembly_position_3d

The assembly_position_3d is an inverse relationship that specifies the Component_assembly_3d_position (see 4.2.113) that specifies the Next_higher_assembly_relationship as its component. There shall be no more than one Component_assembly_3d_position for a Next_higher_assembly_relationship.

4.2.556.3 quantity

The quantity specifies the role of the Data_element (see 4.2.211) for the Next_higher_assembly_relationship. The quantity need not be specified for a particular Next_higher_assembly_relationship.

4.2.556.4 reference_designation

The reference_designation specifies the ee_name as an identifier for the Next_higher_assembly_relationship.

NOTE Some components, such as mechanical fasteners, may not be identified by reference_designations within a PCA. They are tracked in the Bill of Material for the PCA by part number and quantity. This application practice varies among enterprises. This practice is supported by Assembly_composition_relationship and not by Next_higher_assembly_relationship.

Constraints:

UR1: The combination of reference_designation and the assembly attribute inherited from the supertype Assembly_composition_relationship shall be unique within a population of Next_higher_assembly_relationship.

IP1: The quantity shall be provided only when the related Assembly_component is an Interconnect_component, and the quantity shall be a length unit.

IP2: Things shall not be located on themselves.

NOTE EXPRESS specification:

```

*)
ENTITY next_higher_assembly_relationship
  SUBTYPE OF (assembly_composition_relationship);
  --tt tc1 wd10 modified
  reference_designation : OPTIONAL ee_name;
  quantity               : OPTIONAL data_element;

```

4.2.558 `Non_conductive_cross_section_template`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Non_conductive_cross_section_template` is a type of a `Part_template` (see 4.2.620).

The data associated with a `Non_conductive_cross_section_template` are the following:

- `template_technology`;
- `nominal_width`.

4.2.558.1 `template_technology`

The `template_technology` specifies a `Stratum_technology` (see 4.2.871) for the `Non_conductive_cross_section_template`.

4.2.558.2 `nominal_width`

The `nominal_width` specifies a `Length_data_element` (see 4.2.511) for the `Non_conductive_cross_section_template`.

NOTE EXPRESS specification:

```
*)
ENTITY non_conductive_cross_section_template
  SUBTYPE OF (part_template);
  template_technology : stratum_technology;
  nominal_width : length_data_element;
END_ENTITY; -- non_conductive_cross_section_template

(*
```

4.2.559 Non_feature_shape_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Non_feature_shape_definition is a type of Shape_definition (see 4.2.808). A Non_feature_shape_definition may be one of a View_level_non_feature_shape_definition (see 4.2.955), or a Pre_defined_datum_axis_3d_symbol (see 4.2.705), or a Pre_defined_datum_plane_3d_symbol (see 4.2.706), or a Pre_defined_parallel_datum_axis_2d_symbol (see 4.2.709), or a Pre_defined_perpendicular_datum_axis_2d_symbol (see 4.2.711), or a Pre_defined_perpendicular_datum_plane_2d_symbol (see 4.2.713). A Non_feature_shape_definition may also be one of a Physical_unit_3d_keepout_shape (see 4.2.665), or a Physical_unit_planar_keepout_shape (see 4.2.669). A Non_feature_shape_definition shall be used to represent annotation information or other shape property information that is not appropriate for Feature_shape_definition.

NOTE Shape information that is derived from a physical shape and whose algorithmic derivation details are unavailable may be exchanged with this Application Object.

The data associated with a Non_feature_shape_definition are the following:

- associated_element;
- model_shape.

4.2.559.1 associated_element

The associated_element specifies the role of the Non_feature_shape_element (see 4.2.560) for the Non_feature_shape_definition.

4.2.559.2 model_shape

The model_shape specifies the role of the Feature_shape_definition (see 4.2.372) for the Non_feature_shape_definition. The model_shape need not be supplied.

NOTE EXPRESS specification:

```

*)
ENTITY non_feature_shape_definition
  SUPERTYPE OF ((ONEOF(
    pre_defined_datum_axis_3d_symbol,
    pre_defined_datum_plane_3d_symbol,

END_ENTITY; -- non_feature_shape_definition
( *

```

4.2.560 Non_feature_shape_element

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Non_feature_shape_element is a type of Shape_element (see 4.2.810) that is not on the physical boundary of a Physical_unit (see 4.2.664). A Non_feature_shape_element may be one of a Datum_-reference_frame (see 4.2.235), a Datum_system (see 4.2.236), a Derived_shape_element (see 4.2.260), a Directed_axis (see 4.2.303), a Positional_boundary (see 4.2.698), a Positional_boundary_member (see 4.2.701), a Tolerance_zone (see 4.2.913), a Tolerance_zone_boundary (see 4.2.915), a Tolerance_zone_-boundary_member (see 4.2.917), an Interconnect_module_constraint_region (see 4.2.446), a Mounting_restriction_area (see 4.2.550), a Mounting_restriction_volume (see 4.2.551), or a Viewing_plane (see 4.2.956). Additionally, a Non_feature_shape_element may be a Datum (see 4.2.214).

The data associated with a Non_feature_shape_element are the following:

- element_shape;
- scope.

EXAMPLE 1 The centre axis of a cylindrical hole is a Non_feature_shape_element.

4.2.560.1 element_shape

The element_shape may specify the role of a Feature_shape_occurrence (see ??), for the Non_feature_shape_element.

4.2.560.2 scope

The scope may specify the role of a Footprint_definition (see 4.2.388), a Padstack_definition (see 4.2.595), a Physical_unit (see 4.2.664), a Stratum (see 4.2.845), or a Template_definition (see 4.2.887) for the Non_feature_shape_element.

Constraints:

UR1: The combination of name inherited from Shape_element and scope shall be unique.

WR1: If the Non_feature_shape_element is a Datum it shall not also be a Datum_reference_frame, a Datum_system, a Directed_axis, a Positional_boundary, a Positional_boundary_member, a Tolerance_zone, a Tolerance_zone_boundary, a Tolerance_zone_boundary_member, or a Viewing_plane.

IP1: The Non_feature_shape_element shall not be on the boundary of a Physical_unit.

NOTE EXPRESS specification:

4.2.561 Non_feature_shape_element_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Non_feature_shape_element_relationship` is a type of `Shape_element_relationship` (see 4.2.816) that associates a `Derived_shape_element` (see 4.2.260) with a `Shape_element` (see 4.2.810) from which the `Derived_shape_element` is derived.

The data associated with a `Non_feature_shape_element_relationship` are the following:

- `related_shape_element`;
- `relating_shape_element`.

4.2.561.1 `related_shape_element`

The `related_shape_element` specifies the `Non_feature_shape_element` (see 4.2.560) for the `Non_feature_shape_element_relationship`.

4.2.561.2 `relating_shape_element`

The `relating_shape_element` specifies the `Non_feature_shape_element` (see 4.2.560) for the `Non_feature_shape_element_relationship`.

NOTE The attribute `related_shape_element` is declared in the `Shape_element_relationship` entity of which this entity is a subtype.

Constraints:

UR1: The combination of the `relating_shape_element` inherited from `Shape_element_relationship` and `related_shape_element` inherited from `Shape_element_relationship` shall be unique within a population of `Non_feature_shape_element_relationship`.

NOTE EXPRESS specification:

```

*)
ENTITY non_feature_shape_element_relationship
  SUBTYPE OF (shape_element_relationship);
    SELF\shape_element_relationship.related_shape_element : non_feature_shape_element;
    SELF\shape_element_relationship.relying_shape_element : non_feature_shape_element;
  UNIQUE
    UR1 : related_shape_element, relating_shape_element;
END_ENTITY; -- non_feature_shape_element_relationship

( *
```

4.2.562 `Non_functional_land`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Non_functional_land` is a type of `Stratum_feature_template_component` (see 4.2.862) whose implementing `Stratum_feature` (see 4.2.851) is not also being composed by other instances of `Laminate_component` (see 4.2.483). A `Non_functional_land` may be one of a `Component_termination_passage_and_contact_size_dependent_non_functional_land` (see 4.2.145), a `Component_termination_passage_dependent_non_functional_land` (see 4.2.147), a `Contact_size_dependent_non_functional_land` (see 4.2.195), an `Unsupported_passage_dependent_non_functional_land` (see 4.2.940), a `Via_and_contact_size_dependent_non_functional_land` (see 4.2.949), or a `Via_dependent_non_functional_land` (see 4.2.951).

The data associated with a `Non_functional_land` are the following:

- `access_mechanism`;
- `alternate_land_definition`;
- `usage_definition`.

4.2.562.1 `access_mechanism`

The `access_mechanism` is an inverse relationship that specifies that the existence of the `Non_functional_land` is dependent on the existence of the `Non_functional_land_join_terminal` (see 4.2.564) that specifies the `Non_functional_land` as its `associated_component`. There shall be one or more `Non_functional_land_join_terminal` for a `Non_functional_land`. The `access_mechanism` is only provided for support of plated passages within the lateral geometric boundary of the `Non_functional_land` and.

4.2.562.2 `alternate_land_definition`

The `alternate_land_definition` specifies one role of the `Land_physical_template` (see 4.2.493) for the `Non_functional_land`. The `alternate_land_definition` need not be specified for a particular `Non_functional_land`. An `alternate_land_definition` overrides the `usage_definition` if it is provided.

4.2.562.3 `usage_definition`

The `usage_definition` specifies one role of the `Land_physical_template` (see 4.2.493) for the `Non_functional_land`.

Constraints:

WR1: There shall be no direct connection to a `Conductive_interconnect_element` from a member of `Non_functional_land`.

WR2: The `stratum_feature` specified by `SELF\stratum_feature_template_component.stratum_feature_implementation` shall not be in the role of `stratum_feature_implementation` for any other `stratum_feature_template_component`.

NOTE EXPRESS specification:

```

*)
ENTITY non_functional_land
  SUPERTYPE OF (ONEOF (via_dependent_non_functional_land,
    component_termination_passage_dependent_non_functional_land,
    contact_size_dependent_non_functional_land,
    component_termination_passage_and_contact_size_dependent_non_functional_land,
    unsupported_passage_dependent_non_functional_land,
    via_and_contact_size_dependent_non_functional_land))
  SUBTYPE OF (stratum_feature_template_component);
  alternate_land_definition          : OPTIONAL land_physical_template;
  SELF\assembly_component.usage_definition : land_physical_template;
  INVERSE
    access_mechanism                : SET [1:?] OF
                                      non_functional_land_join_terminal FOR
                                      associated_component;
END_ENTITY; -- non_functional_land

( *
```

4.2.563 Non_functional_land_interface_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Non_functional_land_interface_terminal is a type of Component_feature (see 4.2.118) included to identify the interface available for attachment in the next level of assembly.

NOTE Use of this capability occurs when a member of Component_feature_to_physical_usage_view_assignment (see 4.2.123) references a member of Non_functional_land_interface_terminal to assign a relationship to an Interconnect_module_terminal (see 4.2.463). A Non_functional_land_interface_terminal shall only be associated to types of Non_functional_land established for the purpose of interface attachment.

The data associated with a Non_functional_land_interface_terminal are the following:

- associated_component;
- definition.

4.2.563.1 associated_component

The associated_component specifies the role of the Non_functional_land (see 4.2.562) for the Non_functional_land_interface_terminal.

4.2.563.2 definition

The definition specifies the role of the Land_template_interface_terminal (see 4.2.494) for the Non_functional_land_interface_terminal.

Constraints:

WR1: The Land_template that is the usage_definition for the Non_functional_land in the role of associated_component for this Non_functional_land_interface_terminal is the associated_definition for the definition of this Non_functional_land_interface_terminal.

NOTE EXPRESS specification:

```

*)
ENTITY non_functional_land_interface_terminal
  SUBTYPE OF (laminare_component_interface_terminal);
    SELF\component_feature.definition      : land_template_interface_terminal;
    SELF\component_feature.associated_component : non_functional_land;
WHERE
  WR1: SIZEOF([ 'AP210_ARM.CONTACT_SIZE_DEPENDENT_NON_FUNCTIONAL_LAND',
                'AP210_ARM.COMPONENT_TERMINATION_PASSAGE_AND_CONTACT_SIZE_DEPENDENT_NON_FUN
                'AP210_ARM.VIA_AND_CONTACT_SIZE_DEPENDENT_NON_FUNCTIONAL_LAND' ] *
            TYPEOF(SELF\component_feature.associated_component))
    = 1;
END_ENTITY; -- non_functional_land_interface_terminal

( *
```

4.2.564 Non_functional_land_join_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Non_functional_land_join_terminal is a type of Component_terminal (see 4.2.137) that is included in a design to support the description of the relationship between the Non_functional_land and a plated passage that implements a connection to a feature on a different member of Stratum (see 4.2.845) than the member of Stratum the Non_functional_land_join_terminal is associated with.

The data associated with a Non_functional_land_join_terminal are the following:

- associated_component;
- definition.

4.2.564.1 associated_component

The associated_component specifies the role of the Non_functional_land (see 4.2.562) for the Non_functional_land_join_terminal.

4.2.564.2 definition

The definition specifies the role of the Land_template_join_terminal (see 4.2.495) for the Non_functional_land_join_terminal. The valid purposes for a Non_functional_land_join_terminal are to connect to a Via_terminal or a Component_termination_passage_join_terminal.

Constraints:

WR1: The Land_template that is the usage_definition for the Non_functional_land this Non_functional_land_join_terminal is a terminal of is the associated_definition for the definition of this Non_functional_land_join_terminal.

WR2: A Non_functional_land_join_terminal is only to be connected to a passage join terminal, and to nothing else. It is not allowed to be connected to a trace on the same layer; the join is required to be to a passage within the lateral extent of the non-functional land.

NOTE EXPRESS specification:

```
*)
ENTITY non_functional_land_join_terminal
  SUBTYPE OF (laminar_component_join_terminal);
    SELF\component_feature.definition      : land_template_join_terminal;
    SELF\component_feature.associated_component : non_functional_land;
END_ENTITY; -- non_functional_land_join_terminal

( *
```

4.2.565 Numeric_parameter

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Numeric_parameter is a type of Characteristic (see 4.2.98). A Numeric_parameter is a quantitative value in an identified unit of measure. Uncertainty may be applied to the value by referencing the Qualified_data_element (see ??) type of Data_element.

NOTE Actual values of occurrence data will be dependent on many variables.

The data associated with a Numeric_parameter are the following:

— property_value.

4.2.565.1 property_value

The property_value specifies the Data_element (see 4.2.211) for the quantitative value and unit of measure for the Numeric_parameter.

NOTE EXPRESS specification:

```

*)
ENTITY numeric_parameter
  SUBTYPE OF (characteristic);
  SELF\characteristic.property_value : data_element;
END_ENTITY; -- numeric_parameter

--tt tc1 wd9
( *
```

4.2.566 Open_shell_based_surface

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Open_shell_based_surface` is a type of `Feature_shape_definition` (see 4.2.372) that represents a shape with a simple or complex surface using a set of connected faces. The shape shall be manifold and shall not be closed. The shape shall not be used in the composition of a closed volume. The shape shall be a single shell if it is the shape of a `Stratum_feature` (see 4.2.851), `Stratum_feature_template_component` (see 4.2.862), `Stratum_feature_template` (see 4.2.861), or the shape of a `Design_intent_modification` (see 4.2.267). The shape shall be one or more shell if it is the shape of a `Stratum` (see 4.2.845). The shape shall be a single shell if it is the shape of a `Stratum_average_surface` (see 4.2.847) or the shape of a `Stratum_surface` (see 4.2.868). An `Open_shell_based_surface` guarantees material continuity as the material traverses corners in a three-dimensional model.

NOTE EXPRESS specification:

```

*)
ENTITY open_shell_based_surface
  SUPERTYPE OF (ONEOF(
    stratum_average_surface_shape,
    stratum_surface_shape,
    design_intent_modification_non_planar_2d_shape,
    part_template_non_planar_2d_shape,
    stratum_feature_non_planar_2d_shape))
  SUBTYPE OF (shape_definition);
END_ENTITY; -- open_shell_based_surface

( *
```

4.2.567 Operational_requirement_occurrence_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Operational_requirement_occurrence_relationship` is a type of `Managed_design_object` (see 4.2.524). An `Operational_requirement_occurrence_relationship` is the association between one `Ee_requirement_occurrence` (see 4.2.330) and another, with a defined type of relationship. An `Operational_requirement_occurrence_relationship` is an incompletely modeled concept and shall be combined with members of `Requirement_composition` (see 4.2.770) to form a complete requirement.

The data associated with an `Operational_requirement_occurrence_relationship` are the following:

- `related_requirement_occurrence`;
- `relating_requirement_occurrence`;
- `relationship_type`.

4.2.567.1 `related_requirement_occurrence`

The `related_requirement_occurrence` specifies the first `Ee_requirement_occurrence` (see 4.2.330) for the `Operational_requirement_occurrence_relationship`. The first `Ee_requirement_occurrence` is the dependent item if the relationship is a dependency relationship.

4.2.567.2 `relating_requirement_occurrence`

The `relating_requirement_occurrence` specifies the second `Ee_requirement_occurrence` (see 4.2.330) for the `Operational_requirement_occurrence_relationship`. The second `Ee_requirement_occurrence` is the independent item if the relationship is a dependency relationship.

4.2.567.3 `relationship_type`

The `relationship_type` specifies one of the following:

- an `AND_OPERATION`;
- an `OR_OPERATION`;
- a `DERIVED_FROM` relationship.

The mathematical operations `AND`, `OR` shall be implemented for this `relationship_type`. `DERIVED_FROM` only asserts a dependency relationship. The `AND_OPERATION` is provided so that changes in `relationship_type` from `OR_OPERATION` to `AND_OPERATION` do not cause a structural change to the populated data. The implicit relationship between two member of `Ee_requirement_occurrence` that help to compose the same `Requirement_group_occurrence` is an `AND` relationship.

Constraints:

WR1: Each member of `Operational_requirement_occurrence_relationship` shall specify members of `Ee_requirement_occurrence` that are also specified by a member of `Requirement_composition` that specifies a member of `Requirement_group_occurrence` as the composition or result of the operation.

NOTE EXPRESS specification:

```
*)
ENTITY operational_requirement_occurrence_relationship
  SUBTYPE OF (managed_design_object);
    relationship_type      : relationship_operation;
    relating_requirement_occurrence : ee_requirement_occurrence;
    related_requirement_occurrence  : ee_requirement_occurrence;
END_ENTITY; -- operational_requirement_occurrence_relationship

( *
```

4.2.568 `Opposing_boundary_set_size_characteristic`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An `Opposing_boundary_set_size_characteristic` is a type of `Boundary_size_characteristic` (see 4.2.78) that defines the distance between the two members of a `Tolerance_zone_opposing_boundary_set` (see 4.2.926). The two members may or may not be explicitly identified.

The data associated with an `Opposing_boundary_set_size_characteristic` are the following:

— `sized_boundary_set`.

4.2.568.1 `sized_boundary_set`

The `sized_boundary_set` specifies the `Tolerance_zone_opposing_boundary_set` (see 4.2.926) of which the distance between its two members is defined by the `Opposing_boundary_set_size_characteristic`.

Constraints:

WR1: The `Tolerance_zone_boundary` specified as the `sized_boundary_set` shall be the same instance of `Tolerance_zone_boundary` as specified by the `defined_zone_boundary` of the `Boundary_zone_definition_with_specified_size` that is specified as the `boundary_definition`.

NOTE The attribute `boundary_definition` is declared in the `Boundary_size_characteristic` entity of which this entity is a subtype.

NOTE EXPRESS specification:

```

*)
ENTITY opposing_boundary_set_size_characteristic
  SUBTYPE OF (boundary_size_characteristic);
    sized_boundary_set : tolerance_zone_opposing_boundary_set;
END_ENTITY; -- opposing_boundary_set_size_characteristic

( *

```

4.2.569 Organization

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Organization is a type of Managed_design_object (see 4.2.524). An Organization is a collection of persons grouped for a specific purpose.

The data associated with an Organization are the following:

- address;
- identifier.

4.2.569.1 address

The address specifies the string that describes the location where the Organization may be reached by postal mail or in person. The address need not be specified for a particular Organization.

4.2.569.2 identifier

The identifier specifies the name of the Organization.

EXAMPLE 1 The identifier may be a concatenation of the following: "Country code" = country code (as established by UN); "Organization code name" = identifying name the country gives the code; "Organization code" = organization code (as established by country assigning the organization code); "Sub Organization code" = sub organization code (as established by organization). This illustrates the usage: "Country code" = "USA", "Organization code name" = "CAGE", "Organization code" = "12345", "Sub Organization code" = "Telecommunications".

NOTE Reference ISO 6523 amendment 1:1994.

Constraints:

UR1: The identifier shall be unique within a population of Organizations.

NOTE EXPRESS specification:

```

*)
ENTITY organization
  SUBTYPE OF (managed_design_object);
  identifier : ee_name;
  address    : OPTIONAL STRING;
  UNIQUE
    UR1 : identifier;
END_ENTITY; -- organization

( *
```

4.2.570 Owned_design_object

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Owned_design_object is a type of Managed_design_object (see 4.2.524). An Owned_design_object identifies the Managed_design_object which participates in the Owned_assignment (see ??).

NOTE The purpose of Owned_design_object is identify the single authority ownership of design aspects. The typical use is to negotiate between the owners of the different design aspects. If there are multiple joint owners, then the Frozen_design_object is more appropriate since that uses Ee_approval which supports multiple signatures.

NOTE EXPRESS specification:

```

*)
ENTITY owned_design_object
  SUBTYPE OF (managed_design_object);
  INVERSE
    owner : owner_assignment for owned_item;
END_ENTITY; -- owned_design_object

( *
```

4.2.571 Owner_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Owner_assignment is a type of Managed_design_object (see 4.2.524). An Owner_assignment is the specification that one or more Owned_design_object (see 4.2.570) are controlled by a specific entity during design activity.

The data associated with an Owner_assignment are the following:

- assigned_owner;
- owned_item.

4.2.571.1 assigned_owner

An assigned_owner specifies the role of the Person_and_organization (see 4.2.647) for the Owner_assignment.

4.2.571.2 owned_item

The owned_item specifies an Owned_design_object (see 4.2.570) for which the design is owned by the assigned_owner. There shall be one or more Owned_design_object for a Owner_assignment.

Constraints:

WR1: Each Owner_assignment shall not be referenced by any Owner_assignment.

NOTE EXPRESS specification:

```
*)  
ENTITY owner_assignment  
  SUBTYPE OF (managed_design_object);  
    owned_item      : SET [1:?] OF owned_design_object;  
    assigned_owner : person_and_organization;  
END_ENTITY; -- owner_assignment  
  
(*
```

4.2.572 Movable_packaged_component_join_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Movable_packaged_component_join_terminal is a type of Packaged_component_join_terminal (see 4.2.586). A Movable_packaged_component_join_terminal is one termination for a Movable_packaged_component (see ??). The terminal provides access to the electrical functionality of the movable_packaged part being terminated.

The data associated with a Movable_packaged_component_join_terminal are the following:

- maximum_wire_terminal_length;
- minimum_wire_terminal_length.

4.2.572.1 maximum_wire_terminal_length

The maximum_wire_terminal_length specifies the maximum dimension of the Length_data_element (see 4.2.511) of the Movable_packaged_component_join_terminal.

4.2.572.2 minimum_wire_terminal_length

The minimum_wire_terminal_length specifies the minimum dimension of the Length_data_element (see 4.2.511) of the Movable_packaged_component_join_terminal.

NOTE EXPRESS specification:

```

*)
ENTITY movable_packaged_component_join_terminal
  SUBTYPE OF (packaged_component_join_terminal)
    maximum_wire_terminal_length          : length_data_element;
    minimum_wire_terminal_length          : length_data_element;
WHERE
  WR1: 'AP210_ARM.WIRE_TERMINAL' IN
    TYPEOF(SELF\component_feature.definition\packaged_part_terminal.
      terminal_of_package);
END_ENTITY; -- movable_packaged_component_join_terminal
( *
```

4.2.573 Package

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Package is a type of a Physical_unit_usage_view (see 4.2.672). A Package may be a Altered_package (see 4.2.8). A Package describes the physical container of a Packaged_part (see 4.2.591). A Package includes no more than one package body and one or more package terminals.

EXAMPLE 1 Figures 64 through 69 illustrate types of Packages and parameters related to Geometric Dimensioning and Tolerancing supported by this part of ISO 10303. ISO 10303-202 would be used in conjunction with this part of ISO 10303 to define the exchange of the presentation information (i.e., the drawings). This part of ISO 10303 supports the direct application to application exchange of the parametric data illustrated in the drawings.

EXAMPLE 2 Figures 87 through 93 illustrate parameters and features related to Package orientation for assembly purposes supported by this part of ISO 10303. ISO 10303-202 would be used in conjunction with this part of ISO 10303 to define the exchange of the presentation information (i.e., the drawings).

NOTE When used for a Packaged_part "white box model", the Part_device (see 4.2.606) is installed in the Package and an electrical connection is defined between each terminal on the installed Part_device and one or more terminals on the Package.

The data associated with a Package are the following:

- body;
- cutout_required;
- least_lead_length_below_seating_plane;
- least_material_condition_centroid_location;
- maximum_body_clearance_above_seating_plane;
- maximum_body_clearance_below_seating_plane;
- maximum_body_height_above_seating_plane;
- maximum_body_height_below_seating_plane;
- maximum_lead_length_below_seating_plane;
- maximum_material_condition_centroid_location;
- minimum_body_clearance_above_seating_plane;
- minimum_body_clearance_below_seating_plane;
- package_accesses;
- package_polarity_indication;
- package_primary_orientation_feature;
- interface_plane;
- package_seating_plane;
- package_secondary_orientation_feature;
- package_tertiary_orientation_feature;
- mounting_technology.

Figure 64 – Axial lead

Figure 65 – Eight lead SOIC

Figure 66 – Eight lead DIP

Figure 68 – Ball grid array

4.2.573.1 body

The body is an inverse relationship that specifies the Package_body (see 4.2.574) that specifies the Package as its associated_definition. There shall be no more than one Package_body for a Package.

4.2.573.2 cutout_required

The cutout_required specifies a derived value of TRUE or FALSE, depending on the existence of the optional attribute maximum_body_height_below_seating_plane. If the attribute exists, the value is TRUE. If the attribute is not present, the value is FALSE.

4.2.573.3 least_lead_length_below_seating_plane

The least_lead_length_below_seating_plane is a Length_data_element (see 4.2.511) that specifies the smallest lead length below the seating plane. The least_lead_length_below_seating_plane need not be specified for a particular Package.

4.2.573.4 least_material_condition_centroid_location

The least_material_condition_centroid_location specifies a Cartesian_point that is the location of the center of mass for the minimum material state for the Package. The least_material_condition_centroid_location need not be specified for a Package.

4.2.573.5 maximum_body_clearance_above_seating_plane

The maximum_body_clearance_above_seating_plane specifies a Length_data_element that is the maximum length between the body and the top of the seating_plane. A maximum_body_clearance_above_seating_plane need not be specified for a Package.

4.2.573.6 maximum_body_clearance_below_seating_plane

The maximum_body_clearance_below_seating_plane specifies a Length_data_element that is the maximum length between the body and the bottom of the seating_plane. A maximum_body_clearance_below_seating_plane need not be specified for a Package.

4.2.573.7 maximum_body_height_above_seating_plane

The maximum_body_height_above_seating_plane is a Length_data_element (see 4.2.511) that specifies the maximum height of the Package above the seating plane. Since there is no attribute describing the maximum terminal height above the seating plane, this attribute shall be interpreted as the furthest point away from the seating plane of either the body or of any Package_terminal (see 4.2.581) above the seating plane.

EXAMPLE 1 In the case of package to be mounted in a cutout there may only be the surface mounted leads protruding above the seating plane.

Note 1 : Positional tolerance of leads applies only within distance above base plane specified.

Figure 69 – T099

4.2.573.8 maximum_body_height_below_seating_plane

The `maximum_body_height_below_seating_plane` is a `Length_data_element` (see 4.2.511) that specifies the maximum height of the Package below the seating plane. The `maximum_body_height_below_seating_plane` need not be specified for a particular Package.

4.2.573.9 maximum_lead_length_below_seating_plane

The `maximum_lead_length_below_seating_plane` is a `Length_data_element` (see 4.2.511) that specifies the maximum lead length below the seating plane. The `maximum_lead_length_below_seating_plane` need not be specified for a particular Package.

4.2.573.10 maximum_material_condition_centroid_location

The `maximum_material_condition_centroid_location` specifies a `Cartesian_point` that is the location of the center of mass for the maximum material state for the Package. The `maximum_material_condition_centroid_location` need not be specified for a Package.

4.2.573.11 minimum_body_clearance_above_seating_plane

The `minimum_body_clearance_above_seating_plane` specifies a `Length_data_element` (see 4.2.511) that is the minimum length between the body and the seating plane. A `minimum_body_clearance_below_seating_plane` need not be specified for a Package.

4.2.573.12 minimum_body_clearance_below_seating_plane

The `minimum_body_clearance_below_seating_plane` specifies a `Length_data_element` that is the minimum length between the body and the seating plane. A `minimum_body_clearance_below_seating_plane` need not be specified for a Package.

4.2.573.13 package_accesses

The `package_accesses` is an inverse relationship that specifies that the existence of the Package is dependent on the existence of the `Package_terminal` (see 4.2.581) that specifies the Package as its `associated_definition`. There shall be zero or more `Package_terminal` for a Package.

4.2.573.14 package_polarity_indication

The `package_polarity_indication` is an inverse relationship that specifies the `Part_feature` (see 4.2.609) that specifies the Package as its `associated_definition`. There shall be no more than one `Part_feature` for a Package in this role.

4.2.573.15 package_primary_orientation_feature

The package_primary_orientation_feature is an inverse relationship that specifies the Part_feature (see 4.2.609) that specifies the Package as its associated_definition. There shall be no more than one Part_feature for a Package in this role.

4.2.573.16 interface_plane

The interface_plane is an inverse relationship that specifies the Seating_plane (see 4.2.802) that specifies the Package as its scope. The seating_plane simulates the interface surface of an external device.

NOTE The interface_plane is typically used for connectors, but may be used for modules.

EXAMPLE 1 A use of interface_plane is in the case of a fiber-optic transceiver that is mounted on a PCB but has a right angle connector to interface with a fiber.

4.2.573.17 package_seating_plane

The package_seating_plane is an inverse relationship that specifies the Seating_plane (see 4.2.802) that specifies the Package as its scope. The seating_plane simulates the mounting surface for the terminals in the case of surface mounted parts and in the case of through-hole technology, an arbitrarily established mounting surface. Terminals are required to approach the seating_plane from the top, which is the side where the values on the Z axis are positive. Package installation is defined to be only from the top of the seating_plane in order to reduce orientation errors between two-dimensional and three-dimensional models in this part of ISO 10303.

4.2.573.18 package_secondary_orientation_feature

The package_secondary_orientation_feature is an inverse relationship that specifies the Part_feature (see 4.2.609) that specifies the Package as its associated_definition. There shall be no more than one Part_feature for a Package in this role.

4.2.573.19 package_tertiary_orientation_feature

The package_tertiary_orientation_feature is an inverse relationship that specifies the Part_feature (see 4.2.609) that specifies the Package as its associated_definition. There shall be no more than one Part_feature for a Package in this role.

4.2.573.20 mounting_technology

The mounting_technology specifies a value of surface_mount or through_hole for the Package. Surface_mount indicates that the Package_terminals have a Connection_zone that is congruent with the package_seating_plane and through_hole indicates the terminals penetrate the package_seating_plane.

Constraints:

WR1: Only a Primary_orientation_feature shall be in the role of package_primary_orientation_feature.

WR2: Only a Secondary_orientation_feature shall be in the role of package_secondary_orientation_feature.

WR3: Only a Polarity_indication_feature shall be in the role of package_polarity_indication.

WR4: The package_primary_orientation_feature shall not be the package_secondary_orientation_feature.

WR5: The package_primary_orientation_feature shall not be the package_tertiary_orientation_feature.

WR6: The package_tertiary_orientation_feature shall not be the package_secondary_orientation_feature.

WR7: There shall be a package category associated with the product the package is a definition for.

4.2.574 Package_body

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Package_body is a type of Part_feature (see 4.2.609) that is the encasement used in the realization of a Package (see 4.2.573). The observer view shall be above the seating plane and shall be higher than the highest point of the Package_body.

The data associated with a Package_body are the following:

- associated_definition;
- body_bottom_surface;
- body_material;
- body_top_surface.

4.2.574.1 associated_definition

The associated_definition specifies the role of the Package (see 4.2.573) for the Package_body.

4.2.574.2 body_bottom_surface

The body_bottom_surface specifies the role of a Package_body_bottom_surface (see 4.2.575) for the Package_body. A body_bottom_surface need not be specified for a Package_body.

4.2.574.3 body_material

The body_material specifies the Ee_material (see 4.2.318) used in the manufacture of the Package_body.

4.2.574.4 body_top_surface

The body_top_surface specifies the role of a Package_body_top_surface (see 4.2.579) for the Package_body. A body_top_surface need not be specified for a Package_body.

NOTE EXPRESS specification:

4.2.578 Package_body_surface

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Package_body_surface is either a Package_body_top_surface (see 4.2.579) or a Package_body_bottom_surface (see 4.2.575). A Package_body_surface relationship to the seating plane may be explicitly established, helping to unambiguously orient the Packaged_part (see 4.2.591).

The data associated with a Package_body_surface are the following:

— associated_package_body.

4.2.578.1 associated_package_body

The associated_package_body specifies the role of the Package_body (see 4.2.574) for the Package_body_surface.

NOTE EXPRESS specification:

```
*)
ENTITY package_body_surface
  ABSTRACT SUPERTYPE OF (ONEOF (

4.2.580 Package_external_reference

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Package_external_reference is a type of Managed_design_object (see 4.2.524). A Package_external_reference is an unambiguous reference to the definition of a Package (see 4.2.573) in an external system.

NOTE Package_external_reference is included to permit references to Packaged_part_terminal (see 4.2.594) without requiring that a geometric representation be present for the terminal.

The data associated with a Package_external_reference are the following:

- design_owner;
- part_number;
- revision_code;
- product_definition_id.

4.2.580.1 design_owner

The design_owner specifies one role of a string for the Package_external_reference. The design_owner controls the assignment of part_number for the Package being referenced.

4.2.580.2 part_number

The part_number specifies one role of a string for the Package_external_reference. The part_number represents an identifier unique within the organization for packages.

4.2.580.3 revision_code

The revision_code specifies one role of a string for the Package_external_reference. The revision_code represents a version of the package, and together with part_number is unique within the organization for packages.

4.2.580.4 product_definition_id

The product_definition_id specifies one role of a string for the Package_external_reference. The product_definition_id represents the identification of the definition of the Package being referenced.

NOTE EXPRESS specification:

```

*)
ENTITY package_external_reference
  SUBTYPE OF (managed_design_object);

    product_definition_id : STRING;
END_ENTITY; -- package_external_reference

```

(*

4.2.581 Package_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Package_terminal is a type of Part_feature (see 4.2.609). A Package_terminal may be one or more of a Guided_wave_terminal (see 4.2.427), a Altered_package_terminal (see 4.2.9), a Wire_terminal (see 4.2.963), or a Primary_reference_terminal (see 4.2.718). When the case or package body is used as a terminal then Package_terminal shall be populated to specify the feature of the Package_body (see 4.2.574) that serves that purpose. The Package_terminal shall be in a sequence, with the initial member being Primary_reference_terminal, and each member that is not a Primary_reference_terminal shall reference a previous member in the sequence using the precedent_feature attribute inherited from Part_feature. The seating_plane_zone shall not exist if the seating_plane_intersection attribute is 'does not intersect'. The seating_plane_intersection attribute shall not be 'does not intersect' if the seating_plane_zone attribute exists.

NOTE The Seating_plane referenced indirectly by this terminal may be in the role of interface_plane for the Package referenced by associaed_definition.

EXAMPLE 1 Figure 70 illustrates a cutaway view of a terminal and shows the characteristics related to a terminal.

The data associated with a Package_terminal are the following:

- associated_definition;
- external_connection_zone;
- feature_shape;
- internal_connection_zone;
- seating_plane_intersection;
- maximum_terminal_diametrical_extent;
- minimum_terminal_diametrical_extent;
- model_representation;
- terminal_characteristic;
- terminal_core_material;
- terminal_surface_material.

4.2.581.1 associated_definition

The associated_definition specifies the role of the Package (see 4.2.573) for the Package_terminal.

Figure 70 – Package_terminal

4.2.581.2 external_connection_zone

The `external_connection_zone` specifies the `Connection_zone` (see 4.2.185) on the outside surface of the `Package_terminal`. There may be more than one `Connection_zone` for a `Package_terminal`. The `external_connection_zone` is optional and need not be supplied if the source system does not contain the data. If the source system contains the data, then the `external_connection_zone` shall be supplied.

NOTE The `Feature_shape_occurrence` (see ??) specified by the terminal or mounting feature may be the same `Feature_shape_occurrence` that is specified by the associated `Connection_zone` (see 4.2.185). In this case the whole terminal is the `Connection_zone`.

4.2.581.3 feature_shape

The `feature_shape` specifies the role of the `Feature_shape_occurrence` (see ??) for the `Package_terminal`. There shall be one or more `Feature_shape_occurrence` for the `Package_terminal`.

4.2.581.4 internal_connection_zone

The `internal_connection_zone` specifies the `Connection_zone` (see 4.2.185) on the inside portion of the `Package_terminal`. There may be more than one `Connection_zone` in the role of `internal_connection_zone`. The `internal_connection_zone` need not be specified for a particular `Package_terminal`.

NOTE The `internal_connection_zone` is separate from the `external_connection_zone`.

4.2.581.5 seating_plane_intersection

The `seating_plane_intersection` specifies whether or not the shape of the `Package_terminal` intersects the shape of the seating plane to within the tolerance of the geometric context. The values allowed for the attribute are 'surface_intersection', 'through_intersection', 'does_not_intersect'.

NOTE Not all terminals need to intersect the seating plane.

4.2.581.6 maximum_terminal_diametrical_extent

The `maximum_terminal_diametrical_extent` specifies the `Length_data_element` (see 4.2.511) that represents the maximum allowed diameter of a `Package_terminal`. The `Length_data_element` need not be specified for a `Package_terminal`. The `Length_data_element` is the diameter of a circle that circumscribes the cross-sectional shape of the terminal.

4.2.581.7 minimum_terminal_diametrical_extent

The `minimum_terminal_diametrical_extent` specifies the `Length_data_element` (see 4.2.511) that represents the minimum allowed diameter of a `Package_terminal`. The `Length_data_element` need not be specified for a `Package_terminal`. The `Length_data_element` is the diameter of a circle that circumscribes the cross-sectional shape of the terminal.

4.2.581.8 model_representation

The `model_representation` specifies the `Analytical_representation` (see 4.2.22) that embodies the analysis characteristics identified as `terminal_characteristics`. The `model_representation` need not be specified for a particular `Package_terminal`. There may be more than one `Analytical_representation` for a `Package_terminal`.

4.2.581.9 terminal_characteristic

The `terminal_characteristic` specifies the `Characteristic` (see 4.2.98) of the `Package_terminal`. The `terminal_characteristic` need not be specified for a particular `Package_terminal`. There may be more than one `Characteristic` for a `Package_terminal`.

4.2.581.10 terminal_core_material

The `terminal_core_material` specifies the role of the `Material_definition` (see 4.2.531) for the `Package_terminal` core material. The `terminal_core_material` is optional and need not be supplied.

4.2.581.11 terminal_surface_material

The `terminal_surface_material` specifies the role of the `Material_definition` (see 4.2.531) for the outer surface of the `Package_terminal` surface material.

Constraints:

WR1: The `Package` instance specified by `associated_definition` shall have a cartesian coordinate system frame of reference.

NOTE EXPRESS specification:

```

4.2.582 Package_terminal_external_reference

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Package_terminal_external_reference` is a type of `Managed_design_object` (see 4.2.524). A `Package_terminal_external_reference` is an unambiguous reference to a `Package_terminal` (see 4.2.581) in an external system.

EXAMPLE 1 Items in a `Physical_connectivity_definition` (see 4.2.652) may need to reference terminals in a library without duplicating the geometric context.

The data associated with a `Package_terminal_external_reference` are the following:

- `associated_definition`;
- `name`.

4.2.582.1 associated_definition

The `associated_definition` specifies the role for a `Package_external_reference` (see 4.2.580) for the `Package_terminal_external_reference`.

4.2.582.2 name

The `name` specifies the role of a string for the `Package_terminal_external_reference`. The `name` shall be interpreted as the `name` attribute inherited by `Package_terminal` from `Shape_element`.

Constraints:

UR1: Each member of `Package_terminal_external_reference` shall have a unique combination of attributes.

NOTE EXPRESS specification:

```
*)
ENTITY package_terminal_external_reference
  SUBTYPE OF (managed_design_object);
    associated_definition : package_external_reference;
    name                  : STRING;
  UNIQUE
    UR1 : associated_definition, name;
END_ENTITY; -- package_terminal_external_reference

( *
```

4.2.583 Package_terminal_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Package_terminal_occurrence` is a type of `Managed_design_object` (see 4.2.524). A `Package_terminal_occurrence` is an occurrence of a `Package_terminal` (see 4.2.581) in a `Packaged_component` (see 4.2.585) for the case where the equivalent `Packaged_part_terminal` (see 4.2.594) is not populated. This application object is provided to specify the cases where no `Packaged_part_terminal` is defined for a `Package_terminal` because there is no access to functionality specified through that `Package_terminal`. There is a requirement to support the fact that the `Assembly_joint` (see 4.2.41) connects the realized terminal of the component to the realized terminal of an `Interconnect_module_component` (see 4.2.442) or to other members of `Assembly_component`.

The data associated with a `Package_terminal_occurrence` are the following:

- `associated_component`;
- `definition`.

4.2.583.1 `associated_component`

The `associated_component` specifies the role of the `Packaged_component` (see 4.2.585) for the `Package_terminal_occurrence`.

4.2.583.2 `definition`

The `definition` specifies the role of the `Package_terminal` (see 4.2.581) that has no defined electrical functionality for the `Package_terminal_occurrence`.

NOTE EXPRESS specification:

```

*)
ENTITY package_terminal_occurrence
  SUBTYPE OF (managed_design_object);
    definition          : package_terminal;

4.2.584 `Package_terminal_surface_constituent_relationship`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Package_terminal_surface_constituent_relationship` is a type of `Shape_element_constituent_relationship` (see 4.2.813).

NOTE EXPRESS specification:

```

*)
ENTITY package_terminal_surface_constituent_relationship
  SUBTYPE OF (shape_element_constituent_relationship);
  SELF\shape_element_relationship.relatng_shape_element : package_body_surface;
  SELF\shape_element_relationship.related_shape_element : package_terminal;
END_ENTITY; -- package_terminal_surface_constituent_relationship

( *
```

4.2.585 Packaged_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Packaged_component is a type of Assembly_component (see 4.2.34). A Packaged_component may be a Packaged_connector_component (see 4.2.588) or additionally a Routed_packaged_component (see ??). A Packaged_component is an instantiation of a Packaged_part (see 4.2.591) at a given location within the context of a printed circuit assembly.

The data associated with a Packaged_component are the following:

- access_mechanism;
- selected_package_alterate;
- usage_definition.

4.2.585.1 access_mechanism

The access_mechanism is an inverse relationship that specifies that the existence of the Packaged_component is dependent on the existence of the Packaged_component_join_terminal (see 4.2.586) that specifies the Packaged_component as its associated_component. There shall be one or more Packaged_component_join_terminal for a Packaged_component.

4.2.585.2 selected_package_alterate

The selected_package_alterate specifies the role of the Altered_package (see 4.2.8) for the Packaged_component. The selected_package_alterate need not be specified for a particular Packaged_component.

4.2.585.3 usage_definition

The usage_definition specifies the role of the Packaged_part (see 4.2.591) for the Packaged_component.

Constraints:

WR1: If `selected_package_alternate` exists, then the `selected_package_alternate` shall be in the role of `used_package` for the `Packaged_part` in the role of `usage_definition` for the `Packaged_component`.

NOTE EXPRESS specification:

```

*)
ENTITY packaged_component
  SUPERTYPE OF (packaged_connector_component)
  --tt tc1 wd11 modify
  SUBTYPE OF (physical_component);
    SELF\assembly_component.usage_definition : packaged_part;
    selected_package_alternate                : OPTIONAL altered_package;
  INVERSE
    access_mechanism : SET [1:?] OF packaged_component_join_terminal FOR
                          associated_component;
END_ENTITY; -- packaged_component

( *
```

4.2.586 Packaged_component_join_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Packaged_component_join_terminal` is a type of `Physical_component_terminal` (see 4.2.650). A `Packaged_component_join_terminal` may be a `Movable_packaged_component_join_terminal` (see 4.2.572). A `Packaged_component_join_terminal` is one termination for a `Packaged_component` (see 4.2.585). The terminal provides access to the electrical functionality of the packaged part being terminated.

EXAMPLE 1 Figure 71 illustrates a detail of a assembly drawing that shows a microcircuit plugged into a socket, and the role of the `Packaged_component_join_terminal`.

The data associated with a `Packaged_component_join_terminal` are the following:

- `associated_component`;
- `definition`.

4.2.586.1 associated_component

The `associated_component` specifies the `Packaged_component` (see 4.2.585) being accessed by the `Packaged_component_join_terminal`.

Figure 71 – Packaged_component_join_terminal

4.2.586.2 definition

The definition specifies the role of the Packaged_part_join_terminal (see 4.2.593) for the Packaged_component_join_terminal.

NOTE EXPRESS specification:

```

*)
ENTITY packaged_component_join_terminal
  SUPERTYPE OF (movable_packaged_component_join_terminal)
  SUBTYPE OF (physical_component_terminal);
  SELF\component_feature.definition          : packaged_part_join_terminal;
  SELF\component_feature.associated_component : packaged_component;
END_ENTITY; -- packaged_component_join_terminal

```

(*

4.2.587 Packaged_connector

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Packaged_connector` is a type of `Packaged_part` (see 4.2.591) whose functionality between certain terminals is defined to be a short by this part of ISO 10303. The short shall be between the interface terminal and the join terminal specified by a member of `Packaged_connector_terminal_relationship` (see 4.2.590). The short is a logical abstraction for CAD purposes. The detailed functional properties of the connector are defined in the connector specification.

NOTE One use for a `Packaged_connector` is to provide access to the physical network of the printed circuit assembly from an external source.

EXAMPLE 1 Figure 72 illustrates a `Packaged_connector` and its usage in a design context as a `Packaged_connector_component` (see 4.2.588).

The data associated with a `Packaged_connector` are the following:

— `characterized_connector_terminal_relationship`.

4.2.587.1 `characterized_connector_terminal_relationship`

The `characterized_connector_terminal_relationship` is an inverse relationship that specifies that the existence of the `Packaged_connector` is dependent on the existence of the `Packaged_connector_terminal_relationship` (see 4.2.590) that specifies the `Packaged_connector` as its connector. There shall be one or more `Packaged_connector_terminal_relationship` for a `Packaged_connector`.

NOTE EXPRESS specification:

```
*)
ENTITY packaged_connector
  SUBTYPE OF (packaged_part);
  INVERSE
    characterized_connector_terminal_relationship :
      SET [1:?] OF packaged_connector_terminal_relationship FOR connector;
END_ENTITY; -- packaged_connector
(*
```

4.2.588 `Packaged_connector_component`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Packaged_connector_component` is a type of `Packaged_component` (see 4.2.585) that is an occurrence of a `Packaged_connector` (see 4.2.587).

EXAMPLE 1 Figure 73 illustrates a member of `Packaged_connector_component` that is a socket.

Figure 72 – Packaged_connector

The data associated with a `Packaged_connector_component` are the following:

- `interface_access_mechanism`;
- `usage_definition`.

4.2.588.1 `interface_access_mechanism`

The `interface_access_mechanism` is an inverse relationship that specifies that the existence of the `Packaged_connector_component` is dependent on the existence of the `Packaged_connector_component_interface_terminal` (see 4.2.589) that specifies the `Packaged_connector_component` as its `associated_component`. There shall be one or more `Packaged_connector_component_interface_terminal` for a `Packaged_connector_component`.

4.2.588.2 `usage_definition`

The `usage_definition` specifies the role of the `Packaged_connector` (see 4.2.587) for the `Packaged_connector_component`.

NOTE EXPRESS specification:

```

*)
ENTITY packaged_connector_component
--tt tc1 wd9 modified
  SUBTYPE OF (interface_component, packaged_component);
  SELF\assembly_component.usage_definition : packaged_connector;
  INVERSE
    interface_access_mechanism : SET [1:?] OF
                                     packaged_connector_component_interface_terminal FOR
                                     associated_component;
END_ENTITY; -- packaged_connector_component

( *
```

4.2.589 `Packaged_connector_component_interface_terminal`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Packaged_connector_component_interface_terminal` is a type of `Component_interface_terminal` (see 4.2.125). The `Packaged_connector_component_interface_terminal` indicates explicitly that the object is an interface terminal of a connector and that the terminal will never be connected to the circuit board or substrate.

Figure 73 – Packaged_connector_component

NOTE In the context of system simulation and test, a `Packaged_connector_component_interface_terminal` may represent a cabling or external connection interface. Further, it provides the exact geometric location of the terminal, whereby the exact geometric location of a mating terminal may be checked to determine whether the physical connection zones of the two interface terminals mate properly.

The data associated with a `Packaged_connector_component_interface_terminal` are the following:

- `associated_component`;
- `definition`.

4.2.589.1 associated_component

The `associated_component` specifies the role of the `Packaged_connector_component` (see 4.2.588) for the `Packaged_connector_component_interface_terminal`.

4.2.589.2 definition

The definition specifies the role of the `Packaged_part_interface_terminal` (see 4.2.592) for the `Packaged_connector_component_interface_terminal`.

NOTE EXPRESS specification:

```
*)
ENTITY packaged_connector_component_interface_terminal
  SUBTYPE OF (component_interface_terminal);
    SELF\component_feature.definition      : packaged_part_interface_terminal;
    SELF\component_feature.associated_component : packaged_connector_component;
END_ENTITY; -- packaged_connector_component_interface_terminal

( *
```

4.2.590 Packaged_connector_terminal_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Packaged_connector_terminal_relationship` is a type of `Managed_design_object` (see 4.2.524). A `Packaged_connector_terminal_relationship` is the association between one interface terminal and a corresponding join terminal of the `Packaged_connector` (see 4.2.587) that specifies that the two terminals are shorted internally to the `Packaged_connector` as part of its required functionality. This relationship is an explicit statement of the inherent functionality of a connector. Therefore no separate `Functional_unit_network_definition` (see 4.2.402) or `Analytical_model` (see 4.2.14) is required to specify the nominal functionality of a connector. A `Functional_unit_usage_view` (see 4.2.410) may be supplied to support mapping the functional design to the connector join terminals.

NOTE 1 One use for this relationship is to specify the short between the terminal that is installed to the printed circuit assembly and the terminal that provides the access to the outside environment when an occurrence of `Packaged_connector` is installed in the assembly.

NOTE 2 Installation into the next higher assembly is not necessary to achieve this relationship.

NOTE 3 There is a member of this relationship populated for every pair of terminals in the `Packaged_connector`.

The data associated with a `Packaged_connector_terminal_relationship` are the following:

- connector;
- interface_terminal;
- join_terminal.

4.2.590.1 connector

The connector specifies the Packaged_connector (see 4.2.587) that has the Package_terminal (see 4.2.581) that are defined to be shorted by the Packaged_connector_terminal_relationship.

4.2.590.2 interface_terminal

The interface_terminal specifies the role of the Packaged_part_interface_terminal (see 4.2.592) for the Packaged_connector_terminal_relationship.

4.2.590.3 join_terminal

The join_terminal specifies the role of the Packaged_part_join_terminal (see 4.2.593) for the Packaged_connector_terminal_relationship.

Constraints:

UR1: The combination of the connector and the join_terminal shall be unique within a population of Packaged_connector_terminal_relationship.

UR2: The combination of the connector and the interface_terminal shall be unique within a population of Packaged_connector_terminal_relationship.

WR1: The Packaged_part associated with the interface_terminal shall be the Packaged_connector specified by connector.

WR2: The Packaged_part associated with the join_terminal shall be the Packaged_connector specified by connector.

NOTE EXPRESS specification:

```

*)
ENTITY packaged_connector_terminal_relationship
  SUBTYPE OF (managed_design_object);
    connector          : packaged_connector;
    join_terminal      : packaged_part_join_terminal;
    interface_terminal : packaged_part_interface_terminal;
  UNIQUE
    UR1 : join_terminal, connector;
    UR2 : interface_terminal, connector;
END_ENTITY; -- packaged_connector_terminal_relationship

```

(*

4.2.591 Packaged_part

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Packaged_part` is a type of a `Physical_unit_usage_view` (see 4.2.672). A `Packaged_part` may be a `Packaged_connector` (see 4.2.587) or additionally an `Altered_packaged_part` (see 4.2.10). A `Packaged_part` describes a part that exists independently from any particular assembly on which it may be used.

NOTE 1 The `Packaged_part` Application object does not indicate that a product used as a component is in a particular product category.

NOTE 2 A `Packaged_part` sometimes is realized by installing one or more occurrences of `Bare_die` (see 4.2.59) into a `Package_body` (see 4.2.574), bonding conductors between appropriate ports on the occurrence of the `Bare_die` and `Package_terminal` (see 4.2.581) on the `Package` (see 4.2.573), filling the void between the occurrences of the `Bare_die` and the `Package_body` with an insulating potting material, and marking the realization with an identifier. See Figure 74 for an illustration of a cutaway view of a `Packaged_part`.

NOTE 3 Two `Packaged_part` models may be exchanged with this part of ISO 10303, depending on usage. One may support the exchange information that maps the functionality of the `Packaged_part` to the `bare_die`, or dies, included in the `Packaged_part`; and information that maps the terminals of those instances of `Bare_die` to the terminals of the `Packaged_part`. This mechanism provides maximum flexibility and information exchange and is characterized as a "white box" model. This model is primarily included in the standard to support design to analysis activities. Alternatively, one may map the functionality required directly to the `Packaged_part` terminals, and not populate the `Bare_die`. This is simpler, but does not provide as much information and is characterized as the "black box" model.

The data associated with a `Packaged_part` are the following:

- `access_mechanisms`;
- `implemented_function`;
- `potting_compound`;
- `used_package`.

4.2.591.1 access_mechanisms

The `access_mechanisms` is an inverse relationship that specifies that the existence of the `Packaged_part` is dependent on the existence of the `Packaged_part_terminal` (see 4.2.594) that specifies the `Packaged_part` as its associated_definition. There shall be zero or more `Packaged_part_terminal` for a `Packaged_part`.

4.2.591.2 implemented_function

The `implemented_function` specifies the role of the `Functional_unit_usage_view` (see 4.2.410) for the `Packaged_part`. The function specified shall be that mapped by the functional view terminal to physical view terminal allocation requirement. The `implemented_function` need not be specified for a particular `Packaged_part` unless the `access_mechanism` is not an empty set.

Figure 74 – Packaged_part exploded assembly detail

4.2.591.3 potting_compound

The potting_compound specifies the Ee_material (see 4.2.318) that is used to support the enclosed Bare_die (see 4.2.59) in the Packaged_part. The potting_compound need not be specified for a particular Packaged_part. The potting_compound may form the Package_body (see 4.2.574) itself for some technologies when the Package_body is molded from the potting_compound.

4.2.591.4 used_package

The used_package specifies the Package (see 4.2.573) of the Packaged_part. There may be one or more used_package for a Packaged_part. All members of used_package shall reference the same Ee_product_version.

Constraints:

WR1: The function implemented shall exist if and only if the size of the access_mechanisms is greater than zero and the size of the access_mechanisms shall be greater than zero if and only if the implemented_function exists.

WR2: The function implemented shall be the function whose terminals are mapped to the terminals of this Packaged_part.

IP1: The combination of implemented_function and used_package\ee_product_definition.version shall be unique within a population of Packaged_part. In the case where the Package_external_reference is used the combination shall be extended to include the Package_external_reference.part_number string.

NOTE EXPRESS specification:

```

*)
ENTITY packaged_part
  SUPERTYPE OF (packaged_connector ANDOR altered_packaged_part)

  WR2: single_package_version(SELF);
END_ENTITY; -- packaged_part
( *
```

4.2.592 Packaged_part_interface_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Packaged_part_interface_terminal` is a type of `Packaged_part_terminal` (see 4.2.594) that is a terminal of a `Packaged_connector` (see 4.2.587). An occurrence of the `Packaged_part_interface_terminal` provides access to the functionality of the assembly into which an occurrence of a `Packaged_connector` is installed.

The data associated with a `Packaged_part_interface_terminal` are the following:

— `external_connector_function`.

4.2.592.1 `external_connector_function`

The `external_connector_function` is an inverse relationship that specifies that the existence of the `Packaged_part_interface_terminal` is dependent on the existence of the `Packaged_connector_terminal_relationship` (see 4.2.590) that specifies the `Packaged_part_interface_terminal` as its `interface_terminal`. There shall be one or more `Packaged_connector_terminal_relationship` for a `Packaged_part_interface_terminal`.

NOTE One interface terminal may be connected to several join terminals by members of `Packaged_connector_terminal_relationship`.

NOTE EXPRESS specification:

```
*)
ENTITY packaged_part_interface_terminal
  SUBTYPE OF (packaged_part_terminal);
  INVERSE
    external_connector_function : SET [1:?] OF
      packaged_connector_terminal_relationship FOR
      interface_terminal;
END_ENTITY; -- packaged_part_interface_terminal

( *
```

4.2.593 `Packaged_part_join_terminal`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Packaged_part_join_terminal` is a type of `Packaged_part_terminal` (see 4.2.594) such that an occurrence of the `Packaged_part_terminal` shall not be in the role of an external interface when the occurrence of the associated `Packaged_connector` (see 4.2.587) is a component in an assembly.

The data associated with a `Packaged_part_join_terminal` are the following:

— `internal_connector_function`.

4.2.593.1 internal_connector_function

The `internal_connector_function` is an inverse relationship that specifies the `Packaged_connector_terminal_relationship` (see 4.2.590) that specifies the `Packaged_part_join_terminal` as its `join_terminal`. There shall be no more than one `Packaged_connector_terminal_relationship` for a `Packaged_part_join_terminal`.

NOTE EXPRESS specification:

```
*)
ENTITY packaged_part_join_terminal
  SUBTYPE OF (packaged_part_terminal);
  INVERSE
    internal_connector_function : SET [0:1] OF
      packaged_connector_terminal_relationship FOR
      join_terminal;
END_ENTITY; -- packaged_part_join_terminal

(*
```

4.2.594 Packaged_part_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Packaged_part_terminal` is a type of `Part_terminal` (see 4.2.630) that describes a terminal of a `Packaged_part` (see 4.2.591). A `Packaged_part_terminal` is one of a `Packaged_part_interface_terminal` (see 4.2.592) or a `Packaged_part_join_terminal` (see 4.2.593).

The data associated with a `Packaged_part_terminal` are the following:

- `associated_definition`;
- `terminal_connection_zone`;
- `terminal_of_package`.

4.2.594.1 associated_definition

The `associated_definition` specifies the `Packaged_part` (see 4.2.591) that has the `Packaged_part_terminal`.

4.2.594.2 terminal_connection_zone

The `terminal_connection_zone` specifies the `Connection_zone` (see 4.2.185) of the `Packaged_part_terminal`. There may be more than one `Connection_zone` for a `Packaged_part_terminal`. The `terminal_connection_zone` need not be specified for a particular `Packaged_part_terminal`.

4.2.594.3 terminal_of_package

The terminal_of_package specifies the role of either the Package_terminal (see 4.2.581) or the Package_terminal_external_reference (see 4.2.582) for the Packaged_part_terminal. There may be more than one terminal_of_package. If there is more than one terminal_of_package then the member reference different Package members.

Constraints:

WR1: Each member of terminal_of_package shall specify a member of Package that is specified by the Packaged_part in the role of associated_definition as used_package. No member of Package that is specified by the Packaged_part in the role of a associated_definition as used_package shall be specified by more than one member of terminal_of_package.

WR2: The precedent_feature attribute inherited from Part_feature shall not exist.

NOTE EXPRESS specification:

```
*)

    )) &#62;= 0;
END_ENTITY; -- padstack_definition
( *
```

4.2.596 Padstack_definition_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Padstack_definition_shape is a type of Managed_design_object (see 4.2.524). A Padstack_definition_shape is the planar shape of a Part_template (see 4.2.620).

The data associated with a Padstack_definition_shape are the following:

- shape_characterized_padstack_definition;
- shape_environment;
- shape_material_condition;
- shape_representation.

4.2.596.1 shape_characterized_padstack_definition

The `shape_characterized_padstack_definition` specifies the role of the `Part_template` (see 4.2.620) for the `Padstack_definition_shape`.

4.2.596.2 shape_environment

The `shape_environment` specifies either manufacturing or an `end_user_application` as the valid environment for the `Padstack_definition_shape`. The `shape_environment` need not be specified for a particular `Padstack_definition_shape`.

4.2.596.3 shape_material_condition

The `shape_material_condition` specifies either the `maximum_material_condition`, the `minimum_material_condition`, or the `nominal_material_condition` as the material condition for the `Padstack_definition_shape`.

4.2.596.4 shape_representation

The `shape_representation` specifies the `Planar_projected_shape` (see 4.2.677) that is the model for the `Padstack_definition_shape`.

NOTE EXPRESS specification:

```

*)
ENTITY padstack_definition_shape
  SUBTYPE OF (planar_projected_shape);

4.2.600 Padstack_occurrence_sub_assembly_relationship

A Padstack_occurrence_sub_assembly_relationship is a type of Managed_design_object (see 4.2.524). A Padstack_occurrence_sub_assembly_relationship is an association that specifies a subassembly constraint among two or more Laminate_component (see 4.2.483) that is aggregated into an Padstack_occurrence (see 4.2.599). A Land may participate in a Padstack_occurrence. In that case, there is no need to populate a separate Assembly_composition_relationship between the Land and the Pcb, since the Assembly_composition_relationship between the Padstack_occurrence and the Pcb establishes the required association. Also, in that case, there is no need to separately populate the usage_definition from Land to Land_physical_template because the Land template may be deduced from the Padstack_definition structure. A Via may appear in a Padstack_occurrence.

The data associated with a Padstack_occurrence_sub_assembly_relationship are the following:

- sub_assembly_reference_designation;
- related_component;
- relating_component.

4.2.600.1 sub_assembly_reference_designation

The sub_assembly_reference_designation specifies the string which is the identifier for this Padstack_occurrence_sub_assembly_relationship in the context of the relating_component.

4.2.600.2 related_component

The related_component specifies the dependent Laminate_component (see 4.2.483) of the Padstack_occurrence_sub_assembly_relationship.

4.2.600.3 relating_component

The relating_component specifies the independent Padstack_occurrence (see 4.2.599) which is the aggregation of two or more Assembly_component (see 4.2.34) specified by related_component.

Constraints:

UR1: The combination of relating_component, resident_stratum of the related_component, and sub_assembly_reference_designation shall be unique in a population of Padstack_occurrence_sub_assembly_relationship.

WR1: An Assembly_component specified as a relating_component shall not appear in the chain of components in the set of Assembly_component specified by related_component.

NOTE EXPRESS specification:

```

*)
ENTITY padstack_occurrence_sub_assembly_relationship

  UR1: sub_assembly_reference_designation,
        relating_component,
        related_component;
END_ENTITY; -- padstack_occurrence_sub_assembly_relationship
( *
```

4.2.601 Parallel_shape_element_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Parallel_shape_element_relationship is a type of Shape_element_relationship (see 4.2.816) that asserts that two Shape_element (see 4.2.810) are parallel to each other. One Shape_element is specified as the related_shape_element and the other Shape_element is specified as the relating_shape_element.

NOTE 1 The attribute related_shape_element is declared in the Shape_element_relationship entity of which this entity is a subtype.

NOTE 2 The attribute relating_shape_element is declared in the Shape_element_relationship entity of which this entity is a subtype.

Constraints:

WR1: The Shape_element specified as the relating_shape_element shall not be specified as parallel to itself either directly or through intermediate Parallel_shape_element_relationship.

NOTE EXPRESS specification:

```
* )
ENTITY parallel_shape_element_relationship
  SUBTYPE OF (shape_element_relationship);
END_ENTITY; -- parallel_shape_element_relationship

( *
```

4.2.602 Parallelism_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Parallelism_tolerance is a type of Geometric_tolerance_with_referenced_datum_system (see 4.2.422) that specifies or partially specifies the design requirement on the parallelism of a Shape_element (see 4.2.810) in relation to a Datum_plane (see 4.2.232) or Datum_axis (see 4.2.215).

NOTE Parallelism tolerance is defined in terms of tolerance zone definitions in 14.7 of ISO 1101.

Constraints:

WR1: The Shape_element specified as the toleranced_shape_element shall be a Centre_axis, Centre_plane, Physical_feature_or_part_template, or Tangent_plane.

NOTE The attribute toleranced_shape_element is declared in the Geometric_tolerance entity of which this entity is a subtype.

WR2: There shall be at most two Datum in the Datum_system the definition of which is specified as the datum_system_definition.

NOTE The attribute datum_system_definition is declared in the Geometric_tolerance_with_referenced_datum_system entity of which this entity is a subtype.

WR3: At least one Datum_plane or Datum_axis shall be in the Datum_system the definition of which is specified as the datum_system_definition.

WR4: If the toleranced_shape_element is a Centre_plane, Physical_feature_or_part_template, or Tangent_plane, the Parallelism_tolerance shall specify a Tolerance_zone_definition as its tolerance_zone_or_boundary_definition; and that Tolerance_zone_definition shall specify a Tolerance_zone_boundary_definition_with_specified_size as its boundary_definition; and that Tolerance_zone_boundary_definition_with_specified_size shall specify an Opposing_boundary_set_size_characteristic as its specified_boundary_size.

IP1: The form of the tolerated Shape_element shall be consistent with the form of a shape element for which the application of a parallelism tolerance is sensible.

NOTE EXPRESS specification:

```
*)
ENTITY parallelism_tolerance
  SUBTYPE OF (geometric_tolerance_with_referenced_datum_system);
END_ENTITY; -- parallelism_tolerance

```

4.2.603 Parameter_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Parameter_assignment is a type of Managed_design_object (see 4.2.524). A Parameter_assignment is the association of either a Characteristic (see 4.2.98) or Coordinated_characteristic (see 4.2.197) with a Model_parameter (see 4.2.549), used to provide actual values for characteristics declared formally by the the Model_parameter.

The data associated with a Parameter_assignment are the following:

- assigned_parameter;
- parameter_value.

4.2.603.1 assigned_parameter

The assigned_parameter specifies the Model_parameter (see 4.2.549) that declares the formal parameters assigned values by the Parameter_assignment.

4.2.603.2 parameter_value

The parameter_value specifies either the role of a Characteristic (see 4.2.98) or a Coordinated_characteristic (see 4.2.197) for the Parameter_assignment.

Constraints:

WR1: The type of the parameter_value shall be the same as that of the assigned_parameter.

NOTE EXPRESS specification:

```

*)
ENTITY parameter_assignment
  SUBTYPE OF (managed_design_object);
    parameter_value : scalar_or_coordinated_characteristics;
    assigned_parameter : model_parameter;
END_ENTITY; -- parameter_assignment

```

4.2.604 Part_array_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_array_feature is a type of Part_group_feature (see 4.2.613) that is an array of Part_feature (see 4.2.609) whose positions are specified as members of an array, and whose tolerances are applied based upon the array nature of Part_array_feature.

NOTE Tolerances applied to Part_array_feature are specified by an object external to the Part_array_feature.

NOTE EXPRESS specification:

```

*)
ENTITY part_array_feature
  ABSTRACT SUPERTYPE OF (ONEOF (part_linear_array_feature,
    part_rectangular_array_feature))
  SUBTYPE OF (part_group_feature);
END_ENTITY; -- part_array_feature

( *
```

4.2.605 Part_connected_terminals_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_connected_terminals_definition is a type of Managed_design_object (see 4.2.524). A Part_connected_terminals_definition is the association between two or more Part_terminal (see 4.2.630) that are connected internally to the part. This object serves as a formal requirement statement for connections implemented by a product. It is a topological abstraction in that it does not provide any information stating the variation of properties with respect to product or environmental variability.

NOTE This object is included to support the case where multiple terminals of a part are connected internally (e.g VCC, Ground) to facilitate mapping between the physical terminal definition and the functional terminal definition.

The data associated with a `Part_connected_terminals_definition` are the following:

- `associated_definition`;
- `connected_terminals`;
- `name`.

4.2.605.1 associated_definition

The `associated_definition` specifies the `Physical_unit_usage_view` (see 4.2.672) that is the product definition *s* for the `Part_connected_terminals_definition`.

4.2.605.2 connected_terminals

The `connected_terminals` specifies the role of the `Part_terminal` (see 4.2.630) for the `Part_connected_terminals_definition`. There shall be two or more `Part_terminal` for a `Part_connected_terminals_definition`.

4.2.605.3 name

The `name` identifies the `Part_connected_terminals_definition`.

Constraints:

UR1: The combination of the `name` and `associated_definition` shall be unique within a population of `Part_connected_terminals_definitions`.

WR1: All terminals specified by the member of this object shall be on the `associated_definition`.

WR2: All terminals specified by the member of this object shall be mapped to the same terminal of the functional definition.

NOTE EXPRESS specification:

```

*)
ENTITY part_connected_terminals_definition
  SUBTYPE OF (managed_design_object);
    associated_definition : physical_unit_usage_view;
    connected_terminals   : SET [2:?] OF part_terminal;

  UNIQUE
    UR1 : name, associated_definition;
WHERE
  WR1 : SIZEOF(QUERY( ct &#60;* connected_terminals |
    NOT(associated_definition = ct\part_feature.associated_definition)
  )) = 0;
END_ENTITY; -- part_connected_terminals_definition

( *

```

4.2.606 Part_device

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_device is a type of Managed_design_object (see 4.2.524). A Part_device is a specific occurrence of a Bare_die (see 4.2.59) in a Packaged_part (see 4.2.591).

The data associated with a Part_device are the following:

- bonding_agent;
- defined_packaged_part;
- device_2d_position;
- device_3d_position;
- included_device;
- item_identification.

4.2.606.1 bonding_agent

The bonding_agent specifies the Ee_material (see 4.2.318) used to attach the Bare_die (see 4.2.59) within the Packaged_part (see 4.2.591). The bonding_agent need not be specified for a particular Part_device.

4.2.606.2 defined_packaged_part

The defined_packaged_part specifies the Packaged_part (see 4.2.591) that contains this Part_device.

4.2.606.3 device_2d_position

The device_2d_position is an inverse relationship that specifies the existence of the Device_2d_position (see 4.2.283) that specifies the Part_device as its placed_device. There shall be no more than one Device_2d_position for a Part_device.

4.2.606.4 device_3d_position

The device_3d_position is an inverse relationship that specifies the existence of the Device_3d_position (see 4.2.284) that specifies the Part_device as its placed_device. There shall be no more than one Device_3d_position for a Part_device.

4.2.606.5 included_device

The included_device specifies the Bare_die (see 4.2.59) used to provide the function of the Part_device.

4.2.606.6 item_identification

The item_identification specifies the name for the reference designation of the Bare_die instance within the Packaged_part.

Constraints:

UR1: The combination of the defined_package_part and the item_identification shall be unique within a population of Part_devices.

NOTE EXPRESS specification:

```

*)
ENTITY part_device
  SUBTYPE OF (managed_design_object);
  defined_package_part : packaged_part;

    UR1 : defined_package_part, item_identification;
END_ENTITY; -- part_device

( *
```

4.2.607 Part_device_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_device_terminal is a type of Managed_design_object (see 4.2.524). A Part_device_terminal is the surface area on an occurrence of a Bare_die (see 4.2.59) in a Packaged_part (see 4.2.591) that shall allow access to the function of an occurrence of the Bare_die. A Part_device_terminal is included to support detailed modeling and analysis of the internal connection to a Packaged_part_terminal. No connection between Part_device_terminals is supported in this part of ISO 10303. Connections between Bare_die are supported only within Assembly_module.

The data associated with a Part_device_terminal are the following:

- terminated_device;
- used_bare_die_terminal.

4.2.607.1 terminated_device

The terminated_device specifies the Part_device (see 4.2.606) that has this Part_device_terminal.

4.2.607.2 used_bare_die_terminal

The used_bare_die_terminal specifies the Bare_die_terminal (see 4.2.66) that shall be used by the Part_device_terminal.

Constraints:

UR1: The combination of the terminated_device and the used_bare_die_terminal shall be unique within a population of Part_device_terminals.

NOTE EXPRESS specification:

```
*)
ENTITY part_device_terminal
  SUBTYPE OF (managed_design_object);
    used_bare_die_terminal : minimally_defined_bare_die_terminal;
    terminated_device      : part_device;
  UNIQUE
    UR1 : used_bare_die_terminal, terminated_device;
END_ENTITY; -- part_device_terminal
```

(*

4.2.608 Part_device_terminal_model_port_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Part_device_terminal_model_port_assignment` is a type of `Managed_design_object` (see 4.2.524). A `Part_device_terminal_model_port_assignment` is the relationship between the `Analytical_model_port` (see 4.2.17) and the `Part_device_terminal` (see 4.2.607), for the purpose of supporting behavioural simulation of bond wire and lead frame effects in a full package simulation. A simulation model provides an explicitly defined functional block that acts as the interface between the `Part_device_terminals` that are the access mechanisms of the `Part_device` and the `Packaged_part_terminals` that are the access mechanisms of the `Packaged_part`. This is appropriate where there is no detailed physical information available. The purpose, fidelity, and accuracy of the simulation model are not predefined in this part of ISO 10303.

NOTE 1 The `Device_terminal_map` (see 4.2.285) is the mechanism provided in this part of ISO 10303 for defining the "internal" surface of the `Package_terminal` (see 4.2.581) as used in a `Packaged_part` (see 4.2.591) since the design of a `Packaged_part` is outside the scope of this part of ISO 10303.

NOTE 2 Various manufacturers provide simulation models for the combination of leadframe and IC bond whose internal connection may be referenced by this object and whose external connection may be assigned to the `Package_terminal` by the `Part_feature_model_port_assignment` (see 4.2.611) object.

NOTE 3 This part of ISO 10303 does not specify the physical details of the connection from the `Package_terminal` to the `Part_device_terminal` since that is outside the scope of the `Packaged_part` Application Object.

NOTE 4 A single IC package design definition (e.g. Ball-grid design definition) may be exchanged with this part of ISO 10303 by considering the package to be an `Interconnect_module` (see 4.2.440).

The data associated with a `Part_device_terminal_model_port_assignment` are the following:

- `internal_connection`;
- `internal_port`.

4.2.608.1 internal_connection

The `internal_connection` specifies the role of the `Part_device_terminal` (see 4.2.607) for the `Part_device_terminal_model_port_assignment`.

4.2.608.2 internal_port

The `internal_port` specifies the role of the `Analytical_model_port` (see 4.2.17) for the `Part_device_terminal_model_port_assignment`.

Constraints:

UR1: The combination of the `internal_connection` and the `internal_port` shall be unique within a population of `Part_device_terminal_model_port_assignment`.

NOTE EXPRESS specification:

```

*)
ENTITY part_device_terminal_model_port_assignment
  SUBTYPE OF (managed_design_object);
    internal_connection : part_device_terminal;
    internal_port       : analytical_model_port;
  UNIQUE
    UR1 : internal_connection, internal_port;
END_ENTITY; -- part_device_terminal_model_port_assignment

( *

```

4.2.609 Part_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_feature is a type of Physical_feature_or_part_template (see 4.2.658). A Part_feature may be one or more of a Part_group_feature (see 4.2.613), a Part_mounting_feature (see 4.2.618), a Part_tooling_feature (see 4.2.633), a Thermal_feature (see 4.2.901), a Package_terminal (see 4.2.581), or a Part_terminal (see 4.2.630); or additionally one of a Primary_orientation_feature (see 4.2.717), or a Package_body (see 4.2.574), or an Interconnect_module_surface_feature (see 4.2.462).

NOTE 1 A Part_feature is a distinctive aspect of a Physical_unit (see 4.2.664) that partially supports the choice of that Physical_unit in the design.

NOTE 2 The design_view_definition_component_feature and design_view_definition_stratum_concept should only be populated for design archival and should not normally be publicly available as they allow queries against detailed design data.

The data associated with a Part_feature are the following:

- associated_definition;
- design_view_definition_component_feature;
- design_view_definition_stratum_concept;
- feature_shape;
- name;
- precedent_feature.

4.2.609.1 associated_definition

The associated_definition specifies the Physical_unit_usage_view (see 4.2.672) for the targeted Part_feature.

4.2.609.2 design_view_definition_component_feature

The design_view_definition_component_feature is an inverse relationship that specifies the Component_feature_to_physical_usage_view_assignment (see 4.2.123) that specifies the Part_feature as its defined_part_feature. There shall be no more than one Component_feature_to_physical_usage_view_assignment for a Part_feature.

4.2.609.3 design_view_definition_stratum_concept

The design_view_definition_stratum_concept is an inverse relationship that specifies the Stratum_concept_to_physical_usage_view_assignment (see 4.2.850) that specifies the Part_feature as its defined_part_feature. There shall be no more than one Stratum_concept_to_physical_usage_view_assignment for a Part_feature.

4.2.609.4 feature_shape

The feature_shape specifies the role of the Feature_shape_occurrence (see ??) for the Part_feature. The feature_shape need not be specified for a particular Part_feature. There may be more than one Feature_shape_occurrence for a Part_feature.

4.2.609.5 name

The name specifies the descriptive label recognizable within the electronics community and by a computer system for the Part_feature. The name is a redeclaration of the name attribute inherited from Shape_element and shall be interpreted as the name attribute of shape_aspect.

4.2.609.6 precedent_feature

The precedent_features specifies the role of the Part_feature for the Part_feature. The precedent_feature need not be specified for a particular Part_feature.

Constraints:

UR1: The combination of the associated_definition and the name shall be unique within a population of Part_features.

WR1: The shape of features shall be consistent with the shape of the physical_unit_usage_view defined by associated_definition.

WR2: The Part_feature shall not participate in a cyclic relationship with the precedent_feature, either directly or indirectly.

WR3: Each Part_feature shall not be assigned by both a Stratum_concept_to_physical_usage_view_assignment and a Component_feature_to_physical_usage_view_assignment.

NOTE EXPRESS specification:

4.2.610 Part_feature_make_from_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_feature_make_from_relationship is a type of Managed_design_object (see 4.2.524).

The data associated with a Part_feature_make_from_relationship are the following:

- associated_make_from;
- reusable_feature;
- resultant_feature.

4.2.610.1 associated_make_from

The associated_make_from specifies an Engineering_make_from (see 4.2.353) for the Part_feature_make_from_relationship.

4.2.610.2 reusable_feature

The reusable_feature specifies a Part_feature (see 4.2.609) for the Part_feature_make_from_relationship.

4.2.610.3 resultant_feature

The resultant_feature specifies a Part_feature (see 4.2.609) for the Part_feature_make_from_relationship.

Constraints:

UR1: The combination of reusable_feature and resultant_feature shall be unique within a population of Part_feature_make_from_relationship.

WR1: The reusable_feature shall not be the resultant_feature within a population of Part_feature_make_from_relationship.

WR2: The Physical_unit_usage_view referenced by the reusable_feature shall not be the Physical_unit_usage_view referenced by the resultant_feature within a population of Part_feature_make_from_relationship.

NOTE EXPRESS specification:

4.2.611 Part_feature_model_port_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_feature_model_port_assignment is a type of Managed_design_object (see 4.2.524). A Part_feature_model_port_assignment is the relationship between an Analytical_model_port (see 4.2.17) and the Part_feature (see 4.2.609).

NOTE Usually a simulation model is associated on a one to one basis with the Physical_unit_usage_view.

The data associated with a Part_feature_model_port_assignment are the following:

- source;
- target.

4.2.611.1 source

The source specifies the Part_feature (see 4.2.609) whose port is to be associated with an Analytical_model_port (see 4.2.17) in a Part_feature_model_port_assignment.

4.2.611.2 target

The target specifies the Analytical_model_port (see 4.2.17) that is to be associated with a Part_feature (see 4.2.609) in a Part_feature_model_port_assignment.

NOTE EXPRESS specification:

```

*)

```

4.2.612 Part_feature_placement_link

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_feature_placement_link is a type of a Managed_design_object (see 4.2.524).

The data associated with a Part_feature_placement_link are the following:

- precedent_element;
- referenced_by;
- subsequent_element.

4.2.612.1 precedent_element

The precedent_element specifies a Part_feature (see 4.2.609) for the Part_feature_placement_link.

4.2.612.2 referenced_by

The referenced_by is an inverse relationship that specifies that the existence of the Part_feature_placement_link is dependent on the existence of the Part_linear_array_feature (see 4.2.615) that specifies the Part_feature_placement_link as its element.

4.2.612.3 subsequent_element

The subsequent_element specifies a Part_feature (see 4.2.609) for the Part_feature_placement_link.

NOTE EXPRESS specification:

```
*)
ENTITY part_feature_placement_link
  SUBTYPE OF (managed_design_object);

4.2.614 Part_interface_access_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_interface_access_feature is a type of Part_feature (see 4.2.609) that is identified to facilitate tolerance specification when an occurrence of the associated part is used in an assembly. Specifically the intent is to provide identification that the function of the Part_feature is to provide access via a void in the material to internal components or terminals, which have been identified as having some function at the Part level, e.g., are Part_terminals. The material_state_change attribute inherited from Part_feature shall be material_removal.

EXAMPLE 1 The reset button in a notebook computer requires a Part_interface_access_feature whose properties are coupled to the reset button to ensure correct functionality of the end product.

The data associated with a Part_interface_access_feature are the following:

- accessed_interface;
- interface_access_connection_area.

4.2.614.1 accessed_interface

The accessed_interface specifies the role of the Part_feature (see 4.2.609) for the Part_interface_access_feature. The accessed_interface is the feature for which the Part_interface_access_feature provides access.

NOTE The accessed_interface is at the same level of design hierarchy as the Part_interface_access_feature for consistency purposes. It is anticipated that component_feature_to_physical_usage_view_assignment will be populated as necessary to support the design process peculiar to the enterprise.

4.2.614.2 interface_access_connection_area

The interface_access_connection_area specifies the role of the Connection_zone (see 4.2.185) for the Part_interface_access_feature. The accessed_interface specifies the role of the Part_feature (see 4.2.609) for the Part_interface_access_feature. The interface_access_connection_area provides a means to geometrically specify an area for critical mechanical interface_access properties. The Connection_zone area is void of material.

NOTE EXPRESS specification:

```

*)
ENTITY part_interface_access_feature
  SUBTYPE OF (part_feature);
  accessed_interface : part_feature;
  interface_access_area : OPTIONAL SET [1:?] OF connection_zone;
WHERE
  WR1: SELF\part_feature.material_state_change = material_removal;
  WR2: SELF &#60;&#62; accessed_interface;
  WR3: NOT('AP210_ARM.PART_TERMINAL' IN TYPEOF(SELF));
  WR4: NOT('AP210_ARM.PACKAGE_BODY' IN TYPEOF(SELF));
  WR5: NOT('AP210_ARM.PART_MOUNTING_FEATURE' IN TYPEOF(SELF));
  WR6: NOT('AP210_ARM.INTERCONNECT_MODULE_SURFACE_FEATURE' IN TYPEOF(SELF));
  WR7: NOT('AP210_ARM.PACKAGE_TERMINAL' IN TYPEOF(SELF));
  WR8: NOT('AP210_ARM.PACKAGE_BODY_SURFACE' IN TYPEOF(SELF));
  WR9: NOT('AP210_ARM.POLARITY_INDICATION_FEATURE' IN TYPEOF(SELF));
END_ENTITY; -- part_interface_access_feature

( *
```

4.2.615 Part_linear_array_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_linear_array_feature is a type of Part_array_feature (see 4.2.604). The location_uncertainty refers to originating CAD system geometric uncertainty, not material processing tolerance.

The data associated with a Part_linear_array_feature are the following:

- element;
- initial_node_positive_x_displacement;
- terminus_node_positive_x_displacement.

4.2.615.1 element

The element specifies the role of a Part_feature_placement_link (see 4.2.612) for the Part_linear_array_feature. There shall be one or more Part_feature_placement_link for a Part_linear_array_feature.

4.2.615.2 initial_node_positive_x_displacement

The initial_node_positive_x_displacement specifies a Length_data_element (see 4.2.511) for the Part_linear_array_feature.

4.2.615.3 terminus_node_positive_x_displacement

The terminus_node_positive_x_displacement specifies a Length_data_element (see 4.2.511) for the Part_linear_array_feature.

NOTE EXPRESS specification:

```

*)
ENTITY part_linear_array_feature
  SUBTYPE OF (part_array_feature);
  element : SET [1:?] OF part_feature_placement_link;
  initial_node_positive_x_displacement : length_data_element;
  terminus_node_positive_x_displacement : length_data_element;
  location_uncertainty : length_data_element;
END_ENTITY; -- part_linear_array_feature
(

```

4.2.616 Part_linear_array_feature_link

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Part_linear_array_feature_link` is a type of a `Managed_design_object` (see 4.2.524).

The data associated with a `Part_linear_array_feature_link` are the following:

- `precedent_element`;
- `referenced_by`;
- `subsequent_element`.

4.2.616.1 `precedent_element`

The `precedent_element` specifies a `Part_linear_array_feature` (see 4.2.615) for the `Part_linear_array_feature_link`.

4.2.616.2 `referenced_by`

The `referenced_by` is an inverse relationship that specifies that the existence of the `Part_linear_array_feature_link` is dependent on the existence of the `Part_rectangular_array_feature` (see 4.2.619) that specifies the `Part_linear_array_feature_link` as its element.

4.2.616.3 `subsequent_element`

The `subsequent_element` specifies a `Part_linear_array_feature` (see 4.2.615) for the `Part_linear_array_feature_link`.

NOTE EXPRESS specification:

```

*)
ENTITY part_linear_array_feature_link
  SUBTYPE OF (managed_design_object);
    precedent_element : part_linear_array_feature;
    subsequent_element : part_linear_array_feature;
INVERSE
  referenced_by : part_rectangular_array_feature FOR
                  element;
END_ENTITY; -- part_linear_array_feature_link

--tt tc1wd9 modified supertype constraint
--tt tc1wd8 added supertype constraint
( *
```

4.2.617 `Part_mating_feature`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Part_mating_feature` is a type of `Part_feature` (see 4.2.609) that is identified to facilitate tolerance specification when an occurrence of the associated part is mated to a complementary part. A `Part_mating_feature` is provided where there is no requirement to convey electrical functionality as would be provided by `Part_terminal` (see 4.2.630).

NOTE The use of multi-pin connectors may require specification of mechanical mating areas in addition to electrical terminals.

EXAMPLE 1 The plastic housing on some connectors may contain `Part_mating_features`.

The data associated with a `Part_mating_feature` are the following:

— `mating_connection_area`.

4.2.617.1 `mating_connection_area`

The `mating_connection_area` specifies the role of the `Connection_zone` (see 4.2.185) for the `Part_mating_feature`. The `mating_connection_area` provides a means to geometrically specify a surface area for critical mechanical mating properties.

NOTE The `Feature_shape_occurrence` (see ??) specified by the mating feature may be the same `Feature_shape_occurrence` that is specified by the associated `Connection_zone` (see 4.2.185). In this case the whole mating feature is the `Connection_zone`.

NOTE EXPRESS specification:

```
*)
ENTITY part_mating_feature
  SUBTYPE OF (part_feature);
    mating_area : OPTIONAL SET [1:?] OF connection_zone;
WHERE
  WR1: NOT('AP210_ARM.PART_MOUNTING_FEATURE' IN TYPEOF(SELF));
  WR2: NOT('AP210_ARM.INTERCONNECT_MODULE_SURFACE_FEATURE' IN TYPEOF(SELF));
  WR3: NOT('AP210_ARM.PACKAGE_TERMINAL' IN TYPEOF(SELF));
  WR4: NOT('AP210_ARM.PART_TERMINAL' IN TYPEOF(SELF));
END_ENTITY; -- part_mating_feature

( *
```

4.2.618 `Part_mounting_feature`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Part_mounting_feature` is a type of `Part_feature` (see 4.2.609) that is identified to facilitate tolerance specification when an occurrence of the associated part is used in an assembly.

NOTE The use of high density surface mount parts may require specification of mechanical mounting areas in addition to electrical terminals.

The data associated with a `Part_mounting_feature` are the following:

— `mounting_connection_area`.

4.2.618.1 `mounting_connection_area`

The `mounting_connection_area` specifies the role of the `Connection_zone` (see 4.2.185) for the `Part_mounting_feature`. The `mounting_connection_area` provides a means to geometrically specify a surface area for critical mechanical mounting properties.

NOTE The `Feature_shape_occurrence` (see ??) specified by the mounting feature may be the same `Feature_shape_occurrence` that is specified by the associated `Connection_zone` (see 4.2.185). In this case the whole mounting feature is the `Connection_zone`.

NOTE EXPRESS specification:

```
*)
ENTITY part_mounting_feature
  SUPERTYPE OF (bare_die_surface)
  SUBTYPE OF (part_feature);
  mounting_area : OPTIONAL SET [1:?] OF connection_zone;
END_ENTITY; -- part_mounting_feature

--tt tc1 wd8 addition
(*
```

4.2.619 `Part_rectangular_array_feature`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Part_rectangular_array_feature` is a type of `Part_array_feature` (see 4.2.604). The `location_uncertainty` refers to originating CAD system uncertainty, not material processing tolerances.

The data associated with a `Part_rectangular_array_feature` are the following:

— `element`;

— `initial_row_positive_y_displacement`;

— `terminus_row_positive_y_displacement`.

4.2.619.1 element

The element specifies the role of a Part_linear_array_feature_link (see 4.2.616) for the Part_rectangular_array_feature. There shall be one or more Part_linear_array_feature_link for a Part_rectangular_array_feature.

4.2.619.2 initial_row_positive_y_displacement

The initial_row_positive_y_displacement specifies a Length_data_element (see 4.2.511) for the Part_rectangular_array_feature.

4.2.619.3 terminus_row_positive_y_displacement

The terminus_row_positive_y_displacement specifies a Length_data_element (see 4.2.511) for the Part_rectangular_array_feature.

NOTE EXPRESS specification:

```

*)
ENTITY part_rectangular_array_feature
  SUBTYPE OF (part_array_feature);
  element : SET [1:?] OF part_linear_array_feature_link;
  initial_row_positive_y_displacement : length_data_element;
  terminus_row_positive_y_displacement : length_data_element;
  location_uncertainty : length_data_element;
END_ENTITY; -- part_rectangular_array_feature
( *
```

4.2.620 Part_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_template is a type of Physical_feature_or_part_template (see 4.2.658). A Part_template may be one of an Inter_stratum_feature_template (see 4.2.435), a Material_addition_feature_template (see 4.2.529), a Material_removal_feature_template (see 4.2.534), a Printed_part_template (see 4.2.730), a Special_symbol_part_template (see 4.2.835), a Stratum_feature_template (see 4.2.861), or a Trace_template (see 4.2.930), or additionally may be a Part_text_template (see 4.2.632). One reason for including information provided by members of Part_template is that they are collectors for shape data templates for layout items.

The data associated with a Part_template are the following:

- analytical_part_template_representation;
- part_template_analytical_model;
- physical_characteristic.

4.2.620.1 analytical_part_template_representation

The analytical_part_template_representation specifies the role of the Analytical_representation (see 4.2.22) for the Part_template. There may be more than one Analytical_representation for the Part_template. The analytical_part_template_representation need not be specified for a particular Part_template.

4.2.620.2 part_template_analytical_model

The part_template_analytical_model specifies the role of the Analytical_model (see 4.2.14) for the Part_template. The part_template_analytical_model need not be specified for a particular Part_template.

4.2.620.3 physical_characteristic

The physical_characteristic specifies either the Characteristic (see 4.2.98) or Coordinated_characteristic (see 4.2.197) for the Part_template. There may be more than one Characteristic for the Part_template. The physical_characteristic need not be specified for a particular Part_template.

NOTE EXPRESS specification:

```

4.2.621 Part_template_3d_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_template_3d_shape is a type of Bound_volume_shape (see 4.2.76) and a type of Feature_shape_definition (see 4.2.372). A Part_template_3d_shape is the shape in three dimensions of the Part_template (see 4.2.620).

The data associated with a Part_template_3d_shape are the following:

- shape_characterized_part_template;
- shape_environment;
- shape_material_condition;
- shape_representation.

4.2.621.1 shape_characterized_part_template

The shape_characterized_part_template specifies the role of the Part_template (see 4.2.620) for the Part_template_3d_shape.

4.2.621.2 shape_environment

The shape_environment specifies either manufacturing or the end_user_application as the environment in which the Part_template_3d_shape is valid. The shape_environment need not be specified for a particular Part_template_3d_shape.

4.2.621.3 shape_material_condition

The shape_material_condition specifies either the maximum_material_condition, the minimum_material_condition or the nominal_material_condition as the material condition for the Part_template_3d_shape.

4.2.621.4 shape_representation

The shape_representation specifies the Bound_volume_shape (see 4.2.76) that is the model for the Part_template_3d_shape.

NOTE EXPRESS specification:

```

*)
ENTITY part_template_3d_shape
--tt tc1 wd9 modified
    SUBTYPE OF (bound_volume_shape, feature_shape_definition);
        shape_material_condition      : material_condition;
        shape_environment              : OPTIONAL environment;
(* tt tc1 wd9 deleted

    shape_characterized_part_template : part_template;
END_ENTITY; -- part_template_3d_shape

( *
```

4.2.622 Part_template_3d_keepout_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_template_3d_keepout_shape is a type of Bound_volume_shape (see 4.2.76) and a type of Non_feature_shape_definition (see 4.2.559). A Part_template_3d_keepout_shape is the shape in three orthogonal dimensions of a keepout constraint for a Part_template (see 4.2.620).

NOTE Keepout regions typically include some minimal spacing around the extreme shape.

The data associated with a `Part_template_3d_keepout_shape` are the following:

- `application_technology_constraint`;
- `centroid_location`;
- `constrained_design_object_category`;
- `shape_characterized_part_template`;
- `shape_environment`;
- `shape_material_condition`;
- `shape_purpose`;
- `shape_representation`.

4.2.622.1 application_technology_constraint

The `application_technology_constraint` specifies the role of `Ee_requirement_occurrence` for the `Part_template_3d_keepout_shape`. The `application_technology_constraint` is the relationship between keepout shapes and process constraints under which those keepout shapes are valid.

EXAMPLE 1 An example of an `application_technology_constraint` is the relationship of the shape of a clearance area to an assembly or testing process which requires the clearance.

4.2.622.2 centroid_location

The `centroid_location` is a `Cartesian_point` (see 4.2.87) which is the center of a `Part_template_3d_keepout_shape`. A `centroid_location` need not be specified for a particular `Part_template_3d_keepout_shape`.

4.2.622.3 constrained_design_object_category

The `constrained_design_object_category` specifies the category for which the `Part_template_3d_keepout_shape` is a constraint.

4.2.622.4 shape_characterized_part_template

The `shape_characterized_part_template` specifies the role of the `Part_template` (see 4.2.620) for the `Part_template_3d_keepout_shape`.

4.2.622.5 shape_environment

The shape_environment specifies either manufacturing or an end_user_application as the environment for the Part_template_3d_keepout_shape.

4.2.622.6 shape_material_condition

The shape_material_condition specifies either the maximum_material_condition, the minimum_material_condition, or the nominal_material_condition as the material condition for the Part_template_3d_keepout_shape.

4.2.622.7 shape_purpose

The shape_purpose specifies either electro_magnetic_compatibility, shock, thermal, vibration, or an external_definition as the purpose for the Part_template_3d_keepout_shape.

4.2.622.8 shape_representation

The shape_representation specifies the role of the Bound_volume_shape (see 4.2.76) for the Part_template_3d_keepout_shape.

NOTE EXPRESS specification:

```

*)
ENTITY part_template_3d_keepout_shape
  SUBTYPE OF (bound_volume_shape, non_feature_shape_definition);
  application_technology_constraint : OPTIONAL ee_requirement_occurrence;
  constrained_design_object_category : keepout_product_design_object_category;
  shape_characterized_part_template : part_template;
  shape_material_condition          : material_condition;
  shape_purpose                       : keepout_purpose;
  shape_environment                 : environment;
  centroid_location                 : OPTIONAL cartesian_point;
END_ENTITY; -- part_template_3d_keepout_shape

( *
```

4.2.623 Part_template_location_in_padstack_definition

A Part_template_location_in_padstack_definition is a type of Managed_design_object (see 4.2.524). A Part_template_location_in_padstack_definition is the relationship that identifies the location of a Part_template in a Padstack_definition. The Application Object references a Template_definition in the formal model since the interpretation of this Application Object is to an Assembly_component_usage, and since there is a one to one relationship between a Part_template and the associated Template_definition.

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

NOTE EXPRESS specification:

```

*)
ENTITY part_template_location_in_padstack_definition
  SUBTYPE OF (managed_design_object);
    padstack : padstack_definition;
    template : template_definition;
    reference_designation : string;
END_ENTITY; -- part_template_location_in_padstack_definition
( *

```

4.2.624 Part_template_location_in_padstack_definition_transform

A Part_template_location_in_padstack_definition_transform is a type of Managed_design_object (see 4.2.524).

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

NOTE EXPRESS specification:

```

*)
ENTITY part_template_location_in_padstack_definition_transform
  SUBTYPE OF (managed_design_object);
    padstack_shape : padstack_definition_shape;
    template_shape : part_template_planar_shape;
    reference_location : part_template_location_in_padstack_definition;
    transform : axis_placement_2d;
END_ENTITY; -- part_template_location_in_padstack_definition_transform
( *

```

4.2.625 Part_template_non_planar_2d_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_template_non_planar_2d_shape is a type of Managed_design_object (see 4.2.524). A Part_template_non_planar_2d_shape is the shape of a Part_template (see 4.2.620) that is represented in the form of a surface.

The data associated with a `Part_template_non_planar_2d_shape` are the following:

- `shape_characterized_part_template`;
- `shape_environment`;
- `shape_material_condition`;
- `shape_representation`;
- `transformation`.

4.2.625.1 `shape_characterized_part_template`

The `shape_characterized_part_template` specifies the role of the `Part_template` (see 4.2.620) for the `Part_template_non_planar_2d_shape`.

4.2.625.2 `shape_environment`

The `shape_environment` specifies either manufacturing or an `end_user_application` as the valid environment for the `Part_template_non_planar_2d_shape`. The `shape_environment` need not be specified for a particular `Part_template_non_planar_2d_shape`.

4.2.625.3 `shape_material_condition`

The `shape_material_condition` specifies either the `maximum_material_condition`, the `minimum_material_condition`, or the `nominal_material_condition` as the material condition for the `Part_template_non_planar_2d_shape`.

4.2.625.4 `shape_representation`

The `shape_representation` specifies the `Open_shell_based_surface` (see 4.2.566) that is the model for the `Part_template_non_planar_2d_shape`.

4.2.625.5 `transformation`

The `transformation` specifies the role of the `Axis_placement_3d` (see 4.2.58) for the `Part_template_non_planar_2d_shape`.

NOTE EXPRESS specification:

```

*)
ENTITY part_template_non_planar_2d_shape
  SUBTYPE OF (open_shell_based_surface, feature_shape_definition);
    transformation          : axis_placement_3d;
    shape_characterized_part_template : part_template;
    shape_environment        : OPTIONAL environment;
    shape_material_condition : material_condition;
END_ENTITY; -- part_template_non_planar_2d_shape
( *

```

4.2.626 Part_template_or_physical_unit_2d_shape_representation_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_template_or_physical_unit_2d_shape_representation_relationship is a type of Managed_design_object (see 4.2.524).

The data associated with a Part_template_or_physical_unit_2d_shape_representation_relationship are the following:

- principal_part_shape;
- related_part_shape.

4.2.626.1 principal_part_shape

The principal_part_shape specifies the role of a Part_template_planar_shape (see 4.2.628) or a Physical_unit_planar_shape (see 4.2.670) for the Part_template_or_physical_unit_2d_shape_representation_relationship.

4.2.626.2 related_part_shape

The related_part_shape specifies the role of a Part_template_planar_shape (see 4.2.628) or a Physical_unit_planar_shape (see 4.2.670) for the Part_template_or_physical_unit_2d_shape_representation_relationship.

Constraints:

UR1: The combination of principal_part_shape and related_part_shape shall be unique within a population of Part_template_or_physical_unit_2d_shape_representation_relationship.

WR1: The principal_part_shape shall not be the related_part_shape within a population of Part_template_or_physical_unit_2d_shape_representation_relationship.

WR2: The `principal_part_shape` and `related_part_shape` shall be for the same definition or item and exist in the same `Cartesian_coordinate_system` (see 4.2.86) within a population of `Part_template_or_physical_unit_2d_shape_representation_relationship`.

NOTE EXPRESS specification:

```

*)
ENTITY part_template_or_physical_unit_2d_shape_representation_relationship
  SUBTYPE OF (managed_design_object);
    principal_part_shape : part_template_or_physical_unit_2d_shape_select;
    related_part_shape   : part_template_or_physical_unit_2d_shape_select;
UNIQUE
  UR1: principal_part_shape, related_part_shape;
WHERE
  WR1: principal_part_shape :=&#60;&#62;; related_part_shape;
(
  WR2: principal_part_shape and related_part_shape shall be for the same definition
  or item and exist in the same Cartesian_coordinate_system.
*)
END_ENTITY; -- part_template_or_physical_unit_2d_-
            -- shape_representation_relationship

--tt tc1 correction added
(

```

4.2.627 Part_template_or_physical_unit_3d_shape_representation_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Part_template_or_physical_unit_3d_shape_representation_relationship` is a type of `Managed_design_object` (see 4.2.524).

The data associated with a `Part_template_or_physical_unit_3d_shape_representation_relationship` are the following:

- `principal_part_shape`;
- `related_part_shape`.

4.2.627.1 principal_part_shape

The `principal_part_shape` specifies the role of one of a `Part_template_3d_shape` (see 4.2.621), a `Part_template_non_planar_2d_shape` (see 4.2.625), or a `Physical_unit_3d_shape` (see 4.2.666) for the `Part_template_or_physical_unit_3d_shape_representation_relationship`.

4.2.627.2 related_part_shape

The related_part_shape specifies the role of one of a Part_template_3d_shape (see 4.2.621), a Part_template_non_planar_2d_shape (see 4.2.625), or a Physical_unit_3d_shape (see 4.2.666) for the Part_template_or_physical_unit_3d_shape_representation_relationship.

Constraints:

UR1: The combination of principal_part_shape and related_part_shape shall be unique within a population of Part_template_or_physical_unit_3d_shape_representation_relationship.

WR1: The principal_part_shape shall not be the related_part_shape within a population of Part_template_or_physical_unit_3d_shape_representation_relationship.

WR2: The principal_part_shape and related_part_shape shall be for the same definition or item and shall exist in the same Cartesian_coordinate_system (see 4.2.86) within a population of Part_template_or_physical_unit_3d_shape_representation_relationship.

NOTE EXPRESS specification:

```

4.2.628 Part_template_planar_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_template_planar_shape is a type of Managed_design_object (see 4.2.524). A Part_template_planar_shape is the planar shape of a Part_template (see 4.2.620).

The data associated with a Part_template_planar_shape are the following:

- shape_characterized_part_template;
- shape_environment;
- shape_material_condition;
- shape_representation.

4.2.628.1 shape_characterized_part_template

The shape_characterized_part_template specifies the role of the Part_template (see 4.2.620) for the Part_template_planar_shape.

4.2.628.2 shape_environment

The shape_environment specifies either manufacturing or an end_user_application as the valid environment for the Part_template_planar_shape. The shape_environment need not be specified for a particular Part_template_planar_shape.

4.2.628.3 shape_material_condition

The shape_material_condition specifies either the maximum_material_condition, the minimum_material_condition, or the nominal_material_condition as the material condition for the Part_template_planar_shape.

4.2.628.4 shape_representation

The shape_representation specifies the Planar_projected_shape (see 4.2.677) that is the model for the Part_template_planar_shape.

NOTE EXPRESS specification:

```

*)
ENTITY part_template_planar_shape
--tt tc1 wd9 modified
    SUBTYPE OF (planar_projected_shape);
    shape_characterized_part_template : part_template;

    shape_representation                : planar_projected_shape;
*)
    shape_environment                    : OPTIONAL environment;
    shape_material_condition              : material_condition;
END_ENTITY; -- part_template_planar_shape

( *
```

4.2.629 Part_template_planar_keepout_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_template_planar_keepout_shape is a type of Planar_shape (see 4.2.678) and a type of Non_feature_shape_definition (see 4.2.559). A Part_template_planar_keepout_shape is the projected shape of a keepout region around the Part_template (see 4.2.620) in two dimensions.

NOTE 1 Keepout regions typically include some minimal spacing around the extreme shape represented by Part_template_planar_shape where the exact relationship between the two shapes is unrecorded.

NOTE 2 There may be multiple Part_template_planar_keepout_shape for a particular purpose. The recommended method to aggregate several Part_template_planar_keepout_shape that together describe a volumetric constraint is to reference them from a member of Shape_and_ee_product_definition_based_constraint_occurrence (see 4.2.806).

The data associated with a Part_template_planar_keepout_shape are the following:

- application_technology_constraint;
- centroid_location;
- constrained_design_object_category;
- shape_characterized_part_template;
- shape_environment;
- shape_material_condition;
- shape_purpose.

4.2.629.1 application_technology_constraint

The application_technology_constraint specifies the role of Ee_requirement_occurrence for the Part_template_3d_shape. The application_technology_constraint is the relationship between keepout shapes and process constraints under which those keepout shapes are valid.

EXAMPLE 1 An example of an application_technology_constraint is the relationship of the shape of a clearance area to an assembly or testing process which requires the clearance.

4.2.629.2 centroid_location

The centroid_location is a Cartesian_point (see 4.2.87) which is the center of a Part_template_planar_keepout_shape. A centroid_location need not be specified for a particular Part_template_planar_keepout_shape.

4.2.629.3 constrained_design_object_category

The constrained_design_object_category specifies the category of design object for which the Part_template_planar_keepout_shape is a constraint.

4.2.629.4 shape_characterized_part_template

The shape_characterized_part_unit specifies the role of the Part_template (see 4.2.620) for the Part_template_planar_keepout_shape.

4.2.629.5 shape_environment

The shape_environment specifies either manufacturing or an end_user_application as the environment for the Part_template_planar_keepout_shape.

4.2.629.6 shape_material_condition

The shape_material_condition specifies either the maximum_material_condition, the minimum_material_condition, or the nominal_material_condition as the material condition for the Part_template_planar_keepout_shape.

4.2.629.7 shape_purpose

The shape_purpose specifies either electro_magnetic_compatibility, shock, thermal, vibration, or an external_definition as the purpose for the Part_template_planar_keepout_shape.

NOTE EXPRESS specification:

```

*)
ENTITY part_template_planar_keepout_shape
  SUBTYPE OF (planar_shape, non_feature_shape_definition);

```

4.2.630 Part_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_terminal is a type of Part_feature (see 4.2.609). A Part_terminal is one of an Assembly_module_terminal (see 4.2.50), a Bare_die_terminal (see 4.2.66), an Interconnect_module_terminal (see 4.2.463), or a Packaged_part_terminal (see 4.2.594).

The data associated with a Part_terminal are the following:

- connection_requirement;
- functional_usage_view_terminal.

4.2.630.1 connection_requirement

The connection_requirement is an inverse relationship that specifies the Part_connected_terminals_definition (see 4.2.605) that specifies the Part_terminal as its connected_terminals. There shall be no more than one Part_connected_terminals_definition for a Part_terminal.

4.2.630.2 functional_usage_view_terminal

The functional_usage_view_terminal is an inverse relationship to the Functional_usage_view_to_part_terminal_assignment (see 4.2.413) that specifies the Part_terminal as its physical_usage_view_terminal. There shall be no more than one Functional_usage_view_to_part_terminal_assignment (see 4.2.413) for a Part_terminal.

NOTE EXPRESS specification:

```

*)
ENTITY part_terminal
  ABSTRACT SUPERTYPE OF (ONEOF (minimally_defined_bare_die_terminal,

physical_usage_view_terminal;
END_ENTITY; -- part_terminal

( *
```

4.2.631 Part_terminal_external_reference

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Part_terminal_external_reference` is a type of `Managed_design_object` (see 4.2.524). A `Part_terminal_external_reference` is an unambiguous reference to a `Part_terminal` (see 4.2.630) or to a terminal associated with a type of `Part_template` (see 4.2.620) in an external system. A `Part_terminal_external_reference` specifies the type of the terminal as well as the identification for the terminal.

EXAMPLE 1 Items in a design definition may need to reference terminals in a library without duplicating the geometric context, and may need to specify terminal types by reference instead of explicit instantiation.

The data associated with a `Part_terminal_external_reference` are the following:

- `associated_definition`;
- `feature_name`;
- `feature_type`.

4.2.631.1 associated_definition

The `associated_definition` specifies the role of either a `Part_template` (see 4.2.620) or a `Physical_unit` (see 4.2.664) for the `Part_terminal_external_reference`.

4.2.631.2 feature_name

The `feature_name` specifies the role of a string as identification for the `Part_terminal_external_reference`.

4.2.631.3 feature_type

The `feature_type` specifies the string that identifies the type of the terminal referenced for the `Part_terminal_external_reference`. The interpretation of this string by a receiving system shall be in accordance with the interpretation of `Part_terminal`.

Constraints:

UR1: Each member of `Part_terminal_external_reference` shall have a unique combination of attributes.

WR1: The types of terminals are limited to those types defined in this part of ISO 10303.

WR2: If a `Part_terminal` type is specified for the `feature_type`, a `Physical_unit` type shall be specified. If a `Part_terminal` type is not specified for the `feature_type`, a `Part_template` type shall be specified for the `associated_definition`.

NOTE EXPRESS specification:

```

*)
ENTITY part_terminal_external_reference
  SUBTYPE OF (managed_design_object);
    associated_definition : physical_unit_or_part_template;
    feature_name          : ee_name;
    feature_type          : ee_name;
  UNIQUE
    UR1 : associated_definition, feature_name, feature_type;
END_ENTITY; -- part_terminal_external_reference

( *

```

4.2.632 Part_text_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_text_template is a type of Part_template (see 4.2.620) that is the information required to support the creation of text messages in the stratum material on the Interconnect_module (see 4.2.440) or in a marking application.

The data associated with a Part_text_template are the following:

- font;
- maximum_font_horizontal_extent;
- maximum_font_vertical_extent;
- slant_angle;
- stroke_width.

4.2.632.1 font

The font specifies either the Font_definition (see 4.2.387) or the Registered_font (see 4.2.768) for the Part_text_template.

4.2.632.2 maximum_font_horizontal_extent

The maximum_font_horizontal_extent specifies the role of the Length_data_element (see 4.2.511) for the width of the Part_text_template.

4.2.632.3 maximum_font_vertical_extent

The maximum_font_vertical_extent specifies the role of the Length_data_element (see 4.2.511) for the height of the Part_text_template.

4.2.632.4 slant_angle

The slant_angle specifies the Angle_data_element that is the deviation from vertical for the Part_text_template.

4.2.632.5 stroke_width

The stroke_width specifies the Length_data_element that is the distance across a single line that draws the glyph for the Part_text_template.

NOTE A per character shape is required because the message is not available in the template definition. This limits the capability to support proportional font by causing the bounding box to be the maximum size required rather than the minimum that would occur if the bounding box were calculated strictly on the basis of the font proportions in the actual design.

Constraints:

WR1: font glyph shall not extend beyond the shape established by the template_shape.

NOTE EXPRESS specification:

```
*)
ENTITY part_text_template
  SUBTYPE OF (part_template);
    font                : font_select;
    maximum_font_horizontal_extent : length_data_element;
    maximum_font_vertical_extent   : length_data_element;
    slant_angle           : angle_data_element;
    stroke_width          : length_data_element;
END_ENTITY; -- part_text_template

( *
```

4.2.633 Part_tooling_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Part_tooling_feature is a type of Part_feature (see 4.2.609). A Part_tooling_feature may be a Fiducial_part_feature (see 4.2.374) or may be a Test_point_part_feature (see 4.2.894). A Part_tooling_feature identifies a feature for tooling purposes. A feature may be used for other purposes or may intrinsically be in a particular feature category, and in either of those cases the feature would be a Part_tooling_feature and also the other type of feature.

NOTE Tooling purposes as used herein includes test instrumentation and measurement purposes, not just inspection, fabrication and assembly tooling.

EXAMPLE 1 Examples of a Part_tooling_feature include, but are not limited, to slots, passages, notches defined by Geometric Dimensioning and Tolerancing methodology, as well as fiducials.

NOTE EXPRESS specification:

```
*)
ENTITY part_tooling_feature
    SUPERTYPE OF (fiducial_part_feature ANDOR
                  test_point_part_feature)
    SUBTYPE OF (part_feature);

( *
```

4.2.634 Partially_plated_cutout

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Partially_plated_cutout is a type of Cutout (see 4.2.208) that is not a completely plated cutout for reason of manufacturing capabilities or design purposes.

The data associated with a Partially_plated_cutout are the following:

- plated_segment;
- unplated_segment.

4.2.634.1 plated_segment

A plated_segment is an inverse relationship that specifies that the existence of the Partially_plated_cutout is dependent on the existence of the Plated_cutout_edge_segment that specifies the Partially_plated_cutout as a composed_cutout. There shall be one or more Plated_cutout_edge_segment (see 4.2.686) in the role of plated_segment for the Partially_plated_cutout. The plated_segment specifies the segment that is plated.

4.2.634.2 unplated_segment

An unplated_segment is an inverse relationship that specifies that the existence of the Partially_plated_cutout is dependent on the existence of the Cutout_edge_segment that specifies the Partially_plated_cutout as a composed_cutout. There shall be one or more Cutout_edge_segment (see 4.2.209) in the role of unplated_segment for the Partially_plated_cutout. The unplated_segment specifies the segment that is unplated.

Constraints:

WR1: A Plated_cutout_segment shall not be in the role of unplated_segment.

NOTE EXPRESS specification:

```
*)
ENTITY partially_plated_cutout
  SUBTYPE OF (cutout);
  INVERSE
    plated_segment : SET [1:?] OF cutout_edge_segment FOR composed_cutout;
    unplated_segment : SET [1:?] OF cutout_edge_segment FOR composed_cutout;
END_ENTITY; -- partially_plated_cutout
```

(*

4.2.635 Partially_plated_interconnect_module_edge

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Partially_plated_interconnect_module_edge is a type of Interconnect_module_edge (see 4.2.449) that is not a completely plated edge for reason of manufacturing capabilities or design purposes.

The data associated with a Partially_plated_interconnect_module_edge are the following:

- plated_segment;
- unplated_segment.

4.2.635.1 plated_segment

A plated_segment is an inverse relationship that specifies that the existence of the Partially_plated_interconnect_module is dependent upon the existence of the Plated_interconnect_module_edge_segment that specifies the Partially_plated_interconnect_module_edge in the role of composed_edge. There shall be one or more Plated_interconnect_module_edge_segment (see 4.2.689) for the Partially_plated_interconnect_module_edge.

4.2.635.2 unplated_segment

An unplated_segment is an inverse relationship that specifies that the existence of the Partially_plated_interconnect_module is dependent upon the existence of the Interconnect_module_edge_segment that specifies the Partially_plated_interconnect_module_edge in the role of composed_edge. There shall be one or more Interconnect_module_edge_segment (see 4.2.450) for the Partially_plated_interconnect_module_edge.

Constraints:

WR1: There shall be no Plated_interconnect_module_edge_segment in the role of unplated_segment for the Partially_plated_interconnect_module.

NOTE EXPRESS specification:

```

*)
ENTITY partially_plated_interconnect_module_edge
  SUBTYPE OF (interconnect_module_edge);

4.2.636 Partially_routed_physical_network

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Partially_routed_physical_network is a type of Physical_network (see 4.2.660). A Partially_routed_physical_network is a description of an incompletely specified mapping from requirements to layout. The set of unrouted elements shall be a subset of the total requirement set.

The data associated with a Partially_routed_physical_network are the following:

— unrouted_connectivity_requirement_element.

4.2.636.1 unrouted_connectivity_requirement_element

The unrouted_connectivity_requirement_element specifies the Component_terminal (see 4.2.137) that are not yet implemented by circuitry layout for the Partially_routed_physical_network. There shall be two or more Component_terminal for a Partially_routed_physical_network.

NOTE EXPRESS specification:

```

*)
ENTITY partially_routed_physical_network
  SUBTYPE OF (physical_network);
    unrouted_connectivity_requirement_element : SET [1:?] OF unrouted_join_relationship;

```

4.2.637 Participant_date_and_time_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Participant_date_and_time_assignment is a type of Managed_design_object (see 4.2.524). A Participant_date_and_time_assignment is the relationship between a Person_and_organization (see 4.2.647) and a Date_and_time (see 4.2.213).

The data associated with a Participant_date_and_time_assignment are the following:

- action_date_and_time;
- action_participant.

4.2.637.1 action_date_and_time

The action_date_and_time specifies the role of the Date_and_time (see 4.2.213) for the Participant_date_and_time_assignment.

4.2.637.2 action_participant

The action_participant specifies the role of the Person_and_organization (see 4.2.647) for the Participant_date_and_time_assignment.

NOTE EXPRESS specification:

```

*)
ENTITY participant_date_and_time_assignment

```

4.2.638 Passage_technology

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Passage_technology is a type of Managed_design_object (see 4.2.524). A Passage_technology may be either a Default_component_termination_passage_definition (see 4.2.249), a Default_unsupported_passage_definition (see 4.2.254), or a Default_via_definition (see 4.2.256). A Passage_technology specifies material properties and parametric data associated with a specific manufacturing process for identified material, where that material and manufacturing process has been selected for a specific design. A Passage_technology includes the material stackup parametric data related to the design of the interconnect substrate associated with the Stratum the Passage_technology is related to through the as_finished_inter_stratum_extent attribute.

The data associated with a `Passage_technology` are the following:

- `associated_definition`;
- `as_finished_inter_stratum_extent`;
- `deposition_material`;
- `maximum_aspect_ratio`;
- `maximum_as_finished_deposition_thickness`;
- `maximum_as_finished_passage_extent`;
- `minimum_as_finished_deposition_thickness`;
- `minimum_as_finished_passage_extent`;
- `name`;
- `plated_passage`;
- `specification`.

NOTE `Passage_technology` also supports substrate edges.

4.2.638.1 `associated_definition`

The `associated_definition` specifies the role of the `Interconnect_module` (see 4.2.440) that uses the `Passage_technology`.

NOTE The `Passage_technology` is for a particular design since the vertical extent is within the context of the design.

4.2.638.2 `as_finished_inter_stratum_extent`

The `as_finished_inter_stratum_extent` specifies the `Inter_stratum_extent` (see 4.2.431) that will be created for the `Passage_technology`. Material additions by plating or other means will extend the reach of the `Inter_stratum_extent` to the as-finished condition because these `Stratum` (see 4.2.845) are not present during the machining operation but are created during the finishing operations.

4.2.638.3 `deposition_material`

The `deposition_material` specifies the role of the `Ee_material` (see 4.2.318) that forms the vertical wall of a feature that uses the `Passage_technology`. The `deposition_material` need not be specified for a particular `Passage_technology`.

4.2.638.4 maximum_aspect_ratio

The `maximum_aspect_ratio` specifies the largest allowable ratio of passage length divided by passage diameter for the `Passage_technology`. The `maximum_aspect_ratio` need not be specified for a particular `Passage_technology`.

NOTE The aspect ratio is a factor in determining the expected quality of the electroplating process in depositing metal in the passage. If the aspect ratio is large, meaning an extremely long passage in relation to its diameter, the deposition will be thinner in the central portion of the passage length than at each end of the passage. For this reason, a `maximum_aspect_ratio` is often determined as a factor in deciding upon the smallest passage diameters to be allowed in a PCB design. Thicker PCBs require larger minimum passage diameters, for the same expected plating quality.

4.2.638.5 maximum_as_finished_deposition_thickness

The `maximum_as_finished_deposition_thickness` specifies the `Length_data_element` (see 4.2.511) that is the upper bound of the thickness of the deposition metal in the passage by the `Passage_technology`.

NOTE Material deposition within a passage, by plating or other means, decreases the diameter of the passage. This attribute assists in providing the information required to select the correct tool for creating the passage before plating. The maximum deposition thickness results in the smallest passage diameter after finishing.

4.2.638.6 maximum_as_finished_passage_extent

The `maximum_as_finished_passage_extent` specifies the `Length_data_element` (see 4.2.511) of the upper bound of the diametrical extent after processing for the `Passage_technology`. A `maximum_as_finished_passage_extent` need not be specified for a particular `Passage_technology`.

4.2.638.7 minimum_as_finished_deposition_thickness

The `minimum_as_finished_deposition_thickness` specifies the `Length_data_element` (see 4.2.511) of the lower bound of the thickness of deposited plating in the passage of a PCB for the `Passage_technology`. The `minimum_as_finished_deposition_thickness` need not be specified for a particular `Passage_technology`.

NOTE In order to help insure continuity of the deposited conductive material in a passage, and therefore to help insure connectivity between the plating in a passage and the lands of every `Design_layer_stratum` (see 4.2.275) that intersect that passage, a minimum plating thickness is specified. This plating thickness is usually verified in the fabrication process by including test coupons in the panel of PCBs being fabricated. These coupons include typically sized lands and passages as are found on the PCBs being fabricated; the coupons are removed from the panel during fabrication and metallurgical cross sections are created for process quality verification. These cross sections provide visibility of both the electroless and electrolytic plating process quality as well as the quality of the final tin-lead plating or coating of the passage walls as well as of the so-called knee area, where the passage wall intersects the lands at each end of the passage. Solderability of the tin-lead is partially a factor of the minimum plating thickness at the knee, since tin-lead solder and copper form a visible intermetallic structure when one dissolves into the other during the process of melting the solder. This visible intermetallic structure is brittle and is not indicative of a solder joint of high quality. There must be ample solder, in the bare PCB, over this intermetallic knee, in order to assist in providing a PCB that has good solderability to the assembly operation.

4.2.638.8 minimum_as_finished_passage_extent

The `minimum_as_finished_passage_extent` specifies the `Length_data_element` (see 4.2.511) of the lower bound of the diametrical extent for the `Passage_technology`. The `minimum_as_finished_passage_extent` need not be specified for a particular `Passage_technology`.

4.2.638.9 name

The name identifies the `Passage_technology`.

4.2.638.10 plated_passage

The `plated_passage` specifies whether or not the `deposition_material` is added to the passage for the `Passage_technology`. The value of TRUE indicates that the material is added. The value of FALSE indicates that the material is not added.

NOTE 1 This boolean makes no reference to the process to be used for adding a tin-lead alloy or other solder to the conductive walls of the `plated_passage`. Some processes electroplate the tin-lead alloy and later melt, or reflow, the alloy to reduce its granular appearance; other processes coat the passage walls and other exposed conductive surfaces of the PCB with molten solder in a process called solder-coating. These processes are only applicable to `plated_passages` in the PCB.

NOTE 2 This part of ISO 10303 does not presume a `Pcb` (see 4.2.642) wet-chemistry only process, but allows for other processes of metallization of passage walls.

4.2.638.11 specification

The specification establishes the role of `Process_specification` for the `Passage_technology`. The specification need not be specified for a particular `Passage_technology`.

Constraints:

UR1: The name shall be unique within `associated_definition`.

WR1: Each passage that is plated shall have `deposition_material` provided.

WR2: Each passage that has `maximum_as_finished_deposition_thickness` provided shall have `deposition_material` provided.

WR3: Each passage that has `minimum_as_finished_deposition_thickness` provided shall have `deposition_material` provided.

WR4: If `plated_passage` has a value of TRUE `Passage_technology` shall reference `Material_conductivity_classification` that equals "conductive".

NOTE EXPRESS specification:

```

*)

4.2.639 Pca

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Pca is a type of Assembly_module (see 4.2.43). A Pca describes a printed circuit assembly. A printed circuit assembly is nearly a synonym for printed wiring assembly, except that a printed circuit assembly may include printed components in its printed circuit board and a printed wiring assembly is constructed upon a printed wiring board that is totally interconnect without printed components. Another synonym for printed circuit assembly is circuit card assembly.

EXAMPLE 1 See figure 75 for an illustration of a Pca.

The data associated with a Pca are the following:

— usage_view.

4.2.639.1 usage_view

The usage_view specifies the Pca_usage_view (see 4.2.641), as seen from the context of its next assembly, for the Pca.

Figure 75 – Pca

NOTE EXPRESS specification:

```
* )
ENTITY pca
  SUBTYPE OF (assembly_module);
  SELF\physical_unit_design_view.usage_view : pca_usage_view;
END_ENTITY; -- pca
```

(*

4.2.640 Pca_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Pca_terminal is a type of Assembly_module_terminal (see 4.2.50) that is part of the interface between the Pca (see 4.2.639) and its next higher assembly.

The data associated with a Pca_terminal are the following:

— associated_definition.

4.2.640.1 associated_definition

The associated_definition specifies the role of the Pca_usage_view (see 4.2.641) for the Pca_terminal.

NOTE EXPRESS specification:

```
*)
ENTITY pca_terminal
  SUBTYPE OF (assembly_module_terminal);
  SELF\part_feature.associated_definition : pca_usage_view;
END_ENTITY; -- pca_terminal
```

(*

4.2.641 Pca_usage_view

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Pca_usage_view is a type of Assembly_module_usage_view (see 4.2.51). A Pca_usage_view provides the information needed to include the Pca (see 4.2.639) in the design of the next higher level assembly, but not necessarily sufficient information to reproduce that Pca.

NOTE A Packaged_connector may be located in a usage view in addition to terminals. Reference Assembly_module_usage_view_connector_relationship (see 4.2.52)

EXAMPLE 1 Figure 76 illustrates details available in a usage view for a Pca. The information available in the usage view specifically is separate from that in the design view and the relationships between the two views are usually controlled by a design organization.

Constraints:

WR1: Each Pca_usage_view shall have at least two terminals.

NOTE EXPRESS specification:

```
*)
ENTITY pca_usage_view
  SUBTYPE OF (assembly_module_usage_view);
END_ENTITY; -- pca_usage_view
```

(*

4.2.642 Pcb

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

Figure 76 – Pca_usage_view

A Pcb is a type of Interconnect_module (see 4.2.440). A Pcb describes a printed circuit board. A printed circuit board is nearly a synonym for printed wiring board, except that a printed circuit board may include printed components and a printed wiring board is totally interconnected without printed components. This part of ISO 10303 supports the exchange of product categories in order to allow the exchange partners to differentiate between printed wiring board and printed circuit board.

EXAMPLE 1 Figure 79 illustrates a printed wiring board design.

EXAMPLE 2 Figures 77 and 78 illustrate complex printed wiring board mechanical designs that have functional shape requirements that are communicated using Geometric Dimensioning and Tolerancing information in a product model and not graphically.

Figure 78 – Complex Pcb tolerances

The data associated with a Pcb are the following:

— usage_view.

4.2.642.1 usage_view

The usage_view specifies the role of the Pcb_usage_view (see 4.2.643) for the Pcb. The usage_view shall not be specified if the Pcb is a Layout_macro_definition, otherwise it shall exist.

Figure 79 – Bare printed wiring board

NOTE EXPRESS specification:

```

*)
ENTITY pcb
  SUPERTYPE OF (layout_macro_definition)
  SUBTYPE OF (interconnect_module);
  SELF\physical_unit_design_view.usage_view : OPTIONAL pcb_usage_view;
WHERE
  WR1: ('AP210_ARM.LAYOUT_MACRO_DEFINITION' IN TYPEOF(SELF)) XOR
    (EXISTS(SELF\physical_unit_design_view.usage_view));
END_ENTITY; -- pcb

```

(*

4.2.643 Pcb_usage_view

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Pcb_usage_view` is a type of `Interconnect_module_usage_view` (see 4.2.465) that provides the information necessary to include the `Pcb` (see 4.2.642) in its next higher level assembly for design and some simulation purposes, but may not include sufficient information to reproduce the `Pcb`.

EXAMPLE 1 Some of the information in figures 77 and 78 that communicate fit tolerances may be included in a usage view.

NOTE EXPRESS specification:

```
*)
ENTITY pcb_usage_view
  SUBTYPE OF (interconnect_module_usage_view);
END_ENTITY; -- pcb_usage_view

( *
```

4.2.644 Perpendicular_shape_element_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Perpendicular_shape_element_relationship` is a type of `Shape_element_relationship` (see 4.2.816) that asserts that two `Shape_element` (see 4.2.810) are perpendicular to each other. One `Shape_element` is specified as the `related_shape_element` and the other `Shape_element` is specified as the `relating_shape_element`.

NOTE 1 The attribute `related_shape_element` is declared in the `Shape_element_relationship` entity of which this entity is a subtype.

NOTE 2 The attribute `relating_shape_element` is declared in the `Shape_element_relationship` entity of which this entity is a subtype.

Constraints:

WR1: The `Shape_element` specified as the `relating_shape_element` shall not be specified as perpendicular to itself either directly or through intermediate `Perpendicular_shape_element_relationship`.

NOTE EXPRESS specification:

```
*)
ENTITY perpendicular_shape_element_relationship
  SUBTYPE OF (shape_element_relationship);
END_ENTITY; -- perpendicular_shape_element_relationship

( *
```

4.2.645 Perpendicularity_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Perpendicularity_tolerance is a type of Geometric_tolerance_with_referenced_datum_system (see 4.2.422) that specifies or partially specifies the design requirement on the perpendicularity of a Shape_element (see 4.2.810) in relation to one or two Datum (see 4.2.214).

NOTE Perpendicularity tolerance is defined in terms of tolerance zone definitions in 14.8 of ISO 1101.

Constraints:

WR1: The Shape_element specified as the toleranced_shape_element shall be a Centre_axis, Centre_plane, Physical_feature_or_part_template, or Tangent_plane.

NOTE The attribute toleranced_shape_element is declared in the Geometric_tolerance entity of which this entity is a subtype.

WR2: There shall be at most two Datum in the Datum_system the definition of which is specified as the datum_system_definition.

NOTE The attribute datum_system_definition is declared in the Geometric_tolerance_with_referenced_datum_system entity of which this entity is a subtype.

WR3: At least one Datum_plane or Datum_axis shall be in the Datum_system the definition of which is specified as the datum_system_definition.

WR4: If the toleranced_shape_element is a Centre_plane, Physical_feature_or_part_template, or Tangent_plane, the Perpendicularity_tolerance shall specify a Tolerance_zone_definition as its tolerance_zone_or_boundary_definition; and that Tolerance_zone_definition shall specify a Tolerance_zone_boundary_definition_with_specified_size as its boundary_definition; and that Tolerance_zone_boundary_definition_with_specified_size shall specify an Opposing_boundary_set_size_characteristic as its specified_boundary_size.

IP1: The form of the toleranced Shape_element shall be consistent with the form of a shape element for which the application of a perpendicularity tolerance is sensible.

NOTE EXPRESS specification:

```
*)
ENTITY perpendicularity_tolerance
  SUBTYPE OF (geometric_tolerance_with_referenced_datum_system);
END_ENTITY; -- perpendicularity_tolerance
```

```
( *
```

4.2.646 Person

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Person is a type of Managed_design_object (see 4.2.524). A Person is an individual within the context of a single Organization (see 4.2.569).

The data associated with a Person are the following:

- address;
- identifier.

4.2.646.1 address

The address specifies the string for the interpretable name for the location of the Person. The address specifies the routing for postal mail or the physical location of the Person. The address need not be specified for a particular Person.

4.2.646.2 identifier

The identifier specifies the name that represents either the personal name or title of the Person.

NOTE EXPRESS specification:

```
*)
ENTITY person
  SUBTYPE OF (managed_design_object);
    identifier : ee_name;
    address    : OPTIONAL STRING;
END_ENTITY; -- person

( *
```

4.2.647 Person_and_organization

A Person_and_organization is a type of Managed_design_object (see 4.2.524). A Person_and_organization is the aggregation of a Person (see 4.2.646) and an Organization (see 4.2.569).

The data associated with a Person_and_organization are the following:

- assigned_organization;
- assigned_person;
- person_id_in_organization.

4.2.647.1 assigned_organization

The assigned_organization specifies the role of the Organization (see 4.2.569) for the Person_and_organization.

4.2.647.2 assigned_person

The assigned_person specifies the role of the Person (see 4.2.646) for the Person_and_organization.

4.2.647.3 person_id_in_organization

The person_id_in_organization specifies the identifier for the Person within the context of the Organization for the Person_and_organization. The person_in_organization is optional and need not be supplied.

Constraints:

UR1: The combination of the person_id_in_organization and the assigned_organization shall be unique within a population of Person_and_organizations.

UR2: The combination of the assign_person and the assigned_organization shall be unique within a population of Person_and_organizations.

NOTE EXPRESS specification:

```
* )

```

4.2.651 `Physical_connectivity_abstraction_map`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_connectivity_abstraction_map` is a type of `Managed_design_object` (see 4.2.524) that provides traceability between a `Physical_connectivity_element` (see 4.2.654) and a `Conductive_interconnect_element` (see 4.2.171) for simulation or routing purposes.

The data associated with a `Physical_connectivity_abstraction_map` are the following:

— `geometric_context_based_definition`;

— `name_space_context_based_definition`.

4.2.651.1 geometric_context_based_definition

The `geometric_context_based_definition` specifies the role of the `Conductive_interconnect_element` (see 4.2.171) for the `Physical_connectivity_abstraction_map`.

4.2.651.2 name_space_context_based_definition

The `name_space_context_based_definition` specifies the role of the `Physical_connectivity_element` (see 4.2.654) for the `Physical_connectivity_abstraction_map`.

Constraints:

UR1: The combination of the `geometric_context_based_definition` and the `name_space_context_based_definition` shall be unique within a population of `Physical_connectivity_abstraction_maps`.

NOTE EXPRESS specification:

```

*)
ENTITY physical_connectivity_abstraction_map
  SUBTYPE OF (managed_design_object);
    name_space_context_based_definition : physical_connectivity_element;
    geometric_context_based_definition  : conductive_interconnect_element;
UNIQUE
  UR1: name_space_context_based_definition, geometric_context_based_definition;
END_ENTITY; -- physical_connectivity_abstraction_map

( *
```

4.2.652 Physical_connectivity_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_connectivity_definition` is a type of `Managed_design_object` (see 4.2.524). A `Physical_connectivity_definition` may be a `Physical_connectivity_structure_definition` (see 4.2.657). A `Physical_connectivity_definition` is the root node in the classification hierarchy of connectivity in the physical domain. All types of connectivity in this domain contain additional information to that of the base type. A `Physical_connectivity_definition` is a definition of one node, in an electrical network, consisting of physical terminals.

The data associated with a `Physical_connectivity_definition` are the following:

- `associated_terminals`;
- `name`.

4.2.652.1 associated_terminals

The associated_terminals specify the Component_terminal (see 4.2.137) of the Physical_connectivity_definition. There shall be two or more Component_terminal for a Physical_connectivity_definition.

4.2.652.2 name

The name identifies the Physical_connectivity_definition.

Constraints:

UR1: The name shall be unique within the context of the associated_definition.

WR1: Each design view that references a member of associated_terminals shall reference all members of associated_terminals.

WR2: The associated_definition shall reference all members of associated_terminals.

NOTE EXPRESS specification:

```

*)
ENTITY physical_connectivity_definition
  SUPERTYPE OF (physical_connectivity_structure_definition)
  SUBTYPE OF (managed_design_object);
  associated_definition : physical_unit_network_definition;
  associated_terminals : SET [2:?] OF physical_component_terminal;
  name                  : ee_name;
  UNIQUE
  UR1 : name, associated_definition;
END_ENTITY; -- physical_connectivity_definition
( *
```

4.2.653 Physical_connectivity_definition_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Physical_connectivity_definition_relationship is a type of Managed_design_object (see 4.2.524). A Physical_connectivity_definition_relationship is the association between Physical_connectivity_definition (see 4.2.652) that exists because of a Requirement_occurrence.

NOTE The purpose of the Physical_connectivity_definition_relationship is documented in the Requirement_occurrence, and is typically life cycle dependent, based on design iterations, or variations.

The data associated with a `Physical_connectivity_definition_relationship` are the following:

- `current_definition`;
- `previous_definition`;
- `requirement`.

4.2.653.1 `current_definition`

The `current_definition` specifies one role of the `Physical_connectivity_definition` (see 4.2.652) for the `Physical_connectivity_definition_relationship`.

4.2.653.2 `previous_definition`

The `previous_definition` specifies one role of the `Physical_connectivity_definition` (see 4.2.652) for the `Physical_connectivity_definition_relationship`.

4.2.653.3 `requirement`

The `requirement` specifies the `Ee_requirement_occurrence` (see 4.2.330) that causes the `Physical_connectivity_definition_relationship` to be in existence between the current `Physical_connectivity_definition` (see 4.2.652) and the previous `Physical_connectivity_definition`.

NOTE EXPRESS specification:

```

*)
ENTITY physical_connectivity_definition_relationship
  SUBTYPE OF (managed_design_object);
    requirement      : ee_requirement_occurrence;
    previous_definition : physical_connectivity_definition;
    current_definition : physical_connectivity_definition;
END_ENTITY; -- physical_connectivity_definition_relationship

( *
```

4.2.654 `Physical_connectivity_element`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_connectivity_element` is a type of `Managed_design_object` (see 4.2.524). A `Physical_connectivity_element` is the object that describes a link between two nodes for the graph representation.

The data associated with a `Physical_connectivity_element` are the following:

- `connectivity_context`;
- `end_terminus`;
- `name`;
- `start_terminus`.

4.2.654.1 `connectivity_context`

The `connectivity_context` specifies the role of the `Physical_connectivity_structure_definition` (see 4.2.657) for the `Physical_connectivity_element`. The `connectivity_context` contains all the link elements of the graph, of which a `Physical_connectivity_element` is one.

4.2.654.2 `end_terminus`

The `end_terminus` specifies either a `Component_terminal` (see 4.2.137) or a `Topological_junction` (see 4.2.928) as the end of the `Physical_connectivity_element`.

4.2.654.3 `name`

The `name` identifies the member of `Physical_connectivity_element` within the context of the assembly.

4.2.654.4 `start_terminus`

The `start_terminus` specifies either a `Component_terminal` (see 4.2.137) or a `Topological_junction` (see 4.2.928) as the beginning of the `Physical_connectivity_element`.

Constraints:

UR1: The combination of the `name` and the `connectivity_context` shall be unique within a population of `Physical_connectivity_element`.

WR1: The `start_terminus` shall not be the `end_terminus`;

WR2: Each object referenced by the `Physical_connectivity_element` shall be in the design view specified by `connectivity_context.associated_definition`.

NOTE EXPRESS specification:

```

*)
ENTITY physical_connectivity_element
  SUBTYPE OF (managed_design_object);
    start_terminus      : termination_or_junction;

(*

4.2.655 Physical_connectivity_interrupting_cutout

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Physical_connectivity_interrupting_cutout is a type of Cutout (see 4.2.208) that is included in the design of an Interconnect_module (see 4.2.440) for the purpose of interrupting one or more connectivity_elements in an Interconnect_module.

NOTE A Physical_connectivity_interrupting_cutout is used where a relayout of the design that would remove the connectivity elements from the design is not provided, but where traceability to a Physical_connectivity_definition (see 4.2.652) is required.

The data associated with a Physical_connectivity_interrupting_cutout are the following:

— interrupted_connectivity_element.

4.2.655.1 interrupted_connectivity_element

The interrupted_connectivity_element specifies the Conductive_interconnect_element (see 4.2.171) that is interrupted with the Physical_connectivity_interrupting_cutout. There shall be one or more Conductive_interconnect_element for a Physical_connectivity_interrupting_cutout.

NOTE EXPRESS specification:

```

*)
ENTITY physical_connectivity_interrupting_cutout
  SUBTYPE OF (cutout);

(*

4.2.656 **Physical_connectivity_make_from_relationship**

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_connectivity_make_from_relationship` is a type of `Managed_design_object` (see 4.2.524). A `Physical_connectivity_make_from_relationship` is an association between one `Physical_connectivity_definition` (see 4.2.652) that is used as a basis for modification into another `Physical_connectivity_definition` and the modified `Physical_connectivity_definition` that results from the modification.

The data associated with a `Physical_connectivity_make_from_relationship` are the following:

- `resultant_definition`;
- `reusable_definition`.

4.2.656.1 **resultant_definition**

The `resultant_definition` specifies the `Physical_connectivity_definition` (see 4.2.652) that results from modification of the `reusable_definition` of the `Physical_connectivity_make_from_relationship`.

4.2.656.2 **reusable_definition**

The `reusable_definition` specifies the `Physical_connectivity_definition` (see 4.2.652) for the basis for modification into the `resultant_definition` in the `Physical_connectivity_make_from_relationship`.

NOTE EXPRESS specification:

```
*)
ENTITY physical_connectivity_make_from_relationship
  SUBTYPE OF (managed_design_object);
    reusable_definition : physical_connectivity_definition;
    resultant_definition : physical_connectivity_definition;
END_ENTITY; -- physical_connectivity_make_from_relationship

( *
```

4.2.657 **Physical_connectivity_structure_definition**

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_connectivity_structure_definition` is a type of `Physical_connectivity_definition` (see 4.2.652) that has a structure. Structure included supports assignment of path based properties to a `Physical_connectivity_definition` for routing or validation purposes. The structure is a graph and may be a tree if there are no redundant arcs, but that is not a requirement.

The data associated with a `Physical_connectivity_structure_definition` are the following:

— `structural_element`.

4.2.657.1 `structural_element`

The `structural_element` is an inverse relationship that specifies that the existence of the `Physical_connectivity_structure_definition` is dependent on the existence of the `Physical_connectivity_element` (see 4.2.654) that specifies the `Physical_connectivity_structural_definition` as its `connectivity_context`. There shall be one or more `Physical_connectivity_element` for a `Physical_connectivity_structural_definition`.

NOTE Ordering is not explicitly represented in this Application Object.

NOTE EXPRESS specification:

```
*)
ENTITY physical_connectivity_structure_definition
  SUBTYPE OF (physical_connectivity_definition);
  INVERSE
    structural_element : SET [1:?] OF physical_connectivity_element FOR
                          connectivity_context;
END_ENTITY; -- physical_connectivity_structure_definition

( *
```

4.2.658 `Physical_feature_or_part_template`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_feature_or_part_template` is a type of `Shape_element` (see 4.2.810) that is either on the physical boundary of a `Physical_unit` (see 4.2.664) or is a `Part_template` (see 4.2.620). A `Physical_feature_or_part_template` is one of a `Part_feature` (see 4.2.609), a `Physical_component_feature` (see 4.2.649), a `Physical_laminate_component` (see 4.2.659), a `Part_template`, or a `Stratum_feature` (see 4.2.851). Additionally, a `Physical_feature_or_part_template` may either be a `Datum_feature` (see 4.2.226) or a `Datum_target` (see 4.2.240). The `Physical_feature_or_part_template` is an intersection application object that supports assignment of Geometric Dimensioning and Tolerance data to features or template definitions.

Constraints:

IP1: If the `Physical_feature_or_part_template` is not a `Part_template` it shall be on the boundary of the `Physical_unit`.

NOTE EXPRESS specification:

```

*)
ENTITY physical_feature_or_part_template
  ABSTRACT SUPERTYPE OF (ONEOF (part_feature,
    physical_component_feature, physical_laminate_component, part_template,
    stratum_feature) ANDOR ONEOF (datum_feature, datum_target))
  SUBTYPE OF (shape_element);
END_ENTITY; -- physical_feature_or_part_template

( *

```

4.2.659 Physical_laminate_component

A `Physical_laminate_component` is a type of `Laminate_component` (see 4.2.483) and a type of `Physical_feature_or_part_template` (see 4.2.658). The `Physical_laminate_component` supports the specification of a `Laminate_component` as a `Datum_target` or `Datum_feature` for the purpose of establishing a `Datum_reference_frame` for tolerance specification. A `Physical_laminate_component` shall be in a complex instance with another member of the subtype tree of `Laminate_component` and `Physical_feature_or_part_template`. The interpretation shall be in compliance with the interpretation as if `Physical_laminate_component` were `Abstract`.

NOTE ISO 10303-11 does not permit `Physical_laminate_component` to be `Abstract`. Therefore this requirement is encoded in a rule.

NOTE EXPRESS specification:

```

4.2.660 Physical_network

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_network` is a type of `Managed_design_object` (see 4.2.524). A `Physical_network` may be a `Partially_routed_physical_network` (see 4.2.636). A `Physical_network` is the result of mapping a topological definition of a physical connectivity requirement onto the conducting `Design_layer_stratum` (see 4.2.275) of an `Interconnect_module` (see 4.2.440). The vertices, specified by `Component_terminal` (see 4.2.137), are mapped onto `Layer_connection_point` (see 4.2.499) on the surface of one or more conducting `Design_layer_stratum` in the `Interconnect_module`. The design features that are implementing the `Physical_network` are accessed by traversing the structure specified by the `interconnect_module_net_topology_element` attribute. The `Physical_network` shall not implement direct connections to `Component_terminal` specified by `Interface_mounted_join` (see 4.2.470), or `Assembly_joint` (see 4.2.41), but shall implement connections only to `Component_terminals` in the scope of the design view being implemented. This `Physical_network` implements connectivity to the join terminals of the components that are interface components in this `Interconnect_module`, which is a design view. The scope of the `Physical_network` is entirely within the interconnect design view and provides no information about assembly connectivity of design views within which occurrences of the `Interconnect_module`, as `Interconnect_module_component` (see 4.2.442) may appear. The `Physical_network` shall not use as `connectivity_requirement_element` terminals of `Land` or `Non_functional_land` that are supporting internal implementation of the `Physical_network`. Only `Land` or `Non_functional_land` types that have `interface_terminals` shall be referenced.

NOTE The `Physical_node_requirement_to_implementing_component_allocation` (see 4.2.663) application object is provided so that traceability of the required connectivity for an assembly design view to that implemented internally in an `Interconnect_module` may be supported. The `Part_connected_terminals_definition` (see 4.2.605) application object is provided to specify explicitly the external terminals of the interconnect substrate that are to be connected. In a case where a design organization re-uses an interconnect design, the `Part_connected_terminals_definition`, since it is the actual connection statement for an `Interconnect_module`, defines the capabilities of the interconnect substrate to satisfy the requirements imposed by the `Physical_node_requirement_to_implementing_component_allocation` object. There may be many sets of `Physical_node_requirement_to_implementing_component_allocation` (one set per assembly design) that reference an interconnect substrate. There is only one set of `Part_connected_terminals_definition` for an interconnect substrate.

The data associated with a `Physical_network` are the following:

- `current_associated_definition`;
- `prior_associated_definition`;
- `connectivity_requirement_element`;
- `interconnect_module_net_topology_element`;
- `name`.

4.2.660.1 `current_associated_definition`

The `current_associated_definition` specifies the `Interconnect_module` (see 4.2.440) that is the current product definition associated with the `Physical_network`.

4.2.660.2 prior_associated_definition

The prior_associated_definition specifies one or more Interconnect_module (see 4.2.440) that are definitions for prior versions of the design. The prior_associated_definition need not be provided.

4.2.660.3 connectivity_requirement_element

The connectivity_requirement_element specifies the Component_terminal (see 4.2.137) to be connected by the network described by the Physical_network. There shall be two or more Component_terminal for a Physical_network.

4.2.660.4 interconnect_module_net_topology_element

The interconnect_module_net_topology_element specifies the unique Join_relationship (see 4.2.479) that results from mapping the topological statement of the physical connectivity requirement onto the coordinate space of the conducting Design_layer_stratum (see 4.2.275) that compose the Interconnect_module (see 4.2.440). There shall be one or more Join_relationship for a Physical_network.

4.2.660.5 name

The name identifies the Physical_network.

Constraints:

UR1: The name shall be unique within a population of Physical_networks in the context of the current_associated_definition.

WR1: The Component_terminal specified by connectivity_requirement_element shall be one of the following:

Land_join_terminal,

Non_functional_land_join_terminal,

Printed_component_join_terminal,

Via_terminal,

Component_termination_passage_join_terminal.

WR2: All members of connectivity_requirement_element and interconnect_module_network_topology_element shall be in the current_associated_definition.

WR3: If the prior_associated_definition exists, then all members of connectivity_requirement_element and interconnect_module_network_topology_element shall be in the prior_associated_definition.

WR4: If the prior_associated_definition exists, then each member of prior_associated_definition shall not be an current_associated_definition.

WR5: Each Ee_material that participates in the Physical_network shall be the same material.

WR6: Each member of Component_terminal in the role of connectivity_requirement_element and each member of Join_relationship in the role of interconnect_module_network_topology_element referenced by Physical_network shall be in the same design view or shall be an explicit external reference.

NOTE A Physical_network does not include connection requirements that are implemented by a Printed_component.

NOTE EXPRESS specification:

4.2.661 Physical_network_supporting_inter_stratum_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_network_supporting_inter_stratum_feature` is a type of `Inter_stratum_join_implementation` (see 4.2.436) and a type of `Plated_inter_stratum_feature` (see 4.2.687), that is included in the design for the purpose of implementing connectivity. A `Physical_network_supporting_inter_stratum_feature` references the `Physical_network` it is supporting through a relationship to the `Join_relationship` application object that it inherits from the `Inter_stratum_join_implementation` application object.

NOTE EXPRESS specification:

*)

```

(*

4.2.662 `Physical_network_supporting_stratum_feature_conductive_join`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_network_supporting_stratum_feature_conductive_join` is a type of `Inter_stratum_join_implementation` (see 4.2.436) and a type of `Stratum_feature_conductive_join` (see 4.2.853), that is included in the design for the purpose of implementing a `Physical_network`. A `Physical_network_supporting_stratum_feature_conductive_join` effects an interconnection from a succeeding conductive material deposition to a preceding conductive material deposition for the purpose of implementing connectivity.

Constraints:

WR1: Each `Stratum_feature` interconnected shall be resident on a `Stratum` that is a resident stratum for a `Layer_connection_point` specified by the topological requirement that this implementation satisfies.

WR2: Each `Stratum` referenced by a `Stratum_feature` interconnected shall be disjoint from `Stratum` referenced by any other `Stratum_feature` interconnected.

NOTE EXPRESS specification:

*)

```
ENTITY physical_network_supporting_stratum_feature_conductive_join
  SUBTYPE OF (stratum_feature_conductive_join,
              inter_stratum_join_implementation);
END_ENTITY; -- physical_network_supporting_stratum_feature_conductive_join
```

(*

4.2.663 **Physical_node_requirement_to_implementing_component_allocation**

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_node_requirement_to_implementing_component_allocation` is a type of `Managed_design_object` (see 4.2.524). A `Physical_node_requirement_to_implementing_component_allocation` is the association between the connectivity requirements and the component and joints that provide that connectivity. The component specified by `implementation_component` participate in an assembly relationship with the components whose terminals are specified by the `physical_node_requirement` in order for the total connectivity specified by `physical_node_requirement` to be achieved. There may be more than one member of `physical_node_requirement_to_implementing_component_allocation` for a member of `Physical_connectivity_definition` if the nodal implementation is split among more than one component.

NOTE The `Physical_node_requirement_to_implementing_component_allocation` is a link in the traceability path between the functional definition and the geometric representation of the interconnect substrate conductive patterns.

The data associated with a `Physical_node_requirement_to_implementing_component_allocation` are the following:

- `implementation_component`;
- `physical_node_requirement`;
- `implementation_interface_joint_set`;
- `implementation_joint_set`.

4.2.663.1 **implementation_component**

The `implementation_component` specifies the role of the `Assembly_component` (see 4.2.34) for the `Physical_node_requirement_to_implementing_component_allocation`. The `implementation_component` is the component physically providing the implementation of connectivity stated by the requirements.

4.2.663.2 **physical_node_requirement**

The `physical_node_requirement` specifies the role of the `Physical_connectivity_definition` (see 4.2.652) for the `Physical_node_requirement_to_implementing_component_allocation`.

4.2.663.3 **implementation_interface_joint_set**

The `implementation_interface_joint_set` specifies the role of the `Interface_mounted_join` (see 4.2.470) for the `Physical_node_requirement_to_implementing_component_allocation`. The `implementation_interface_joint_set` identifies the joints that attach the terminals specified by the connectivity requirement to the interface features of the component that is implementing that requirement.

4.2.663.4 implementation_joint_set

The implementation_joint_set specifies the role of the Assembly_joint (see 4.2.41) for the Physical_node_requirement_to_implementing_component_allocation. The implementation_joint_set identifies the joints that attach the terminals specified by the connectivity requirement to the features of the component that is implementing that requirement. The implementation_joint_set identifies the joints that attach the terminals of interface components to the features of the component that is implementing that requirement.

Constraints:

WR1: The implementation_component, implementation_interface_joint_set, implementation_joint_set, and physical_node_requirement shall be in the same design view.

WR2: Either implementation_interface_joint_set shall be provided or implementation_joint_set shall be provided, but both shall not be provided.

WR3: Each member of implementation_joint_set shall reference a feature of implementation_component in its set of assembly_features. Each member of implementation_joint_set shall either reference a Component_terminal (see 4.2.137) that is also referenced by the attribute associated_terminals of the physical_node_requirement, or shall reference a join terminal of the implementation_component referenced by another member of Physical_node_requirement_to_implementing_component_allocation where the interface terminal is referenced by implementation_interface_joint_set of that Physical_node_requirement_to_implementing_component_allocation.

NOTE This rule reduces potential confusion caused by more than one implementation_component implementing a single binary connection between two terminals.

NOTE EXPRESS specification:

```

*)

```

4.2.664 Physical_unit

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A **Physical_unit** is a type of **Ee_product_definition** (see 4.2.323). Each **Physical_unit** is either a **Physical_unit_design_view** (see 4.2.667) or a **Physical_unit_usage_view** (see 4.2.672). A **Physical_unit** is the description of physical characteristics common to a variety of realizations of an **Ee_product** (see 4.2.319). This description is applicable to every occurrence of a physical realization in composing a higher level assembly.

The data associated with a `Physical_unit` are the following:

- `analytical_physical_unit_representation`;
- `design_requirement`;
- `physical_device_characteristic`;
- `physical_device_coordinated_characteristic`;
- `unit_technology`.

4.2.664.1 analytical_physical_unit_representation

The `analytical_physical_unit_representation` specifies the `Analytical_representation` (see 4.2.22) for the instance of a computer interpretable model (including assigned parameter values) of the `Physical_unit`. The `analytical_physical_unit_representation` need not be specified for a particular subtype of `Physical_unit`. There may be more than one `Analytical_representation` for a `Physical_unit`.

NOTE Computer interpretable models are used to predict temperatures, stress, and failure rate. This is a representation because all declared parameters have values assigned so that when interpreted by a computer a report may be generated that describes the behaviour of the item represented. This report may be a graph or table.

4.2.664.2 design_requirement

The `design_requirement` specifies the `Ee_requirement_occurrence` (see 4.2.330) for the technical requirement for the `Physical_unit`. The `design_requirement` need not be specified for a particular `Physical_unit`. There may be more than one `Ee_requirement_occurrence` for a `Physical_unit`.

4.2.664.3 physical_device_characteristic

The `physical_device_characteristic` specifies the role of the `Characteristic` (see 4.2.98) for the `Physical_unit`. The `physical_device_characteristic` need not be specified for a particular `Physical_unit`. There may be more than one `Characteristic` for a `Physical_unit`.

4.2.664.4 physical_device_coordinated_characteristic

The `physical_device_coordinated_characteristic` specifies the role of the `Coordinated_characteristic` (see 4.2.197) for the `Physical_unit`. The `physical_device_coordinated_characteristic` need not be specified for a particular `Physical_unit`. There may be more than one `Coordinated_characteristic` for a `Physical_unit`.

4.2.664.5 unit_technology

The `unit_technology` specifies the `Technology` (see 4.2.886) used to realize the `Physical_unit`. The `unit_technology` need not be specified for a particular `Physical_unit`.

EXAMPLE 1 Examples of the unit_technologies for the Physical_units that are Physical_unit_design_views called Interconnect_modules include rigid, flexible, and flex-rigid multilayer printed circuit boards, and three-dimensional Molded Interconnect Devices. Another categorization of such Physical_units includes digital, analogue, mixed, and rf technologies.

EXAMPLE 2 Some examples of the unit_technologies for Physical_units that are Physical_unit_usage_views called Packages include ceramic Dual Inline (DIP), plastic DIP, Single Inline (SIP), J-Lead, metal can, ball grid array, molded axial, and molded radial packages.

EXAMPLE 3 Examples of the unit_technologies for the Physical_units that are Physical_unit_usage_views called Bare_die include CMOS, ECL, GAAS, BICMOS.

EXAMPLE 4 Examples of the unit_technologies for the Physical_units that are Physical_unit_design_views called Assembly_modules are MCM-D (Multichip Modules, Deposited), MCM-L (Multichip Modules, Laminated), MCM-C (Multichip Modules, Ceramic), and hybrid microcircuits.

NOTE For interoperability purposes, the technology data also may be included in a more generic manner in Ee_product_category.

NOTE EXPRESS specification:

```

4.2.665 Physical_unit_3d_keepout_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Physical_unit_3d_keepout_shape is a type of Bound_volume_shape (see 4.2.76) and a type of Non_feature_shape_definition (see 4.2.559). A Physical_unit_3d_keepout_shape is the shape in three orthogonal dimensions of a keepout constraint for a Physical_unit (see 4.2.664).

NOTE Keepout regions typically include some minimal spacing around the extreme shape.

The data associated with a `Physical_unit_3d_keepout_shape` are the following:

- `application_technology_constraint`;
- `centroid_location`;
- `constrained_design_object_category`;
- `shape_characterized_physical_unit`;
- `shape_environment`;
- `shape_material_condition`;
- `shape_purpose`;
- `shape_representation`.

4.2.665.1 application_technology_constraint

The `application_technology_constraint` specifies the role of `Ee_requirement_occurrence` for the `Physical_unit_3d_keepout_shape`. The `application_technology_constraint` is the relationship between keepout shapes and process constraints under which those keepout shapes are valid.

EXAMPLE 1 An example of an `application_technology_constraint` is the relationship of the shape of a clearance area to an assembly or testing process which requires the clearance.

4.2.665.2 centroid_location

The `centroid_location` is a `Cartesian_point` (see 4.2.87) which is the center of a `Physical_unit_3d_keepout_shape`. A `centroid_location` need not be specified for a particular `Physical_unit_3d_keepout_shape`.

4.2.665.3 constrained_design_object_category

The `constrained_design_object_category` specifies the category for which the `Physical_unit_3d_keepout_shape` is a constraint.

4.2.665.4 shape_characterized_physical_unit

The `shape_characterized_physical_unit` specifies the role of the `Physical_unit` (see 4.2.664) for the `Physical_unit_3d_keepout_shape`.

4.2.665.5 shape_environment

The `shape_environment` specifies either manufacturing or an `end_user_application` as the environment for the `Physical_unit_3d_keepout_shape`.

4.2.665.6 shape_material_condition

The shape_material_condition specifies either the maximum_material_condition, the minimum_material_condition, or the nominal_material_condition as the material condition for the Physical_unit_3d_keeput_shape.

4.2.665.7 shape_purpose

The shape_purpose specifies either electro_magnetic_compatibility, shock, thermal, vibration, or an external_definition as the purpose for the Physical_unit_3d_keeput_shape.

4.2.665.8 shape_representation

The shape_representation specifies the role of the Bound_volume_shape (see 4.2.76) for the Physical_unit_3d_keeput_shape.

NOTE EXPRESS specification:

```

*)
ENTITY physical_unit_3d_keeput_shape
  SUBTYPE OF (bound_volume_shape, non_feature_shape_definition);
    application_technology_constraint : OPTIONAL ee_requirement_occurrence;
    constrained_design_object_category : keeput_product_design_object_category;
    shape_characterized_physical_unit : physical_unit;
    shape_material_condition          : material_condition;
    shape_purpose                      : keeput_purpose;
    shape_environment                 : environment;
    centroid_location                 : OPTIONAL cartesian_point;
END_ENTITY; -- physical_unit_3d_keeput_shape
( *
```

4.2.666 Physical_unit_3d_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Physical_unit_3d_shape is a type of Bound_volume_shape (see 4.2.76) and a type of Feature_shape_definition (see 4.2.372). A Physical_unit_3d_shape is the shape in three orthogonal dimensions of a Physical_unit (see 4.2.664). A Physical_unit_3d_shape may be included for purposes which include the actual shape or boundaries of the actual shape. A Physical_unit (see 4.2.664) shall not be referenced by a Physical_unit_3d_shape.

NOTE 1 When a extreme boundary of the actual shape is provided, mass property calculations based on the extreme shape may be invalid, depending on the purpose. For example, the centroid_location in particular may not be valid for an extreme shape representing the envelope of a mult-mode vibration since the centroid may also vary over a range.

NOTE 2 The shape for a Packaged_part is provided by a Package, eliminating the requirement to support a shape for a Packaged_part separately.

The data associated with a Physical_unit_3d_shape are the following:

- application_technology_constraint;
- centroid_location;
- shape_characterized_physical_unit;
- shape_environment;
- shape_material_condition;
- shape_purpose;
- shape_representation.

4.2.666.1 application_technology_constraint

The application_technology_constraint specifies the role of Ee_requirement_occurrence for the Physical_unit_3d_shape. The application_technology_constraint is the relationship between physical shapes and process constraints under which those physical shapes are valid.

4.2.666.2 centroid_location

The centroid_location is a Cartesian_point (see 4.2.87) which is the center of a Physical_unit_3d_shape. A centroid_location need not be specified for a particular Physical_unit_3d_shape.

4.2.666.3 shape_characterized_physical_unit

The shape_characterized_physical_unit specifies the role of the Physical_unit (see 4.2.664) for the Physical_unit_3d_shape.

4.2.666.4 shape_environment

The shape_environment specifies either manufacturing or an end_user_application as the environment for the Physical_unit_3d_shape.

4.2.666.5 shape_material_condition

The shape_material_condition specifies either the maximum_material_condition, the minimum_material_condition, or the nominal_material_condition as the material condition for the Physical_unit_3d_shape.

4.2.666.6 shape_purpose

The shape_purpose specifies either a design, a design_profile, a design_profile_above_seating_plane, a design_profile_below_seating_plane, an electro_magnetic_compatibility_analysis, a shock_analysis, a thermal_analysis, or a vibration_analysis as the purpose for the Physical_unit_3d_shape.

4.2.666.7 shape_representation

The shape_representation specifies the role of the Bound_volume_shape (see 4.2.76) for the Physical_unit_3d_shape.

NOTE EXPRESS specification:

```

*)

4.2.667 Physical_unit_design_view

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Physical_unit_design_view is a type of Physical_unit (see 4.2.664). A Physical_unit_design_view may be one or both of an Assembly_module (see 4.2.43) or an Interconnect_module (see 4.2.440). A Physical_unit_design_view shall fully describe a specifically designed item in sufficient detail to permit production of that item in a manufacturing process and analysis of that item's response to a simulated environment in a computer based experimental environment.

EXAMPLE 1 Figure 80 illustrates an assembly design view.

The data associated with a `Physical_unit_design_view` are the following:

— `usage_view`.

4.2.667.1 `usage_view`

The `usage_view` specifies the role of the `Physical_unit_usage_view` (see 4.2.672) for the `Physical_unit_design_view`. The `usage_view` provides sufficient detail to allow the `Physical_unit` (see 4.2.664) to be utilized in its next assembly, but does not provide sufficient detail to allow reproduction of the `Physical_unit`. The `usage_view` specifies the features visible in the next assembly and the terminals of the `Physical_unit`, if there are any. The `usage_view` shall not be supplied for the `Layout_macro_definition` but shall be supplied for all other types of `Physical_unit_design_view`.

`Pca` is a type of `Assembly_module`

Figure 80 – `Physical_unit_design_view`

NOTE EXPRESS specification:

```

*)
ENTITY physical_unit_design_view
--tt tc1 wd11 modified
    SUPERTYPE OF (ONEOF(assembly_module,
                        interconnect_module))
    SUBTYPE OF (physical_unit);
    usage_view : OPTIONAL physical_unit_usage_view;
WHERE
    WR1: ( 'AP210_ARM.LAYOUT_MACRO_DEFINITION' IN TYPEOF(SELF)) OR
    EXISTS(usage_view);
END_ENTITY; -- physical_unit_design_view

( *
```

4.2.668 Physical_unit_network_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_unit_network_definition` is a type of `Ee_product_definition` (see 4.2.323). A `Physical_unit_network_definition` specifies a network of physical nodes, each of which references several physical terminals. Each node in the network is isolated from the other nodes in the network and is separately identifiable.

NOTE This Application object corresponds to the `Functional_unit_network_definition` but the nodes and terminals in that AO are abstract.

EXAMPLE 1 A `Physical_unit_network_definition` is referenced by members of `Physical_connectivity_definition` that correspond to the connectivity input to a design process for interconnect design.

NOTE EXPRESS specification:

```

*)
ENTITY physical_unit_network_definition
    SUBTYPE OF (ee_product_definition);
END_ENTITY; -- physical_unit_network_definition

( *
```

4.2.669 Physical_unit_planar_keepout_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_unit_planar_keepout_shape` is a type of `Planar_shape` (see 4.2.678) and a type of `Non_feature_shape_definition` (see 4.2.559). A `Physical_unit_planar_keepout_shape` is the projected shape of a keepout region around the `Physical_unit` (see 4.2.664) in two dimensions.

NOTE 1 Keepout regions typically include some minimal spacing around the extreme shape represented by `Physical_unit_planar_shape` where the exact relationship between the two shapes is unrecorded.

NOTE 2 There may be multiple `Physical_unit_planar_keepout_shape` for a particular purpose. The recommended method to aggregate several `Physical_unit_planar_keepout_shape` that together describe a volumetric constraint is to reference them from a member of `Shape_and_ee_product_definition_based_constraint_occurrence` (see 4.2.806).

The data associated with a `Physical_unit_planar_keepout_shape` are the following:

- `application_technology_constraint`;
- `centroid_location`;
- `constrained_design_object_category`;
- `shape_characterized_physical_unit`;
- `shape_environment`;
- `shape_distance_from_seating_plane`;
- `shape_location_with_respect_to_seating_plane`;
- `shape_material_condition`;
- `shape_purpose`.

4.2.669.1 application_technology_constraint

The `application_technology_constraint` specifies the role of `Ee_requirement_occurrence` for the `Physical_unit_3d_shape`. The `application_technology_constraint` is the relationship between keepout shapes and process constraints under which those keepout shapes are valid.

EXAMPLE 1 An example of an `application_technology_constraint` is the relationship of the shape of a clearance area to an assembly or testing process which requires the clearance.

4.2.669.2 centroid_location

The `centroid_location` is a `Cartesian_point` (see 4.2.87) which is the center of a `Physical_unit_planar_keepout_shape`. A `centroid_location` need not be specified for a particular `Physical_unit_planar_keepout_shape`.

4.2.669.3 constrained_design_object_category

The `constrained_design_object_category` specifies the category of design object for which the `Physical_unit_planar_keepout_shape` is a constraint.

4.2.669.4 shape_characterized_physical_unit

The shape_characterized_part_unit specifies the role of the Physical_unit (see 4.2.664) for the Physical_unit_planar_keepout_shape.

4.2.669.5 shape_environment

The shape_environment specifies either manufacturing or an end_user_application as the environment for the Physical_unit_planar_keepout_shape.

4.2.669.6 shape_distance_from_seating_plane

The shape_distance_from_seating_plane specifies the distance of the Physical_unit_planar_keepout_shape from the seating_plane. The shape_distance_from_seating_plane is coordinated with the shape_location_with_respect_to_seating_plane. The shape_distance_from_seating_plane need not be provided with a Physical_unit_planar_keepout_shape.

4.2.669.7 shape_location_with_respect_to_seating_plane

The shape_location_with_respect_to_seating_plane specifies the location of the Physical_unit_planar_keepout_shape as 'above', 'below' or 'congruent' with the seating_plane.

4.2.669.8 shape_material_condition

The shape_material_condition specifies either the maximum_material_condition, the minimum_material_condition, or the nominal_material_condition as the material condition for the Physical_unit_planar_keepout_shape.

4.2.669.9 shape_purpose

The shape_purpose specifies either electro_magnetic_compatibility, shock, thermal, vibration, or an external_definition as the purpose for the Physical_unit_planar_keepout_shape.

Constraints:

WR1: If the shape_location_with_respect_to_seating_plane value is 'congruent', the shape_distance_from_seating_plane shall not be supplied.

NOTE EXPRESS specification:

```

*)
ENTITY physical_unit_planar_keepout_shape
  SUBTYPE OF (planar_shape, non_feature_shape_definition);
    application_technology_constraint : OPTIONAL ee_requirement_occurrence;
    constrained_design_object_category : keepout_product_design_object_category;
    shape_characterized_physical_unit : physical_unit;
    shape_distance_from_seating_plane : OPTIONAL length_data_element;
    shape_location_with_respect_to_seating_plane: shape_location;
    shape_material_condition          : material_condition;
    centroid_location                 : OPTIONAL cartesian_point;
    shape_environment                 : environment;
    shape_purpose                       : keepout_purpose;
WHERE
  WR1: NOT((congruent =
    shape_location_with_respect_to_seating_plane) AND
    (EXISTS(shape_distance_from_seating_plane)));
END_ENTITY; -- physical_unit_planar_keepout_shape
( *

```

4.2.670 Physical_unit_planar_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_unit_planar_shape` is a type of `Planar_projected_shape` (see 4.2.677). A `Physical_unit_planar_shape` is the projected shape of the `Physical_unit` (see 4.2.664) in two dimensions. A `Physical_unit_planar_shape` shall not reference a `Packaged_part` (see 4.2.591).

NOTE 1 When an extreme boundary of the actual shape is provided, static mass property calculations based on the extreme shape may be invalid, depending on the purpose.

NOTE 2 The shape of the Package is the shape for a `Packaged_part` that references that Package, eliminating the requirement to provide a shape for a `Packaged_part`.

The data associated with a `Physical_unit_planar_shape` are the following:

- `application_technology_constraint`;
- `centroid_location`;
- `shape_characterized_physical_unit`;
- `shape_distance_from_seating_plane`;
- `shape_environment`;
- `shape_location_with_respect_to_seating_plane`;
- `shape_material_condition`;
- `shape_purpose`.

4.2.670.1 `application_technology_constraint`

The `application_technology_constraint` specifies the role of `Ee_requirement_occurrence` for the `Physical_unit_3d_shape`. The `application_technology_constraint` is the relationship between physical shapes and process constraints under which those shapes are valid.

4.2.670.2 `centroid_location`

The `centroid_location` is a `Cartesian_point` (see 4.2.87) which is the center of a `Physical_unit_planar_shape`. A `centroid_location` need not be specified for a particular `Physical_unit_planar_shape`.

4.2.670.3 `shape_characterized_physical_unit`

The `shape_characterized_part_unit` specifies the role of the `Physical_unit` (see 4.2.664) for the `Physical_unit_planar_shape`.

4.2.670.4 `shape_distance_from_seating_plane`

The `shape_distance_from_seating_plane` specifies the distance of the `Physical_unit_planar_shape` from the seating plane. The `shape_distance_from_seating_plane` is coordinated with the `shape_location_with_respect_to_seating_plane`. The `shape_distance_from_seating_plane` need not be provided with a `Physical_unit_planar_shape`.

4.2.670.5 `shape_environment`

The `shape_environment` specifies either manufacturing or an `end_user_application` as the environment for the `Physical_unit_planar_shape`.

4.2.670.6 shape_location_with_respect_to_seating_plane

The shape_location_with_respect_to_seating_plane specifies the location of the Physical_unit_planar_shape as 'above', 'below' or 'congruent' with the seating_plane.

4.2.670.7 shape_material_condition

The shape_material_condition specifies either the maximum_material_condition, the minimum_material_condition, or the nominal_material_condition as the material condition for the Physical_unit_planar_shape.

4.2.670.8 shape_purpose

The shape_purpose specifies either a design, a design_profile, a design_profile_above_seating_plane, a design_profile_below_seating_plane, an electro_magnetic_compatibility_analysis, a shock_analysis, a thermal_analysis, or a vibration_analysis, as the purpose for the Physical_unit_planar_shape.

Constraints:

WR1: If the shape_characterized_physical_unit attribute specifies a Bare_die, or Package, and the shape_environment is equal to "manufacturing" and the shape_purpose is equal to "design" then the planar shape shall be oriented parallel to the seating plane and the distance to the seating plane shall be greater than any point in the volume of the Physical_unit.

NOTE This rule provides a shape representation useful for the top view of an item as may be seen in an assembly.

NOTE EXPRESS specification:

```

*)
ENTITY physical_unit_planar_shape
  SUBTYPE OF (planar_projected_shape);
    application_technology_constraint : OPTIONAL ee_requirement_occurrence;
    shape_characterized_physical_unit : physical_unit;
    shape_distance_from_seating_plane : OPTIONAL length_data_element;
    shape_location_with_respect_to_seating_plane: shape_location;
    shape_material_condition          : material_condition;
    centroid_location                 : OPTIONAL cartesian_point;
    shape_environment                 : environment;
    shape_purpose                       : planar_purpose;
WHERE
  WR1: NOT('AP210_ARM.PACKAGED_PART' IN TYPEOF(shape_characterized_physical_unit));
END_ENTITY; -- physical_unit_planar_shape

```

4.2.671 Physical_unit_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_unit_relationship` is a type of `Managed_design_object` (see 4.2.524). A `Physical_unit_relationship` is the association of two `Physical_unit` (see 4.2.664).

The data associated with a `Physical_unit_relationship` are the following:

- `related_unit`;
- `relating_unit`.

4.2.671.1 `related_unit`

The `related_unit` specifies the dependent `Physical_unit` (see 4.2.664) that is related to the independent `Physical_unit` in a `Physical_unit_relationship`.

4.2.671.2 `relating_unit`

The `relating_unit` specifies the independent `Physical_unit` (see 4.2.664) to which the `Physical_unit_relationship` is made.

NOTE EXPRESS specification:

```
*)
ENTITY physical_unit_relationship
  SUBTYPE OF (managed_design_object);
    relating_unit : physical_unit;
    related_unit  : physical_unit;
END_ENTITY; -- physical_unit_relationship

( *
```

4.2.672 `Physical_unit_usage_view`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Physical_unit_usage_view` is a type of `Physical_unit` (see 4.2.664). Each `Physical_unit_usage_view` may be one of an `Assembly_module_usage_view` (see 4.2.51), a `Bare_die` (see 4.2.59), an `Interconnect_module_usage_view` (see 4.2.465), a `Package` (see 4.2.573), or a `Packaged_part` (see 4.2.591). A `Physical_unit_usage_view` identifies a `Physical_unit` as a part in its next assembly with sufficient detail to allow its use but without sufficient detail to permit reproduction of the `Physical_unit`. The product version referenced by the version attribute inherited from `Ee_product_definition` need not reference the same product version referenced by the design view.

NOTE 1 The product information necessary for a `Physical_unit_usage_view` is much less than that necessary to design, manufacture, or verify its performance from first principles. Terminals are defined only in the usage view of an item in this part of ISO 10303.

NOTE 2 The usage view and design view of product contain similar concepts. It is the responsibility of the design organization to create the mapping between the usage view and the design view. As the design evolves to meet the requirements, the design view will reference different versions than the usage view.

NOTE 3 In a drawing based exchange, an interface control drawing would contain the same information found in a usage view. Industry standards describing the information represented by interface control drawings could migrate to computer interpretable standards exchange using this standard.

EXAMPLE 1 Examples of information provided in a usage view include outline shape, functional block diagram, terminal identification, package orientation features, mounting features, interface models, pin mapping.

The data associated with a `Physical_unit_usage_view` are the following:

— `approved_part`.

4.2.672.1 `approved_part`

The `approved_part` specifies the `Supplied_product_version` (see 4.2.879) that satisfies the intended application of a certain `Physical_unit_usage_view`. The `approved_part` need not be specified for a particular `Physical_unit_usage_view`. There may be more than one `Supplied_product_version` for a `Physical_unit_usage_view`.

NOTE EXPRESS specification:

```
*)
ENTITY physical_unit_usage_view
  SUPERTYPE OF (ONEOF (package, bare_die, packaged_part,
    assembly_module_usage_view, interconnect_module_usage_view))
  SUBTYPE OF (physical_unit);
-- tt deleted aug 25, 2001
-- material : OPTIONAL SET [1:?] OF ee_material;
END_ENTITY; -- physical_unit_usage_view

(*
```

4.2.673 `Pitch_class`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Pitch_class is a type of Managed_design_object (see 4.2.524). A Pitch_class is a category in which a particular group of Part_feature (see 4.2.609) may fall, depending on the value of their paired spacing. The Pitch_class controls the width of the mating feature which is measured perpendicular to the primary axis of a terminal in the class. The only Data_element type permitted in the range is a Length_data_element.

EXAMPLE 1 The Pitch_class is included so that tolerances may be applied to all members of the same class, and specified only once. E.g., all pitches with a design spacing greater than 50 mils and less than 75 mils are in the 'big' class.

NOTE Other Application Objects will be populated in order to apply the class property to tolerances of the product being designed .

The data associated with a Pitch_class are the following:

- class_member;
- class_name.

4.2.673.1 class_member

The class_member specifies the role of the Range_characteristic for the Pitch_class. The range specifies the spacings which are included as a member of the Pitch_class. The Range_characteristic shall use Length_data_element for the Numeric_parameter.

4.2.673.2 class_name

The class_name specifies the name for the Pitch_class.

NOTE EXPRESS specification:

```

*)
ENTITY pitch_class
  SUBTYPE OF (managed_design_object);
    class_member : range_characteristic;
    class_name   : ee_name;
WHERE
  WR1: SIZEOF(QUERY( np &#60;* class_member\coordinated_characteristic.component_characteri
    NOT('AP210_ARM.LENGTH_DATA_ELEMENT' IN TYPEOF(np\characteristic.property_value))
  )) = 0;
END_ENTITY; -- pitch_class

( *
```

4.2.674 Placement_group

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Placement_group is a type of Managed_design_object (see 4.2.524). A Placement_group is a group composed of Assembly_component (see 4.2.34) that are associated with each other for this purpose by the Component_group_assignment (see 4.2.124), in order to meet some specific placement requirement. The placement is assigned through the Placement_group_area_assignment (see 4.2.675) object, and does not indicate the explicit geometric relationship of the Assembly_components to each other, only that they are all to be placed within an area.

EXAMPLE 1 An example of a Placement_group is the collection of Assembly_components necessary to satisfy the functional requirement for a power supply.

EXAMPLE 2 An example of a Placement_group is the collection of Assembly_components necessary to satisfy the functional requirement for a digital signal processor.

EXAMPLE 3 An example of a Placement_group is the collection of Assembly_components with a case temperature greater than 55 degrees Centigrade. The associated area would be a rectangle all of whose inner points are within 6 cm of the cooling unit.

The data associated with a Placement_group are the following:

- design_specific_usage;
- requirement.

4.2.674.1 design_specific_usage

The design_specific_usage specifies the name of the Placement_group.

EXAMPLE 1 Examples of design_specific_usage include analogue input buffer, preprocessor, emi filter, video multiplexor, and high speed digital.

4.2.674.2 requirement

The requirement specifies the role of the Ee_requirement_occurrence (see 4.2.330) for the Placement_group. There shall be one or more Ee_requirement_occurrence for a Placement_group.

NOTE EXPRESS specification:

```
*)
ENTITY placement_group
  SUBTYPE OF (managed_design_object);
  design_specific_usage : ee_name;
  requirement           : SET [1:?] OF ee_requirement_occurrence;
END_ENTITY; -- placement_group

( *
```

4.2.675 Placement_group_area_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Placement_group_area_assignment is a type of Managed_design_object (see 4.2.524). A Placement_group_area_assignment is the relationship between a Placement_group (see 4.2.674) and the Mounting_restriction_area (see 4.2.550) on the interconnect substrate instance to which it is restricted.

The data associated with a Placement_group_area_assignment are the following:

- area;
- placed_group.

4.2.675.1 area

The area specifies the role of the Mounting_restriction_area (see 4.2.550) for the Placement_group_area_assignment.

4.2.675.2 placed_group

The placed_group specifies the role of the Placement_group (see 4.2.674) for the Placement_group_area_assignment.

NOTE EXPRESS specification:

```

*)
ENTITY placement_group_area_assignment
  SUBTYPE OF (managed_design_object);
    placed_group : placement_group;

--tt tc1 wd9 modified
( *
```

4.2.676 Placement_group_volume_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Placement_group_volume_assignment is a type of Managed_design_object (see 4.2.524). A Placement_group_volume_assignment is the relationship between a Placement_group (see 4.2.674) and the Mounting_restriction_volume (see 4.2.551) on the interconnect substrate instance to which it is restricted.

The data associated with a Placement_group_volume_assignment are the following:

- volume;
- placed_group.

4.2.676.1 volume

The volume specifies the role of the Mounting_restriction_volume (see 4.2.551) for the Placement_group_volume_assignment.

4.2.676.2 placed_group

The placed_group specifies the role of the Placement_group (see 4.2.674) for the Placement_group_volume_assignment.

NOTE EXPRESS specification:

```

*)
ENTITY placement_group_volume_assignment
  SUBTYPE OF (managed_design_object);
    placed_group      : placement_group;

```

4.2.677 Planar_projected_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Planar_projected_shape is a type of Planar_shape (see 4.2.678). A Planar_projected_shape may be one of an Assembly_component_2d_shape (see 4.2.35), a Design_intent_modification_planar_shape (see 4.2.272), a Part_template_planar_shape (see 4.2.628), a Physical_unit_planar_shape (see 4.2.670), a Stratum_feature_planar_shape (see 4.2.857), or a Stratum_planar_shape (see 4.2.867). A Planar_projected_shape is also a type of Feature_shape_definition (see 4.2.372). A Planar_projected_shape is projected from a solid. A Planar_projected_shape that is an Assembly_component_2d_shape may also be either a Part_template_planar_shape or a Physical_unit_planar_shape.

NOTE A Planar_shape may also be projected from a solid to handle the case where a Non_feature_shape_definition is needed that is not predefined in this standard. The predefined non feature shape projections included in this standard are Physical_unit_3d_keepout_shape (see 4.2.665) and Physical_unit_planar_keepout_shape (see 4.2.669).

The data associated with a `Planar_projected_shape` are the following:

— `curve_basis`.

4.2.677.1 `curve_basis`

The `curve_basis` is an inverse relationship that specifies `Volume_shape_projection` (see ??) that specifies the `Planar_projected_shape` as its `surface_projection`. There shall be no more than one `Volume_shape_projection` for a `Planar_projected_shape`.

NOTE EXPRESS specification:

```

*)
ENTITY planar_projected_shape
  SUPERTYPE OF (ONEOF(
    (assembly_component_2d_shape ANDOR (ONEOF(
      part_template_planar_shape,
      footprint_definition_shape,
      padstack_definition_shape,
      physical_unit_planar_shape))),
    design_intent_modification_planar_shape,
    stratum_feature_planar_shape,
    stratum_planar_shape))
  SUBTYPE OF (planar_shape, feature_shape_definition);
  INVERSE
    curve_basis_1 : SET [0:1] OF volume_shape_plane_projection FOR surface_projection_result;
    curve_basis_2 : SET [0:1] OF volume_shape_intersection FOR surface_intersection_result;

    WR1: EXISTS (curve_basis_1) XOR EXISTS (curve_basis_2);
END_ENTITY; -- planar_projected_shape
(
  *
```

4.2.678 `Planar_shape`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Planar_shape` is a type of `Shape_definition` (see 4.2.808) that lies on a two-dimensional plane. A `Planar_shape` may be one of a `geometrically_bounded_2d_wireframe` (see 4.2.424), a `shell_based_2d_wireframe` (see 4.2.819), an `edge_based_2d_wireframe` (see 4.2.309), or a `csg_2d_shape` (see 4.2.200). A `Planar_shape` may also be either a `Planar_projected_shape` or a `Physical_unit_planar_keepout_shape`.

NOTE A `Planar_projected_shape` is a physical shape, while a `Physical_unit_planar_keepout_shape` is a keepout region constraint shape. The Application Object name for `Planar_projected_shape` is consistent with the previous edition of this standard.

NOTE EXPRESS specification:

```

*)
ENTITY planar_shape
  ABSTRACT SUPERTYPE OF (ONEOF(
    geometrically_bounded_2d_wireframe,
    shell_based_2d_wireframe,
    edge_based_2d_wireframe,

```

4.2.679 Planned_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Planned_characteristic` is a type of `Managed_design_object` (see 4.2.524). A `Planned_characteristic` associates design intent information based on manufacturing capabilities and component characteristics with an allocated requirement. A `Planned_characteristic` is a set of properties planned to be valid for all occurrences of the designed product under the conditions defined in the allocated requirement.

The data associated with a `Planned_characteristic` are the following:

- `planned_coordinated_characteristic`;
- `reference_requirement`.

4.2.679.1 planned_coordinated_characteristic

The `planned_coordinated_characteristic` specifies the role of the `Coordinated_characteristic` (see 4.2.197) for the `Planned_characteristic`.

4.2.679.2 reference_requirement

The `reference_requirement` specifies the `Assembly_requirement_allocation` (see 4.2.53), `Functional_unit_requirement_allocation` (see 4.2.406), or the `Requirement_allocation` (see 4.2.769) for the `Planned_characteristic`.

NOTE This information is part of the design view for archival purposes of the design organization.

NOTE EXPRESS specification:

4.2.680 Planned_date_effectivity

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Planned_date_effectivity is a type of Planned_effectivity (see 4.2.681). A Planned_date_effectivity is the specification by the design organization of the intended use of an Ee_product (see 4.2.319) or of an Ee_product within an Ee_product_configuration (see 4.2.322), determined by one or two dates.

The data associated with a Planned_date_effectivity are the following:

- end_date;
- start_date.

4.2.680.1 end_date

The end_date specifies either the final Date (see 4.2.212) or the final Date_and_time (see 4.2.213) upon which the Ee_product (see 4.2.319) is planned by a design organization to be used in the Ee_product_configuration (see 4.2.322), as defined by the Planned_date_effectivity. The end_date need not be specified for a particular Planned_date_effectivity.

4.2.680.2 start_date

The start_date specifies either the initial Date (see 4.2.212) or the initial Date_and_time (see 4.2.213); upon which the Ee_product (see 4.2.319) is planned by a design organization to be used in the Ee_product_configuration (see 4.2.322), as defined by the Planned_date_effectivity.

NOTE EXPRESS specification:

```

*)
ENTITY planned_date_effectivity
  SUBTYPE OF (planned_effectivity);
    start_date : date_or_date_and_time;
    end_date   : OPTIONAL date_or_date_and_time;
END_ENTITY; -- planned_date_effectivity

( *

```

4.2.681 Planned_effectivity

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Planned_effectivity is a type of Managed_design_object (see 4.2.524). A Planned_effectivity may be a Planned_date_effectivity (see 4.2.680), Planned_lot_effectivity (see 4.2.682), or Planned_serial_number_effectivity (see 4.2.683). A Planned_effectivity is the specification by a design organization of the intended use of an Ee_product (see 4.2.319) or of an Ee_product within a particular Ee_product_configuration (see 4.2.322). The Planned_effectivity details the circumstances under which the usage will take place.

The data associated with a Planned_effectivity are the following:

- component_quantity;
- configuration;
- effective_assembly;
- effectivity_approval.

4.2.681.1 component_quantity

The component_quantity specifies the number of parts as a Data_element (see 4.2.211) that are included in the affected Ee_product_configuration (see 4.2.322). The component_quantity need not be specified for a particular Planned_effectivity.

4.2.681.2 configuration

The configuration specifies the Ee_product_configuration (see 4.2.322) that is effected by the Planned_effectivity.

4.2.681.3 effective_assembly

The effective_assembly specifies the role of the Assembly_composition_relationship (see 4.2.39) for the Planned_effectivity.

4.2.681.4 effectivity_approval

The effectivity_approval specifies the Ee_approval (see 4.2.314) that is associated with the Ee_product (see 4.2.319) changes having the Planned_effectivity.

Constraints:

UR1: The combination of the configuration and the effective_assembly shall be unique within a population of Planned_effectivities.

WR1: The component_quantity, if it exists, shall be an integer greater than zero.

NOTE EXPRESS specification:

```

*)
ENTITY planned_effectivity
  SUPERTYPE OF (ONEOF (planned_date_effectivity,
    planned_serial_number_effectivity,planned_lot_effectivity))
  SUBTYPE OF (managed_design_object);
  effective_assembly : assembly_composition_relationship;
  effectivity_approval : ee_approval;
  configuration : ee_product_configuration;
  component_quantity : OPTIONAL data_element;
  UNIQUE
    UR1 : effective_assembly, configuration;
END_ENTITY; -- planned_effectivity

( *
```

4.2.682 Planned_lot_effectivity

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Planned_lot_effectivity is a type of Planned_effectivity (see 4.2.681). A Planned_lot_effectivity is the specification by the design organization of the intended use of an Ee_product (see 4.2.319) or of an Ee_product within an Ee_product_configuration (see 4.2.322), where the Ee_product or the Ee_product within an Ee_product_configuration is produced as one of a group or lot.

The data associated with a Planned_lot_effectivity are the following:

- lot_number;
- lot_size.

4.2.682.1 lot_number

The lot_number specifies the string for the alphanumeric identification of the group of Ee_product (see 4.2.319) that compose a lot for the Planned_lot_effectivity.

4.2.682.2 lot_size

The lot_size specifies the quantity of Ee_product (see 4.2.319) as a Data_element (see 4.2.211) within the lot with the Planned_lot_effectivity.

Constraints:

WR1: The lot_size shall be an integer greater than zero.

NOTE EXPRESS specification:

```
*)
ENTITY planned_lot_effectivity
  SUBTYPE OF (planned_effectivity);
    lot_number : STRING;
    lot_size   : data_element;
END_ENTITY; -- planned_lot_effectivity

( *
```

4.2.683 Planned_serial_number_effectivity

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Planned_serial_number_effectivity is a type of Planned_effectivity (see 4.2.681). A Planned_serial_number_effectivity is the specification by the design organization of the intended use of an Ee_product (see 4.2.319) identified by a range of serial numbers or of an Ee_product within Ee_product_configuration (see 4.2.322) identified by a range of serial numbers.

The data associated with a Planned_serial_number_effectivity are the following:

- from_effectivity_id;
- through_effectivity_id.

4.2.683.1 from_effectivity_id

The from_effectivity_id specifies the string for the initial serial number of the range of serial numbers for the Planned_serial_number_effectivity.

4.2.683.2 through_effectivity_id

The `through_effectivity_id` specifies the string for the final serial number of the range of serial numbers for the `Planned_serial_number_effectivity`. The `through_effectivity_id` need not be specified for a particular `Planned_serial_number_effectivity`.

NOTE EXPRESS specification:

```
*)
ENTITY planned_serial_number_effectivity
  SUBTYPE OF (planned_effectivity);
    through_effectivity_id : OPTIONAL STRING;
    from_effectivity_id    : STRING;
END_ENTITY; -- planned_serial_number_effectivity

( *
```

4.2.684 Plated_conductive_base_blind_via

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Plated_conductive_base_blind_via` is a type of `Blind_via` (see 4.2.71) in which the material that composes the floor of the `Blind_via` is conductive, and in which the floor material of the `Blind_via` is contiguous with the material on the wall of the `Blind_via`. The process that is to create this conductive contiguous material is electroplating or similar.

NOTE EXPRESS specification:

```
*)
ENTITY plated_conductive_base_blind_via
  SUBTYPE OF (blind_via);
END_ENTITY; -- plated_conductive_base_blind_via

( *
```

4.2.685 Plated_cutout

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Plated_cutout` is a type of `Plated_inter_stratum_feature` (see 4.2.687). The `Plated_cutout` is an interior volume of the substrate, such as a void included for passage of a shaft, and may be plated for EMI shielding purposes. This object conveys the semantic that the interior referenced by the related shape is conductive.

Constraints:

WR1: Each member of Plated_cutout shall not form part of the outer periphery of the Interconnect_module.

NOTE EXPRESS specification:

```

*)
ENTITY plated_cutout
  SUBTYPE OF (cutout,plated_inter_stratum_feature);
END_ENTITY; -- plated_cutout

( *
```

4.2.686 Plated_cutout_edge_segment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Plated_cutout_edge_segment is a type of Plated_inter_stratum_feature (see 4.2.687) that helps compose a Partially_plated_cutout (see 4.2.634). The Plated_cutout_edge_segment is a feature with a specified shape that makes up part of the edge of a Partially_plated_cutout.

The data associated with a Plated_cutout_edge_segment are the following:

- composed_cutout;
- end_vertex;
- start_vertex.

4.2.686.1 composed_cutout

The composed_cutout specifies the Partially_plated_cutout (see 4.2.634) for whose edge this Plated_cutout_edge_segment is a segment.

4.2.686.2 end_vertex

The end_vertex specifies one role of an Edge_segment_vertex for the Plated_cutout_edge_segment.

4.2.686.3 start_vertex

The start_vertex specifies one role of an Edge_segment_vertex for the Plated_cutout_edge_segment.

Constraints:

WR1: The start_vertex shall not be the end_vertex.

NOTE EXPRESS specification:

```
*)
ENTITY plated_cutout_edge_segment
  SUBTYPE OF (cutout_edge_segment, plated_inter_stratum_feature);
  SELF\cutout_edge_segment.composed_cutout : partially_plated_cutout;
END_ENTITY; -- plated_cutout_edge_segment

( *
```

4.2.687 Plated_inter_stratum_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Plated_inter_stratum_feature is a type of Inter_stratum_feature (see 4.2.432) with deposited metal on its walls that makes an electrical connection between conductive patterns on internal Design_layer_stratum (see 4.2.275), external Design_layer_stratum, or both, of a printed circuit board. A Plated_inter_stratum_feature is one of a Plated_cutout (see 4.2.685), a Plated_cutout_edge_segment (see 4.2.686), a Plated_interconnect_module_edge (see 4.2.688), a Plated_interconnect_module_edge_segment (see 4.2.689), or a Plated_passage (see 4.2.690), or additionally may be a Physical_network_supporting_inter_stratum_feature (see 4.2.661).

NOTE 1 A cross-section illustration of Plated_inter_stratum_feature that is the result of a wet chemistry process is shown in figure 81. An expanded view of one section of the feature is shown in figure 82.

NOTE 2 Plated_inter_stratum_features that completely pass through the PCB are sometimes known as plated through holes.

NOTE 3 Plated_inter_stratum_features are features that may be custom designed for this design by creating custom Inter_stratum_feature_template (see 4.2.435) shapes.

Constraints:

WR1: Each Plated_inter_stratum_feature shall reference a Passage_technology that has the attribute plated_passage set to TRUE.

Figure 81 – Plated_inter_stratum_feature cross-section

NOTE EXPRESS specification:

```

*)
ENTITY plated_inter_stratum_feature
ABSTRACT SUPERTYPE OF (ONEOF (plated_cutout,
    plated_interconnect_module_edge, plated_cutout_edge_segment,
    plated_interconnect_module_edge_segment, plated_passage) ANDOR

    SUBTYPE OF (inter_stratum_feature);
END_ENTITY; -- plated_inter_stratum_feature

```

(*

4.2.688 Plated_interconnect_module_edge

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Plated_interconnect_module_edge is a type of Plated_inter_stratum_feature (see 4.2.687) that forms one of the edges of an interconnect substrate.

Constraints:

WR1: Each member of Plated_interconnect_module_edge shall only form the outer periphery of the Interconnect_module.

The Ee_material in the role of feature_material for a Plated_inter_stratum_feature is contiguous with the Ee_material in the role of stratum_material for a Stratum_technology, when the values of both Ee_material are identical.

Figure 82 – Exploded view of Plated_inter_stratum_feature

NOTE EXPRESS specification:

```

*)
ENTITY plated_interconnect_module_edge
  SUBTYPE OF (interconnect_module_edge, plated_inter_stratum_feature);
END_ENTITY; -- plated_interconnect_module_edge

( *

```

4.2.689 Plated_interconnect_module_edge_segment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Plated_interconnect_module_edge_segment is a type of Plated_inter_stratum_feature (see 4.2.687) that forms a section of the edge of an interconnect substrate.

EXAMPLE 1 Figure 83 illustrates an edge segment that is plated. Note that the opposite side of the cross-section is unplated. There is not enough information in the figure to define the extent of the plated segment.

The data associated with a Plated_interconnect_module_edge_segment are the following:

- composed_edge;
- end_vertex;
- start_vertex.

Figure 83 – Plated_interconnect_module_edge_segment

4.2.689.1 composed_edge

The composed_edge specifies the Partially_plated_interconnect_module_edge (see 4.2.635) that contains the Plated_interconnect_module_edge_segment.

4.2.689.2 end_vertex

The end_vertex specifies one role of an Edge_segment_vertex for the Plated_interconnect_module_edge_segment.

4.2.689.3 start_vertex

The start_vertex specifies one role of an Edge_segment_vertex for the Plated_interconnect_module_edge_segment.

Constraints:

WR1: The start_vertex shall not be the end_vertex.

NOTE EXPRESS specification:

```
* )
ENTITY plated_interconnect_module_edge_segment
  SUBTYPE OF (plated_inter_stratum_feature, interconnect_module_edge_segment);
  SELF\interconnect_module_edge_segment.composed_edge :
  partially_plated_interconnect_module_edge;
END_ENTITY; -- plated_interconnect_module_edge_segment

( *
```

4.2.690 Plated_passage

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Plated_passage is a type of Plated_inter_stratum_feature (see 4.2.687). A Plated_passage is either a Component_termination_passage (see 4.2.143) or a Via (see 4.2.947).

EXAMPLE 1 Figure 84 graphically collects the various types of plated passages into a more generic category.

Constraints:

WR1: Each Plated_passage shall not be a member of Interconnect_module_edge.

WR2: Each Plated_passage shall not be a member of Interconnect_module_edge_segment.

Figure 84 – Plated_passage

NOTE EXPRESS specification:

4.2.691 Plus_minus_tolerance_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Plus_minus_tolerance_characteristic` is a type of `Tolerance_characteristic` (see 4.2.911). The `Plus_minus_tolerance_characteristic` includes a minimum, maximum, and nominal characteristic numeric parameter. All three have the same base unit, but may have different prefixes.

The data associated with a `Plus_minus_tolerance_characteristic` are the following:

— `component_characteristic`.

4.2.691.1 component_characteristic

The `component_characteristic` specifies the nominal, minimum, and maximum values of the `Numeric_`-parameter (see 4.2.565) for the `Plus_minus_tolerance_characteristic`. There shall be one nominal, one minimum and one maximum value for the `Plus_minus_tolerance_characteristic`.

Constraints:

WR1: All Data_element referenced by Numeric_parameter in the role of component_characteristic for Plus_minus_tolerance_characteristic shall have the same unit_of_measure.

WR2: The Numeric_parameter in the role of component_characteristic shall have a type_name of minimum, nominal, or maximum.

WR3: The Numeric_parameter in the role of component_characteristic that has a type_name of minimum shall have a property_value that is less than the property_value of the Numeric_parameter in the role of component_characteristic that has a type_name of nominal.

WR4: The Numeric_parameter in the role of component_characteristic that has a type_name of nominal shall have a property_value that is less than the property_value of the Numeric_parameter in the role of component_characteristic that has a type_name of maximum.

NOTE EXPRESS specification:

```

*)
ENTITY plus_minus_tolerance_characteristic
  SUBTYPE OF (tolerance_characteristic);
    SELF\coordinated_characteristic.component_characteristic : SET [3:3] OF
                                                                numeric_parameter;
END_ENTITY; -- plus_minus_tolerance_characteristic

( *
```

4.2.692 Plus_minus_tolerance_range_representation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Plus_minus_tolerance_range_representation is a type of Shape_dimension_representation (see 4.2.809) that represents a Dimensional_characteristic (see 4.2.298) with three Data_element (see 4.2.211) from which the limits of the Dimensional_characteristic can be calculated.

The data associated with a Plus_minus_tolerance_range_representation are the following:

- basic_dimension_value;
- lower_deviation;
- upper_deviation.

4.2.692.1 basic_dimension_value

The basic_dimension_value specifies the Data_element (see 4.2.211) from which the lower and upper limits of the associated Dimensional_characteristic (see 4.2.298) may be calculated.

NOTE 1 The `basic_dimension_value` corresponds to the basic size component of toleranced dimensions and is described in ISO 286-1 and ISO 406.

NOTE 2 The `basic_dimension_value` should not be confused with basic dimensions defined in 1.3.9 of ASME Y14.5M.

4.2.692.2 lower_deviation

The `lower_deviation` specifies the `Data_element` (see 4.2.211) that is added to the `Data_element` specified by the `basic_dimension_value` to determine the lower limit of the associated `Dimensional_characteristic` (see 4.2.298).

4.2.692.3 upper_deviation

The `upper_deviation` specifies the `Data_element` (see 4.2.211) that is added to the `Data_element` specified by the `basic_dimension_value` to determine the upper limit of the associated `Dimensional_characteristic` (see 4.2.298).

Constraints:

WR1: The units of the `Data_elements` specified by the `basic_dimension_value`, `lower_deviation`, and `upper_deviation` shall be the same.

WR2: The value of the `Data_element` specified by the `lower_deviation` shall be less than the value of the `Data_element` specified by the `upper_deviation`.

NOTE EXPRESS specification:

```
*)

```

4.2.693 Polarity_indication_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Polarity_indication_feature` is a type of `Part_feature` (see 4.2.609). A `Polarity_indication_feature` provides visible or tactile means to reduce or eliminate ambiguity of the location of a polarized part in an assembly operation. A `Polarity_indication_feature` shall not be used to identify orientation features of non-polarized components.

NOTE Other orientation information may be required in addition to the `Polarity_indication_feature` to totally disambiguate the correct orientation.

NOTE EXPRESS specification:

```
*)
ENTITY polarity_indication_feature
  SUBTYPE OF (part_feature);

4.2.694 Polygonal_area

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Polygonal_area` is a type of `Primitive_2d` (see 4.2.720).

The data associated with a `Polygonal_area` are the following:

— bounds.

4.2.694.1 bounds

The bounds specifies the role of a `Cartesian_point` (see 4.2.87) for the `Polygonal_area`. There shall be three or more `Cartesian_point` for a `Polygonal_area`. No `Cartesian_point` shall be specified more than once as a bounds for a particular `Polygonal_area`.

NOTE EXPRESS specification:

```
*)
ENTITY polygonal_area

(*

4.2.695 Position_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Position_tolerance is a type of Geometric_tolerance (see 4.2.419) that specifies or partially specifies the design requirement on the location of a Shape_element (see 4.2.810) in relation to other Shape_elements, such as a Datum_system (see 4.2.236). A Position_tolerance is either a Position_tolerance_with_referenced_datum_system (see 4.2.696) or a Position_tolerance_without_referenced_datum_system (see 4.2.697). A Position_tolerance may also be a Composite_feature_relating_position_tolerance (see 4.2.158).

NOTE Position tolerance is defined in terms of tolerance zone definitions in 14.10 of ISO 1101.

Constraints:

WR1: The Shape_element specified as the toleranced_shape_element shall be a Centre_axis, Centre_plane, Centre_point, or Physical_feature_or_part_template.

WR2: If the toleranced_shape_element is a Centre_plane, the Position_tolerance shall specify a Tolerance_zone_definition as its tolerance_zone_or_boundary_definition; and that Tolerance_zone_definition shall specify a Tolerance_zone_boundary_definition_with_specified_size as its boundary_definition; and that Tolerance_zone_boundary_definition_with_specified_size shall specify an Opposing_boundary_set_size_characteristic as its specified_boundary_size.

WR3: If the toleranced_shape_element is a Centre_point the Position_tolerance shall specify a Tolerance_zone_definition as its tolerance_zone_or_boundary_definition.

IP1: The form of the toleranced Shape_element shall be consistent with the form of a shape element for which the application of a position tolerance is sensible.

NOTE EXPRESS specification:

```

4.2.698 Positional_boundary

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Positional_boundary` is a type of `Non_feature_shape_element` (see 4.2.560) that is a theoretical boundary that is defined by a `Boundary_based_position_tolerance` (see 4.2.77). The theoretical boundary is a boundary that cannot be intruded upon by the toleranced `Physical_feature_or_part_template` (see 4.2.658) if the `Physical_feature_or_part_template` is an internal `Physical_feature_or_part_template` (e.g., a hole) and the `Boundary_based_position_tolerance` is applied on a "maximum material principle" basis, or if the toleranced `Physical_feature_or_part_template` is an external `Physical_feature_or_part_template` (e.g., a tab) and the `Boundary_based_position_tolerance` is applied on a "least material requirement" basis. Additionally, the theoretical boundary is a boundary that cannot be escaped by the toleranced `Physical_feature_or_part_template` if the `Physical_feature_or_part_template` is an internal `Physical_feature_or_part_template` and the `Boundary_based_position_tolerance` is applied on a "least material requirement" basis, or if the toleranced `Physical_feature_or_part_template` is an external `Physical_feature_or_part_template` and the `Boundary_based_position_tolerance` is applied on a "maximum material principle" basis. A `Positional_boundary` is either a `Profile_related_positional_boundary` (see 4.2.750) or a `Dimension_related_positional_boundary` (see 4.2.295).

The data associated with a `Positional_boundary` are the following:

— `boundary_definition`.

4.2.698.1 `boundary_definition`

The `boundary_definition` is an inverse relationship that specifies that the existence of the `Positional_boundary` is dependent on the existence of the `Positional_boundary_definition` (see 4.2.700) that specifies the `Positional_boundary` as its `defined_positional_boundary`.

NOTE EXPRESS specification:

4.2.699 `Positional_boundary_and_profile_boundary_member_relationship`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Positional_boundary_and_profile_boundary_member_relationship` is a type of `Managed_design_object` (see 4.2.524). A `Positional_boundary_and_profile_boundary_member_relationship` is a relationship that associates a `Profile_related_positional_boundary` (see 4.2.750) with the `Tolerance_zone_boundary_member` (see 4.2.917) from which the `Profile_related_positional_boundary` is offset.

The data associated with a `Positional_boundary_and_profile_boundary_member_relationship` are the following:

- `base_profile_tolerance_zone_boundary_member`;
- `offset`;
- `offset_positional_boundary`.

4.2.699.1 `base_profile_tolerance_zone_boundary_member`

The `base_profile_tolerance_zone_boundary_member` specifies the `Tolerance_zone_boundary_member` (see 4.2.917) from which the `Profile_related_positional_boundary` (see 4.2.750) specified as the `offset_positional_boundary` is offset.

4.2.699.2 `offset`

The `offset` is an inverse relationship that specifies that the existence of the `Positional_boundary_and_profile_boundary_member_relationship` is dependent on the existence of the `Positional_boundary_offset` (see 4.2.703) that specifies the `Positional_boundary_and_profile_boundary_member_relationship` as its `offset_boundary_relationship`.

4.2.699.3 `offset_positional_boundary`

The `offset_positional_boundary` specifies the `Profile_related_positional_boundary` (see 4.2.750) that is offset from the `Tolerance_zone_boundary_member` (see 4.2.917) that is specified as the `base_profile_tolerance_zone_boundary_member`.

4.2.700 Positional_boundary_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Positional_boundary_definition is a type of Managed_design_object (see 4.2.524). A Positional_boundary_definition is a definition that characterizes a Positional_boundary (see 4.2.698). A Positional_boundary_definition is either a Profile_related_positional_boundary_definition (see 4.2.751) or a Dimension_related_positional_boundary_definition (see 4.2.296).

The data associated with a Positional_boundary_definition are the following:

— defined_positional_boundary.

4.2.700.1 defined_positional_boundary

The defined_positional_boundary specifies the Positional_boundary (see 4.2.698) that is characterized by the Positional_boundary_definition.

NOTE EXPRESS specification:

```
*)
ENTITY positional_boundary_definition
  ABSTRACT SUPERTYPE OF (ONEOF (
    profile_related_positional_boundary_definition,
    dimension_related_positional_boundary_definition))
  SUBTYPE OF (managed_design_object);
  defined_positional_boundary : positional_boundary;
END_ENTITY; -- positional_boundary_definition

( *
```

4.2.701 Positional_boundary_member

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Positional_boundary_member is a type of Non_feature_shape_element (see 4.2.560) that is a member of a Dimension_related_positional_boundary (see 4.2.295). A Positional_boundary_member is defined by a Boundary_based_position_tolerance (see 4.2.77) in conjunction with a Dimensional_size (see 4.2.301).

The data associated with a Positional_boundary_member are the following:

— boundary_member_definition;

— composed_positional_boundary.

4.2.701.1 boundary_member_definition

The boundary_member_definition is an inverse relationship that specifies that the existence of the Positional_boundary_member is dependent on the existence of the Positional_boundary_member_definition (see 4.2.702) that specifies the Positional_boundary_member as its defined_positional_boundary_member.

4.2.701.2 composed_positional_boundary

The composed_positional_boundary is an inverse relationship that specifies that the existence of the Positional_boundary_member is dependent on the existence of the Dimension_related_positional_boundary (see 4.2.295) that specifies the Positional_boundary_member as one of its boundary_members.

NOTE EXPRESS specification:

```
*)

END_ENTITY; -- positional_boundary_member

(*
```

4.2.702 Positional_boundary_member_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Positional_boundary_member_definition is a type of Managed_design_object (see 4.2.524). A Positional_boundary_member_definition is a definition that characterizes a Positional_boundary_member (see 4.2.701). Each Positional_boundary_member_definition is defined by a Boundary_based_position_tolerance (see 4.2.77) in conjunction with a Dimensional_size (see 4.2.301). The shape of the Positional_boundary_member is identical to that of the toleranced Physical_feature_or_part_template (see 4.2.658). However, the size of the Positional_boundary_member is based on the associated Dimensional_size, the material conditions specified by the associated Boundary_based_position_tolerance, and whether the toleranced Physical_feature_or_part_template is an internal (e.g., a pair of opposing slot sides) or an external (e.g., a pair of opposing tab sides) Physical_feature_or_part_template.

The data associated with a `Positional_boundary_member_definition` are the following:

- `associated_dimension`;
- `boundary_definition`;
- `defined_positional_boundary_member`;
- `tolerance_value`.

4.2.702.1 associated_dimension

The `associated_dimension` specifies the `Dimensional_size` (see 4.2.301) that defines the maximum material size and minimum material size of the tolerated `Physical_feature_or_part_template` (see 4.2.658). If the associated `Boundary_based_position_tolerance` (see 4.2.77) is specified on a "maximum material principle" basis, the maximum material size is used as the base size to which the `Length_data_element` (see 4.2.511) specified as the `tolerance_value` is subtracted if the tolerated `Physical_feature_or_part_template` is an internal `Physical_feature_or_part_template`, or added if the tolerated `Physical_feature_or_part_template` is an external `Physical_feature_or_part_template`. If the associated `Boundary_based_position_tolerance` is specified on a "least material requirement" basis, the least material size is used as the base size to which the `Length_data_element` specified as the `tolerance_value` is added if the tolerated `Physical_feature_or_part_template` is an internal `Physical_feature_or_part_template`, or subtracted if the tolerated `Physical_feature_or_part_template` is an external `Physical_feature_or_part_template`.

4.2.702.2 boundary_definition

The `boundary_definition` is an inverse relationship that specifies that the existence of the `Positional_boundary_member_definition` is dependent on the existence of the `Dimension_related_positional_boundary_definition` (see 4.2.296) that specifies the `Positional_boundary_member_definition` as one of its `characterized_boundary_member_definitions`.

4.2.702.3 defined_positional_boundary_member

The `defined_positional_boundary_member` specifies the `Positional_boundary_member` (see 4.2.701) that is characterized by the `Positional_boundary_member_definition`.

4.2.702.4 tolerance_value

The `tolerance_value` specifies the `Length_data_element` (see 4.2.511) that represents the amount the size of the `Positional_boundary_member` (see 4.2.701) is reduced or enlarged from the base size that is determined by the associated `Dimensional_size` (see 4.2.301) and the material condition specified by the associated `Boundary_based_position_tolerance` (see 4.2.77).

Constraints:

WR1: The Dimension_related_positional_boundary specified as the composed_positional_boundary by the Positional_boundary_member that is specified as the defined_positional_boundary_member shall be the same instance of Dimension_related_positional_boundary as specified as the defined_positional_boundary by the Dimension_related_positional_boundary_definition that is specified as the boundary_definition.

WR2: The Positional_boundary_member_definition shall be specified by exactly one Geometric_tolerance as the tolerance_zone_or_boundary_definition, and that Geometric_tolerance shall be a Boundary_based_position_tolerance.

NOTE EXPRESS specification:

```

```

4.2.703 Positional_boundary_offset

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Positional_boundary_offset is a type of Managed_design_object (see 4.2.524). A Positional_boundary_offset is a definition that characterizes the offset of a Profile_related_positional_boundary (see 4.2.750) from a Tolerance_zone_boundary_member (see 4.2.917).

The data associated with a Positional_boundary_offset are the following:

- boundary_definition;
- offset_boundary_relationship;
- tolerance_value.

4.2.703.1 boundary_definition

The boundary_definition is an inverse relationship that specifies that the existence of the Positional_boundary_offset is dependent on the existence of the Profile_related_positional_boundary_definition (see 4.2.751) that specifies the Positional_boundary_offset as its boundary_offset.

4.2.703.2 offset_boundary_relationship

The offset_boundary_relationship specifies the Positional_boundary_and_profile_boundary_member_relationship (see 4.2.699) that associates the Profile_related_positional_boundary (see 4.2.750) with the Tolerance_zone_boundary_member (see 4.2.917) from which it is offset, and which is characterized by the Positional_boundary_offset.

4.2.703.3 tolerance_value

The tolerance_value specifies the Length_data_element (see 4.2.511) for the Positional_boundary_offset. The associated Profile_related_positional_boundary (see 4.2.750) is offset from the associated Tolerance_zone_boundary_member (see 4.2.917) by half the distance specified by the tolerance_value.

NOTE EXPRESS specification:

4.2.707 Pre_defined_dimension_qualifier

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Pre_defined_dimension_qualifier is a type of Dimension_qualifier (see 4.2.294) the intent of which is unambiguous and is commonly used in geometric dimensioning.

The data associated with a Pre_defined_dimension_qualifier are the following:

— description.

4.2.707.1 description

The description specifies the label that describes the manner in which the Dimensional_characteristic (see 4.2.298) that are specified as the qualified_dimensions are qualified by the Pre_defined_dimension_qualifier. The description shall be either "average", or "free_state".

NOTE The attribute qualified_dimensions is declared in the Dimension_qualifier entity of which this entity is a subtype.

NOTE EXPRESS specification:

4.2.708 Pre_defined_geometric_tolerance_qualifier

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Pre_defined_geometric_tolerance_qualifier is a type of Geometric_tolerance_qualifier (see 4.2.420) the intent of which is unambiguous and is commonly used in geometric tolerancing.

The data associated with a Pre_defined_geometric_tolerance_qualifier are the following:

— description.

4.2.708.1 description

The description specifies the label that describes the manner in which the Geometric_tolerance (see 4.2.419) that are specified as the qualified_geometric_tolerances are qualified by the Pre_defined_geometric_tolerance_qualifier. The description shall be either "each_element", "each_radial_element", "free_state", "major_diameter", "minor_diameter", "not_concave", "not_convex", or "pitch_diameter".

NOTE The attribute qualified_geometric_tolerances is declared in the Geometric_tolerance_qualifier entity of which this entity is a subtype.

EXAMPLE 1 "each element" is a commonly used qualifier that indicates the requirement specified by the geometric tolerance to which the qualifier is applied. "each_element" is on each line element of the feature to which the geometric tolerance is applied rather than on the feature as a whole.

NOTE EXPRESS specification:

4.2.717 Primary_orientation_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Primary_orientation_feature is a type of Part_feature (see 4.2.609) and is a type of Datum_feature (see 4.2.226). A Primary_orientation_feature participates in providing for the unambiguous orientation of a part on its next assembly.

NOTE A Primary_orientation_feature is not necessarily also a Primary_reference_terminal (see 4.2.718).

EXAMPLE 1 Figure 85 illustrates two of the three-dimensional geometric relationships between a component and the printed circuit board it is mounted on. A Datum_system (see 4.2.236) is included for reference purposes. The Z direction is parallel to the normal of the top surface of the board. Both the top and bottom surface normal vectors are parallel to the normal vectors of the seating plane for the components.

EXAMPLE 2 Figure 86 illustrates two of the two-dimensional geometric relationships between a component and the printed circuit board it is mounted on. A Datum_system (see 4.2.236) is included for reference purposes.

EXAMPLE 3 Figures 87 through 91 illustrates orientation details for microcircuit packages.

EXAMPLE 4 Figure 92 illustrates details associated with several variations of an Axial package modification and the associated seating_plane. In all these cases, the seating plane orientation with respect to the Axis_placement (see 4.2.56) is constant, while the Package (see 4.2.573) shape orientation changes due to the modification.

EXAMPLE 5 Figure 93 illustrates Primary_reference_terminal (see 4.2.718) assignment and also assignment of Polarity_indication_feature. Knowledge of Polarity_indication_features separate from the orientation feature increases the ability to determine when to use polarity indication symbols on the interconnect substrate for polarized components e.g., polarized capacitors, diodes).

```

4.2.718 Primary_reference_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

Figure 85 – Three-dimensional assembly relationships

Figure 86 – Two-dimensional assembly relationships

A `Primary_reference_terminal` is a type of `Package_terminal` (see 4.2.581). This terminal is assigned the first identifier string in the sequence of package terminal names to be assigned to the part. The `Primary_reference_terminal` shall not specify a `precedent_feature` and is the first member of the sequence of `Package_terminal`. The sort order of the names assigned to the `Packaged_terminals` is defined by the explicit sequence established by the use of `precedent_feature` inherited from `Part_feature`.

EXAMPLE 1 If a value of '1' is available, assigning a value of '2' to this terminal would be prohibited by this part of ISO 10303, due to the possibility of confusion.

NOTE The `Primary_reference_terminal` is often associated with an orientation feature, but it may not be the orientation feature itself. Usually the `Primary_reference_terminal` and the `Primary_orientation_feature` (see 4.2.717) are different `part_features`.

Constraints:

WR1: The `precedent_feature` inherited from `Part_feature` shall not be provided for a `Primary_reference_terminal`.

```

4.2.719 Primary_stratum_indicator_symbol

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

Figure 88 – Eight lead gull wing orientation features

A `Primary_stratum_indicator_symbol` is a type of `Special_symbol_laminate_component` (see 4.2.834) that is used to identify the arbitrarily named primary side of a printed circuit board.

NOTE This symbol may be found in the stratum material of the conductive stratum that is on the primary side of the printed circuit board, implemented in a stratum of silk-screen printed marking ink on the primary side, or otherwise. The primary side is normally defined as that side of the printed circuit board which will contain the largest number of components, but in cases where the component count is balanced, the primary side is arbitrarily named for convenience. Not all printed circuit boards contain this symbol.

Constraints:

WR1: The value of the attribute `primary_design_layer_stratum` shall be TRUE for the `Design_layer_stratum` in the role of `resident_stratum` for the member of `Stratum_feature` in the role of `stratum_feature_implementation` inherited from the supertype `Stratum_feature_template_component`.

4.2.720 Primitive_2d

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

NOTE : axis_placement at origin.

Figure 90 – TO-99 orientation features

A Primitive_2d is a type of Shape_item (see 4.2.818). A Primitive_2d may be one of a Circular_area (see 4.2.101), an Elliptic_area (see 4.2.350), a Rectangular_area (see 4.2.762), or a Polygonal_area (see 4.2.694).

Constraints:

WR1: The dimensionality attribute of the Cartesian_coordinate_system (see 4.2.86) referenced by the geometric_context attribute inherited from the Feature_shape_definition (see 4.2.372) shall be two-dimensional within a population of Primitive_2d.

4.2.721 Printed_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_component is a type of Assembly_component (see 4.2.34). A Printed_component may be a Join_two_physical_connectivity_definition_supporting_printed_component (see 4.2.481) or a Printed_connector_component (see 4.2.724) or a Routed_printed_component (see 4.2.779). A Printed_component is an occurrence of Printed_part_template (see 4.2.730) that is used as an Assembly_component (see 4.2.34) in an Interconnect_module (see 4.2.440). A Printed_component is manufactured integral to an Interconnect_module (see 4.2.440). Only the Routed_printed_component subtype shall reference a Printed_part_cross_section_template as a usage_definition.

The data associated with a Printed_component are the following:

- access_mechanism;
- cad_layer;
- stratum_feature_implementation;
- usage_definition.

4.2.721.1 access_mechanism

The access_mechanism is an inverse relationship that specifies that the existence of the Printed_component is dependent on the existence of the Printed_component_join_terminal (see 4.2.722) that specifies the Printed_component as its associated_component. There shall be one or more Printed_component_join_terminal for a Printed_component.

4.2.721.2 cad_layer

The `cad_layer` specifies the `External_definition` (see 4.2.361) for the `Printed_component`. The `cad_layer` is optional and need not be supplied.

NOTE The `cad_layer` is only appropriate where there is a single layer material being defined.

4.2.721.3 stratum_feature_implementation

The `stratum_feature_implementation` specifies the `Stratum_feature` (see 4.2.851) for the `Printed_component`. There shall be one or more `Stratum_feature` for a `Printed_component`.

4.2.721.4 usage_definition

The `usage_definition` specifies the `Printed_part_template` (see 4.2.730) or the `Printed_part_cross_section_template` (see 4.2.728) for the definition for the `Printed_component`.

NOTE EXPRESS specification:

4.2.722 Printed_component_join_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_component_join_terminal is a type of Component_terminal (see 4.2.137). This terminal is a terminus for internal circuitry in the interconnect substrate.

EXAMPLE 1 Figure 94 illustrates a detail of a layout drawing that shows the internal terminals of the printed connector (edge connector).

The data associated with a Printed_component_join_terminal are the following:

- associated_component;
- connection;
- definition;
- stratum_concept_implementation_component.

4.2.722.1 associated_component

The associated_component specifies the Printed_component (see 4.2.721) being accessed by the Printed_component_join_terminal.

4.2.722.2 connection

The connection specifies the role of the Connection_zone (see 4.2.185) for the Printed_component_join_terminal.

4.2.722.3 definition

The definition specifies the Printed_part_template_join_terminal (see 4.2.733) that defines the Printed_component_join_terminal.

4.2.722.4 stratum_concept_implementation_component

The stratum_concept_implementation_component specifies either the Inter_stratum_feature (see 4.2.432), the Laminate_component (see 4.2.483), the Stratum (see 4.2.845), the Stratum_feature (see 4.2.851), or the Stratum_surface (see 4.2.868) for the Printed_component_join_terminal.

```

4.2.724 Printed_connector_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_connector_component is a type of Printed_component (see 4.2.721). The Printed_connector_component is the occurrence of a printed_connector_template. The purpose of the Printed_connector_component is to provide access to the assembly in which the interconnect substrate, that the realized connector is part of, is installed.

The data associated with a Printed_connector_component are the following:

- interface_access_mechanism;
- usage_definition.

4.2.724.1 interface_access_mechanism

The interface_access_mechanism is an inverse relationship that specifies that the existence of the Printed_connector_component is dependent on the existence of the Printed_connector_component_interface_terminal (see 4.2.725) that specifies the Printed_connector_component as its associated_component. There shall be one or more Printed_connector_component_interface_terminal for a Printed_connector_component.

4.2.724.2 usage_definition

The usage_definition specifies the role of the Printed_connector_template (see 4.2.726) for the Printed_connector_component.

Figure 94 – Printed_connector_component and associated terminals

NOTE EXPRESS specification:

--tt tc1 wd9 modified
--tt tc1 wd8 modified
(

```

4.2.725 Printed_connector_component_interface_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_connector_component_interface_terminal is a type of Component_feature (see 4.2.118). The Printed_connector_component_interface_terminal is an individual access mechanism (e.g., one terminal on a Printed_connector_component). "Interface" means it is not tied to the substrate as part of the fabrication or assembly operation.

The data associated with a Printed_connector_component_interface_terminal are the following:

- associated_component;
- definition.

4.2.725.1 associated_component

The associated_component specifies the role of the Printed_connector_component (see 4.2.724) for the Printed_connector_component_interface_terminal.

4.2.725.2 definition

The definition specifies the role of the Printed_part_template_interface_terminal (see 4.2.732) for the Printed_connector_component_interface_terminal.

NOTE Use of this capability occurs when a member of Component_feature_to_physical_usage_view_assignment references a member of Printed_connector_component_interface_terminal.

NOTE EXPRESS specification:

```
*)
ENTITY printed_connector_component_interface_terminal
  SUBTYPE OF (laminate_component_interface_terminal);
  SELF\component_feature.definition :
      printed_part_template_interface_terminal;

--tt tc1 wd9 modified
  stratum_concept_implementation : stratum_feature;
WHERE
  WR1: SIZEOF(QUERY( temp &#60;*
    SELF\component_feature.associated_component\printed_component.stratum_feature_implemen
    | temp :=: stratum_concept_implementation )) = 1;
END_ENTITY; -- printed_connector_component_interface_terminal

( *
```

4.2.726 Printed_connector_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_connector_template is a type of a Printed_part_template (see 4.2.730). A Printed_connector_template is a Printed_part_template that contains contacts, each of whose function is to act as a short from an interface_terminal of a Printed_part_template to the related join_terminal of the Printed_part_template. Each contact corresponds to one member of characterized_connector_terminal_relationship. The contact shall be a Part_template and the geometric relationship of the shape of the contact to the shape of the Printed_connector_template shall be established by a member of Usage_view_usage_relationship.

EXAMPLE 1 Figure 95 illustrates a template and associated parameters for one contact of a printed connector. Specific parameter values and explicit geometry will be provided for individual technology based contacts.

EXAMPLE 2 Figure 94 illustrates a detail of a layout drawing that shows an instance of the Printed_connector_template.

NOTE 1 It is redundant to have a separate functional definition that merely specifies shorts for any type of connector in this part of ISO 10303, because the functional definition of a short is included in the definition of the connector. That is, a functional definition that worries about shorts is not a functional definition. It is appropriate to define the location of required shorts in the physical definition, and connector is one of the places in this part of ISO 10303 where that occurs.

NOTE 2 There may be multiple simulation models associated with a connector in this part of ISO 10303. The explicit method of defining the connector functionality does not prohibit having multiple simulation models. This explicit method is for the purpose of supporting the standardized structural definition of connectivity.

The data associated with a Printed_connector_template are the following:

— characterized_connector_terminal_relationship.

Figure 95 – Single contact of a Printed_connector_template

4.2.726.1 characterized_connector_terminal_relationship

The characterized_connector_terminal_relationship is an inverse relationship that specifies that the existence of the Printed_connector_template is dependent on the existence of the Printed_connector_template_terminal_relationship (see 4.2.727) that specifies the Printed_connector_template as its connector. There shall be one or more Printed_connector_template_terminal_relationship for a Printed_connector_template.

Constraints:

WR1: The material of individual contacts shall be disjoint.

WR2: A member of Usage_view_usage_relationship shall be populated for each member of characterized_connector_terminal_relationship to position the Part_template referenced indirectly by Printed_connector_template_terminal_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY printed_connector_template
  SUBTYPE OF (printed_part_template);
  INVERSE
    characterized_connector_terminal_relationship :
SET [1:?] OF printed_connector_template_terminal_relationship FOR connector;
END_ENTITY; -- printed_connector_template

( *
```

4.2.727 Printed_connector_template_terminal_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_connector_template_terminal_relationship is a type of Managed_design_object (see 4.2.524). A Printed_connector_template_terminal_relationship is the definition of the connection between a Printed_part_template_interface_terminal (see 4.2.732) and a Printed_part_template_join_terminal (see 4.2.733) for one contact of a Printed_connector_template.

NOTE 1 An occurrence of Printed_connector_template_terminal_relationship is only required at the Part model level in the Standard. A Printed_connector_component (see 4.2.724) that references a Printed_connector_template (see 4.2.726) has the visibility of this functional requirement by virtue of a mandatory inverse relationship to the Printed_connector_template_terminal_relationship on the Printed_connector_template.

NOTE 2 A Printed_connector_template_terminal_relationship is the actual specification of the short referred to in Printed_connector_template.

The data associated with a Printed_connector_template_terminal_relationship are the following:

- connector;
- interface_terminal;
- join_terminal.

4.2.727.1 connector

The connector specifies the role of the Printed_connector_template (see 4.2.726) for the Printed_connector_template_terminal_relationship.

4.2.727.2 interface_terminal

The interface_terminal specifies the role of the Printed_part_template_interface_terminal (see 4.2.732) for the Printed_connector_template_terminal_relationship.

4.2.727.3 join_terminal

The join_terminal specifies the role of the Printed_part_template_join_terminal (see 4.2.733) for the Printed_connector_template_terminal_relationship.

Constraints:

UR1: The combination of the join_terminal and the connector shall be unique within a population of Printed_connector_template_terminal_relationships.

UR2: The combination of the interface_terminal and the connector shall be unique within a population of Printed_connector_template_terminal_relationships.

WR1: The connector establishes the Part_template that has the contact with which the join_terminal is associated.

WR2: The connector establishes the Part_template that has the contact with which the interface_terminal is associated.

NOTE EXPRESS specification:

```

*)
ENTITY printed_connector_template_terminal_relationship

    UR1 : join_terminal, connector;
    UR2 : interface_terminal, connector;
END_ENTITY; -- printed_connector_template_terminal_relationship

--tt tc1 wd8 modified
( *

```

4.2.728 Printed_part_cross_section_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_part_cross_section_template is a type of Printed_part_template (see 4.2.730) that describes a cross sectional view of a Printed_part_template.

EXAMPLE 1 Figure 96 illustrates parameters, cross-sectional geometry, and materials needed to describe different transmission lines and related media.

The data associated with a Printed_part_cross_section_template are the following:

- maximum_width;
- minimum_width;
- transmission_line_model.

EXAMPLE 2 An example of Printed_part_cross_section_template is the two-dimensional shape based model in figure 96 for a regular transmission line structure. The cross sectional shape of the structure is invariant along the path of the center line of the structure. These structures include the definition of conductive Stratum_feature cross sections and the placement and location of dielectric Stratum in the Stratum_sequence. The width of each Stratum_feature is included.

4.2.728.1 maximum_width

The maximum_width specifies the maximum overall lateral Length_data_element (see 4.2.511) dimension through all the material of the Printed_part_cross_section_template.

Figure 96 – Printed_part_cross_section_template

4.2.728.2 minimum_width

The minimum_width specifies the minimum overall lateral Length_data_element (see 4.2.511) dimension through all the material of the Printed_part_cross_section_template.

4.2.728.3 transmission_line_model

The transmission_line_model specifies the role of the Analytical_model (see 4.2.14) for the Printed_part_cross_section_template.

Constraints:

WR1: There shall be more than one terminal provided for a Printed_part_cross_section_template.

NOTE EXPRESS specification:

4.2.729 Printed_part_cross_section_template_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_part_cross_section_template_terminal is a type of Printed_part_template_terminal (see 4.2.737) that is the terminal of the Printed_part_cross_section_template (see 4.2.728).

The data associated with a Printed_part_cross_section_template_terminal are the following:

— associated_definition.

4.2.729.1 associated_definition

The associated_definition specifies the role of the Printed_part_cross_section_template (see 4.2.728) for the Printed_part_cross_section_template_terminal.

NOTE EXPRESS specification:

```

*)
ENTITY printed_part_cross_section_template_terminal
  SUBTYPE OF (printed_part_template_terminal);

4.2.730 Printed_part_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_part_template is a type of Part_template (see 4.2.620). Each Printed_part_template may be either one of or both of a Printed_connector_template (see 4.2.726) or a Printed_part_cross_section_template (see 4.2.728). A Printed_part_template is a Part_template that has a specified function. Material may be discontinuous in a Printed_part_template.

NOTE 1 An occurrence of this object is a Printed_component (see 4.2.721) that is realized during the manufacturing process for the printed circuit board.

NOTE 2 The functionality realized in an occurrence of a Printed part is determined by the shape of the occurrence and the material constituting the occurrence.

EXAMPLE 1 Figure 97 illustrates shape data associated with single layer Printed_part. This part of ISO 10303 supports complex, specific purpose, multi-layer Printed_part exchange using the design reuse concept with the Interconnect_module (see 4.2.440) being a design view that contains the full multi-layer definition of the part design. Individual elements of the part design on a layer basis would be related to individual elements in the design being created using the Component_make_from_relationship (see 4.2.126).

The data associated with a Printed_part_template are the following:

- access_mechanisms;
- characterized_material;
- cross_section;
- implemented_function.

Figure 97 – Printed_part_template

4.2.730.1 access_mechanisms

The access_mechanisms is an inverse relationship that specifies that the existence of the Printed_part_template is dependent on the existence of the Printed_part_template_terminal (see 4.2.737) that specifies the Printed_part_template as its associated_definition. There shall be two or more Printed_part_template_terminal for a Printed_part_template.

4.2.730.2 characterized_material

The characterized_material specifies the sequence of Printed_part_template_material (see 4.2.735) required to realize an implementation of a Printed_part_template, including conductive and dielectric materials. There shall be one or more Printed_part_template_material for a Printed_part_template, and the same characterized_material may occur more than once in the sequence.

NOTE The members of the sequence characterized_material need not be unique because the Printed_part_template is an incomplete set of information that is used as a reference in the construction of the complete product data for a design. The complete material shapes are not defined.

4.2.730.3 cross_section

The cross_section specifies the role of the Printed_part_cross_section_template (see 4.2.728) for the Printed_part_template. The cross_section need not be specified for a particular Printed_part_template.

4.2.730.4 implemented_function

The implemented_function specifies the role of the Functional_unit_usage_view (see 4.2.410) for the Printed_part_template.

Constraints:

WR1: The function this member of Printed_part_template implements shall be the associated function for the functional terminals mapped to the terminals of this member of Printed_part_template.

NOTE The Printed_part_template will have two product categories populated: one for the Part_template and one for the Printed_part_template. There is no conflict between these two categories.

NOTE EXPRESS specification:

4.2.731 Printed_part_template_connected_terminals_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_part_template_connected_terminals_definition is a type of Managed_design_object (see 4.2.524).
A Printed_part_template_connected_terminals_definition is the association between two or more Printed_part_template_terminal (see 4.2.737) that are connected.

The data associated with a Printed_part_template_connected_terminals_definition are the following:

- connected_terminals;
- name.

4.2.731.1 connected_terminals

The connected_terminals specify the Printed_part_template_terminal (see 4.2.737) for the Printed_part_template_connected_terminals_definition. There shall be two or more Printed_part_template_terminal for the Printed_part_template_connected_terminals_definition.

4.2.731.2 name

The name identifies the Printed_part_template_connected_terminals_definition.

Constraints:

UR1: The name shall be unique within a population of Printed_part_template_connected_terminals_definitions.

NOTE EXPRESS specification:

```
*)
ENTITY printed_part_template_connected_terminals_definition
  SUBTYPE OF (managed_design_object);
    connected_terminals : SET [2:?] OF printed_part_template_terminal;
    name                  : ee_name;
  UNIQUE

END_ENTITY; -- printed_part_template_connected_terminals_definition

(*
```

4.2.732 Printed_part_template_interface_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_part_template_interface_terminal is a type of Printed_part_template_terminal (see 4.2.737), an occurrence of which is an external access to the printed circuit board of which it is a component.

The data associated with a Printed_part_template_interface_terminal are the following:

— external_connector_function.

4.2.732.1 external_connector_function

The external_connector_function is an inverse relationship that specifies the Printed_connector_template_terminal_relationship (see 4.2.727) that specifies the Printed_part_template_interface_terminal as its interface_terminal. There shall be one or more Printed_connector_template_terminal_relationship for a Printed_part_template_interface_terminal.

NOTE EXPRESS specification:

```

*)
ENTITY printed_part_template_interface_terminal
  SUBTYPE OF (printed_part_template_terminal);
  SELF\printed_part_template_terminal.associated_definition :
                                     printed_connector_template;

                                     interface_terminal;
END_ENTITY; -- printed_part_template_interface_terminal

( *
```

4.2.733 Printed_part_template_join_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_part_template_join_terminal is a type of Printed_part_template_terminal (see 4.2.737) an occurrence of which provides access to the functionality of the Printed_part_template (see 4.2.730) from within a printed circuit board.

NOTE Join is a concept that explicitly states the purpose is for completing the network connections internal to a physical design.

The data associated with a Printed_part_template_join_terminal are the following:

— internal_connector_function.

4.2.733.1 internal_connector_function

The internal_connector_function is an inverse relationship that specifies the Printed_connector_template_terminal_relationship (see 4.2.727) that specifies the Printed_part_template_join_terminal as its join_terminal. There shall be no more than one Printed_connector_template_terminal_relationship for a Printed_part_template_join_terminal.

NOTE EXPRESS specification:

```

*)
ENTITY printed_part_template_join_terminal

```

4.2.735 Printed_part_template_material

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_part_template_material is a type of Managed_design_object (see 4.2.524). A Printed_part_template_material is the Ee_material (see 4.2.318) characterized in Printed_part_cross_section_template (see 4.2.728), for the realization of the Stratum (see 4.2.845) containing part of the Printed_component (see 4.2.721) during fabrication of the Interconnect_module (see 4.2.440).

NOTE A Printed_component may span more than one Stratum, as defined by the Printed_part_template (see 4.2.730).

The data associated with a Printed_part_template_material are the following:

- maximum_thickness;
- minimum_thickness;
- required_material.

4.2.735.1 maximum_thickness

The maximum_thickness specifies the maximum Length_data_element (see 4.2.511) for the thickness of the Printed_part_template_material.

4.2.735.2 minimum_thickness

The minimum_thickness specifies the minimum Length_data_element (see 4.2.511) for the thickness of the Printed_part_template_material.

4.2.735.3 required_material

The required_material specifies the role of the Ee_material (see 4.2.318) for the Printed_part_template_material.

NOTE EXPRESS specification:

```

4.2.736 Printed_part_template_material_link

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_part_template_material_link is a type of Managed_design_object (see 4.2.524).

The data associated with a Printed_part_template_material_link are the following:

- precedent_material;
- subsequent_material.

4.2.736.1 precedent_material

The precedent_material specifies a Template_material_cross_section_boundary (see 4.2.888) for the Printed_part_template_material_link.

4.2.736.2 subsequent_material

The subsequent_material specifies a Template_material_cross_section_boundary (see 4.2.888) for the Printed_part_template_material_link.

Constraints:

UR1: The combination of precedent_material and subsequent_material shall be unique within a population of Printed_part_template_material_link.

WR1: The precedent_material shall not be the subsequent_material within a population of Printed_part_template_material_link.

WR2: The name attribute inherited from Shape_element (see 4.2.810) for the precedent_material shall be one of "bottom" or "right" within a population of Template_material_cross_section_boundary.

WR3: The name attribute inherited from Shape_element (see 4.2.810) for the subsequent_material shall be one "top" or "left" within a population of Template_material_cross_section_boundary.

NOTE EXPRESS specification:

```

*)
ENTITY printed_part_template_material_link

```

4.2.737 Printed_part_template_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Printed_part_template_terminal` is a type of `Managed_design_object` (see 4.2.524). A `Printed_part_template_terminal` is a `Printed_part_cross_section_template_terminal` (see 4.2.729) or additionally one of a `Printed_part_template_interface_terminal` (see 4.2.732) or a `Printed_part_template_join_terminal` (see 4.2.733). A `Printed_part_template_terminal` is a terminal of a `Printed_part_template` (see 4.2.730).

The data associated with a `Printed_part_template_terminal` are the following:

- `associated_definition`;
- `connection_requirement`;
- `connection_zone_category`;
- `feature_shape`;
- `functional_usage_view_terminal`;
- `name`;
- `terminal_connection_zone`.

4.2.737.1 associated_definition

The `associated_definition` specifies the role of the `Printed_part_template` (see 4.2.730) for the `Printed_part_template_terminal`.

4.2.737.2 connection_requirement

The `connection_requirement` is an inverse relationship that specifies that the existence of the `Printed_part_template_terminal` is dependent on the existence of the `Printed_part_template_connected_terminals_definition` (see 4.2.731) that specifies the `Printed_part_template_terminal` as its `connected_terminals`. There shall be no more than one `Printed_part_template_connected_terminals_definition` for a `Printed_part_template_terminal`.

4.2.737.3 connection_zone_category

The `connection_zone_category` specifies either an `area_edge_segment`, a `curve_edge_segment`, a `surface_area`, or a `surface_point` for the `Printed_part_template_terminal`.

4.2.737.4 feature_shape

The `feature_shape` specifies the role of the `Feature_shape_occurrence` (see ??) for the `Printed_part_template_terminal`. There shall be one or more `Feature_shape_occurrence` for the `Printed_part_template_terminal`.

4.2.737.5 functional_usage_view_terminal

The functional_usage_view_terminal is an inverse relationship that specifies the Functional_usage_view_to_printed_part_template_terminal_assignment (see 4.2.414) that specifies the Printed_part_template_terminal as its physical_usage_view_terminal. There shall be no more than one Functional_usage_view_to_printed_part_template_terminal_assignment for a Printed_part_template_terminal.

4.2.737.6 name

The name identifies the descriptive label for the Printed_part_template_terminal.

4.2.737.7 terminal_connection_zone

The terminal_connection_zone specifies the role of the Connection_zone (see 4.2.185) for the Printed_part_template_terminal. There may be one or more Connection_zone for a Printed_part_template_terminal. The terminal_connection_zone is optional and need not be supplied if the source system does not contain the data. If the source system contains the data, then the terminal_connection_zone shall be provided. The Feature_shape_occurrence (see ??) specified by the terminal or mounting feature may be the same Feature_shape_occurrence that is specified by the associated Connection_zone (see 4.2.185). In this case the whole terminal is specified as the Connection_zone.

Constraints:

UR1: The combination of the name and the associated_definition shall be unique within a population of Printed_part_template_terminals.

WR1: The points comprising the attachment surface must reside in the shape of the electrical device being accessed.

WR2: The points comprising the terminal_connection_zone shall be defined in the coordinate system of the device being accessed via the terminal_connection_zone.

NOTE EXPRESS specification:

```

4.2.738 Printed_part_template_terminal_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Printed_part_template_terminal_relationship is a type of Managed_design_object (see 4.2.524). A Printed_part_template_terminal_relationship is an association between two Printed_part_template_terminal (see 4.2.737) in a Printed_part_template (see 4.2.730).

The data associated with a Printed_part_template_terminal_relationship are the following:

- related_printed_part_terminal;
- relating_printed_part_terminal.

4.2.738.1 related_printed_part_terminal

The related_printed_part_terminal specifies the dependent Printed_part_template_terminal (see 4.2.737) in the Printed_part_template_terminal_relationship.

4.2.738.2 relating_printed_part_terminal

The relating_printed_part_terminal specifies the independent Printed_part_template_terminal (see 4.2.737) in the Printed_part_template_terminal_relationship.

NOTE EXPRESS specification:

```
*)
ENTITY printed_part_template_terminal_relationship

END_ENTITY; -- printed_part_template_terminal_relationship

( *
```

4.2.739 Probe_access_area

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Probe_access_area is a type of Laminate_component (see 4.2.483). A Probe_access_area may be an Internal_probe_access_area (see 4.2.475). A Probe_access_area is a feature incorporated into the design of an Interconnect_module (see 4.2.440) for the purpose of measuring electrical characteristics of the design. It is realized by an exposed surface of conducting material that is in physical contact with the Conductor (see 4.2.176) or Conductive_filled_area (see 4.2.170) upon which the measurement is to be made.

EXAMPLE 1 Figure 98 illustrates a detail of a layout drawing that shows a probe area in the layout. Sufficient detail may be included in the design to evaluate accurately probe placement and volume restrictions.

The data associated with a Probe_access_area are the following:

- probe_contact_zone;
- probed_layout_item.

4.2.739.1 probe_contact_zone

The probe_contact_zone specifies the role of the Connection_zone (see 4.2.185) for the Probe_access_area.

4.2.739.2 probed_layout_item

The probed_layout_item specifies the role of the Stratum_feature (see 4.2.851) for the Probe_access_area.

Figure 98 – Probe_access_area

NOTE EXPRESS specification:

```

4.2.741 Product_association

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Product_association is a type of Managed_design_object (see 4.2.524). A Product_association is a usage constraint relationship among some parts that may be used in a design. If the relating part is used in a design then the related parts must also be incorporated in the design and in a prescribed fashion.

The data associated with a Product_association are the following:

- constraint_source;
- related_product;
- relating_product.

4.2.741.1 constraint_source

The constraint_source specifies the Ee_specification (see 4.2.338) that describes the manner in which Ee_product_version (see 4.2.328) that participate in the Product_association are to be used in the design.

4.2.741.2 related_product

The related_product specifies the Ee_product_version (see 4.2.328) that must be incorporated in the design when the relating_product is used in the design for the Product_association. There shall be one or more Ee_product_version for the Product_association.

4.2.741.3 relating_product

The relating_product specifies the Ee_product_version (see 4.2.328) that, when incorporated in the design, requires the incorporation of one or more related_product to be incorporated in the design to realize the desired functionality of the relating_product for the Product_association.

Constraints:

UR1: The constraint_source shall be unique within a population of Product_associations.

WR1: An Ee_product_version shall not be an ancestor or descendent of itself in a population of this object.

NOTE EXPRESS specification:

```

*)
ENTITY product_association
  SUBTYPE OF (managed_design_object);

```

4.2.742 Profile_boundary_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Profile_boundary_definition is a type of Boundary_zone_definition_with_specified_size (see 4.2.79) that characterizes a Tolerance_zone_boundary (see 4.2.915) of a Tolerance_zone (see 4.2.913) that is defined by either a Profile_of_any_line_tolerance (see 4.2.744) or a Profile_of_any_surface_tolerance (see 4.2.747). A Profile_boundary_definition may be a Profile_boundary_definition_with_offsets (see 4.2.743).

The data associated with a Profile_boundary_definition are the following:

- basic_profile;
- defined_zone_boundary.

4.2.742.1 basic_profile

The basic_profile specifies the True_profile (see 4.2.934) that characterizes the theoretically exact profile of the toleranced Physical_feature_or_part_template (see 4.2.658) along which the Tolerance_zone_opposing_boundary_set (see 4.2.926) is disposed.

4.2.742.2 defined_zone_boundary

The `defined_zone_boundary` specifies the `Tolerance_zone_opposing_boundary_set` (see 4.2.926) that is characterized by the `Profile_boundary_definition`. If a `Tolerance_zone_implicit_boundary_set` is specified as the `defined_zone_boundary`, the `Tolerance_zone_boundary` (see 4.2.915) is equally disposed about the `True_profile` (see 4.2.934).

Constraints:

WR1: The `Tolerance_zone_definition` specified as the `zone_definition` shall be specified as the `tolerance_zone_or_boundary_definition` by either a `Profile_of_any_line_tolerance` or a `Profile_of_any_surface_tolerance`.

NOTE EXPRESS specification:

```

*)
ENTITY profile_boundary_definition
  SUPERTYPE OF (profile_boundary_definition_with_offsets)
  SUBTYPE OF (boundary_zone_definition_with_specified_size);
    basic_profile : true_profile;
    SELF\tolerance_zone_boundary_definition.defined_zone_boundary :
tolerance_zone_opposing_boundary_set;
END_ENTITY; -- profile_boundary_definition

( *
```

4.2.743 Profile_boundary_definition_with_offsets

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Profile_boundary_definition_with_offsets` is a type of `Profile_boundary_definition` (see 4.2.742) in which the offset of each `Tolerance_zone_boundary_member` (see 4.2.917) relative to the `True_profile` (see 4.2.934) is explicitly defined.

The data associated with a `Profile_boundary_definition_with_offsets` are the following:

- `boundary_offsets`;
- `defined_zone_boundary`.

4.2.743.1 boundary_offsets

The `boundary_offsets` specifies the `Tolerance_zone_boundary_member_offset` (see 4.2.918) for each `Tolerance_zone_boundary_member` (see 4.2.917) of the `Tolerance_zone_explicit_opposing_boundary_set` (see 4.2.923) specified as the `defined_zone_boundary`. Each `Tolerance_zone_boundary_member_offset` characterizes the offset of a `Tolerance_zone_boundary_member` from the `True_profile` (see 4.2.934). There shall be exactly two `Tolerance_zone_boundary_member_offset` specified as the `boundary_offsets` for the `Profile_boundary_definition_with_offsets`.

4.2.743.2 defined_zone_boundary

The `defined_zone_boundary` specifies the `Tolerance_zone_explicit_opposing_boundary_set` (see 4.2.923) that is characterized by the `Profile_boundary_definition_with_offsets`.

Constraints:

WR1: The sum of each `Length_data_element` specified as the `offset_value` by the two `Tolerance_zone_boundary_member` that are specified as the `boundary_offsets` shall equal the `Length_data_element` specified by the `tolerance_value` of the `Boundary_size_characteristic` specified as the `specified_boundary_size`.

WR2: The value of the label specified by the `type_of_offset` of one of the `Tolerance_zone_boundary_member_offsets` specified by the `boundary_offsets` shall be "away_from_material".

WR3: The value of the label specified by the `type_of_offset` of one of the `Tolerance_zone_boundary_member_offsets` specified by the `boundary_offsets` shall be "towards offset".

NOTE EXPRESS specification:

```

*)
ENTITY profile_boundary_definition_with_offsets
  SUBTYPE OF (profile_boundary_definition);
    SELF\tolerance_zone_boundary_definition.defined_zone_boundary :
tolerance_zone_explicit_opposing_boundary_set;
    boundary_offsets :
SET [2:2] OF tolerance_zone_boundary_member_offset;
END_ENTITY; -- profile_boundary_definition_with_offsets

( *
```

4.2.744 Profile_of_any_line_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Profile_of_any_line_tolerance` is a type of `Geometric_tolerance` (see 4.2.419). A `Profile_of_any_line_tolerance` is either a `Profile_of_any_line_tolerance_without_referenced_datum_system` (see 4.2.746) or a `Profile_of_any_line_tolerance_with_referenced_datum_system` (see 4.2.745). A `Profile_of_any_line_tolerance` may also be a `Composite_linear_profile_refinement_tolerance` (see 4.2.161). A `Profile_of_any_line_tolerance` participates in the specification of a design requirement on the form, and possibly on the orientation, size, and location of line elements of a surface. The `Profile_of_any_line_tolerance` is similar to the `Profile_of_any_surface_tolerance` (see 4.2.747) in that the `Tolerance_zone` (see 4.2.913) is based on the `True_profile` (see 4.2.934). However, with a `Profile_of_any_line_tolerance`, each line element of the surface must lie within its associated `Tolerance_zone`, where the line elements are the cross-sections of the tolerated surface that are parallel to the specified `Viewing_plane` (see 4.2.956). If the design requirements are such that the `Tolerance_zone_boundary` (see 4.2.915) is unequally disposed about the `True_profile`, either unilaterally or bilateral, a `Profile_boundary_definition_with_offsets` (see 4.2.743) shall be used to specify this requirement.

NOTE Profile of any line tolerance is defined in terms of tolerance zone definitions in 14.5 of ISO 1101.

Constraints:

WR1: The `Shape_element` specified as the `toleranced_shape_element` shall be a `Physical_feature_or_part_template`.

NOTE The attribute `toleranced_shape_element` is declared in the `Geometric_tolerance` entity of which this entity is a subtype.

WR2: The `Profile_of_any_line_tolerance` shall not be a `Geometric_tolerance_with_applied_material_condition_property`.

WR3: The `Profile_of_any_line_tolerance` shall specify as the `tolerance_zone_or_boundary_definition` a `Tolerance_zone_definition` that specifies a `Profile_boundary_definition` as its `boundary_definition`.

IP1: The form of the tolerated `Shape_element` shall be consistent with the form of a shape element for which the application of a profile of any line tolerance is sensible.

NOTE EXPRESS specification:

```
*)
ENTITY profile_of_any_line_tolerance
  ABSTRACT SUPERTYPE OF (ONEOF (
    profile_of_any_line_tolerance_with_referenced_datum_system,
    profile_of_any_line_tolerance_without_referenced_datum_system)

END_ENTITY; -- profile_of_any_line_tolerance_with_referenced_datum_system

( *
```

4.2.746 **Profile_of_any_line_tolerance_without_referenced_datum_system**

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Profile_of_any_line_tolerance_without_referenced_datum_system` is a type of `Geometric_tolerance_-without_referenced_datum_system` (see 4.2.423) and a type of `Profile_of_any_line_tolerance` (see 4.2.744) in which the line elements of the tolerated `Physical_feature_or_part_template` (see 4.2.658) are not oriented and/or located in relation to a `Datum_system` (see 4.2.236). That is, it is a `Profile_of_any_line_-tolerance` that specifies design requirements on the profile of line elements of the `Shape_element` (see 4.2.810) to which the `Profile_of_any_line_tolerance_without_referenced_datum_system` is applied, and in which the line elements are oriented parallel to a specified `Viewing_plane` (see 4.2.956) as opposed to oriented relative to a referenced `Datum_system`.

Constraints:

WR1: The `Tolerance_zone_definition` specified as the `tolerance_zone_or_boundary_definition` shall be a `Tolerance_zone_definition_with_specified_orientation` that specifies a `Viewing_plane_based_orientation` as its `zone_orientation`.

NOTE EXPRESS specification:

```

*)
ENTITY profile_of_any_line_tolerance_without_referenced_datum_system
  SUBTYPE OF (profile_of_any_line_tolerance,
    geometric_tolerance_without_referenced_datum_system);
END_ENTITY; -- profile_of_any_line_tolerance_without_referenced_datum_system

( *
```

4.2.747 Profile_of_any_surface_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Profile_of_any_surface_tolerance is a type of Geometric_tolerance (see 4.2.419) that specifies or partially specifies the design requirement on the form and possibly on the orientation, size, and location of a surface. A Profile_of_any_surface_tolerance is either a Profile_of_any_surface_tolerance_with_referenced_datum_system (see 4.2.748) or a Profile_of_any_surface_tolerance_without_referenced_datum_system (see 4.2.749). A Profile_of_any_surface_tolerance may also be a Composite_surface_profile_refinement_tolerance (see 4.2.166). The Profile_of_any_surface_tolerance defines a uniform Tolerance_zone_boundary (see 4.2.915) along the true profile of the surface within which the actual surface must lie. If the design requirements are such that the Tolerance_zone_boundary is unequally disposed about the True_profile (see 4.2.934), either unilaterally or bilateral, a Profile_boundary_definition_with_offsets (see 4.2.743) shall be used to specify this requirement.

NOTE Profile of any surface tolerance is defined in terms of tolerance zone definitions in 14.6 of ISO 1101.

Constraints:

WR1: The Shape_element specified as the toleranced_shape_element shall be a Physical_feature_or_part_template.

NOTE The attribute toleranced_shape_element is declared in the Geometric_tolerance entity of which this entity is a subtype.

WR2: The Profile_of_any_surface_tolerance shall not be a Geometric_tolerance_with_applied_material_condition_property.

WR3: The Profile_of_any_surface_tolerance shall specify as the tolerance_zone_or_boundary_definition a Tolerance_zone_definition that specifies a Profile_boundary_definition as its boundary_definition.

NOTE EXPRESS specification:

```

*)
ENTITY profile_of_any_surface_tolerance
  ABSTRACT SUPERTYPE OF (ONEOF (
    profile_of_any_surface_tolerance_with_referenced_datum_system,
    profile_of_any_surface_tolerance_without_referenced_datum_system)

```

4.2.750 Profile_related_positional_boundary

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Profile_related_positional_boundary is a type of Positional_boundary (see 4.2.698) that is a theoretical boundary that is defined by a Boundary_based_position_tolerance (see 4.2.77) in conjunction with a Profile_of_any_surface_tolerance (see 4.2.747). The Profile_of_any_surface_tolerance defines a Tolerance_zone (see 4.2.913) that is bounded by two Tolerance_zone_boundary_member (see 4.2.917). The Profile_related_positional_boundary is offset from one of these Tolerance_zone_boundary_member. The particular Tolerance_zone_boundary_member and the direction of offset are determined by the material conditions specified by the Boundary_based_position_tolerance. If the Boundary_based_position_tolerance is specified on a "maximum material principle" basis, then the Tolerance_zone_boundary_member from which the Profile_related_positional_boundary is offset is the one that is offset from the True_profile (see 4.2.934)"away from material". Similarly, if the Boundary_based_position_tolerance is specified on a "least material requirement" basis, then the Tolerance_zone_boundary_member from which the Profile_related_positional_boundary is offset is the one that is offset from the True_profile "towards material". The Profile_related_positional_boundary is offset from the Tolerance_zone_boundary_member in the same direction that the Tolerance_zone_boundary_member is offset from the True_profile.

The data associated with a Profile_related_positional_boundary are the following:

— associating_relationship.

4.2.750.1 associating_relationship

The associating_relationship is an inverse relationship that specifies that the existence of the Profile_related_positional_boundary is dependent on the existence of the Positional_boundary_and_profile_boundary_member_relationship (see 4.2.699) that specifies the Profile_related_positional_boundary as its offset_positional_boundary.

Constraints:

WR1: The Positional_boundary_definition specified as the boundary_definition shall be a Profile_related_positional_boundary_definition.

NOTE The attribute `boundary_definition` is declared in the `Positional_boundary` entity of which this entity is a subtype.

NOTE EXPRESS specification:

```

*)
ENTITY profile_related_positional_boundary
  SUBTYPE OF (positional_boundary);
  INVERSE
    associating_relationship :
    positional_boundary_and_profile_boundary_member_relationship FOR
    offset_positional_boundary;
END_ENTITY; -- profile_related_positional_boundary

( *
```

4.2.751 Profile_related_positional_boundary_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Profile_related_positional_boundary_definition` is a type of `Positional_boundary_definition` (see 4.2.700) that characterizes a `Profile_related_positional_boundary` (see 4.2.750). A `Profile_related_positional_boundary_definition` is defined by a `Boundary_based_position_tolerance` (see 4.2.77) in conjunction with a `Profile_of_any_surface_tolerance` (see 4.2.747).

The data associated with a `Profile_related_positional_boundary_definition` are the following:

- `boundary_offset`;
- `defined_positional_boundary`.

4.2.751.1 boundary_offset

The `boundary_offset` specifies the `Positional_boundary_offset` (see 4.2.703) that characterizes the offset of the `Profile_related_positional_boundary` (see 4.2.750) for the `Profile_related_positional_boundary_definition`.

4.2.751.2 defined_positional_boundary

The `defined_positional_boundary` specifies the `Profile_related_positional_boundary` (see 4.2.750) that is characterized by the `Profile_related_positional_boundary_definition`.

Constraints:

WR1: The Profile_related_positional_boundary specified as the offset_positional_boundary by the Positional_boundary_and_profile_boundary_member_relationship that is specified as the offset_boundary_relationship by the Positional_boundary_offset that is specified as the boundary_offset shall be the same instance of Profile_related_positional_boundary as specified as the defined_positional_boundary.

WR2: The Profile_related_positional_boundary_definition shall be specified by exactly one Geometric_tolerance as the tolerance_zone_or_boundary_definition, and that Geometric_tolerance shall be a Boundary_based_position_tolerance.

NOTE EXPRESS specification:

```

*)
ENTITY profile_related_positional_boundary_definition
  SUBTYPE OF (positional_boundary_definition);
  SELF\positional_boundary_definition.defined_positional_boundary :
profile_related_positional_boundary;
  boundary_offset :

END_ENTITY; -- profile_related_positional_boundary_definition

( *
```

4.2.752 Projected_tolerance_zone_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Projected_tolerance_zone_definition is a type of Tolerance_zone_definition (see 4.2.920) in which the Tolerance_zone (see 4.2.913) is projected from a Physical_feature_or_part_template (see 4.2.658) of the Physical_unit (see 4.2.664).

The data associated with a Projected_tolerance_zone_definition are the following:

— projected_zone_height.

4.2.752.1 projected_zone_height

The projected_zone_height specifies the Projected_zone_height_characteristic (see 4.2.754) that defines the height that the defined Tolerance_zone (see 4.2.913) is projected above a base Physical_feature_or_part_template (see 4.2.658).

Constraints:

WR1: The Tolerance_zone specified as the projected_zone of the Projected_zone_and_base_relationship that is specified as the defined_height_of of the projected_zone_height that is specified as the Projected_zone_height shall be the same instance of Projected_tolerance_zone as specified as the defined_tolerance_zone.

NOTE The attribute defined_tolerance_zone is declared in the Tolerance_zone_definition entity of which this entity is a subtype.

WR2: The Projected_tolerance_zone_definition shall be specified as the tolerance_zone_or_boundary_definition by exactly one Geometric_tolerance, and that Geometric_tolerance shall not be a Circularity_tolerance, a Cylindricity_tolerance, a Flatness_tolerance, a Straightness_tolerance, a Circular_runout_tolerance, a Total_runout_tolerance, a Profile_of_any_line_tolerance, a Profile_of_any_surface_tolerance, or a Boundary_based_position_tolerance.

WR3: The Projected_tolerance_zone_definition shall be specified as the tolerance_zone_or_boundary_definition by exactly one Geometric_tolerance, and that Geometric_tolerance shall specify either a Centre_axis, or Centre_plane as its toleranced_shape_element.

NOTE EXPRESS specification:

```

*)
ENTITY projected_tolerance_zone_definition
  SUBTYPE OF (tolerance_zone_definition);
    projected_zone_height : projected_zone_height_characteristic;
END_ENTITY; -- projected_tolerance_zone_definition

( *
```

4.2.753 Projected_zone_and_base_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Projected_zone_and_base_relationship is a type of Managed_design_object (see 4.2.524). A Projected_zone_and_base_relationship is a relationship that associates a Tolerance_zone (see 4.2.913) with the Physical_feature_or_part_template (see 4.2.658) from which the Tolerance_zone is projected.

The data associated with a Projected_zone_and_base_relationship are the following:

- base_physical_feature;
- projected_zone;
- size_characteristic.

4.2.753.1 base_physical_feature

The base_physical_feature specifies the Physical_feature_or_part_template (see 4.2.658) from which the Tolerance_zone (see 4.2.913) that is specified as the projected_zone is projected.

4.2.753.2 projected_zone

The projected_zone specifies the Tolerance_zone (see 4.2.913) that is projected from the Physical_feature_or_part_template (see 4.2.658) that is specified as the base_physical_feature.

4.2.753.3 size_characteristic

The size_characteristic is an inverse relationship that specifies that the existence of the Projected_zone_and_base_relationship is dependent on the existence of the Projected_zone_height_characteristic (see 4.2.754) that specifies the Projected_zone_and_base_relationship as its defined_height_of.

Constraints:

IP1: The Physical_feature_or_part_template specified as the base_physical_feature shall be a feature from which it is sensible to project a Tolerance_zone.

NOTE EXPRESS specification:

```

*)
ENTITY projected_zone_and_base_relationship
  SUBTYPE OF (managed_design_object);
    base_physical_feature : physical_feature_or_part_template;
    projected_zone        : tolerance_zone;
  INVERSE
    size_characteristic : projected_zone_height_characteristic FOR
                        defined_height_of;
END_ENTITY; -- projected_zone_and_base_relationship

( *
```

4.2.754 Projected_zone_height_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Projected_zone_height_characteristic is a type of Managed_design_object (see 4.2.524). A Projected_zone_height_characteristic is a definition that characterizes the height that a Tolerance_zone (see 4.2.913) is projected from a Physical_feature_or_part_template (see 4.2.658).

The data associated with a `Projected_zone_height_characteristic` are the following:

- `defined_height_of`;
- `projected_height_value`;
- `zone_definition`.

4.2.754.1 `defined_height_of`

The `defined_height_of` specifies the `Projected_zone_and_base_relationship` (see 4.2.753) that associates a `Tolerance_zone` (see 4.2.913) with the `Physical_feature_or_part_template` (see 4.2.658) from which the `Tolerance_zone` is projected. The specified `Projected_zone_and_base_relationship` is characterized by the `Projected_zone_height_characteristic`.

4.2.754.2 `projected_height_value`

The `projected_height_value` specifies the `Length_data_element` (see 4.2.511) that represents the height that the associated `Tolerance_zone` (see 4.2.913) is projected relative to the associated `Physical_feature_or_part_template` (see 4.2.658) for the `Projected_zone_height_characteristic`.

4.2.754.3 `zone_definition`

The `zone_definition` is an inverse relationship that specifies that the existence of the `Projected_zone_height_characteristic` is dependent on the existence of the `Projected_tolerance_zone_definition` (see 4.2.752) that specifies the `Projected_zone_height_characteristic` as its `projected_zone_height`.

NOTE EXPRESS specification:

```

( *
```

4.2.755 Promissory_usage_in_product_model_relationship

A Promissory_usage_in_product_model_relationship is a type of Managed_design_object (see 4.2.524). The Promissory_usage_in_product_model_relationship is the relationship of an item to a higher assembly where the part number of the higher level assembly has not been defined.

EXAMPLE 1 A designer is designing an MCM that will be used on a board that will be part of a system. The designer does not yet know the part number for the system or that information is held in another business system. The designer does, however, know the equipment type of the system in which the MCM will be used. Using the Promissory_usage_in_product_model_relationship, the designer can specify that the MCM is promised to be used within the system, without reference to the part number of the system.

The data associated with a Promissory_usage_in_product_model_relationship are the following:

- assembly;
- component;
- security_code.

4.2.755.1 assembly

The product_model specifies the role of the Ee_product_model (see 4.2.325) for the Promissory_usage_in_product_model_relationship.

4.2.755.2 component

The component specifies the role of the Ee_product_definition (see 4.2.323) for the Promissory_usage_in_product_model_relationship.

4.2.755.3 security_code

The security_code specifies the role of the Security_classification (see 4.2.804) for the Promissory_usage_in_product_model_relationship. The security_code is optional and need not be supplied for a Promissory_usage_in_product_model_relationship.

NOTE EXPRESS specification:

```

*)

4.2.756 Promissory_usage_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Promissory_usage_relationship is a type of Managed_design_object (see 4.2.524). The Promissory_usage_relationship is the relationship of an item to a higher assembly where the next higher assembly of the item has not been defined.

EXAMPLE 1 A designer is designing an MCM that will be used on a board that will be part of a system. The designer does not yet know the next higher assembly for the MCM, since the board on which it will be placed has not yet been defined in the product structure for the system. The designer does, however, know the system in which the MCM will be used. Using the Promissory_usage_relationship, the designer can specify that the MCM is promised to be used within the system, without reference to the specific board on which it will reside.

The data associated with a Promissory_usage_relationship are the following:

- assembly;
- component;
- security_code.

4.2.756.1 assembly

The assembly specifies the role of the Physical_unit_design_view (see 4.2.667) for the Promissory_usage_relationship.

4.2.756.2 component

The component specifies the role of the Physical_unit (see 4.2.664) for the Promissory_usage_relationship.

4.2.756.3 security_code

The security_code specifies the role of the Security_classification (see 4.2.804) for the Promissory_usage_relationship. The security_code is optional and need not be supplied for a Promissory_usage_relationship.

Constraints:

UR1: The combination of the component and the assembly shall be unique within a population of Promissory_usage_relationship.

NOTE EXPRESS specification:

```
*)
ENTITY promissory_usage_relationship
  SUBTYPE OF (managed_design_object);
  component      : physical_unit;

```

4.2.759 Radius_edge_feature_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Radius_edge_feature_shape is a type of Edge_shape (see 4.2.313) that describes a circular cross sectioned edge. See Bevel_edge_feature_shape (see 4.2.69) for the additional required geometric information that shall be provided.

EXAMPLE 1 Figure 100 illustrates the shape related information exchanged with this Application object.

The data associated with a Radius_edge_feature_shape are the following:

- maximum_radius_length;
- minimum_radius_length.

4.2.759.1 maximum_radius_length

The maximum_radius_length specifies the Length_data_element (see 4.2.511) of the largest allowable radius of the circle that is tangent to the edge surface and to the lateral surface on which the edge surface is a feature for the Radius_edge_feature_shape. The included angle between the points of tangency shall always be 90 degrees.

4.2.759.2 minimum_radius_length

The minimum_radius_length specifies the Length_data_element (see 4.2.511) of the smallest allowable radius of the circle that is tangent to the edge surface and to the lateral surface on which the edge surface is a feature for the Radius_edge_feature_shape. The included angle between the points of tangency shall always be 90 degrees.

NOTE EXPRESS specification:

4.2.760 Range_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

Figure 100 – Radius_edge_feature_shape

A Range_characteristic is a type of Coordinated_characteristic (see 4.2.197) that specifies a range of values. The range may be open or closed. The range may be single ended.

The data associated with a Range_characteristic are the following:

- component_characteristic;
- range_type.

4.2.760.1 component_characteristic

The component_characteristic specifies the value of the Numeric_parameter (see 4.2.565) for the Range_characteristic. There shall be exactly two Numeric_parameter for the Range_characteristic.

4.2.760.2 range_type

The range_type specifies the classification of the Range_characteristic. The Range_characteristic shall be open, closed, lower_open or upper_open. Open shall be interpreted as not including the end point or points in the range. Closed shall be interpreted as including the end point or points in the range.

NOTE EXPRESS specification:

```

*)

4.2.762 Rectangular_area

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rectangular_area is a type of Primitive_2d (see 4.2.720).

The data associated with a Rectangular_area are the following:

- position;
- x;
- y.

4.2.762.1 position

The position specifies an Axis_placement_2d (see 4.2.57) for the Rectangular_area.

4.2.762.2 x

The x specifies a Length_data_element (see 4.2.511) for the Rectangular_area.

4.2.762.3 y

The y specifies a Length_data_element (see 4.2.511) for the Rectangular_area.

NOTE EXPRESS specification:

```
*)
ENTITY rectangular_area

4.2.763 Rectangular_array_placement_group_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rectangular_array_placement_group_component is a type of Array_placement_group (see 4.2.29). The location_uncertainty refers to originating CAD system geometric uncertainty, not a material processing tolerance.

The data associated with a `Rectangular_array_placement_group_component` are the following:

- `element`;
- `initial_row_positive_y_displacement`;
- `terminus_row_positive_y_displacement`.

4.2.763.1 `element`

The `element` specifies the role of a `Linear_array_placement_group_component_link` (see 4.2.517) for the `Rectangular_array_placement_group_component`. There shall be one or more `Linear_array_placement_group_component_link` for a `Rectangular_array_placement_group`.

4.2.763.2 `initial_row_positive_y_displacement`

The `initial_row_positive_y_displacement` specifies a `Length_data_element` (see 4.2.511) for the `Rectangular_array_placement_group_component`.

4.2.763.3 `terminus_row_positive_y_displacement`

The `terminus_row_positive_y_displacement` specifies a `Length_data_element` (see 4.2.511) for the `Rectangular_array_placement_group_component`.

NOTE EXPRESS specification:

```

*)
ENTITY rectangular_array_placement_group_component
  SUBTYPE OF (array_placement_group);

```

4.2.764 `Reference_composition_path`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Reference_composition_path` is a type of `Managed_design_object` (see 4.2.524). A `Reference_composition_path` is one path through the function reference network graph.

The data associated with a Reference_composition_path are the following:

- path_element;
- reference_functional_unit.

4.2.764.1 path_element

The path_element specifies the role of the Functional_unit (see 4.2.400) for the Reference_composition_path. There shall be one or more Functional_unit for a Reference_composition_path.

4.2.764.2 reference_functional_unit

The reference_functional_unit specifies the Functional_unit (see 4.2.400) that participates as a link to the leaf node in the functional decomposition hierarchical definition in the Reference_composition_path.

NOTE EXPRESS specification:

```

*)
ENTITY reference_composition_path
  SUBTYPE OF (managed_design_object);
    path_element          : SET [1:?] OF functional_unit;
    reference_functional_unit : functional_unit;
END_ENTITY; -- reference_composition_path

( *
```

4.2.765 Reference_functional_unit_assignment_to_part

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Reference_functional_unit_assignment_to_part is a type of Managed_design_object (see 4.2.524). A Reference_functional_unit_assignment_to_part assigns one specific path in the function reference network graph to an implementation. A Reference_functional_unit_assignment_to_part provides support for exchange of information needed to determine swappability of functions assigned to devices.

The data associated with a `Reference_functional_unit_assignment_to_part` are the following:

- `functional_design_definition_path`;
- `implementation`;
- `of_property`;
- `path_alias`;
- `swap_code`.

4.2.765.1 functional_design_definition_path

The `functional_design_definition_path` specifies the role of the `Design_composition_path` (see 4.2.262) for the `Reference_functional_unit_assignment_to_part`.

4.2.765.2 implementation

The `implementation` specifies the role of the `Physical_unit_usage_view` (see 4.2.672) for the `Reference_functional_unit_assignment_to_part`.

4.2.765.3 of_property

The `of_property` specifies the role of the `Coordinated_characteristic` for the `Reference_functional_unit_assignment_to_part`. There may be more than one `of_property` for a `Reference_functional_unit_assignment_to_part`. The `of_property` need not be specified for a particular `Reference_functional_unit_assignment_to_part`.

4.2.765.4 path_alias

The `path_alias` specifies the string that is the identifier for the `Reference_functional_unit_assignment_to_part`.

4.2.765.5 swap_code

The `swap_code` specifies the string that is the type of exchange that is valid.

Constraints:

UR1: The combination of the `implementation` and the `path_alias` shall be unique within a population of `Reference_functional_unit_assignment_to_part`.

NOTE EXPRESS specification:

```

*)
ENTITY reference_functional_unit_assignment_to_part

4.2.768 Registered_font

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Registered_font is a type of Managed_design_object (see 4.2.524). A Registered_font is a font that is registered by an organization and defined within a document. Support shall be provided for font character representation using outline glyphs and font family exchange.

The data associated with a Registered_font are the following:

- font_code;
- registration_document.

4.2.768.1 font_code

The font_code specifies the string for the identifier of the Registered_font. The font_code shall be an entry in the registration_document.

4.2.768.2 registration_document

The registration_document specifies the Ee_document (see 4.2.316) that contains the information about the Registered_font.

Constraints:

UR1: The combination of the font_code and the registration_document shall be unique within all members of a population of Registered_font.

NOTE EXPRESS specification:

```
*)
ENTITY registered_font
  SUBTYPE OF (managed_design_object);
    registration_document : ee_document;

4.2.769 Requirement_allocation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Requirement_allocation is a type of Managed_design_object (see 4.2.524). A Requirement_allocation is the allocation of requirement occurrences to the items in the product that meet the requirements.

The data associated with a Requirement_allocation are the following:

- allocated_requirement;
- target_product_object.

4.2.769.1 allocated_requirement

The allocated_requirement specifies the Ee_requirement_occurrence (see 4.2.330) that is being allocated in the Requirement_allocation.

4.2.769.2 target_product_object

The `target_product_object` specifies either an `Ee_product` (see 4.2.319), an `Ee_product_configuration` (see 4.2.322), an `Ee_product_definition` (see 4.2.323), an `Ee_product_version` (see 4.2.328), a `Part_feature` (see 4.2.609), a `Physical_connectivity_definition` (see 4.2.652), or a `Physical_connectivity_element` (see 4.2.654), or one of an `Assembly_component` (see 4.2.34), a `Component_external_reference` (see 4.2.117), a `Component_feature` (see 4.2.118), a `Component_feature_external_reference` (see 4.2.119), an `Ee_requirement_occurrence` (see 4.2.330), a `Stratum` (see 4.2.845), or one of an `Inter_stratum_feature` (see 4.2.432), a `Laminate_component` (see 4.2.483), a `Stratum_feature` (see 4.2.851), or a `Stratum_surface` (see 4.2.868) as the target for the `Requirement_allocation`. There shall be one or more `Ee_product`, `Ee_product_configuration`, `Ee_product_definition`, `Ee_product_version`, `Part_feature`, `Physical_connectivity_definition`, `Assembly_component`, `Component_external_reference`, `Component_feature`, `Component_feature_external_reference`, `Ee_requirement_occurrence`, `Stratum`, `Inter_stratum_feature`, `Laminate_component`, `Stratum_feature`, or `Stratum_surface` for the `Requirement_allocation`.

NOTE EXPRESS specification:

    allocated_requirement : ee_requirement_occurrence;
END_ENTITY; -- requirement_allocation

(*
```

4.2.770 Requirement_composition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Requirement_composition` is a type of `Managed_design_object` (see 4.2.524). A `Requirement_composition` helps to compose an aggregation of `Ee_requirement_occurrence` (see 4.2.330) into a group in order to construct a requirements structure.

EXAMPLE 1 A requirements table is a typical example of a requirements structure.

EXAMPLE 2 A `Requirement_composition` would be used to convey an aggregate requirement that is the result of combining two requirements.

The data associated with a `Requirement_composition` are the following:

- composition;
- element.

4.2.770.1 composition

The composition specifies the Requirement_group_occurrence (see 4.2.772) for the aggregation for the Requirement_composition.

4.2.770.2 element

The element specifies the role of the Ee_requirement_occurrence (see 4.2.330) for the Requirement_composition. There shall be one or more Ee_requirement_occurrence for a Requirement_composition.

NOTE EXPRESS specification:

```

*)
ENTITY requirement_composition
  SUBTYPE OF (managed_design_object);

4.2.774 Restraint_condition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Restraint_condition` is a type of `Managed_design_object` (see 4.2.524). A `Restraint_condition` is the specification of a requirement on the restraining conditions applied either to a `Datum_feature` (see 4.2.226) or a `Physical_feature_or_part_template` (see 4.2.658) during the verification of one or more `Geometric_tolerance` (see 4.2.419) or `Dimensional_characteristic` (see 4.2.298). The `Restraint_condition` may be a `Tolerance_specific_restraint_condition` (see 4.2.912). If the `Restraint_condition` is not a `Tolerance_specific_restraint_condition`, the `Restraint_condition` is a requirement for all instances of `Geometric_tolerance` and `Dimensional_characteristic` with the exception of those instances of `Geometric_tolerance` that have a `Pre_defined_geometric_tolerance_qualifier` (see 4.2.708) applied to them that have a description of "FREE_STATE", and those instances of `Dimensional_characteristic` that have a `Pre_defined_dimension_qualifier` (see 4.2.707) applied to them that have a description of "FREE_STATE".

The data associated with a `Restraint_condition` are the following:

- `applied_to`;
- `restraint_description`.

4.2.774.1 applied_to

The `applied_to` specifies either a `Physical_feature_or_part_template` (see 4.2.658) or a `Datum_feature_usage_in_datum_relationship` (see 4.2.229). If the `applied_to` specifies a `Physical_feature_or_part_template`, it is on that `Physical_feature_or_part_template` that the restraint requirement is applied. If a `Datum_feature_usage_in_datum_relationship` is specified as the `applied_to`, the `Restraint_condition` specifies a restraint requirement on the relationship between the `Datum_feature` (see 4.2.226) and the `Datum` (see 4.2.214) specified by the `Datum_feature_usage_in_datum_relationship`.

4.2.774.2 restraint_description

The `restraint_description` specifies the `Ee_requirement_occurrence` (see 4.2.330) that describes how the restraint shall be applied.

EXAMPLE 1 The `Restraint_condition` might specify the torque to apply to bolts to secure `Datum_feature` (see 4.2.226)"A" to inspection equipment that simulates `Datum` (see 4.2.214)"A".

NOTE EXPRESS specification:

```
*)
ENTITY restraint_condition

4.2.779 Routed_printed_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Routed_printed_component is a type of Printed_component (see 4.2.721).

The data associated with a Routed_printed_component are the following:

- component_extent;
- routed_shape;
- usage_definition.

EXAMPLE 1 An example of a Routed_printed_component is a meandering stripline.

4.2.779.1 component_extent

The component_extent specifies the role of the Inter_stratum_extent (see 4.2.431) for the Routed_printed_component.

4.2.779.2 routed_shape

The `routed_shape` specifies the role of the `Feature_shape_definition` (see 4.2.372) for the `Routed_printed_component`. The `routed_shape` may be represented as the result of an extrusion process, where the `usage_definition` is extruded along the path of the route.

NOTE This representation is not intended to reflect physical processing.

NOTE Usually there is one `stratum_feature_implementation` for each `Design_layer_stratum` used in the implementation.

4.2.779.3 usage_definition

The `usage_definition` specifies the role of the `Printed_part_cross_section_template` (see 4.2.728) for the `Routed_printed_component`. The `usage_definition` provides a cross-sectional definition that shall be interpreted as a constant cross-section along the path of the route.

NOTE EXPRESS specification:

```
*)
ENTITY routed_printed_component
  SUBTYPE OF (printed_component);
    routed_centrelines_shape : curve;
    SELF\assembly_component.usage_definition : printed_part_cross_section_template;
    component_extent          : inter_stratum_extent;
END_ENTITY; -- routed_printed_component
(*
```

4.2.780 Rule_action

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Rule_action` is a type of `Managed_design_object` (see 4.2.524). A `Rule_action` is one of a `Rule_adoption` (see 4.2.781), a `Rule_change_request` (see 4.2.784), a `Rule_creation` (see 4.2.785), a `Rule_expiration` (see 4.2.786), a `Rule_modification` (see 4.2.788), a `Rule_rejection` (see 4.2.790), a `Rule_request` (see 4.2.791), a `Rule_submission` (see 4.2.794), or a `Rule_supersedence` (see 4.2.795). A `Rule_action` is an assertion that some action has occurred toward management of rules.

The data associated with a `Rule_action` are the following:

- `subject_action_assignment`;
- `subject_rule`.

4.2.780.1 subject_action_assignment

The subject_action_assignment specifies the role of the Participant_date_and_time_assignment (see 4.2.637) for the Rule_action.

4.2.780.2 subject_rule

The subject_rule specifies the Ee_rule_version (see 4.2.337) as the version of an Ee_rule (see ??) for which some management Rule_action has occurred.

Constraints:

UR1: The combination of the subject_action_assignment and the subject_rule shall be unique within a population of Rule_actions.

NOTE EXPRESS specification:

```

*)
ENTITY rule_action
  ABSTRACT SUPERTYPE OF (ONEOF (rule_submission,rule_adoption,
    rule_rejection,rule_supersedence,rule_creation,rule_expiration,
    rule_change_request,rule_request,rule_modification))
  SUBTYPE OF (managed_design_object);
  subject_action_assignment : participant_date_and_time_assignment;
  subject_rule               : ee_rule_version;
  UNIQUE
    UR1 : subject_rule, subject_action_assignment;
END_ENTITY; -- rule_action

```

(*

4.2.781 Rule_adoption

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rule_adoption is a type of Rule_action (see 4.2.780) that states a version of an Ee_rule (see ??) has been adopted.

NOTE EXPRESS specification:

```
* )  
ENTITY rule_adoption  
  SUBTYPE OF (rule_action);  
END_ENTITY; -- rule_adoption  
  
( *
```

4.2.782 Rule_based_constraint_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rule_based_constraint_occurrence is a type of Constraint_occurrence (see 4.2.193) that limits possible solutions to the requirements specification by identifying boundary conditions for any potential solution. A Rule_based_constraint_occurrence specifies a rule that must be satisfied.

EXAMPLE 1 A rule might exist that requires junction temperatures of Silicon based integrated devices to be less than 105 degrees Centrigade.

The data associated with a Rule_based_constraint_occurrence are the following:

— design_constraint.

4.2.782.1 design_constraint

The design_constraint specifies the role of the Ee_rule_version (see 4.2.337) for the Rule_based_constraint_occurrence.

NOTE EXPRESS specification:

```
* )  
ENTITY rule_based_constraint_occurrence  
  SUBTYPE OF (constraint_occurrence);  
    design_constraint : ee_rule_version;  
END_ENTITY; -- rule_based_constraint_occurrence  
  
( *
```

4.2.783 Rule_based_evaluated_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rule_based_evaluated_characteristic is a type of Evaluated_characteristic (see 4.2.356). The Rule_based_evaluated_characteristic identifies the Ee_rule_version (see 4.2.337) used to validate or evaluate a Planned_characteristic (see 4.2.679).

The data associated with a Rule_based_evaluated_characteristic are the following:

— evaluating_rule.

4.2.783.1 evaluating_rule

The evaluating_rule specifies the role of the Ee_rule (see ??) for a Rule_based_evaluated_characteristic.

NOTE EXPRESS specification:

```
*)
ENTITY rule_based_evaluated_characteristic
  SUBTYPE OF (evaluated_characteristic);
    evaluating_rule : ee_rule_version;
END_ENTITY; -- rule_based_evaluated_characteristic
(*
```

4.2.784 Rule_change_request

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rule_change_request is a type of Rule_action (see 4.2.780) that states a request has been made for modification to a version of an Ee_rule (see ??). The change reason shall be provided as a part of the Rule_change_request.

The data associated with a Rule_change_request are the following:

— change_reason.

4.2.784.1 change_reason

The change_reason specifies the human-interpretable reason for requesting a Rule_change_request.

NOTE EXPRESS specification:

```
*)
ENTITY rule_change_request
  SUBTYPE OF (rule_action);
    change_reason : STRING;
END_ENTITY; -- rule_change_request
(*
```

4.2.785 Rule_creation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rule_creation is a type of Rule_action (see 4.2.780) that states that a version of an Ee_rule (see ??) has been created.

NOTE EXPRESS specification:

```
*)  
ENTITY rule_creation  
    SUBTYPE OF (rule_action);  
END_ENTITY; -- rule_creation
```

(*

4.2.786 Rule_expiration

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rule_expiration is a type of Rule_action (see 4.2.780) that states that a version of an Ee_rule (see ??) has expired.

The data associated with a Rule_expiration are the following:

— expiration_rationale.

4.2.786.1 expiration_rationale

The expiration_rationale specifies the human-interpretable reason for the Rule_expiration.

NOTE EXPRESS specification:

```
*)  
ENTITY rule_expiration  
    SUBTYPE OF (rule_action);  
    expiration_rationale : STRING;  
END_ENTITY; -- rule_expiration
```

(*

4.2.787 Rule_justification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rule_justification is a type of Managed_design_object (see 4.2.524). A Rule_justification is the justification for an Ee_rule (see ??).

The data associated with a Rule_justification are the following:

- justification_rationale;
- justified_action.

4.2.787.1 justification_rationale

The justification_rationale specifies the text that describes the Rule_justification.

4.2.787.2 justified_action

The justified_action specifies the Rule_action (see 4.2.780) that results from the Rule_justification.

NOTE EXPRESS specification:

```
*)
ENTITY rule_justification
  SUBTYPE OF (managed_design_object);
    justified_action      : rule_action;
    justification_rationale : STRING;
END_ENTITY; -- rule_justification
```

(*

4.2.788 Rule_modification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rule_modification is a type of Rule_action (see 4.2.780) that states a version of an Ee_rule (see ??) is a result of a request to change an existing version of an Ee_rule.

The data associated with a Rule_modification are the following:

- modification_rationale.

4.2.788.1 modification_rationale

The modification_rationale specifies the role of the Rule_change_request (see 4.2.784) for the Rule_modification.

NOTE EXPRESS specification:

```
*)  
ENTITY rule_modification  
  SUBTYPE OF (rule_action);  
    modification_rationale : rule_change_request;  
END_ENTITY; -- rule_modification  
  
(*
```

4.2.789 Rule_priority

A Rule_priority is a type of Managed_design_object (see 4.2.524). A Rule_priority is a statement that an Ee_product (see 4.2.319) that is in the rule category has a priority value. This value is used to order rules. The priority is applied to the rule through the Ee_rule_definition. It is not the Ee_rule_definition that has the priority.

The data associated with a Rule_priority are the following:

- prioritized_rule;
- priority.

4.2.789.1 prioritized_rule

The prioritized_rule specifies the role of the Ee_rule_definition (see 4.2.333) for the Rule_priority.

4.2.789.2 priority

The priority specifies the integer for the priority number of the Rule_priority. The lowest numeric value shall have the highest priority.

Constraints:

WR1: A number less than zero shall not be allowed.

NOTE EXPRESS specification:

```

*)
ENTITY rule_priority
  SUBTYPE OF (managed_design_object);
  priority      : INTEGER;
  prioritized_rule : ee_rule_definition;
WHERE
  WR1: priority &#62;= 0;
END_ENTITY; -- rule_priority
( *

```

4.2.790 Rule_rejection

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rule_rejection is a type of Rule_action (see 4.2.780) that states a version of an Ee_rule (see ??) has been rejected. The rejection rationale shall be part of the Rule_rejection.

The data associated with a Rule_rejection are the following:

— rejection_reason.

4.2.790.1 rejection_reason

The rejection_reason specifies the human-interpretable explanation for the Rule_rejection.

NOTE EXPRESS specification:

```

*)
ENTITY rule_rejection
  SUBTYPE OF (rule_action);
  rejection_reason : STRING;
END_ENTITY; -- rule_rejection
( *

```

4.2.791 Rule_request

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rule_request is a type of Rule_action (see 4.2.780) that states a version of an Ee_rule (see ??) has been requested. The rationale for the version shall be part of the Rule_request.

NOTE EXPRESS specification:

```
* )  
ENTITY rule_request  
  SUBTYPE OF (rule_action);  
END_ENTITY; -- rule_request  
  
(*
```

4.2.792 Rule_set

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rule_set is a type of Managed_design_object (see 4.2.524). A Rule_set may be a Rule_set_group (see 4.2.793). A Rule_set is an association among Ee_rule (see ??) with Rule_priority (see 4.2.789).

The data associated with a Rule_set are the following:

- identifier;
- purpose;
- rule_priority_member.

4.2.792.1 identifier

The identifier specifies the human-interpretable identification for the Rule_set.

4.2.792.2 purpose

The purpose specifies the human-interpretable string for the purpose for the Rule_set.

4.2.792.3 rule_priority_member

The rule_priority_member specifies the role of the Rule_priority (see 4.2.789) for the Rule_set. There shall be one or more Rule_priority for the Rule_set.

Constraints:

UR1: The identifier shall be unique within a population of Rule_sets.

NOTE EXPRESS specification:

```

*)
ENTITY rule_set
  SUPERTYPE OF (rule_set_group)
  SUBTYPE OF (managed_design_object);
  rule_priority_member : SET [1:?] OF rule_priority;
  identifier            : STRING;
  purpose               : STRING;
  UNIQUE
    UR1 : identifier;
END_ENTITY; -- rule_set

```

(*

4.2.793 Rule_set_group

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rule_set_group is a type of Rule_set (see 4.2.792). A Rule_set_group shall have at least two Rule_sets.

The data associated with a Rule_set_group are the following:

— elements.

4.2.793.1 elements

The elements specify the Rule_set (see 4.2.792) for the Rule_set_group. There may be more than two Rule_set for the Rule_set_group.

NOTE EXPRESS specification:

```

*)
ENTITY rule_set_group
  SUBTYPE OF (rule_set);
  elements : SET [2:?] OF rule_set;
END_ENTITY; -- rule_set_group

```

(*

4.2.794 Rule_submission

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rule_submission is a type of Rule_action (see 4.2.780) stating that a version of an Ee_rule (see ??) has been submitted.

The data associated with a Rule_submission are the following:

— submission_rationale.

4.2.794.1 submission_rationale

The submission_rationale specifies the text that describes the rationale for the Rule_submission.

NOTE EXPRESS specification:

```
*)  
ENTITY rule_submission  
  SUBTYPE OF (rule_action);  
    submission_rationale : STRING;  
END_ENTITY; -- rule_submission  
  
(*
```

4.2.795 Rule_supersedence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Rule_supersedence is a type of Rule_action (see 4.2.780) stating that one Ee_rule_version (see 4.2.337) has been superseded by another Ee_rule_version. Both shall be versions of the same Ee_rule (see ??).

The data associated with a Rule_supersedence are the following:

— superseded_rule.

4.2.795.1 superseded_rule

The superseded_rule specifies the Ee_rule_version (see 4.2.337) that has been superseded for the Rule_supersedence.

Constraints:

WR1: The Ee_rule in the role of configuration_managed_rule for the Ee_rule_version in the role of superseded_rule specified by this Rule_supersedence shall be the same Ee_rule that is in the role of configuration_managed_rule inherited from the supertype Rule_action that is specified by this Rule_supersedence.

NOTE EXPRESS specification:

```

*)
ENTITY rule_supersedence
  SUBTYPE OF (rule_action);
  superseded_rule : ee_rule_version;
END_ENTITY; -- rule_supersedence

( *
```

4.2.796 Runout_tolerance_zone_definition_with_specified_angle

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Runout_tolerance_zone_definition_with_specified_angle is a type of Tolerance_zone_definition (see 4.2.920) that is defined by either a Circular_runout_tolerance (see 4.2.102) or a Total_runout_tolerance (see 4.2.929), and in which the Tolerance_zone (see 4.2.913) is oriented with respect to a Directed_axis (see 4.2.303). The Directed_axis is coincident with the Datum_axis (see 4.2.215) about which the Tolerance_zone is centred.

NOTE Circular run-out tolerance in a specified direction is described in 14.13.4 of ISO 1101.

The data associated with a Runout_tolerance_zone_definition_with_specified_angle are the following:

— runout_orientation.

4.2.796.1 runout_orientation

The runout_orientation specifies the Runout_zone_orientation (see 4.2.798) that defines the orientation of the Tolerance_zone (see 4.2.913) relative to a specified Directed_axis (see 4.2.303) for the Runout_tolerance_zone_definition_with_specified_angle.

Constraints:

WR1: The Tolerance_zone specified as the oriented_zone by the Runout_tolerance_zone_orienting_relationship that is specified as the oriented_relationship by the Runout_zone_orientation that is specified as the runout_orientation, shall be the same instance of Tolerance_zone as specified as the defined_tolerance_zone.

WR2: The Runout_tolerance_zone_definition_with_specified_angle shall be specified as the tolerance_zone_or_boundary_definition by exactly one Geometric_tolerance, and that Geometric_tolerance shall be either a Circular_runout_tolerance or a Total_runout_tolerance.

WR3: The instance of Centre_axis specified as the axis_to_be_oriented by the Directed_axis to which the Tolerance_zone is oriented shall be a Datum_axis that is in the Datum_system the definition of which is specified as the datum_system_definition by the associated Circular_runout_tolerance or Total_runout_tolerance.

NOTE EXPRESS specification:

```

*)
ENTITY runout_tolerance_zone_definition_with_specified_angle
  SUBTYPE OF (tolerance_zone_definition);
  runout_orientation : runout_zone_orientation;
END_ENTITY; -- runout_tolerance_zone_definition_with_specified_angle

( *

```

4.2.797 Runout_tolerance_zone_orienting_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Runout_tolerance_zone_orienting_relationship is a type of Managed_design_object (see 4.2.524). A Runout_tolerance_zone_orienting_relationship is a relationship that associates a Tolerance_zone (see 4.2.913) with the Directed_axis (see 4.2.303) with which it is oriented.

The data associated with a Runout_tolerance_zone_orienting_relationship are the following:

- angular_size_characteristic;
- oriented_zone;
- orienting_axis.

4.2.797.1 angular_size_characteristic

The angular_size_characteristic is an inverse relationship that specifies that the existence of the Runout_tolerance_zone_orienting_relationship is dependent on the existence of the Runout_zone_orientation (see 4.2.798) that specifies the Runout_tolerance_zone_orienting_relationship as its oriented_relationship.

4.2.797.2 oriented_zone

The oriented_zone specifies the Tolerance_zone (see 4.2.913) that is oriented with respect to the specified Directed_axis (see 4.2.303) by the Runout_tolerance_zone_orienting_relationship.

4.2.797.3 orienting_axis

The orienting_axis specifies the Directed_axis (see 4.2.303) to which the specified Tolerance_zone (see 4.2.913) is oriented by the Runout_tolerance_zone_orienting_relationship.

Constraints:

IP1: The Centre_axis upon which the Directed_axis is based shall correspond with the axis upon which the unit would be rotated if the corresponding run-out tolerance (i.e., either a Circular_runout_tolerance or Total_runout_tolerance) were to be verified.

NOTE EXPRESS specification:

```

*)
ENTITY runout_tolerance_zone_orienting_relationship
  SUBTYPE OF (managed_design_object);
    oriented_zone : tolerance_zone;
    orienting_axis : directed_axis;
  INVERSE
    angular_size_characteristic : runout_zone_orientation FOR oriented_relationship;
END_ENTITY; -- runout_tolerance_zone_orienting_relationship

( *
```

4.2.798 Runout_zone_orientation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Runout_zone_orientation is a type of Managed_design_object (see 4.2.524). A Runout_zone_orientation is a definition that characterizes the orientation between a Tolerance_zone (see 4.2.913) and a Directed_axis (see 4.2.303) that is coincident with the Datum_axis (see 4.2.215) about which the Tolerance_zone is centred.

The data associated with a Runout_zone_orientation are the following:

- oriented_relationship;
- semi_angle_value;
- zone_definition.

4.2.798.1 oriented_relationship

The oriented_relationship specifies the Runout_tolerance_zone_orienting_relationship (see 4.2.797) that associates the Tolerance_zone (see 4.2.913) with the Directed_axis (see 4.2.303) with which the Tolerance_zone is oriented, and that is characterized by the Runout_zone_orientation.

4.2.798.2 semi_angle_value

The semi_angle_value specifies the Angle_data_element (see 4.2.23) that represents the size of the angle between the Tolerance_zone (see 4.2.913) and the Directed_axis (see 4.2.303).

4.2.798.3 zone_definition

The zone_definition is an inverse relationship that specifies that the existence of the Runout_zone_orientation is dependent on the existence of the Runout_tolerance_zone_definition_with_specified_angle (see 4.2.796) that specifies the Runout_zone_orientation as its runout_orientation.

NOTE EXPRESS specification:

```
*)
ENTITY runout_zone_orientation
  SUBTYPE OF (managed_design_object);
    oriented_relationship : runout_tolerance_zone_orienting_relationship;
    semi_angle_value      : angle_data_element;
  INVERSE
    zone_definition : runout_tolerance_zone_definition_with_specified_angle FOR
                      runout_orientation;
END_ENTITY; -- runout_zone_orientation

(*
```

4.2.799 Scalar_terminal_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Scalar_terminal_definition is a type of Functional_unit_usage_view_terminal_definition (see 4.2.411) for which the size shall be unity.

NOTE EXPRESS specification:

```
*)
ENTITY scalar_terminal_definition
  SUBTYPE OF (functional_unit_usage_view_terminal_definition);
END_ENTITY; -- scalar_terminal_definition

--tt tc1 correction for list error in analytical_model_vector_port_assignment

```

4.2.800 Scalar_terminal_definition_link

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Scalar_terminal_definition_link is a type of Managed_design_object (see 4.2.524).

The data associated with a `Scalar_terminal_definition_link` are the following:

- `precedent_terminal_definition`;
- `subsequent_terminal_definition`.

4.2.800.1 `precedent_terminal_definition`

The `precedent_terminal_definition` specifies a `Scalar_terminal_definition` (see 4.2.799) for the `Scalar_terminal_definition_link`.

4.2.800.2 `subsequent_terminal_definition`

The `subsequent_terminal_definition` specifies a `Scalar_terminal_definition` (see 4.2.799) for the `Scalar_terminal_definition_link`.

Constraints:

UR1: The combination of `precedent_terminal_definition` and `subsequent_terminal_definition` shall be unique within a population of `Scalar_terminal_definition_link`.

WR1: The `precedent_terminal_definition` shall not be the `subsequent_terminal_definition` within a population of `Scalar_terminal_definition_link`.

NOTE EXPRESS specification:

```

*)
ENTITY scalar_terminal_definition_link
  SUBTYPE OF (managed_design_object);
  precedent_terminal_definition : scalar_terminal_definition;
  subsequent_terminal_definition : scalar_terminal_definition;
UNIQUE
  UR1: precedent_terminal_definition, subsequent_terminal_definition;

ENTITY scattering_parameter_data_element
  SUBTYPE OF (data_element);
END_ENTITY; -- scattering_parameter_data_element

( *
```

4.2.802 `Seating_plane`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Seating_plane` is a type of `Non_feature_shape_element` (see 4.2.560) included specifically for the purpose of providing a description of an interface plane. One primary usage in that purpose is synchronizing the two-dimensional and three-dimensional models of a package. The seating plane simulates a mating feature when referenced as an `interface_plane`. The seating plane simulates the interconnect substrate surface in the definition view of a package, where it is referenced in the role of a `package_seating_plane` or `die_seating_plane`. When represented by a three-dimensional plane the normal shall represent the mating surface. The normal vector shall be in the Z axis and shall be at the origin of the defining coordinate system for the three-dimensional case. A `Seating_plane` scope shall be a `Bare_die`, or a `Package`.

NOTE EXPRESS specification:

```
*)
ENTITY seating_plane
  SUBTYPE OF (non_feature_shape_element);
WHERE
  WR1: SIZEOF([ 'AP210_ARM.BARE_DIE',
               'AP210_ARM.PACKAGE' ] *
            TYPEOF(SELF\non_feature_shape_element.scope)) = 1;
END_ENTITY; -- seating_plane

( *
```

4.2.803 Secondary_orientation_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Secondary_orientation_feature is both a Part_feature (see 4.2.609) and a Datum_feature (see 4.2.226). A secondary_orientation_feature provides anti-rotation capability for unambiguous orientation of the part in the datum_reference_frame.

The data associated with a Secondary_orientation_feature are the following:

— associated_body_vertical_extent.

4.2.803.1 associated_body_vertical_extent

An associated_body_vertical_extent specifies the role of the Package_body_surface (see 4.2.578) for a Secondary_orientation_feature. The associated_body_vertical_extent helps to identify the surface or surfaces which contain the feature. An associated_body_vertical_extent need not be specified for a Secondary_orientation_feature.

NOTE EXPRESS specification:

```
*)
ENTITY secondary_orientation_feature
  SUBTYPE OF (part_feature, datum_feature);
    associated_body_vertical_extent : OPTIONAL SET [1:2] OF package_body_surface;
END_ENTITY; -- secondary_orientation_feature

( *
```

4.2.804 Security_classification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Security_classification is a type of Managed_design_object (see 4.2.524). A Security_classification is the level of confidentiality that is required for the purpose of product data protection.

The data associated with a Security_classification are the following:

- classification_date;
- classification_officer;
- classification_level;
- declassification_date;
- security_classification_approval.

4.2.804.1 classification_date

The classification_date specifies either the effective Date (see 4.2.212) or the effective Date_and_time (see 4.2.213) for the Security_classification.

4.2.804.2 classification_officer

The classification_officer specifies the Person_and_organization (see 4.2.647) responsible for the Security_classification.

4.2.804.3 classification_level

The classification_level specifies the level for the Security_classification.

4.2.804.4 declassification_date

The declassification_date specifies either the Date (see 4.2.212) or the Date_and_time (see 4.2.213) upon which the Security_classification no longer applies. The declassification_date need not be provided for a particular Security_classification.

4.2.804.5 security_classification_approval

The security_classification_approval specifies the role of the Ee_approval (see 4.2.314) for the Security_classification.

NOTE EXPRESS specification:

```

4.2.805 Separate_geometric_tolerance_requirement

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Separate_geometric_tolerance_requirement is a type of Managed_design_object (see 4.2.524). A Separate_geometric_tolerance_requirement is a specification that indicates that a set of one or more Geometric_tolerance_with_referenced_datum_system (see 4.2.422) is to be treated as a separate requirement. That is, when geometric tolerances (excluding the composite profile refinement tolerances and composite feature relating position tolerances) reference the same datum system, all the physical features to which the geometric tolerances are applied are treated as a single pattern with regard to the geometric tolerances. If this type of interrelationship is not desired, the Separate_geometric_tolerance_requirement may be used to specify a set of one or more Geometric_tolerance (see 4.2.419) that are to be treated as a separate requirement.

NOTE Separate requirements are discussed in 4.5.12 of ASME Y14.5M.

The data associated with a Separate_geometric_tolerance_requirement are the following:

— separated_geometric_tolerances.

4.2.805.1 separated_geometric_tolerances

The separated_geometric_tolerances specifies the Geometric_tolerance_with_referenced_datum_system (see 4.2.422) that are to be treated as a separate requirement. There shall be one or more Geometric_tolerances_with_referenced_datum_system for a Separate_geometric_tolerance_requirement.

NOTE If the goal is for an individual Geometric_tolerance to be a separate requirement, then it should be specified as the separated_geometric_tolerances by a Separate_geometric_tolerance_requirement that only specifies that Geometric_tolerance.

Constraints:

WR1: The Geometric_tolerance_with_referenced_datum_system that are specified as the separated_geometric_tolerances shall all specify the same instance of Datum_system_defining_conditions as their datum_system_definition.

WR2: The Geometric_tolerance_with_referenced_datum_system that are specified as the separated_geometric_tolerances shall not either be Composite_linear_profile_refinement_tolerance, Composite_surface_profile_refinement_tolerance, or Composite_feature_relating_position_tolerance.

WR3: The Geometric_tolerance_with_referenced_datum_system that are specified as the separated_geometric_tolerances shall either be Profile_of_any_line_tolerance, Profile_of_any_surface_tolerance, or Position_tolerance.

NOTE EXPRESS specification:

```

*)

```

4.2.806 Shape_and_ee_product_definition_based_constraint_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Shape_and_ee_product_definition_based_constraint_occurrence is a type of Ee_product_definition_based_constraint_occurrence (see 4.2.324) that has a basis in the characteristics of one or more Shape_definition (see 4.2.808) within the context of the constraining_definition inherited from Ee_product_definition_based_constraint_occurrence. Each member of Shape_definition referenced shall reference the Ee_product_definition referenced by the constraining_definition attribute inherited from Ee_product_definition_based_constraint_occurrence.

NOTE This provides a mechanism to specify that one or more of the analysis or keepout shapes on Physical_unit is a constraint.

The data associated with a Shape_and_ee_product_definition_based_constraint_occurrence are the following:

— constraining_shape.

4.2.806.1 constraining_shape

The `constraining_shape` specifies the role of the `Shape_definition` (see 4.2.808) for the `Shape_and_ee_product_definition_based_constraint_occurrence`. The interpretation shall be that the `constraining_shape` specifies the `shape_representation` and the `constraining_definition` inherited from the supertype specifies the `product_definition`. There may be one or more `Shape_definition` for the `Shape_and_ee_product_definition_based_constraint_occurrence`.

NOTE EXPRESS specification:

```

*)
ENTITY shape_and_ee_product_definition_based_constraint_occurrence
  SUBTYPE OF (ee_product_definition_based_constraint_occurrence);
  constraining_shape : SET [1:?] OF shape_definition;
WHERE
  WR1: valid_constraining_shape(constraining_shape,
    SELF\ee_product_definition_based_constraint_occurrence.
    constraining_part);

```

4.2.807 Shape_composition_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Shape_composition_relationship` is a type of `Geometric_representation_relationship` (see 4.2.418). A `Shape_composition_relationship` is the association of a `Non_feature_shape_definition` (see 4.2.559) with its `Axis_placement` (see 4.2.56) to create a resultant `Non_feature_shape_definition` (see 4.2.559).

NOTE A `Shape_composition_relationship` is included to support composition of `Non_feature` and non-physical shapes. `Component_2d_location` and other types of location Application Objects support composition of assembly or interconnect shapes. `Usage_concept_usage_view_relationship` supports composition of shapes in the usage view. The name is generic to support extensibility. Mirroring is possible by use of `Cartesian_transformation_operator`. The use of mirroring should be carefully considered to avoid confusion in receiving systems.

EXAMPLE 1 A `Shape_composition_relationship` would be used to transform a keepout shape for a detail into an overall keepout shape. It may be that the detail shape is a `Physical_unit_planar_keepout_shape`.

The data associated with a `Shape_composition_relationship` are the following:

- `related_feature_shape`;
- `related_feature_shape_placement`;
- `resultant_feature_shape`.

4.2.807.1 related_feature_shape

The related_feature_shape specifies one role of the Non_feature_shape_definition (see 4.2.559) for the Feature_shape_composition_relationship. This role name is redeclared from the shape_2 attribute inherited from Geometric_representation_relationship.

4.2.807.2 related_feature_shape_placement

The related_feature_shape_placement specifies the role of the Axis_placement (see 4.2.56) or of the Cartesian_transformation_operator (see ??) for the Shape_composition_relationship.

4.2.807.3 resultant_feature_shape

The resultant_feature_shape specifies one role of the Non_feature_shape_definition (see 4.2.559) for the Shape_composition_relationship. This role name is redeclared from the shape_1 attribute inherited from Geometric_representation_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY shape_composition_relationship
  SUBTYPE OF (geometric_representation_relationship);
    related_feature_shape_placement : axis_placement_or_cto2d;
DERIVE
  related_feature_shape           : non_feature_shape_definition :=
    SELF\geometric_representation_relationship.shape_2;
  resultant_feature_shape         : non_feature_shape_definition :=
    SELF\geometric_representation_relationship.shape_1;
END_ENTITY; -- shape_composition_relationship
( *
```

4.2.808 Shape_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Shape_definition is a type of Managed_design_object (see 4.2.524) A Shape_definition is one of a Bound_volume_shape (see 4.2.76), a Curve (see 4.2.203), an Edge_based_2d_wireframe (see 4.2.309), a Geometrically_bounded_2d_wireframe (see 4.2.424), an Open_shell_based_surface (see 4.2.566), a Planar_shape (see 4.2.678), or a Shell_based_2d_wireframe (see 4.2.819). A Shape_definition is also one of a Feature_shape_definition (see 4.2.372) or of a Non_feature_shape_definition (see 4.2.559). A Shape_definition is the aggregation of geometry elements that represents the shape of an object or that represents additional properties of an object or that represents annotation information. The dimensionality of the geometric elements is determined by the dimensionality of the object being represented.

The data associated with a Shape_definition are the following:

— geometric_context.

4.2.808.1 geometric_context

The geometric_context specifies the role of the Cartesian_coordinate_system (see 4.2.86) for the Shape_definition.

NOTE EXPRESS specification:

```

*)
ENTITY shape_definition
  ABSTRACT SUPERTYPE OF ((ONEOF (
    bound_volume_shape,
    open_shell_based_surface,
    manifold_subsurface_shape,
    planar_shape)) AND
    (ONEOF(feature_shape_definition,
      non_feature_shape_definition)))
  SUBTYPE OF (managed_design_object);

  element : OPTIONAL SET [1:?] OF shape_item;
END_ENTITY; -- shape_definition
( *
```

4.2.809 Shape_dimension_representation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Shape_dimension_representation is a type of Managed_design_object (see 4.2.524). A Shape_dimension_representation is one of an Externally_defined_dimension_representation (see 4.2.363), a Limit_dimension_representation (see 4.2.514), a Plus_minus_tolerance_range_representation (see 4.2.692), or a Singular_dimension_representation (see 4.2.829). A Shape_dimension_representation is a representation of a Dimensional_characteristic (see 4.2.298). The Shape_dimension_representation explicitly describes one or more Dimensional_characteristic with a single value, a range of values, a combination of values, or values and references to the standard documents that define the meaning of these values.

Constraints:

WR1: The Shape_dimension_representation shall be specified as a representation of at least one Dimensional_characteristic_representation.

NOTE EXPRESS specification:

```

*)
ENTITY shape_dimension_representation
  ABSTRACT SUPERTYPE OF (ONEOF (limit_dimension_representation,
    singular_dimension_representation,
    externally_defined_dimension_representation,
    plus_minus_tolerance_range_representation))
  SUBTYPE OF (managed_design_object);
END_ENTITY; -- shape_dimension_representation

( *

```

4.2.810 Shape_element

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Shape_element is a type of Managed_design_object (see 4.2.524). A Shape_element is one of a Non_feature_shape_element (see 4.2.560) or a Physical_feature_or_part_template (see 4.2.658) or a Land_template_terminal (see 4.2.496) or a Component_termination_passage_template_terminal (see 4.2.153) or a Via_template_terminal (see 4.2.953). A Shape_element may additionally be a Composite_shape_element (see 4.2.162). A Shape_element is an identifiable element of the shape of a Physical_unit (see 4.2.664).

The data associated with a Shape_element are the following:

- description;
- name.

4.2.810.1 description

The description specifies the label that conveys the nature of the Shape_element. The description need not be specified for a Shape_element.

4.2.810.2 name

The name specifies the identifier of the Shape_element.

NOTE EXPRESS specification:

```

*)
ENTITY shape_element
  ABSTRACT SUPERTYPE OF (ONEOF (physical_feature_or_part_template,
    component_termination_passage_template_terminal,

```

4.2.811 Shape_element_boundary_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Shape_element_boundary_relationship is a type of Shape_element_relationship (see 4.2.816) that specifies that a Shape_element (see 4.2.810) is the boundary or a portion of the boundary of another Shape_element. The related_shape_element specifies the Shape_element that is the boundary or a portion of a boundary of the Shape_element specified as the relating_shape_element.

NOTE 1 The attribute related_shape_element is declared in the Shape_element_relationship entity of which this entity is a subtype.

NOTE 2 The attribute relating_shape_element is declared in the Shape_element_relationship entity of which this entity is a subtype.

EXAMPLE 1 A Shape_element_boundary_relationship may be used to specify that a Shape_element is one of the boundaries of a rectangular Datum_target (see 4.2.240) area. The boundary may then be located relative to a Datum (see 4.2.214) with a Dimensional_location (see 4.2.300).

Constraints:

WR1: The Shape_element specified as the relating_shape_element shall not be specified as a boundary of itself either directly or through intermediate Shape_element_boundary_relationship.

NOTE EXPRESS specification:

```
*)
ENTITY shape_element_boundary_relationship
  SUBTYPE OF (shape_element_relationship);
END_ENTITY; -- shape_element_boundary_relationship
```

(*

4.2.812 Shape_element_composing_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Shape_element_composing_relationship is a type of Shape_element_constituent_relationship (see 4.2.813) that associates a Composite_shape_element (see 4.2.162) with a Shape_element (see 4.2.810) from which the Composite_shape_element is composed.

The data associated with a Shape_element_composing_relationship are the following:

— relating_shape_element.

4.2.812.1 relating_shape_element

The relating_shape_element specifies the Composite_shape_element (see 4.2.162) that is the Shape_element (see 4.2.810) that is composed from the Shape_element specified as the related_shape_element for the Shape_element_composing_relationship.

NOTE The attribute related_shape_element is declared in the entity Shape_element_relationship of which this entity is a subtype.

NOTE EXPRESS specification:

```
*)
ENTITY shape_element_composing_relationship
  SUBTYPE OF (shape_element_constituent_relationship);
  SELF\shape_element_relationship.relatating_shape_element : composite_shape_element;
END_ENTITY; -- shape_element_composing_relationship
```

(*

4.2.813 Shape_element_constituent_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Shape_element_constituent_relationship is a type of Shape_element_relationship (see 4.2.816) that associates a Shape_element (see 4.2.810) with a second Shape_element to which the first Shape_element is a constituent. The Shape_element that is the constituent Shape_element is specified as the related_shape_element. The Shape_element to which the constituent Shape_element is a constituent is specified as the relating_shape_element. A Shape_element_constituent_relationship may be a Shape_element_composing_relationship (see 4.2.812).

NOTE 1 The attribute relating_shape_element is declared in the Shape_element_relationship entity of which this entity is a subtype.

NOTE 2 The attribute related_shape_element is declared in the Shape_element_relationship entity of which this entity is a subtype.

NOTE 3 The difference between a Shape_element_constituent_relationship and a Shape_element_composing_relationship is that the Shape_element_constituent_relationship is used to indicate that a Shape_element is part of another Shape_element. However, the Shape_element_composing_relationship is used to completely specify the composition of a Composite_shape_element.

EXAMPLE 1 A Shape_element_constituent_relationship might be used to indicate that a Datum_target is on the bottom surface of a printed circuit board. In this case, the Shape_element that is the Datum_target would be specified as the related_shape_element, and the Shape_element that is the bottom surface of the printed circuit board would be specified as the relating_shape_element.

Constraints:

UR1: The combination of the relating_shape_element inherited from Shape_element_relationship and related_shape_element inherited from Shape_element_relationship shall be unique within a population of Shape_element_constituent_relationship. That is, any specific Shape_element shall not be a constituent of any one Shape_element more than once.

WR1: The Shape_element that is specified as the relating_shape_element shall not be a constituent of itself, either directly or indirectly.

NOTE EXPRESS specification:

```

*)
ENTITY shape_element_constituent_relationship
  SUPERTYPE OF (shape_element_composing_relationship)
  SUBTYPE OF (shape_element_relationship);
  UNIQUE
    UR1 : related_shape_element, relating_shape_element;
END_ENTITY; -- shape_element_constituent_relationship

( *

```

4.2.814 Shape_element_deriving_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Shape_element_deriving_relationship is a type of Shape_element_relationship (see 4.2.816) that associates a Derived_shape_element (see 4.2.260) with a Shape_element (see 4.2.810) from which the Derived_shape_element is derived.

The data associated with a Shape_element_deriving_relationship are the following:

— relating_shape_element.

4.2.814.1 relating_shape_element

The relating_shape_element specifies the Derived_shape_element (see 4.2.260) that is the Shape_element (see 4.2.810) that is derived from the Shape_element specified as the related_shape_element for the Shape_element_deriving_relationship.

NOTE The attribute related_shape_element is declared in the Shape_element_relationship entity of which this entity is a subtype.

EXAMPLE 1 Consider a centre axis that is derived from a cylindrical hole. The nature of the relationship between the centre axis and the cylindrical hole is indicated by a Shape_element_deriving_relationship in which the cylindrical hole is specified as the related_shape_element and the centre axis is specified as the relating_shape_element.

Constraints:

UR1: The combination of the relating_shape_element inherited from Shape_element_relationship and related_shape_element inherited from Shape_element_relationship shall be unique within a population of Shape_element_deriving_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY shape_element_deriving_relationship
  SUBTYPE OF (shape_element_relationship);
  SELF\shape_element_relationship.relate_shape_element : derived_shape_element;
  UNIQUE
  UR1 : related_shape_element, relating_shape_element;
END_ENTITY; -- shape_element_deriving_relationship

```

4.2.815 Shape_element_locating_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Shape_element_locating_relationship is a type of Managed_design_object (see 4.2.524). A Shape_element_locating_relationship is the association between two Shape_element (see 4.2.810) in which the associated Shape_elements are located in relation to each other.

The data associated with a Shape_element_locating_relationship are the following:

- located_shape_element;
- locating_shape_element.

4.2.815.1 located_shape_element

The located_shape_element specifies the Shape_element (see 4.2.810) that is located in relation to the Shape_element specified by the locating_shape_element for the Shape_element_locating_relationship.

4.2.815.2 locating_shape_element

The locating_shape_element specifies the Shape_element (see 4.2.810) in relation to which the Shape_element specified by the located_shape_element is located for the Shape_element_locating_relationship.

Constraints:

UR1: The combination of located and locating Shape_elements shall be unique within a population of Shape_element_locating_relationship. That is, the same Shape_elements shall not be located relative to each other more than once.

WR1: The Shape_element specified by the located_shape_element shall not be the same Shape_element specified by the locating_shape_element.

WR2: The Shape_element_locating_relationship shall be specified as either the located_elements by a Dimensional_location or as the boundary_separation by a Dimensional_size_based_on_opposing_boundaries.

NOTE EXPRESS specification:

```

*)
ENTITY shape_element_locating_relationship
  SUBTYPE OF (managed_design_object);
    locating_shape_element : shape_element;
    located_shape_element  : shape_element;

    UR1 : located_shape_element, locating_shape_element;
END_ENTITY; -- shape_element_locating_relationship

( *
```

4.2.816 Shape_element_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Shape_element_relationship is a type of Managed_design_object (see 4.2.524). A Shape_element_relationship is one of a Parallel_shape_element_relationship (see 4.2.601), a Perpendicular_shape_element_relationship (see 4.2.644), a Shape_element_boundary_relationship (see 4.2.811), a Shape_element_constituent_relationship (see 4.2.813), a Non_feature_shape_element_relationship (see 4.2.561), or a Shape_element_deriving_relationship (see 4.2.814). Additionally, a Shape_element_relationship may be a Datum_feature_usage_in_datum_relationship (see 4.2.229). A Shape_element_relationship is an association between two Shape_element (see 4.2.810).

The data associated with a Shape_element_relationship are the following:

- description;
- name;
- related_shape_element;
- relating_shape_element.

4.2.816.1 description

The description specifies the descriptive label that relates the nature of the Shape_element_relationship. The description need not be specified for a Shape_element_relationship.

4.2.816.2 name

The name specifies the identifying label for the Shape_element_relationship. The name need not be specified for a Shape_element_relationship.

4.2.816.3 related_shape_element

The related_shape_element specifies the Shape_element (see 4.2.810) to which the relating_shape_element refers for the Shape_element_relationship. If one Shape_element of the relationship is dependent upon the other, this attribute shall be the dependent one.

4.2.816.4 relating_shape_element

The relating_shape_element specifies the Shape_element (see 4.2.810) that relates to another, for the Shape_element_relationship.

Constraints:

WR1: If the Shape_element_relationship is a Datum_feature_usage_in_datum_relationship it shall not also be a Parallel_shape_element_relationship, a Perpendicular_shape_element_relationship, a Shape_element_boundary_relationship, or a Shape_element_constituent_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY shape_element_relationship
  ABSTRACT SUPERTYPE OF (ONEOF (parallel_shape_element_relationship,
    perpendicular_shape_element_relationship,
    datum_difference,
    non_feature_shape_element_relationship,

4.2.817 Shape_formed_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Shape_formed_terminal` is a type of a `Altered_package_terminal` (see 4.2.9) that defines a modification of its shape from its original `Package_terminal` (see 4.2.581) shape. This shape modification is done in order to facilitate the installation of a `Packaged_part` (see 4.2.591) in an assembly.

The data associated with a `Shape_formed_terminal` are the following:

— `terminal_form_specification`.

4.2.817.1 terminal_form_specification

The `terminal_form_specification` specifies the `Lead_form_specification` (see 4.2.510) of the `Shape_formed_terminal`.

NOTE EXPRESS specification:

4.2.819 Shell_based_2d_wireframe

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Shell_based_2d_wireframe is a type of Feature_shape_definition (see 4.2.372). A Shell_based_2d_wireframe describes the shape of a product by two-dimensional wireframe geometry with topology. This includes all two-dimensional curves and topological entities that define a graph of vertices, edges, and loops.

NOTE EXPRESS specification:

```

*)
ENTITY shell_based_2d_wireframe
  SUBTYPE OF (planar_shape);
END_ENTITY; -- shell_based_2d_wireframe
( *

```

4.2.820 Shell_based_wireframe

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Shell_based_wireframe` is a type of `Bound_volume_shape` (see 4.2.76). A `Shell_based_wireframe` maintains the topology information along with the geometric wireframe model.

NOTE EXPRESS specification:

```
*)
ENTITY shell_based_wireframe
  SUBTYPE OF (bound_volume_shape);
END_ENTITY; -- shell_based_wireframe

( *
```

4.2.821 Shield

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Shield` is a type of `Assembly_component` (see 4.2.34) included for suppression of unwanted electromagnetic coupling among components. An `Assembly_component` included in the assembly for other purposes might also serve as a `Shield`, and in that case the other type would be specified as well for that instance.

EXAMPLE 1 A `Via` (see 4.2.947) may be a `Shield`. More than one shield may shield the same `shielded_item` for the same purpose.

EXAMPLE 2 Figure 101 illustrates a detail of a layout drawing that shows a shielded trace (carrying a critical signal) on the several layers it traverses in the design.

The data associated with a `Shield` are the following:

— `shielded_item`.

4.2.821.1 shielded_item

The `shielded_item` specifies either an `Assembly_component` (see 4.2.34), a `Component_feature` (see 4.2.118), or a `Physical_connectivity_definition` (see 4.2.652) as the shieldable item for a `Shield`. There shall be one or more `Assembly_component`, `Component_feature`, or `Physical_connectivity_definition` for a `Shield`.

Figure 101 – Shield

NOTE EXPRESS specification:

```
*)  
ENTITY shield  
  SUBTYPE OF (assembly_component);  
    shielded_item : SET [1:?] OF shieldable_item;  
END_ENTITY; -- shield

4.2.822 Shield_allocation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Shield_allocation is a type of Electromagnetic_compatibility_requirement_allocation (see 4.2.347). The Shield_allocation enables the assignment of a requirement to a shield. This allocates required properties of shielding effectiveness to the shield.

The data associated with a Shield_allocation are the following:

- assembly_assignment;
- requirement.

4.2.822.1 assembly_assignment

The assembly_assignment specifies the role of the Shield (see 4.2.821) for the Shield_allocation.

4.2.822.2 requirement

The requirement specifies the role of the Electromagnetic_requirement_occurrence (see 4.2.348) for the Shield_allocation.

NOTE EXPRESS specification:

```
*)  
ENTITY shield_allocation  
  SUBTYPE OF (electromagnetic_compatibility_requirement_allocation);  
    SELF\assembly_requirement_allocation.assembly_assignment : shield;  
    SELF\assembly_requirement_allocation.requirement          :  
electromagnetic_requirement_occurrence;  
END_ENTITY; -- shield_allocation  
  
(*
```

4.2.823 Signal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Signal is a type of Managed_design_object (see 4.2.524). A Signal in this part of ISO 10303 is an abstraction of signal as categorized according to an ISO or IEC standard. Signal in this part of ISO 10303 is specifically included for the purpose of exchanging information related to functional abstractions of products as commonly specified on data sheets. There is no predefined mechanism in this part of ISO 10303 that defines standard physical arrangement of instrumentation and test articles to support test processes. This part of ISO 10303 provides a standard mechanism to associate sets of data that characterize the behaviour of a product with the functional hierarchical model and physical geometric model of that product.

NOTE 1 A Signal is a physical phenomenon that may be characterized by means of appropriate instrumentation or simulated by a computer system for the purpose of evaluating system behaviour.

NOTE 2 IEC Multi-Lingual Dictionary Volume 2, 1992: signal (174) a physical phenomenon, one or more of whose characteristics may vary to represent information.

EXAMPLE 1 The physical phenomenon may be, for instance, an electromagnetic wave, or acoustic wave and the characteristic may be an electric field, a voltage, or a sound pressure.

The data associated with a Signal are the following:

— signal_category.

4.2.823.1 signal_category

The signal_category specifies the External_definition (see 4.2.361) for the category for this Signal.

EXAMPLE 1 Examples of signal_category include an electromagnetic wave, or acoustic wave.

NOTE EXPRESS specification:

```
*)
ENTITY signal
  SUBTYPE OF (managed_design_object);
  signal_category : external_definition;
END_ENTITY; -- signal

( *
```

4.2.824 Signal_property

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Signal_property` is a type of `Managed_design_object` (see 4.2.524). A `Signal_property` may be a `Composite_signal_property` (see 4.2.163). A `Signal_property` is a data set that characterizes a `Signal` (see 4.2.823) and each element of which has units that are traceable to an ISO or IEC standard. The units may be basic SI units, derived SI units, conversion based units, or context dependent units. Conversion based and context dependent units shall be specified in the external standard that defines the `signal_property_category`.

The data associated with a `Signal_property` are the following:

- `characterized_signal`;
- `signal_property_category`;
- `signal_property_representation`.

4.2.824.1 characterized_signal

The `characterized_signal` specifies the `Signal` (see 4.2.823) that has the `Signal_property`.

4.2.824.2 signal_property_category

The `signal_property_category` specifies the role of the `External_definition` (see 4.2.361) for the `Signal_property`.

4.2.824.3 signal_property_representation

The `signal_property_representation` specifies the `Characteristic_data_table` (see 4.2.100) of the `Signal_property`. The `signal_property_representation` is at least a two dimensional representation, including a sample function and a data set represented at the discrete points of the sample function.

NOTE A `signal_property_representation` is a discretized function represented by a table that maps a parameter, such as time, frequency, or distance, onto a response variable. The table is represented in this standard by a list of columnar data, each column is represented by set. One member of the set is a representation of the sample function at that sample point. The other members of the set represents the discretized parameters (e.g., power).

EXAMPLE 1 An example `signal_property_representation` characterizes voltage over a defined frequency range.

NOTE EXPRESS specification:

```

*)
ENTITY signal_property
  SUPERTYPE OF (composite_signal_property)
  SUBTYPE OF (managed_design_object);
  signal_property_representation : characteristic_data_table;
  characterized_signal           : signal;
  signal_property_category       : external_definition;
END_ENTITY; -- signal_property

( *

```

4.2.825 Signal_specification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Signal_specification is a type of Managed_design_object (see 4.2.524). A Signal_specification is a bounded behavioural characteristic as measured between two terminals of a Functional_unit (see 4.2.400) in a controlled environment. The characterization of the behaviour of the functional_unit_definition is in terms of the representations of the Signals that exist at the interface of the instance of the functional_unit_definition with the network within which the instance is embedded.

The data associated with a Signal_specification are the following:

- characterization_network;
- characterizing_functional_unit;
- maximum_characteristic;
- measurement_access_mechanism;
- measurement_condition;
- minimum_characteristic;
- reference_access_mechanism.

4.2.825.1 characterization_network

The characterization_network specifies the Functional_unit_network_definition (see 4.2.402) in which an instance of a usage view of the Functional_unit_definition (see 4.2.401) being characterized is embedded for this Signal_specification. In this part of ISO 10303, the characterization_network shall include all required simulated stimulus sources and measurement sensors.

EXAMPLE 1 Examples of characterization_network types include test bench (VHDL), test fixture, test circuit.

4.2.825.2 characterizing_functional_unit

The `characterizing_functional_unit` specifies the `Functional_unit` (see 4.2.400) being characterized by the `Signal_specification`.

4.2.825.3 maximum_characteristic

The `maximum_characteristic` specifies the upper bound for the valid range of the `Signal_property` (see 4.2.824) for the `Signal_specification`.

4.2.825.4 measurement_access_mechanism

The `measurement_access_mechanism` specifies the role of the `Functional_unit_terminal` (see 4.2.407) for the `Signal_specification`.

4.2.825.5 measurement_condition

The `measurement_condition` specifies the `Test_specification` (see 4.2.898) under which the measurements are valid, including allowed ranges for stimulus conditions, for the `Signal_specification`.

NOTE The `measurement_condition` may specify data using text or graphics.

4.2.825.6 minimum_characteristic

The `minimum_characteristic` specifies the lower bound for the valid range of the `Signal_property` (see 4.2.824) for the `Signal_specification`.

4.2.825.7 reference_access_mechanism

The `reference_access_mechanism` specifies the `Functional_unit_terminal` (see 4.2.407) on the `Functional_unit` (see 4.2.400) being characterized by this `Signal_specification`. The `reference_access_mechanism` need not be specified for a particular `Signal_specification`. The purpose of the `reference_access_mechanism` is to provide a reference facility for measurements. The `reference_access_mechanism` need not be provided.

EXAMPLE 1 The `reference_access_mechanism` need not be supplied for evaluation of non-causal systems such as s- or z-plane characterized control system elements or digital elements. There is no assumption in this part of ISO 10303 that `reference_access_mechanism` is related to any standard reference node, for example, "0" in certain continuous system simulators. Example names of the terminal specified by `reference_access_mechanism` include Ground, Analogue ground, Digital ground, Trigger in, Gate out.

Constraints:

WR1: The External_definition in the role of signal_property_category specified by signal_property in the role of maximum_characteristic shall be the same as the External_definition in the role of signal_property_category specified by signal_property in the role of minimum_characteristic.

WR2: The measurement_access_mechanism shall access an occurrence of the definition being characterized.

WR3: The measurement_access_mechanism shall not be the reference_access_mechanism.

WR4: The network in which the functional_unit_definition being characterized is instantiated shall not be the network being characterized.

WR5: The characterizing_functional_unit shall help compose the characterization_network.

WR6: The measurement_access_mechanism shall be an access_mechanism for the characterizing_functional_unit.

WR7: The reference_access_mechanism, if provided, shall be an access_mechanism for the characterizing_functional_unit.

NOTE EXPRESS specification:

*)

4.2.826 Simultaneous_geometric_tolerance_requirement

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Simultaneous_geometric_tolerance_requirement is a type of Managed_design_object (see 4.2.524). A Simultaneous_geometric_tolerance_requirement is a specification that a set of two or more Geometric_tolerance (see 4.2.419) is to be treated as a simultaneous requirement. That is, the shape elements to which composite profile refinement tolerances and composite feature relating position tolerances are applied are treated as separate shape elements with regard to the geometric tolerances. If this type of independence is not desired, the Simultaneous_geometric_tolerance_requirement may be used to specify a set of two or more Geometric_tolerance that are to be treated as a simultaneous requirement.

NOTE Simultaneous requirements are discussed in 4.5.12.1 of ASME Y14.5M.

The data associated with a Simultaneous_geometric_tolerance_requirement are the following:

— grouped_geometric_tolerances.

4.2.826.1 grouped_geometric_tolerances

The grouped_geometric_tolerances specifies the Geometric_tolerance (see 4.2.419) that are to be treated as a simultaneous requirement. There shall be two or more Geometric_tolerance for a Simultaneous_geometric_tolerance_requirement.

Constraints:

WR1: The Geometric_tolerance that are specified as the grouped_geometric_tolerances either shall all be Geometric_tolerance_without_referenced_datum_system or shall all specify the same instance of Datum_system_defining_conditions as their datum_system_definition.

WR2: The Geometric_tolerance that are specified as the grouped_geometric_tolerances shall either be Composite_linear_profile_refinement_tolerance, Composite_surface_profile_refinement_tolerance, or Composite_feature_relating_position_tolerance.

NOTE EXPRESS specification:

```
*)

4.2.827 Single_boundary_dimension

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Single_boundary_dimension is a type of Dimensional_size (see 4.2.301) that characterizes the size of a Shape_element (see 4.2.810) that can be considered to have a single boundary or have the form of a curve. A Single_boundary_dimension may be a Curve_dimension (see 4.2.204).

EXAMPLE 1 The diameter of a cylindrical Shape_element would be characterized with a Single_boundary_dimension.

NOTE EXPRESS specification:

```

*)
ENTITY single_boundary_dimension
  SUPERTYPE OF (curve_dimension)
  SUBTYPE OF (dimensional_size);
END_ENTITY; -- single_boundary_dimension

( *

```

4.2.828 Single_datum

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Single_datum is a Datum (see 4.2.214) that is established by a single Datum_feature (see 4.2.226).

NOTE The establishment of a datum by a single datum feature is described in 6.2.1 of ISO 5459.

Constraints:

WR1: Each Single_datum shall participate in establishing at least one Datum_system.

WR2: Each Single_datum shall be specified as the relating_shape_element by exactly one Datum_feature_usage_in_single_datum_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY single_datum
  SUPERTYPE OF (edge_segment_vertex)
  SUBTYPE OF (datum);
END_ENTITY; -- single_datum

( *

```

4.2.829 Singular_dimension_representation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Singular_dimension_representation is a type of Shape_dimension_representation (see 4.2.809) that explicitly describes one or more Dimensional_characteristic (see 4.2.298) with a single value. A Singular_dimension_representation is one of a Maximum_dimension_representation (see 4.2.541), a Minimum_dimension_representation (see 4.2.547), or a Theoretically_exact_dimension_representation (see 4.2.899).

The data associated with a Singular_dimension_representation are the following:

— dimension_value.

4.2.829.1 dimension_value

The dimension_value specifies the Data_element (see 4.2.211) that describes the Dimensional_characteristic (see 4.2.298) for which the Singular_dimension_representation is a representation.

NOTE EXPRESS specification:

```
*)  
ENTITY singular_dimension_representation  
  ABSTRACT SUPERTYPE OF (ONEOF (  
    theoretically_exact_dimension_representation,  
    maximum_dimension_representation,

END_ENTITY; -- solid_fill_style

( *
```

4.2.833 Solid_of_linear_extrusion

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Solid_of_linear_extrusion` is a type of `Bound_volume_shape` (see 4.2.76) defined by sweeping a planar face. The direction of translation is defined by a direction vector normal to the plane of the swept face and the length of the translation is defined by a distance "depth". The planar face may have holes which will sweep into holes in the solid.

NOTE EXPRESS specification:

```
*)
ENTITY solid_of_linear_extrusion
  SUBTYPE OF (bound_volume_shape);
END_ENTITY; -- solid_of_linear_extrusion

( *
```

4.2.834 `Special_symbol_laminate_component`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Special_symbol_laminate_component` is a type of `Laminate_component` (see 4.2.483) such as an enterprise logo, trademark, or other enterprise specific symbol. A `Special_symbol_laminate_component` may be a `Primary_stratum_indicator_symbol` (see 4.2.719).

NOTE 1 A `Special_symbol_laminate_component` may or may not be limited to a member of a library of accepted symbols.

NOTE 2 A `Special_symbol_laminate_component` may or may not be scalable. A `Special_symbol_laminate_component` may or may not be associated with a physical net.

NOTE 3 These symbols may be stored in a library for legal reasons.

The data associated with a `Special_symbol_laminate_component` are the following:

- `stratum_feature_implementation`;
- `usage_definition`.

4.2.834.1 `stratum_feature_implementation`

The `stratum_feature_implementation` specifies the role of the `Stratum_feature` (see 4.2.851) for the `Special_symbol_laminate_component`.

4.2.834.2 `usage_definition`

The `usage_definition` specifies the role of the `Special_symbol_part_template` (see 4.2.835) for the `Special_symbol_laminate_component`.

NOTE EXPRESS specification:

```

*)
ENTITY special_symbol_laminate_component
  SUPERTYPE OF (primary_stratum_indicator_symbol)
  SUBTYPE OF (laminate_component);
  SELF\assembly_component.usage_definition : special_symbol_part_template;

4.2.836 Specification_allocation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Specification_allocation` is a type of `Managed_design_object` (see 4.2.524). A `Specification_allocation` is the association between an `Ee_specification` (see 4.2.338) and one or more of an `Ee_product` (see 4.2.319), an `Ee_product_configuration` (see 4.2.322), an `Ee_product_definition` (see 4.2.323), an `Ee_product_version` (see 4.2.328), a `Physical_connectivity_definition` (see 4.2.652), a `Physical_connectivity_element` (see 4.2.654), one or more of an `Assembly_component` (see 4.2.34), a `Component_feature` (see 4.2.118), a `Stratum` (see 4.2.845), one or more of an `Inter_stratum_feature` (see 4.2.432), a `Laminate_component` (see 4.2.483), or a `Stratum_feature` (see 4.2.851) that results from the design activity.

The data associated with a `Specification_allocation` are the following:

- `allocated_specification`;
- `target_product_object`.

4.2.836.1 `allocated_specification`

The `allocated_specification` specifies the role of the `Ee_specification` (see 4.2.338) for the `Specification_allocation`.

4.2.836.2 `target_product_object`

The `target_product_object` specifies either an `Ee_product` (see 4.2.319), an `Ee_product_configuration` (see 4.2.322), an `Ee_product_definition` (see 4.2.323), an `Ee_product_version` (see 4.2.328), a `Part_feature` (see 4.2.609), a `Physical_connectivity_definition` (see 4.2.652), a `Physical_connectivity_element` (see 4.2.654), or one of an `Assembly_component` (see 4.2.34), a `Component_external_reference` (see 4.2.117), a `Component_feature` (see 4.2.118), a `Component_feature_external_reference` (see 4.2.119), a `Stratum` (see 4.2.845) or one of an `Inter_stratum_feature` (see 4.2.432), a `Laminate_component` (see 4.2.483), a `Stratum_feature` (see 4.2.851), or a `Stratum_surface` (see 4.2.868) as the target through which the `Ee_specification` (see 4.2.338) is realized by the `Specification_allocation`. There shall be one or more `Ee_product`, `Ee_product_configuration`, `Ee_product_definition`, `Ee_product_version`, `Part_feature`, `Physical_connectivity_definition`, `Physical_connectivity_element`, `Assembly_component`, `Component_external_reference`, `Component_feature`, `Component_feature_external_reference`, `Stratum`, `Inter_stratum_feature`, `Laminate_component`, `Stratum_feature`, or `Stratum_surface` for a `Specification_allocation`.

NOTE EXPRESS specification:

4.2.840 Statistical_dimensional_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Statistical_dimensional_tolerance is a type of Dimensional_characteristic (see 4.2.298) that specifies design requirements that are based on sound statistics. Associated with the Statistical_dimensional_tolerance is the requirement that a specified level of process control be maintained during the manufacture of the Physical_unit (see 4.2.664). A Statistical_dimensional_tolerance may specify another Dimensional_characteristic as an alternate to the Statistical_dimensional_tolerance in the event that the specified level of process control cannot be met.

The data associated with a Statistical_dimensional_tolerance are the following:

- alternate_dimension;
- statistical_control_requirement.

NOTE Statistical tolerancing is discussed in 2.16 of ASME Y14.5M.

4.2.840.1 alternate_dimension

The alternate_dimension specifies the Dimensional_characteristic (see 4.2.298) that shall be used if the specified level of process control cannot be met. The alternate_dimension need not be specified for a Statistical_dimensional_tolerance.

4.2.840.2 statistical_control_requirement

The statistical_control_requirement specifies the Ee_requirement_occurrence (see 4.2.330) that states the statistical process control requirements that the manufacturing facility shall meet for the Statistical_dimensional_tolerance.

Constraints:

WR1: If a Dimensional_characteristic is specified as an alternate_dimension, the specified Dimensional_characteristic shall not be a Statistical_dimensional_tolerance.

WR2: If a Dimensional_characteristic is specified as an alternate_dimension, the Dimensional_characteristic shall characterize the same Shape_element or Shape_element_locating_relationship as characterized by the Statistical_dimensional_tolerance.

NOTE EXPRESS specification:

```

*)
ENTITY statistical_dimensional_tolerance
  SUBTYPE OF (dimensional_characteristic);
    alternate_dimension          : OPTIONAL dimensional_characteristic;
    statistical_control_requirement : ee_requirement_occurrence;
END_ENTITY; -- statistical_dimensional_tolerance

```

4.2.841 Statistical_geometric_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Statistical_geometric_tolerance is a type of Geometric_tolerance (see 4.2.419) that specifies design requirements that are based on sound statistics. Associated with the Statistical_geometric_tolerance is the requirement that a specified level of process control be maintained during the manufacture of the Physical_unit (see 4.2.664). A Statistical_geometric_tolerance may specify another Geometric_tolerance as an alternate to the Statistical_geometric_tolerance in the event that the specified level of process control cannot be met.

The data associated with a Statistical_geometric_tolerance are the following:

- alternate_tolerance;
- statistical_control_requirement.

NOTE Statistical tolerancing is discussed in 2.16 of ASME Y14.5M.

4.2.841.1 alternate_tolerance

The alternate_tolerance specifies the Geometric_tolerance (see 4.2.419) that shall be used if the specified level of process control cannot be met. The alternate_tolerance need not be specified for a Statistical_geometric_tolerance.

4.2.841.2 statistical_control_requirement

The statistical_control_requirement specifies the Ee_requirement_occurrence (see 4.2.330) that states the statistical process control requirements that the manufacturing facility shall meet for the Statistical_geometric_tolerance.

Constraints:

WR1: If a Geometric_tolerance is specified as an alternate_tolerance, the specified Geometric_tolerance shall not be a Statistical_geometric_tolerance.

WR2: If a Geometric_tolerance is specified as an alternate_tolerance, the Shape_element specified as the tolerated_shape_element by the Statistical_geometric_tolerance shall be the same instance of Shape_element as specified as the tolerated_shape_element by the Geometric_tolerance specified as the alternate_tolerance.

NOTE The attribute tolerated_shape_element is declared in the Geometric_tolerance entity of which this entity is a subtype.

NOTE EXPRESS specification:

```

*)
ENTITY statistical_geometric_tolerance
  SUBTYPE OF (geometric_tolerance);
    alternate_tolerance          : OPTIONAL geometric_tolerance;
    statistical_control_requirement : ee_requirement_occurrence;
END_ENTITY; -- statistical_geometric_tolerance

( *
```

4.2.842 Statistical_tolerance_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Statistical_tolerance_characteristic is a type of Tolerance_characteristic (see 4.2.911). The Statistical_tolerance_characteristic supports the exchange of properties defined by statistical distributions.

Constraints:

IP1: The component_characteristic inherited from Coordinated_characteristic shall all participate in the characterization of one statistical tolerance.

IP2: The type_name inherited from Coordinated_characteristic shall be a recognized statistical tolerance type.

NOTE EXPRESS specification:

```
*)
ENTITY statistical_tolerance_characteristic
  SUBTYPE OF (tolerance_characteristic);
END_ENTITY; -- statistical_tolerance_characteristic

( *
```

4.2.843 Step_edge_feature_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Step_edge_feature_shape is a type of Edge_shape (see 4.2.313) that is the two-dimensional definition of the construction of a step edge. See Bevel_edge_feature_shape (see 4.2.69) for additional supporting geometric information that shall be provided.

EXAMPLE 1 Figure 102 illustrates a detail of a fabrication drawing that shows some of the information exchanged for construction of a step edge.

The data associated with a Step_edge_feature_shape are the following:

- maximum_step_depth;
- maximum_step_width;
- minimum_step_depth;
- minimum_step_width.

4.2.843.1 maximum_step_depth

The maximum_step_depth specifies the Length_data_element (see 4.2.511) of the maximum depth of the step relative to the datum surface.

4.2.843.2 maximum_step_width

The maximum_step_width specifies the Length_data_element (see 4.2.511) of the maximum width of the step relative to the edge surface that is stepped.

4.2.843.3 minimum_step_depth

The minimum_step_depth specifies the Length_data_element (see 4.2.511) of the minimum depth of the step relative to the datum surface.

Figure 102 – Step_edge_feature_shape

4.2.843.4 minimum_step_width

The minimum_step_width specifies the Length_data_element (see 4.2.511) of the minimum width of the step relative to the edge surface that is stepped.

NOTE EXPRESS specification:

```

*)
ENTITY step_edge_feature_shape
  SUBTYPE OF (edge_shape);
    minimum_step_width : length_data_element;
    maximum_step_width : length_data_element;
    maximum_step_depth : length_data_element;
    minimum_step_depth : length_data_element;
END_ENTITY; -- step_edge_feature_shape

( *
```

4.2.844 Straightness_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Straightness_tolerance is a type of Geometric_tolerance_without_referenced_datum_system (see 4.2.423) that specifies or partially specifies the design requirement on the straightness of either the Shape_element (see 4.2.810) to which the Straightness_tolerance is applied or of constituent elements of the Shape_element to which the Straightness_tolerance is applied. When the design requirements are on the straightness of constituent elements of a non-axial Shape_element, the orientation of the Tolerance_zone_boundary (see 4.2.915) is specified by a Viewing_plane (see 4.2.956) to which the Tolerance_zone_boundary is parallel.

NOTE Straightness tolerance is defined in terms of tolerance zone definitions in 14.1 of ISO 1101.

Constraints:

WR1: The Shape_element specified by the toleranced_shape_element shall be either a Physical_feature_or_part_template, a Centre_axis or a Centre_plane

NOTE The attribute toleranced_shape_element is declared in the Geometric_tolerance entity of which this entity is a subtype.

WR2: If the toleranced_shape_element is a Centre_axis, the Straightness_tolerance shall specify a Tolerance_zone_definition as its tolerance_zone_or_boundary_definition; and that Tolerance_zone_definition shall specify a Tolerance_zone_boundary_definition_with_specified_size as its boundary_definition; and that Tolerance_zone_boundary_definition_with_specified_size shall specify a Diametrical_boundary_size_characteristic as its specified_boundary_size; otherwise, the Tolerance_zone_boundary_definition_with_specified_size shall specify an Opposing_boundary_set_size_characteristic as the specified_boundary_size.

WR3: If the toleranced_shape_element is a Physical_feature_or_part_template, the Tolerance_zone_definition that is specified as the tolerance_zone_or_boundary_definition shall be a Tolerance_zone_definition_with_specified_orientation that specifies a Viewing_plane_based_orientation as its zone_orientation; otherwise, the Tolerance_zone_definition shall not be a Tolerance_zone_definition_with_specified_orientation.

IP1: The form of the tolerated Shape_element shall be consistent with the form of a shape element for which the application of a straightness tolerance is sensible.

NOTE EXPRESS specification:

```
*)
ENTITY straightness_tolerance
  SUBTYPE OF (geometric_tolerance_without_referenced_datum_system);
END_ENTITY; -- straightness_tolerance

( *
```

4.2.845 Stratum

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum is a type of Managed_design_object (see 4.2.524). A Stratum may be a Documentation_layer_stratum (see 4.2.306) or a Design_layer_stratum (see 4.2.275). A Stratum consists of a single material within an interconnect substrate. The vertical contours of either boundary surface may vary. Thus, the thickness of the stratum may vary throughout its range. The material used may be specific, such as 24K gold, or more general, such as etched copper. There may only be one boundary.

EXAMPLE 1 Figure 103 illustrates a detail of a stackup drawing included on a fabrication drawing in some cases. In most cases, the detail in this figure is generated at the fabricator's facility from more generic engineering data. This part of ISO 10303 is capable of supporting exchange of generic material stackup data or very explicit material stackup data. This part of ISO 10303 considers either stackup data set as design data. An enterprise may track the source of the stackup data through the design_supplier attribute of Ee_product_version (see 4.2.328).

The data associated with a Stratum are the following:

- assembly;
- bound_volume_shape;
- name;
- of_average_surface;
- of_surface;
- of_technology;
- planar_shape;
- stratum_usage.

```
*Design_layer_stratum  **Documentation_layer_stratum
```

This illustration shows different types of Stratum in a typical multi-layer printed circuit board cross section view. Stratum without footnote references are neither Design_layer_stratum or Documentation_layer_stratum.

Figure 103 – Stratum

4.2.845.1 assembly

The assembly is an inverse relationship that specifies the Interconnect_module_stratum_assembly_relationship (see 4.2.460) that specifies the Stratum as its component. There shall be one or more Interconnect_module_stratum_assembly_relationship for a Stratum, but they shall all be for the same product.

4.2.845.2 bound_volume_shape

The bound_volume_shape is an inverse relationship that specifies the Stratum_3d_shape (see 4.2.846) that specifies the Stratum as its shape_characterized_stratum. There shall be no more than one Stratum_3d_shape for a Stratum.

4.2.845.3 name

The name specifies an identifier of a Stratum and is equal to the product_definition_id attribute inherited from Ee_product_definition.

4.2.845.4 of_average_surface

An of_average_surface is an inverse attribute which specifies the Stratum_average_surface (see 4.2.847) of the Stratum as its of_stratum. There shall be no more than one Stratum_average_surface for a Stratum.

4.2.845.5 of_surface

An of_surface is an inverse attribute which specifies one or two Stratum_surface (see 4.2.868) for a Stratum.

4.2.845.6 of_technology

The of_technology specifies the role of the Stratum_technology (see 4.2.871) for the Stratum.

4.2.845.7 planar_shape

The planar_shape is an inverse relationship that specifies the Stratum_planar_shape (see 4.2.867) that specifies the Stratum as its shape_characterized_stratum. There shall be no more than one Stratum_planar_shape for a Stratum.

4.2.845.8 stratum_usage

The stratum_usage specifies the External_definition (see 4.2.361) that describes the purpose for incorporating a stratum in the Interconnect_module (see 4.2.440) design. The stratum_usage need not be specified for a particular Stratum.

NOTE EXPRESS specification:

```

*)
ENTITY stratum
  SUPERTYPE OF (ONEOF (documentation_layer_stratum, design_layer_stratum))
  SUBTYPE OF (ee_product_definition);

```

4.2.846 Stratum_3d_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_3d_shape is a type of Bound_volume_shape (see 4.2.76) and a type of Feature_shape_definition (see 4.2.372). A Stratum_3d_shape is the three-dimensional shape of a Stratum (see 4.2.845).

The data associated with a Stratum_3d_shape are the following:

— shape_characterized_stratum.

4.2.846.1 shape_characterized_stratum

The shape_characterized_stratum specifies the role of the Stratum (see 4.2.845) for the Stratum_3d_shape.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_3d_shape
  SUBTYPE OF (bound_volume_shape, feature_shape_definition);
  shape_characterized_stratum : stratum;
END_ENTITY; -- stratum_3d_shape

```

4.2.847 Stratum_average_surface

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_average_surface is a type of Managed_design_object (see 4.2.524). A Stratum_average_surface specifies the constructed geometry that is the average of the primary and secondary surface for a Stratum (see 4.2.845). A Stratum_average_surface is provided as a construction aid in defining a Stratum.

The data associated with a Stratum_average_surface are the following:

- of_shape;
- of_stratum.

4.2.847.1 of_shape

An of_shape is an inverse relationship that specifies the role of a Stratum_average_surface_shape (see 4.2.848) for a Stratum_average_surface. An of_shape need not be specified for a Stratum_average_surface.

4.2.847.2 of_stratum

An of_stratum specifies the role of a Stratum (see 4.2.845) for a Stratum_average_surface.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_average_surface
  SUBTYPE OF (managed_design_object);
    of_stratum : stratum;
  INVERSE
    of_shape : SET [0:1] OF stratum_average_surface_shape FOR of_surface;
END_ENTITY; -- stratum_average_surface

```

(*

4.2.848 Stratum_average_surface_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_average_surface_shape is a type of Open_shell_based_surface (see 4.2.566). A Stratum_average_surface_shape is the representation of a Stratum_average_surface (see 4.2.847) using an open manifold surface.

The data associated with a Stratum_average_surface_shape are the following:

— of_surface.

4.2.848.1 of_surface

The of_surface specifies the role of a Stratum_average_surface (see 4.2.847) for the Stratum_average_surface_shape.

NOTE EXPRESS specification:

```
* )
ENTITY stratum_average_surface_shape
  SUBTYPE OF (open_shell_based_surface);
  of_surface : stratum_average_surface;
END_ENTITY; -- stratum_average_surface_shape

4.2.849 Stratum_concept_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_concept_relationship is a type of Managed_design_object (see 4.2.524). A Stratum_concept_relationship is a Dielectric_crossover_area (see 4.2.288) or a Stratum_feature_conductive_join (see 4.2.853).

The data associated with a Stratum_concept_relationship are the following:

— resulting_shape;

— technology_requirement.

4.2.849.1 resulting_shape

The resulting_shape specifies the role of the Feature_shape_definition (see 4.2.372) for the Stratum_concept_relationship. The resulting_shape need not be specified for a particular Stratum_concept_relationship.

4.2.849.2 technology_requirement

The technology_requirement specifies the Ee_requirement_occurrence (see 4.2.330) that results in the resulting_shape. There shall be one or more Ee_requirement_occurrence for a Stratum_concept_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_concept_relationship
  ABSTRACT SUPERTYPE OF (ONEOF (stratum_feature_conductive_join,
    dielectric_crossover_area))
  SUBTYPE OF (managed_design_object);
    resulting_shape      : OPTIONAL feature_shape_definition;
    technology_requirement : SET [1:?] OF ee_requirement_occurrence;
END_ENTITY; -- stratum_concept_relationship

( *

```

4.2.850 Stratum_concept_to_physical_usage_view_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_concept_to_physical_usage_view_assignment is a type of Managed_design_object (see 4.2.524). A Stratum_concept_to_physical_usage_view_assignment is the relationship between a Part_feature (see 4.2.609) and any one of an Inter_stratum_feature (see 4.2.432), a Laminate_component (see 4.2.483), a Stratum (see 4.2.845), Stratum_feature (see 4.2.851), or a Stratum_surface (see 4.2.868) for the purpose of traceability between the Part_feature and the underlying design feature.

The data associated with a Stratum_concept_to_physical_usage_view_assignment are the following:

- assigned_design_object;
- defined_part_feature.

4.2.850.1 assigned_design_object

The assigned_design_object specifies any one of the Inter_stratum_feature (see 4.2.432), Laminate_component (see 4.2.483), Stratum (see 4.2.845), Stratum_feature (see 4.2.851), or Stratum_surface (see 4.2.868) as the assigned object for the Stratum_concept_to_physical_usage_view_assignment.

4.2.850.2 defined_part_feature

The defined_part_feature specifies the role of the Part_feature (see 4.2.609) for the Stratum_concept_to_physical_usage_view_assignment.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_concept_to_physical_usage_view_assignment
  SUBTYPE OF (managed_design_object);
  assigned_design_object : stratum_concept;
  defined_part_feature   : part_feature;
WHERE
  WR1: NOT ( 'AP210_ARM.INTERCONNECT_MODULE_TERMINAL'
             IN TYPEOF(defined_part_feature));
END_ENTITY; -- stratum_concept_to_physical_usage_view_assignment

( *

```

4.2.851 Stratum_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_feature is a type of Physical_feature_or_part_template (see 4.2.658). A Stratum_feature may be either a Conductive_filled_area (see 4.2.170) or a Conductor (see 4.2.176), or additionally may be a Fiducial_stratum_feature (see 4.2.375). A Stratum_feature is a shape realized in the material of the Stratum (see 4.2.845).

EXAMPLE 1 Figure 104 illustrates several types of Stratum_feature. The Conductors shown are purposely distorted in aspect ratio because Conductors are enclosed shapes.

The data associated with a Stratum_feature are the following:

- feature_of_size;
- name;
- resident_stratum.

4.2.851.1 feature_of_size

The feature_of_size specifies whether or not the Stratum_feature interfaces with a feature of another product in an assembly context. A value of TRUE indicates that the Stratum_feature interfaces with a feature of another product. A value of FALSE indicates that the Stratum_feature does not interface with a feature of another product.

NOTE Certain tolerance information depends on knowledge of a particular feature interfacing with features of a mating product.

4.2.851.2 name

The name specifies the identifier of the Stratum_feature.

Stratum_feature types

Figure 104 – Stratum_feature

4.2.851.3 resident_stratum

The resident_stratum specifies the Stratum (see 4.2.845) being composed by the Stratum_feature.

Constraints:

UR1: The combination of the name and the resident_stratum shall be unique within a population of Stratum_features.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_feature
  SUPERTYPE OF (ONEOF (conductor,conductive_filled_area) ANDOR
    fiducial_stratum_feature)
  SUBTYPE OF (physical_feature_or_part_template);

  feature_of_size       : BOOLEAN;
  UNIQUE
    UR1 : name, resident_stratum;
END_ENTITY; -- stratum_feature

```

(*

4.2.852 Stratum_feature_3d_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_feature_3d_shape is a type of Bound_volume_shape (see 4.2.76) and a type of Feature_shape_definition (see 4.2.372). A Stratum_feature_3d_shape is the representation of a Stratum_feature (see 4.2.851) using a closed volume.

The data associated with a Stratum_feature_3d_shape are the following:

- represented_stratum_feature;
- shape_representation.

4.2.852.1 represented_stratum_feature

The represented_stratum_feature specifies the role of a Stratum_feature (see 4.2.851) for the Stratum_feature_3d_shape.

4.2.852.2 shape_representation

The shape_representation specifies the role of a Bound_volume_shape (see 4.2.76) for the Stratum_feature_3d_shape.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_feature_3d_shape
  SUBTYPE OF (bound_volume_shape, feature_shape_definition);
    represented_stratum_feature : stratum_feature;

--tt tc1 wd9 change
( *
```

4.2.853 Stratum_feature_conductive_join

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_feature_conductive_join is a type of Stratum_concept_relationship (see 4.2.849). A Stratum_feature_conductive_join may be a Physical_network_supporting_stratum_feature_conductive_join (see 4.2.662). A Stratum_feature_conductive_join is a connection between two conductive Stratum_feature (see 4.2.851) on disjoint Stratum (see 4.2.845) that is not a passage.

NOTE The two facing surfaces of conductive features are joined.

The data associated with a Stratum_feature_conductive_join are the following:

- related_concept;
- relating_concept;
- using_via.

4.2.853.1 related_concept

The related_concept specifies the source Stratum_feature_template_component (see 4.2.862) for the Stratum_feature_conductive_join.

4.2.853.2 relating_concept

The relating_concept specifies the target Stratum_feature_template_component (see 4.2.862) for the Stratum_feature_conductive_join.

4.2.853.3 using_via

The using_via is an inverse relationship that specifies that there shall be no more than one Bonded_conductive_base_blind_via (see 4.2.74) that specifies the Stratum_feature_conductive_join as its features_join. The using_via need not be specified for a particular Stratum_feature_conductive_join.

Constraints:

WR1: Each member of Stratum_feature_template_component in the role of relating_concept for this Stratum_feature_conductive_join shall not be in the role of related_concept for this member of Stratum_feature_conductive_join.

WR2: A Stratum_feature_template_component shall not be an ancestor or descendant of itself in this relationship.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_feature_conductive_join
  SUPERTYPE OF (
    physical_network_supporting_stratum_feature_conductive_join)
  SUBTYPE OF (stratum_concept_relationship);

```

4.2.854 Stratum_feature_in_stratum_3d_position

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_feature_in_stratum_3d_position is a type of Managed_design_object (see 4.2.524). A Stratum_feature_in_stratum_3d_position is the three-dimensional position and orientation of a three-dimensional model of a Stratum_feature (see 4.2.851) in the three-dimensional model of the Stratum (see 4.2.845).

The data associated with a Stratum_feature_in_stratum_3d_position are the following:

- feature_shape;
- stratum_shape;
- transformation.

4.2.854.1 feature_shape

The feature_shape specifies the role of either the Stratum_feature_3d_shape (see 4.2.852), or the Stratum_feature_non_planar_2d_shape (see 4.2.856) for the Stratum_feature_in_stratum_3d_position.

4.2.854.2 stratum_shape

The stratum_shape specifies the role of the Stratum_3d_shape (see 4.2.846) for the Stratum_feature_in_stratum_3d_position.

4.2.854.3 transformation

The transformation specifies the role of the Axis_placement_3d (see 4.2.58) for the Stratum_feature_in_stratum_3d_position.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_feature_in_stratum_3d_position
  SUBTYPE OF (managed_design_object);
    stratum_shape : stratum_3d_shape;
    transformation : axis_placement_3d;

```

4.2.855 Stratum_feature_in_stratum_planar_position

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_feature_in_stratum_planar_position is a type of Managed_design_object (see 4.2.524). A Stratum_feature_in_stratum_planar_position is the two-dimensional position and orientation of a two-dimensional model of a Stratum_feature (see 4.2.851) in the two-dimensional model of the Stratum (see 4.2.845).

The data associated with a `Stratum_feature_in_stratum_planar_position` are the following:

- `feature_shape`;
- `stratum_shape`;
- `transformation`.

4.2.855.1 `feature_shape`

The `feature_shape` specifies either a `Stratum_feature_planar_shape` (see 4.2.857) or a `Stratum_feature_styled_area_representation` (see 4.2.860) for the `Stratum_feature_in_stratum_planar_position`.

4.2.855.2 `stratum_shape`

The `stratum_shape` specifies the role of the `Stratum_planar_shape` (see 4.2.867) for the `Stratum_feature_in_stratum_planar_position`.

4.2.855.3 `transformation`

The `transformation` specifies the role of the `Axis_placement_2d` (see 4.2.57) for the `Stratum_feature_in_stratum_planar_position`.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_feature_in_stratum_planar_position
  SUBTYPE OF (managed_design_object);
    stratum_shape : stratum_planar_shape;
    transformation : axis_placement_2d;

END_ENTITY; -- stratum_feature_in_stratum_planar_position

( *
```

4.2.856 `Stratum_feature_non_planar_2d_shape`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Stratum_feature_non_planar_2d_shape` is a type of `Managed_design_object` (see 4.2.524). A `Stratum_feature_non_planar_2d_shape` is the representation of a `Stratum_feature` (see 4.2.851) using an open manifold surface.

The data associated with a `Stratum_feature_non_planar_2d_shape` are the following:

- `represented_stratum_feature`;
- `shape_representation`.

4.2.856.1 `represented_stratum_feature`

The `represented_stratum_feature` specifies the role of a `Stratum_feature` (see 4.2.851) for the `Stratum_feature_non_planar_2d_shape`.

4.2.856.2 `shape_representation`

The `shape_representation` specifies the role of a `Open_shell_based_surface` (see 4.2.566) for the `Stratum_feature_non_planar_2d_shape`.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_feature_non_planar_2d_shape

4.2.857 `Stratum_feature_planar_shape`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Stratum_feature_planar_shape` is a type of `Managed_design_object` (see 4.2.524). A `Stratum_feature_planar_shape` is the representation of a `Stratum_feature` (see 4.2.851) by a `Planar_projected_shape` (see 4.2.677).

The data associated with a `Stratum_feature_planar_shape` are the following:

- `represented_stratum_feature`;
- `shape_representation`.

4.2.857.1 represented_stratum_feature

The `represented_stratum_feature` specifies the `Stratum_feature` (see 4.2.851) that is to be characterized by the `Stratum_feature_planar_shape`.

4.2.857.2 shape_representation

The `shape_representation` specifies the `Planar_projected_shape` (see 4.2.677) for the representation of the `Stratum_feature` (see 4.2.851).

NOTE EXPRESS specification:

```

*)
ENTITY stratum_feature_planar_shape
  SUBTYPE OF (planar_projected_shape);
(* tt tc1 wd9 deleted
  shape_representation          : planar_projected_shape;
*)
  represented_stratum_feature : stratum_feature;
END_ENTITY; -- stratum_feature_planar_shape

( *
```

4.2.858 Stratum_feature_shape_stratum_average_surface_shape_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Stratum_feature_shape_stratum_average_surface_shape_relationship` is a type of `Managed_design_object` (see 4.2.524). A `Stratum_feature_shape_stratum_average_surface_shape_relationship` is the association between a `Stratum_feature_non_planar_2d_shape` (see 4.2.856) and a `Stratum_average_surface_shape` (see 4.2.848) for the purpose of specifying that the points on the `Stratum_feature_non_planar_2d_shape` shall be in the domain of the points on the `Stratum_average_surface_shape`.

The data associated with a `Stratum_feature_shape_stratum_average_surface_shape_relationship` are the following:

- `of_stratum_feature_shape`;
- `of_stratum_average_surface_shape`.

4.2.858.1 of_stratum_feature_shape

The `of_stratum_feature_shape` specifies the dependent `Stratum_feature_non_planar_2d_shape` (see 4.2.856) for the `Stratum_feature_shape_stratum_average_surface_shape_relationship`.

4.2.858.2 of_stratum_average_surface_shape

The of_stratum_average_surface_shape specifies the independent Stratum_average_surface_shape (see 4.2.848) for the Stratum_feature_shape_stratum_average_surface_shape_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_feature_shape_stratum_average_surface_shape_relationship
  SUBTYPE OF (managed_design_object);
    of_stratum_feature_shape      : stratum_feature_non_planar_2d_shape;
    of_stratum_average_surface_shape : stratum_average_surface_shape;
END_ENTITY; -- stratum_feature_shape_stratum_average_surface_shape_relationship

( *
```

4.2.859 Stratum_feature_shape_stratum_surface_shape_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_feature_shape_stratum_surface_shape_relationship is a type of Managed_design_object (see 4.2.524). A Stratum_feature_shape_stratum_surface_shape_relationship is the association between a Stratum_feature_non_planar_2d_shape (see 4.2.856) and a Stratum_surface_shape (see 4.2.870) for the purpose of specifying that the points on the Stratum_feature_non_planar_2d_shape shall be in the domain of the points on the Stratum_surface_shape.

The data associated with a Stratum_feature_shape_stratum_surface_shape_relationship are the following:

- of_stratum_feature_shape;
- of_stratum_surface_shape.

4.2.859.1 of_stratum_feature_shape

The of_stratum_feature_shape specifies the dependent Stratum_feature_non_planar_2d_shape (see 4.2.856) for the Stratum_feature_shape_stratum_surface_shape_relationship.

4.2.859.2 of_stratum_surface_shape

The of_stratum_surface_shape specifies the independent Stratum_surface_shape (see 4.2.870) for the Stratum_feature_shape_stratum_surface_shape_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_feature_shape_stratum_surface_shape_relationship
  SUBTYPE OF (managed_design_object);
    of_stratum_feature_shape : stratum_feature_non_planar_2d_shape;
    of_stratum_surface_shape : stratum_surface_shape;
END_ENTITY; -- stratum_feature_shape_stratum_surface_shape_relationship

( *

```

4.2.860 Stratum_feature_styled_area_representation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Stratum_feature_styled_area_representation` is a type of `Managed_design_object` (see 4.2.524). A `Stratum_feature_styled_area_representation` is the association between one or more of a `Stratum_feature` (see 4.2.851) and one of a `Fill_area_occurrence` (see 4.2.377), or a `Styled_curve_occurrence` (see 4.2.875). The `Stratum_feature_styled_area_representation` is intended for use where legacy data may need to be exchanged via this Standard or where complex patterns of `Stratum_feature` are to be created. The `Stratum_feature_styled_area_representation` specifies parametric data to be input to an algorithm. The algorithm output shall be the individual `Stratum_feature` shapes. Once the individual `Stratum_feature` shapes are available, they may be used if explicit shape data is required by a receiving processor. If the individual shapes are provided, the attribute `derived_planar_shape` shall be populated to identify the derived shapes. The units used in the `Stratum_feature_styled_area_representation` shall be those specified in the global geometric context for the `Interconnect_module` (see 4.2.440) design as specified by `Cartesian_coordinate_system` (see 4.2.86).

NOTE A `Stratum_feature_styled_area_representation` is not intended to be used to represent a complex `Stratum_feature` resulting from multiple design intent modifications to a basic shape. The other types of `Stratum_feature` shape representation should be used to convey that information.

EXAMPLE 1 The `Stratum_feature_styled_area_representation` for a "dot" pattern used in manufacturing will result in multiple `Stratum_feature` for one instance of `Stratum_feature_styled_area_representation`. Legacy vector formats that "paint" filled areas using a successive approximation application of a constant width curve may be supported with `Stratum_feature_styled_area_representation` using the `Styled_curve_occurrence` option. If the curve width varies, use of multiple `Design_intent_modification_styled_area_representation` (see 4.2.274) may be appropriate.

The data associated with a `Stratum_feature_styled_area_representation` are the following:

- `derived_planar_shape`;
- `represented_stratum_feature`;
- `shape_styled_area_representation`.

4.2.860.1 derived_planar_shape

The `derived_planar_shape` specifies the role of the `Stratum_feature_planar_shape` (see 4.2.857) for the `Stratum_feature_styled_area_representation`. There may be more than one `Stratum_feature_planar_shape` for the `Stratum_feature_styled_area_representation` if the `Stratum_feature_styled_area_representation` is discontinuous. The `Stratum_feature_planar_shape` need not be supplied for the `Stratum_feature_styled_area_representation`.

4.2.860.2 represented_stratum_feature

The `represented_stratum_feature` specifies the role of the `Stratum_feature` (see 4.2.851) for the `Stratum_feature_styled_area_representation`. There may be more than one `Stratum_feature` for the `Stratum_feature_styled_area_representation` if the `Stratum_feature_styled_area_representation` is discontinuous.

NOTE More than one `Stratum_feature` is required if the shape of the `Stratum_feature_styled_area_representation` is not a contiguous shape, since `Stratum_feature` is required to be a single contiguous shape.

4.2.860.3 shape_styled_area_representation

The `shape_styled_area_representation` specifies one of a `Fill_area_occurrence` (see 4.2.377), or a `Styled_curve_occurrence` (see 4.2.875) as the representation for the `Stratum_feature_styled_area_representation`.

NOTE EXPRESS specification:

```
*)
ENTITY stratum_feature_styled_area_representation
  SUBTYPE OF (managed_design_object);
    derived_planar_shape          : OPTIONAL SET [1:?] OF
                                   stratum_feature_planar_shape;
    shape_styled_area_representation : styled_area_representation;
    represented_stratum_feature    : stratum_feature;
END_ENTITY; -- stratum_feature_styled_area_representation

( *
```

4.2.861 Stratum_feature_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Stratum_feature_template` is a type of `Part_template` (see 4.2.620) that is a definition or partial definition of a `Stratum_feature` (see 4.2.851). A `Stratum_feature_template` may be a `Land_physical_template` (see 4.2.493). A `Stratum_feature_template` defines a contiguous material shape.

The data associated with a `Stratum_feature_template` are the following:

— `of_stratum_technology`.

4.2.861.1 of_stratum_technology

The of_stratum_technology specifies the role of the Stratum_technology (see 4.2.871) for the Material_removal_feature_template.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_feature_template
  SUPERTYPE OF (land_physical_template)
  SUBTYPE OF (part_template);
  of_stratum_technology : stratum_technology;
END_ENTITY; -- stratum_feature_template

( *
```

4.2.862 Stratum_feature_template_component

A Stratum_feature_template_component is a type of Laminate_component (see 4.2.483). A Stratum_feature_template_component may be a Land (see 4.2.490) or a Non_functional_land (see 4.2.562).

The data associated with a Stratum_feature_template_component are the following:

- stratum_feature_implementation;
- usage_definition.

4.2.862.1 stratum_feature_implementation

The stratum_feature_implementation specifies the Stratum_feature (see 4.2.851) that the Stratum_feature_template_component is helping to compose.

4.2.862.2 usage_definition

The usage_definition specifies the role of the Stratum_feature_template (see 4.2.861) for the Stratum_feature_template_component.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_feature_template_component
  SUPERTYPE OF (ONEOF (connected_area_component,
                        non_functional_land, land))
  SUBTYPE OF (laminate_component);
  SELF\assembly_component.usage_definition : OPTIONAL stratum_feature_template;
  stratum_feature_implementation           : stratum_feature;
END_ENTITY; -- stratum_feature_template_component
( *

```

4.2.863 Stratum_interconnect_module_3d_position

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_interconnect_module_3d_position is a type of Managed_design_object (see 4.2.524). A Stratum_interconnect_module_3d_position is the position of the Stratum (see 4.2.845) model in the Interconnect_module (see 4.2.440) model in three dimensions.

The data associated with a Stratum_interconnect_module_3d_position are the following:

- interconnect_module_shape;
- stratum_component;
- stratum_shape;
- transformation.

4.2.863.1 interconnect_module_shape

The interconnect_module_shape specifies the Physical_unit_3d_shape (see 4.2.666) that is the Interconnect_module (see 4.2.440) model for the Stratum_interconnect_module_3d_position.

4.2.863.2 stratum_component

The stratum_component specifies the role of the Interconnect_module_stratum_assembly_relationship (see 4.2.460) for the Stratum_interconnect_module_3d_position.

4.2.863.3 stratum_shape

The stratum_shape specifies the Stratum_3d_shape (see 4.2.846) for the Stratum (see 4.2.845) model for the Stratum_interconnect_module_3d_position.

4.2.863.4 transformation

The transformation specifies the role of the `Axis_placement_3d` (see 4.2.58) for the `Stratum_interconnect_module_3d_position`.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_interconnect_module_3d_position
  SUBTYPE OF (managed_design_object);
    stratum_component      : interconnect_module_stratum_assembly_relationship;
    stratum_shape          : stratum_3d_shape;
    interconnect_module_shape : physical_unit_3d_shape;
    transformation         : axis_placement_3d;
END_ENTITY; -- stratum_interconnect_module_3d_position

( *
```

4.2.864 Stratum_interconnect_module_planar_position

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Stratum_interconnect_module_planar_position` is a type of `Managed_design_object` (see 4.2.524). A `Stratum_interconnect_module_planar_position` is the position of the Stratum (see 4.2.845) model in the `Interconnect_module` (see 4.2.440) model in two dimensions.

The data associated with a `Stratum_interconnect_module_planar_position` are the following:

- `interconnect_module_shape`;
- `stratum_component`;
- `stratum_shape`;
- `transformation`.

4.2.864.1 interconnect_module_shape

The `interconnect_module_shape` specifies the `Physical_unit_planar_shape` (see 4.2.670) for the `Interconnect_module` (see 4.2.440) model for the `Stratum_interconnect_module_planar_position`.

4.2.864.2 stratum_component

The `stratum_component` specifies the role of the `Interconnect_module_stratum_assembly_relationship` (see 4.2.460) for the `Stratum_interconnect_module_planar_position`.

4.2.864.3 stratum_shape

The stratum_shape specifies the Stratum_planar_shape (see 4.2.867) for the Stratum (see 4.2.845) model for the Stratum_interconnect_module_planar_position.

4.2.864.4 transformation

The transformation specifies the role of the Axis_placement_2d (see 4.2.57) for the Stratum_interconnect_module_planar_position.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_interconnect_module_planar_position
  SUBTYPE OF (managed_design_object);
    stratum_component      : interconnect_module_stratum_assembly_relationship;
    stratum_shape          : stratum_planar_shape;
    interconnect_module_shape : physical_unit_planar_shape;
    transformation         : axis_placement_2d;
END_ENTITY; -- stratum_interconnect_module_planar_position

( *
```

4.2.865 Stratum_make_from_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_make_from_relationship is a type of Managed_design_object (see 4.2.524). A Stratum_make_from_relationship is an association between a Stratum (see 4.2.845) whose design is intended to be reused and a Stratum that results from the reuse. The resultant_stratum may differ from the reusable_stratum for the particular Interconnect_module (see 4.2.440) design.

The data associated with a Stratum_make_from_relationship are the following:

- resultant_stratum;
- reusable_stratum.

4.2.865.1 resultant_stratum

The resultant_stratum specifies the Stratum (see 4.2.845) for the result of a design activity that started with reusable_stratum.

4.2.865.2 reusable_stratum

The reusable_stratum specifies the Stratum (see 4.2.845) that is intended to be used as a reference from which to create a resultant_stratum.

NOTE EXPRESS specification:

```
*)
ENTITY stratum_make_from_relationship
  SUBTYPE OF (managed_design_object);
    reusable_stratum : stratum;
    resultant_stratum : stratum;
END_ENTITY; -- stratum_make_from_relationship

( *
```

4.2.866 Stratum_occurrence_specific_padstack_definition

A Stratum_occurrence_specific_padstack_definition is a type of Padstack_definition (see 4.2.595).

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

NOTE EXPRESS specification:

```
*)
ENTITY stratum_occurrence_specific_padstack_definition
  SUBTYPE OF (padstack_definition);
    reference_stratum : stratum;
END_ENTITY; -- stratum_occurrence_specific_padstack_definition

```

4.2.867 Stratum_planar_shape

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_planar_shape is a type of Managed_design_object (see 4.2.524). A Stratum_planar_shape is the two-dimensional shape model of a Stratum (see 4.2.845).

The data associated with a Stratum_planar_shape are the following:

— shape_characterized_stratum.

4.2.867.1 shape_characterized_stratum

The shape_characterized_stratum specifies the role of the Stratum (see 4.2.845) for the Stratum_planar_shape.

NOTE EXPRESS specification:

```
*)
ENTITY stratum_planar_shape
--tt tc1 wd9 modified
  SUBTYPE OF (planar_projected_shape);
  shape_characterized_stratum : stratum;
END_ENTITY; -- stratum_planar_shape
```

(*

4.2.868 Stratum_surface

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_surface is a type of Managed_design_object (see 4.2.524). A Stratum_surface specifies the primary_surface or secondary_surface for a Stratum (see 4.2.845).

The data associated with a Stratum_surface are the following:

- name;
- of_stratum.

4.2.868.1 name

The name designates a primary_surface or a secondary_surface for a Stratum_surface.

4.2.868.2 of_stratum

An of_stratum specifies the Stratum (see 4.2.845) for a Stratum_surface.

Constraints:

UR1: The combination of name and of_stratum shall be unique within a population of Stratum_surface.

NOTE EXPRESS specification:

```

*)
ENTITY stratum_surface
  SUBTYPE OF (managed_design_object);
    of_stratum : stratum;
    name       : stratum_surface_designation;

    UR1 : name, of_stratum;
END_ENTITY; -- stratum_surface

```

(*

4.2.869 Stratum_surface_in_stratum_3d_position

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_surface_in_stratum_3d_position is a type of Managed_design_object (see 4.2.524). A Stratum_surface_in_stratum_3d_position is the three-dimensional position and orientation of a two-dimensional constructed surface model in the three-dimensional model of the Stratum (see 4.2.845).

NOTE The surface represented by the construct may be constructed in a CAD system as a design abstraction or may be a realizeable surface.

The data associated with a Stratum_surface_in_stratum_3d_position are the following:

- stratum_shape;
- surface_shape;
- transformation.

4.2.869.1 stratum_shape

The stratum_shape specifies the role of the Stratum_3d_shape (see 4.2.846) for the Stratum_surface_in_stratum_3d_position.

4.2.869.2 surface_shape

The surface_shape specifies the role of either the Stratum_average_surface_shape (see 4.2.848) or of the Stratum_surface_shape (see 4.2.870) for the Stratum_surface_in_stratum_3d_position.

4.2.869.3 transformation

The transformation specifies the role of the Axis_placement_3d (see 4.2.58) for the Stratum_surface_in_stratum_3d_position.

NOTE EXPRESS specification:

```
*)
ENTITY stratum_surface_in_stratum_3d_position

4.2.871 Stratum_technology

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_technology is a type of Managed_design_object (see 4.2.524). A Stratum_technology may be either a Design_layer_technology (see 4.2.276) or a Documentation_layer_technology (see 4.2.307). A Stratum_technology provides material properties, parametric data associated with the technology, and material identification.

The data associated with a Stratum_technology are the following:

- laminate_stiffness_class;
- layer_position;
- maximum_feature_size_requirement;
- maximum_stratum_thickness;
- minimum_finished_feature_size;
- minimum_finished_feature_spacing;
- minimum_stratum_thickness;
- name;
- specification;
- stratum_material.

4.2.871.1 laminate_stiffness_class

The laminate_stiffness_class specifies either a conformal_coat, a fluid_like, or a stiff_laminate stiffness class of which the Stratum_technology is a member. The laminate_stiffness_class need not be specified for a particular Stratum_technology.

4.2.871.2 layer_position

The layer_position specifies one of an internal, external, all, primary, or secondary position of the Stratum (see 4.2.845) for the Stratum_technology. Primary and secondary shall only be used if the member of Stratum_technology is a Design_layer_technology.

4.2.871.3 maximum_feature_size_requirement

The maximum_feature_size_requirement specifies the maximum Length_data_element (see 4.2.511) of any feature of the Stratum (see 4.2.845). The maximum_feature_size_requirement need not be specified for a particular Stratum_technology.

4.2.871.4 maximum_stratum_thickness

The maximum_stratum_thickness specifies the maximum Length_data_element (see 4.2.511) for the thickness of the Stratum_technology.

4.2.871.5 minimum_finished_feature_size

The minimum_finished_feature_size specifies one role of the Length_data_element (see 4.2.511) of any feature of the Stratum (see 4.2.845). The minimum_finished_feature_size need not be specified for a particular Stratum_technology.

4.2.871.6 minimum_finished_feature_spacing

The minimum_finished_feature_spacing specifies one role of the Length_data_element (see 4.2.511) of any feature of the Stratum (see 4.2.845). The minimum_finished_feature_spacing need not be specified for a particular Stratum_technology.

4.2.871.7 minimum_stratum_thickness

The minimum_stratum_thickness specifies the minimum Length_data_element (see 4.2.511) for the thickness of the Stratum_technology.

4.2.871.8 name

The name specifies the alphanumeric identifier of a Stratum_technology.

4.2.871.9 specification

The specification specifies the role of the Process_specification (see 4.2.740) for the Stratum_technology. The specification need not be specified for a particular Stratum_technology.

4.2.871.10 stratum_material

The stratum_material specifies the role of the Ee_material (see 4.2.318) for the Stratum_technology.

Constraints:

UR1: The name shall be unique within a population of Stratum_technologies.

NOTE EXPRESS specification:

4.2.872 Stratum_technology_link

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Stratum_technology_link is a type of Managed_design_object (see 4.2.524).

The data associated with a Stratum_technology_link are the following:

- precedent_stratum_technology;
- subsequent_stratum_technology;
- precedent_stratum_technology_link.

4.2.872.1 precedent_stratum_technology

The precedent_stratum_technology specifies a Stratum_technology (see 4.2.871) for the Stratum_technology_link.

4.2.872.2 subsequent_stratum_technology

The subsequent_stratum_technology specifies a Stratum_technology (see 4.2.871) for the Stratum_technology_link.

4.2.872.3 precedent_stratum_technology_link

The precedent_stratum_technology_link specifies the role of a Stratum_technology_link (see 4.2.872) for the Stratum_technology_link. The precedent_stratum_technology_link need not be specified for a particular Stratum_technology_link.

Constraints:

WR1: The precedent_stratum_technology shall not be the subsequent_stratum_technology within a population of Stratum_technology_link.

WR2: The Stratum_technology_link shall not be in a circular definition.

NOTE EXPRESS specification:

4.2.873 Stratum_type_independent_padstack_definition

A Stratum_type_independent_padstack_definition is a type of Padstack_definition (see 4.2.595) that shall be applied to all Stratum of a design, irrespective of the type of individual Stratum.

NOTE EXPRESS specification:

```
*)
ENTITY stratum_type_independent_padstack_definition
  SUBTYPE OF (padstack_definition);
END_ENTITY; -- stratum_type_independent_padstack_definition
(*
```

4.2.874 Structured_text

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Structured_text is a type of Managed_design_object (see 4.2.524). A Structured_text is a portion of an Ee_document (see 4.2.316) that may have identifiable relations between itself and other portions of the Ee_document. Those relations are a container relationship in which the Structured_text is "contained in" an Ee_document, or a sequential relationship in which the Structured_text may be in a specific sequence of Structured_text within an Ee_document. Structured_text may be composed of other instances of Structured_text or Ee_text as content, in a tree structure. A Structured_text shall be acyclic. The Structured_text should at least provide content at the lowest level of the structure.

NOTE This part of ISO 10303 is exchanging the content of a document, not its presentation format.

EXAMPLE 1 An example of Structured_text is an extract from an Ee_document in SGML, in which each portion of the Ee_document has a known structure.

EXAMPLE 2 Structured_text objects can be chapters, titles, paragraphs, sentences or structured markup.

The data associated with a Structured_text are the following:

- content_markup;
- plain_text_content;
- precedent_structured_text;
- structured_text_content.

4.2.874.1 content_markup

The content_markup specifies the role of the External_definition (see 4.2.361) for the Structured_text. The content_markup identifies the computer interpretable element type of the content. Plain text shall be a string encoded according to clause 7.3.3 of ISO 10303-21. Plain text shall be identified by the following contents of the External_definition referenced by content_markup: code is "text markup tag", code_value is "plain text", reference_document is "ISO 10303-210".

EXAMPLE 1 An html encoded structure in accordance with HTML 3.2 would reference an External_definition with the following contents: code is "html tag", code_value is "body", reference_document is "!DOCTYPE HTML PUBLIC "-//W3C/DTD HTML 3.2//EN"". This example encloses the required content of a ISO 10303-21 exchange file with quotation marks ("").

4.2.874.2 plain_text_content

The plain_text_content specifies the role of the Ee_text for the Structured_text. The plain_text_content need not be provided for the Structured_text.

NOTE Plain_text_content would only not be provided if there was a need to specify lower level markup within the current markup.

4.2.874.3 precedent_structured_text

The precedent_structured_text specifies the role of the Structured_text for the Structured_text. This role is appropriate when both Structured_text are helping to compose a higher level Structured_text or are referenced by an Ee_document (see 4.2.316). The precedent_structured_text need not be provided for a Structured_text.

NOTE Precedent_structured_text is provided to ensure the correct sequencing of text contents.

4.2.874.4 structured_text_content

The structured_text_content specifies the role of the Structured_text for the Structured_text. There may be one or more entries in the structured_text_content for a particular Structured_text. The structured_text_content need not be provided for the Structured_text.

NOTE Structured_text_content would only not be provided if there was no need to specify lower level markup within the current markup or if plain_text_content were provided.

NOTE EXPRESS specification:

```
*)
ENTITY structured_text
  SUBTYPE OF (managed_design_object);
    content_markup          : external_definition;
    plain_text_content      : OPTIONAL ee_text;
    precedent_structured_text : OPTIONAL structured_text;
    structured_text_content : OPTIONAL SET [1:?] OF structured_text;
END_ENTITY; -- structured_text
```

(*

4.2.875 Styled_curve_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Styled_curve_occurrence` is a type of `Managed_design_object` (see 4.2.524). A `Styled_curve_occurrence` is an occurrence of a curve with specific parametric styling assigned.

The data associated with a `Styled_curve_occurrence` are the following:

- `of_curve_style`;
- `styled_curve`.

4.2.875.1 `of_curve_style`

The `of_curve_style` specifies the `Curve_style` (see 4.2.205) to apply to the `Curve` (see 4.2.203) for the `Styled_curve_occurrence`.

4.2.875.2 `styled_curve`

The `styled_curve` specifies the role of the `Curve` (see 4.2.203) for the `Styled_curve_occurrence`.

NOTE EXPRESS specification:

```
*)
ENTITY styled_curve_occurrence
  SUBTYPE OF (managed_design_object);
    styled_curve    : curve;
    of_curve_style  : curve_style;
END_ENTITY; -- styled_curve_occurrence

( *
```

4.2.876 `Styled_text`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Styled_text` is a type of `Shape_item` (see 4.2.818) that is formatted text that appears in the material in a `Interconnect_module` (see 4.2.440). The text shall be styled by font. The definition specifies font styling that shall be applied to realized characters. Externally defined text font and font family are supported.

NOTE This part of ISO 10303 does not standardize the display of text on computer systems.

EXAMPLE 1 Figure 105 illustrates styling that may be applied to text that appears in the material. The principal styling supported is font size through the bounding box specification. The other variations illustrated in the figure occur through modification of the text orientation during placement, and may require grouping of the text with other shape data. Some of the justification and orientation capability portrayed in the figure is provided by the `Laminate_text_string_component` (see 4.2.489)

The data associated with a `Styled_text` are the following:

— `text_font`.

Figure 105 – `Styled_text`

4.2.876.1 `text_font`

The `text_font` specifies either the `Font_definition` (see 4.2.387) or the `Registered_font` (see 4.2.768) for the `Styled_text`.

NOTE EXPRESS specification:

```
* )
ENTITY styled_text
  SUBTYPE OF (shape_item);
  text_font : font_select;
END_ENTITY; -- styled_text

( *
```

4.2.877 Sub_assembly_relationship

A Sub_assembly_relationship is a type of Managed_design_object (see 4.2.524). A Sub_assembly_relationship is an association that specifies a subassembly constraint among two or more Assembly_component (see 4.2.34) that is aggregated into an Assembly_group_component (see 4.2.40).

NOTE 1 Industrial practice is to associate the parts included in a Assembly_group_component with members of Product_association (see 4.2.741).

NOTE 2 A group of Lands aggregated into a Footprint_occurrence do not also need to be aggregated into Padstack_occurrence.

EXAMPLE 1 Figure 106 illustrates a detail of an assembly drawing that shows components grouped into a sub-assembly, and the corresponding list of items and their associated reference_designations.

EXAMPLE 2 A Land may participate in a sub assembly where that sub assembly is a Footprint_occurrence. In that case the reference_designation provides the ability to map unambiguously to the Footprint_padstack_composition_relationship Application Object that is the reference for the location and orientation of the Land in that footprint. In that case, there is no need to populate a separate Assembly_composition_relationship between the Land and the Pcb, since the Assembly_composition_relationship between the Footprint_occurrence and the Pcb establishes the required association.

The data associated with a Sub_assembly_relationship are the following:

- sub_assembly_reference_designation;
- related_component;
- relating_component.

4.2.877.1 sub_assembly_reference_designation

The sub_assembly_reference_designation specifies the string which is the identifier for this Sub_assembly_relationship in the context of the relating_component.

Note - The mounting hardware (screw, nut, washer, bushing, terminal) individually fill the role of related_component.

A Sub_assembly_relationship relates an Assembly_component with the Assembly_group_component to which it is associated.

Items in the List	Reference Designator
Heatsink	H1
Diode	ZR1
Screw	S1
Screw	S2
Nut	N1
Nut	N2
Washer	W1
Bushing	B1
Terminal	T1
Washer	W2
Washer	W3
Washer	W4
Bushing	B2
Washer	W5

Figure 106 – Sub_assembly_relationship

4.2.877.2 related_component

The related_component specify the dependent Assembly_component (see 4.2.34) of the Sub_assembly_-relationship. There shall be two or more Assembly_component for a Sub_assembly_relationship.

4.2.877.3 relating_component

The relating_component specifies the independent Assembly_group_component (see 4.2.40) which is the aggregation of two or more Assembly_component (see 4.2.34) specified by related_component.

Constraints:

UR1: The combination of relating_component and sub_assembly_reference_designation shall be unique in a population of sub_assembly_relationship.

WR1: An Assembly_component specified as a relating_component shall not appear in the chain of components in the set of Assembly_component specified by related_component.

NOTE EXPRESS specification:

```

*)
ENTITY sub_assembly_relationship
  SUBTYPE OF (managed_design_object);
    related_component : assembly_component;
    relating_component : assembly_group_component;
    sub_assembly_reference_designation : string;
UNIQUE
  UR1: sub_assembly_reference_designation, relating_component;
END_ENTITY; -- sub_assembly_relationship
( *
```

4.2.878 Substitute_product

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Substitute_product is a type of Managed_design_object (see 4.2.524). A Substitute_product is an Ee_product (see 4.2.319) that may be substituted for another Ee_product within the context of an assembly or for a specific instance within an assembly. The Substitute_product is a one-way substitution only. Two instances of Substitute_product are required to support the declaration of a totally equivalent substitution relationship.

NOTE Two different substitutes may be defined within the same assembly for the same base product based on the different usages of that base product within that assembly.

The data associated with a Substitute_product are the following:

- defined_alternate_product;
- substitutable_component.

4.2.878.1 defined_alternate_product

The defined_alternate_product specifies the role of the Ee_product (see 4.2.319) for the Substitute_product. There shall be one or more Ee_product for the Substitute_product.

4.2.878.2 substitutable_component

The substitutable_component specifies the role of the Assembly_composition_relationship (see 4.2.39) for the Substitute_product.

NOTE EXPRESS specification:

```
* )
ENTITY substitute_product
  SUBTYPE OF (managed_design_object);
    defined_alternate_product : SET [1:?] OF ee_product;
    substitutable_component   : assembly_composition_relationship;
END_ENTITY; -- substitute_product

( *
```

4.2.879 Supplied_product_version

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Supplied_product_version is a type of Managed_design_object (see 4.2.524). The Supplied_product_version is a product that is obtained from an external source (the supplier).

The data associated with a Supplied_product_version are the following:

- required_certification;
- supplied_product_version;
- supplied_product_version_approval;
- supplier;
- supplier_part_number.

4.2.879.1 required_certification

The required_certification is an inverse relationship that specifies the Certification (see 4.2.94) that specifies the Supplied_product_version as its certified_product_version. There shall be no more than one Certification for a Supplied_product_version.

4.2.879.2 supplied_product_version

The supplied_product_version specifies the role of the Ee_product_version (see 4.2.328) for the Supplied_product_version.

4.2.879.3 supplied_product_version_approval

The supplied_product_version_approval specifies the role of the Ee_approval (see 4.2.314) for the Supplied_product_version.

4.2.879.4 supplier

The supplier specifies the Organization (see 4.2.569) that supplies the Supplied_product_version.

4.2.879.5 supplier_part_number

The supplier_part_number specifies the name of the Supplied_product_version. The supplier_part_number need not be provided for a particular Supplied_product_version.

Constraints:

UR1: The combination of the supplier and the supplier_part_number shall be unique within a population of Supplied_product_versions.

NOTE EXPRESS specification:

```

*)
ENTITY supplied_product_version
  SUBTYPE OF (managed_design_object);
    supplied_product_version      : ee_product_version;
    supplied_product_version_approval : ee_approval;
    supplier_part_number          : OPTIONAL ee_name;
    supplier                      : organization;
  INVERSE
    required_certification : SET [0:1] OF
                                certification FOR certified_product_version;

  UNIQUE
    UR1 : supplier, supplier_part_number;
END_ENTITY; -- supplied_product_version

( *

```

4.2.880 Surface_finish_specification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Surface_finish_specification is a type of Material_specification (see 4.2.537) that is a collection of the properties applicable to surface textures or coatings either for a product in-process or a completed product.

NOTE EXPRESS specification:

```

*)
ENTITY surface_finish_specification
  SUBTYPE OF (material_specification);
END_ENTITY; -- surface_finish_specification

( *

```

4.2.881 Surface_prepped_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Surface_prepped_terminal is a type of Altered_package_terminal (see 4.2.9) that defines a modification to its surface condition, for solderability or other reasons, prior to its installation on an Interconnect_module_component (see 4.2.442) during the assembly of a Pca (see 4.2.639).

The data associated with a Surface_prepped_terminal are the following:

— surface_preparation.

4.2.881.1 surface_preparation

The surface_preparation specifies the Surface_finish_specification (see 4.2.880) for modification to the surface finish of the Surface_prepped_terminal.

NOTE EXPRESS specification:

```
*)
ENTITY surface_prepped_terminal
  SUBTYPE OF (altered_package_terminal);
    surface_preparation : surface_finish_specification;
END_ENTITY; -- surface_prepped_terminal
```

(*

4.2.882 Symmetrical_tolerance_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Symmetrical_tolerance_characteristic is a type of Tolerance_characteristic (see 4.2.911) that has symmetrical tolerances around the nominal value.

The data associated with a Symmetrical_tolerance_characteristic are the following:

— component_characteristic.

4.2.882.1 component_characteristic

The component_characteristic specifies the value of the Numeric_parameter (see 4.2.565) for the Symmetrical_tolerance_characteristic. There shall be exactly two Numeric_parameter for the Symmetrical_tolerance_characteristic.

NOTE EXPRESS specification:

```
*)
ENTITY symmetrical_tolerance_characteristic
  SUBTYPE OF (tolerance_characteristic);
    SELF\coordinated_characteristic.component_characteristic : SET [2:2] OF
                                                                numeric_parameter;
END_ENTITY; -- symmetrical_tolerance_characteristic
```

(*

4.2.883 Symmetry_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Symmetry_tolerance is a type of Geometric_tolerance_with_referenced_datum_system (see 4.2.422) that specifies or partially specifies the design requirement on the symmetry of a Shape_element (see 4.2.810) with respect to a Datum_plane (see 4.2.232). That is, the median points of all opposed or correspondingly located elements of two or more surfaces of a Shape_element must fall within the defined Tolerance_zone_boundary (see 4.2.915). The Tolerance_zone_boundary is an opposing plane set that is symmetrically disposed about the specified Datum_plane.

NOTE Symmetry tolerance is defined in terms of tolerance zone definitions in 17.12 of ISO/DIS 1101.

Constraints:

WR1: The Shape_element specified as the toleranced_shape_element shall be a Centre_plane.

NOTE The attribute toleranced_shape_element is declared in the Geometric_tolerance entity of which this entity is a subtype.

WR2: There shall be at most two Datum in the Datum_system the definition of which is specified by the datum_system_definition.

NOTE The attribute datum_system_definition is declared in the Geometric_tolerance_with_referenced_datum_system entity of which this entity is a subtype.

WR3: There shall be a Datum_plane in the Datum_system the definition of which is specified by the datum_system_definition.

WR4: The Symmetry_tolerance shall specify a Tolerance_zone_definition as its tolerance_zone_or_boundary_definition; and that Tolerance_zone_definition shall specify a Tolerance_zone_boundary_definition_with_specified_size as its boundary_definition; and that Tolerance_zone_boundary_definition_with_specified_size shall specify an Opposing_boundary_set_size_characteristic as its specified_boundary_size.

IP1: The form of the toleranced Shape_element shall be consistent with the form of a shape element for which the application of a symmetry tolerance is sensible.

NOTE EXPRESS specification:

```
* )
ENTITY symmetry_tolerance
  SUBTYPE OF (geometric_tolerance_with_referenced_datum_system);
END_ENTITY; -- symmetry_tolerance
```

(*

4.2.884 Tangent_plane

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Tangent_plane` is a type of `Tangent_shape_element` (see 4.2.885) that is planar in form.

EXAMPLE 1 An `Angularity_tolerance` (see 4.2.26) might be applied to the `Tangent_plane` derived from a surface of a `Physical_unit` (see 4.2.664), as opposed to the surface itself, if variations in the form of the surface are unimportant or are sufficiently constrained by other tolerances.

Constraints:

IP1: The form of the `Shape_element` from which the `Tangent_plane` is derived shall be consistent with the form of a shape element from which a tangent plane can be derived.

NOTE EXPRESS specification:

```
*)
ENTITY tangent_plane
  SUBTYPE OF (tangent_shape_element);
END_ENTITY; -- tangent_plane

( *
```

4.2.885 `Tangent_shape_element`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Tangent_shape_element` is a type of `Derived_shape_element` (see 4.2.260) that is either a straight line that contacts a curve at only the high points or is a plane that contacts a surface at only its high points. The `Shape_element` from which the `Tangent_shape_element` is derived is associated with the `Tangent_shape_element` by the `Shape_element_deriving_relationship` (see 4.2.814) that is specified as the `deriving_relationships`. A `Tangent_shape_element` may be a `Tangent_plane` (see 4.2.884).

NOTE The attribute `deriving_relationships` is declared in the `Derived_shape_element` entity of which this entity is a subtype.

Constraints:

WR1: The `Tangent_shape_element` shall be derived from only one `Shape_element`.

IP1: The `Shape_element` from which the `Tangent_shape_element` is derived shall be a curve or surface.

NOTE EXPRESS specification:

```
* )  
ENTITY tangent_shape_element  
  SUPERTYPE OF (tangent_plane)  
  SUBTYPE OF (derived_shape_element);  
END_ENTITY; -- tangent_shape_element

4.2.886 Technology

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Technology is a type of Managed_design_object (see 4.2.524). A Technology is the manufacturing process for the realization of an Ee_product (see 4.2.319).

The data associated with a Technology are the following:

- classification;
- material_product_system;
- process_technology.

4.2.886.1 classification

The classification specifies the External_definition (see 4.2.361) which defines the Technology.

4.2.886.2 material_product_system

The material_product_system specifies the Ee_material (see 4.2.318) which defines the material combination which is necessary for the output of the manufacturing process.

4.2.886.3 process_technology

The process_technology specifies the Process_specification (see 4.2.740) which defines the exact process of the Technology.

NOTE EXPRESS specification:

```

*)
ENTITY technology
  SUBTYPE OF (managed_design_object);
    process_technology      : process_specification;

```

4.2.888 Template_material_cross_section_boundary

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Template_material_cross_section_boundary is a type of Non_feature_shape_element (see 4.2.560).

The data associated with a `Template_material_cross_section_boundary` are the following:

— `associated_definition`.

4.2.888.1 `associated_definition`

The `associated_definition` specifies a `Printed_part_template_material` (see 4.2.735) for the `Template_material_cross_section_boundary`.

Constraints:

UR1: The combination of `associated_definition` and the name attribute inherited from `Shape_element` (see 4.2.810) shall be unique within a population of `Template_material_cross_section_boundary`.

WR1: The name attribute inherited from `Shape_element` (see 4.2.810) shall be one of "top", "bottom", "left", or "right" within a population of `Template_material_cross_section_boundary`.

NOTE EXPRESS specification:

```
*)
ENTITY template_material_cross_section_boundary
  SUBTYPE OF (non_feature_shape_element);
  associated_definition : printed_part_template_material;

4.2.889 `Template_stratum_assignment`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Template_stratum_assignment` is a type of `Managed_design_object` (see 4.2.524). A `Template_stratum_assignment` is the relationship between a `Stratum` (see 4.2.845) and any one of an `Stratum_feature_template` (see 4.2.861), a `Material_addition_feature_template` (see 4.2.529), or a `Material_removal_feature_template` (see 4.2.534) for the purpose of binding a template to a specific `Stratum` for a `Padstack_definition`.

The data associated with a `Template_stratum_assignment` are the following:

— `bound_template`;

— `bound_stratum`.

4.2.889.1 bound_template

The bound_template specifies any one of the Stratum_feature_template (see 4.2.861), Material_addition_feature_template (see 4.2.529), Material_removal_feature_template (see 4.2.534) as the assigned object for the Template_stratum_assignment.

4.2.889.2 bound_stratum

The bound_stratum specifies the role of the Stratum (see 4.2.845) for the Template_stratum_assignment.

NOTE EXPRESS specification:

```
*)
ENTITY template_stratum_assignment
  SUBTYPE OF (managed_design_object);
    bound_template : template_select;
    bound_stratum  : stratum;
END_ENTITY; -- template_stratum_assignment

(*
```

4.2.890 Terminal_pair_port_equivalence_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Terminal_pair_port_equivalence_relationship is a type of Managed_design_object (see 4.2.524). A Terminal_pair_port_equivalence_relationship is the assignment association between a pair of scalar ports and a single distributed port.

The data associated with a Terminal_pair_port_equivalence_relationship are the following:

- equivalent_port;
- scalar_ports.

4.2.890.1 equivalent_port

The equivalent_port specifies the Analytical_model_port (see 4.2.17) that represents the single distributed port for the Terminal_pair_port_equivalence_relationship.

4.2.890.2 scalar_ports

The scalar_ports specify the two Analytical_model_scalar_port (see 4.2.20) in the ordered sequence for the Terminal_pair_port_equivalence_relationship. The second scalar_port is always the reference port. Other details depend on the specific domain of the Analytical_model (see 4.2.14).

EXAMPLE 1 Port "INPUT" of a microwave coaxial filter model is the equivalent_port for this example.

Port "INPUT center pin" is the first Analytical_model_scalar_port for this example. Port "INPUT shield" is the second Analytical_model_scalar_port for this example.

Constraints:

WR1: The distributed_properties attribute of the Analytical_model_port in the role of equivalent_port shall be "TRUE".

WR2: The scalar_ports and equivalent_port shall not reference the same Analytical_model.

WR3: The scalar_ports shall reference the same Analytical_model.

WR4: The equivalent_port shall not be a member of Digital_analytical_model_port.

NOTE EXPRESS specification:

```

*)
ENTITY terminal_pair_port_equivalence_relationship
  SUBTYPE OF (managed_design_object);
    equivalent_port : analytical_model_port;
    scalar_ports    : LIST [2:2] OF UNIQUE analytical_model_scalar_port;
END_ENTITY; -- terminal_pair_port_equivalence_relationship

( *
```

4.2.891 Terminal_swap_specification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Terminal_swap_specification is a type of Change_design_object_management_relationship (see 4.2.95). The Terminal_swap_specification is part of the swapping specification from the previous design definition to the current design definition. It identifies the terminal in the previous design that was connected to a node, and the terminal in the current design that is connected to that node instead.

NOTE With the pin mapping between the functional and physical representations in the library, this is sufficient information to derive the swapping at the component terminal; however, note that this is in the previous and present design definitions and not in the library functional definition.

The data associated with a Terminal_swap_specification are the following:

- current_design_object;
- previous_design_object.

4.2.891.1 current_design_object

The current_design_object specifies the Functional_unit_terminal_node_assignment (see 4.2.409) of the terminal node after the swap for the Terminal_swap_specification.

4.2.891.2 previous_design_object

The previous_design_object specifies the Functional_unit_terminal_node_assignment (see 4.2.409) of the terminal node before the swap for the Terminal_swap_specification.

Constraints:

WR1: The current_design_object shall not be the previous_design_object.

NOTE EXPRESS specification:

```
*)
ENTITY terminal_swap_specification
  SUBTYPE OF (change_design_object_management_relationship);
    SELF\change_design_object_management_relationship.previous_design_object :
functional_unit_terminal_node_assignment;

4.2.892 Termination_constraint

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Termination_constraint is a type of Managed_design_object (see 4.2.524). A Termination_constraint is a constraint that requires a set of two or more Mating_connector_termination (see 4.2.540) to satisfy an Ee_requirement_occurrence (see 4.2.330).

The data associated with a Termination_constraint are the following:

- constrained_termination;
- termination_usage_constraint.

4.2.892.1 constrained_termination

The constrained_termination specifies the role of the Mating_connector_termination (see 4.2.540) for the Termination_constraint. There shall be two or more Mating_connector_termination for the Termination_constraint.

4.2.892.2 termination_usage_constraint

The termination_usage_constraint specifies the role of the Ee_requirement_occurrence (see 4.2.330) for the Termination_constraint.

NOTE EXPRESS specification:

```
*)
ENTITY termination_constraint
  SUBTYPE OF (managed_design_object);
    constrained_termination      : SET [2:?] OF mating_connector_termination;
    termination_usage_constraint : ee_requirement_occurrence;
END_ENTITY; -- termination_constraint

(*
```

4.2.893 Tertiary_orientation_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Tertiary_orientation_feature is both a Part_feature (see 4.2.609) and a Datum_feature (see 4.2.226). A tertiary_orientation_feature provides anti-rotation capability for unambiguous orientation of the part in the datum_reference_frame.

The data associated with a Tertiary_orientation_feature are the following:

— associated_body_vertical_extent.

4.2.893.1 associated_body_vertical_extent

An associated_body_vertical_extent specifies the role of the Package_body_surface (see 4.2.578) for a Tertiary_orientation_feature. The associated_body_vertical_extent helps to identify the surface or surfaces which contain the feature. An associated_body_vertical_extent need not be specified for a Tertiary_orientation_feature.

NOTE EXPRESS specification:

```
*)
ENTITY tertiary_orientation_feature
  SUBTYPE OF (part_feature, datum_feature);
    associated_body_vertical_extent : OPTIONAL SET [1:2] OF package_body_surface;
END_ENTITY; -- tertiary_orientation_feature

( *
```

4.2.894 Test_point_part_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Test_point_part_feature is a type of Part_tooling_feature (see 4.2.633). A Test_point_part_feature identifies a feature for use with test instrumentation.

NOTE A Test_point_part_feature may be related to a Probe_access_area (see 4.2.739) if the layout view is also supplied.

NOTE EXPRESS specification:

```
*)
ENTITY test_point_part_feature
  SUBTYPE OF (part_tooling_feature);
END_ENTITY; -- test_point_part_feature

( *
```

4.2.895 Test_requirement_allocation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Test_requirement_allocation is a type of Requirement_allocation (see 4.2.769) for which the Ee_requirement_occurrence (see 4.2.330) has test characteristics. A Test_requirement_allocation is the relationship between the Test_requirement_occurrence (see 4.2.896) and the Ee_product_version (see 4.2.328) to which the requirement is allocated. The terminals of the product are related to either parametric data in an executable form or to data derived from experimental or theoretical measurements.

NOTE The structural split of allocation and requirement occurrence permits re-use of common test requirements and associated procedures over multiple products.

The data associated with a Test_requirement_allocation are the following:

- target_product_object;
- analytical_model_based_data;
- functional_specification_based_data;
- allocated_requirement.

4.2.895.1 target_product_object

The target_product_object specifies the role of the Test_component (see ??) for the Test_requirement_allocation. The target_product_object is a specialization of the attribute inherited from Assembly_requirement_allocation.

4.2.895.2 analytical_model_based_data

The analytical_model_based_data specifies the role of the Part_feature_model_port_assignment (see 4.2.611) for the Test_requirement_allocation. The analytical_model_based_data specifies the mapping of the ports of the Analytical_model (see 4.2.14) onto the relevant terminals of the product for which the test is specified.

NOTE The mapping provides a formal mechanism for associating the details of the required behavior represented in computer executable form, as defined in the body of an Analytical_model, with the terminals of the tested product.

4.2.895.3 functional_specification_based_data

The functional_specification_based_data specifies the role of the Functional_unit_usage_view_to_part-terminal_assignment (see ??) for the Test_requirement_allocation. The functional_specification_based_data specifies the mapping of the terminals of the Functional_unit_usage_view (see 4.2.410) onto the relevant terminals of the product for which the test is specified.

NOTE The mapping provides a formal mechanism for associating the details of the required behavior represented as a result of an experiment, as defined by a Functional_specification, with the terminals of the tested product.

4.2.895.4 allocated_requirement

The allocated_requirement specifies the role of the Test_requirement_occurrence (see 4.2.896) for the Test_requirement_allocation. The allocated_requirement is a specialization of the attribute inherited from Assembly_requirement_allocation.

NOTE EXPRESS specification:

```

(

```

4.2.896 Test_requirement_occurrence

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Test_requirement_occurrence is a type of Ee_requirement_occurrence (see 4.2.330) that specifies a test related requirement. The test method shall be specified in the requirement_specification inherited from Ee_requirement_occurrence. The Test_requirement_occurrence provides a representation of minimum bounds on behaviour. In order to relate a Test_requirement_occurrence to a product, a Requirement_allocation is required to be exchanged that references this Application Object and the version of the product to which the test requirement is allocated. That Requirement_allocation shall also specify a number of Part_feature_analytical_model_port_assignment in order to specify the measurement access points for the test. It is valid to exchange a Test_requirement_occurrence without a Requirement_allocation Either an Analytical_representation shall be provided or a Functional_specification shall be provided.

NOTE 1

NOTE 2 This edition of this part of ISO 10303 does not explicitly relate the test requirement to the test setup.

NOTE 3 The Test_requirement_occurrence may be used as a reference for Planned_characteristic.

NOTE 4 The Test_requirement_occurrence may be a derived requirement from a Design_requirement_occurrence, in which case production capability based margins would cause the actual characteristics to be different between the Design_requirement_occurrence and the Test_requirement_occurrence.

NOTE EXPRESS specification:

```
*)
ENTITY test_requirement_occurrence
  SUBTYPE OF (ee_requirement_occurrence);
WHERE
  WR1: SIZEOF(SELF\ee_requirement_occurrence.required_analytical_representation) +
        SIZEOF(SELF\ee_requirement_occurrence.required_functional_specification) > 0;
END_ENTITY; -- test_requirement_occurrence
(*

END_ENTITY; -- theoretically_exact_dimension_representation

( *
```

4.2.900 Thermal_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Thermal_component is a type of Assembly_component (see 4.2.34) that is included in the design in order to satisfy a heat flow requirement.

NOTE An Assembly_component utilized as a Thermal_component may be another type of Assembly_component as well.

EXAMPLE 1 Examples of Thermal_component are: a heatsink, a thermal via, an active thermal cooler (such as a fan), or a thermoelectric cooler.

NOTE EXPRESS specification:

```
*)
ENTITY thermal_component
  SUBTYPE OF (assembly_component);
END_ENTITY; -- thermal_component

( *
```

4.2.901 Thermal_feature

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Thermal_feature is a type of Part_feature (see 4.2.609) that is specified as having a role in the exchange of heat with the application environment of the Physical_unit (see 4.2.664).

NOTE EXPRESS specification:

```
*)
ENTITY thermal_feature
  SUBTYPE OF (part_feature);
END_ENTITY; -- thermal_feature

( *
```

4.2.902 Thermal_isolation_laminate_component

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Thermal_isolation_laminate_component` is a type of `Design_intent_modification` (see 4.2.267) that indicates that material is to be removed in the realization of the feature that is in the role of `design_intent` inherited from `Design_intent_modification`. A `Thermal_isolation_laminate_component` may be a `Filled_area_material_removal_structure` (see 4.2.385). The requirement shall be interpreted mathematically as a requirement for application of the regularized Boolean subtraction operation.

The data associated with a `Thermal_isolation_laminate_component` are the following:

— `usage_definition`.

4.2.902.1 `usage_definition`

The `usage_definition` specifies the role of the `Thermal_isolation_removal_template` (see 4.2.904) for the `Thermal_isolation_laminate_component`.

NOTE EXPRESS specification:

```
*)
ENTITY thermal_isolation_laminate_component
  SUBTYPE OF (filled_area_material_removal_laminate_component);
  SELF\assembly_component.usage_definition : thermal_isolation_removal_template;
END_ENTITY; -- thermal_isolation_laminate_component

(*
```

4.2.903 `Thermal_isolation_removal_structure`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Thermal_isolation_removal_structure` is a type of `Filled_area_material_removal_structure` (see 4.2.385) included in the design for reasons of thermal isolation.

EXAMPLE 1 Figure 107 illustrates the removal of material from a power plane based on the shape of this structure.

The data associated with a `Thermal_isolation_removal_structure` are the following:

— `thermal_isolation_spacing_requirement`.

4.2.903.1 `thermal_isolation_spacing_requirement`

The `thermal_isolation_spacing_requirement` is an inverse relationship that specifies that the existence of the `Thermal_isolation_removal_structure` is dependent on the existence of the `Thermal_isolation_requirement_assignment` (see 4.2.905) that specifies the `Thermal_isolation_removal_structure` as its resulting structure.

Figure 107 – Thermal_isolation_removal_structure

NOTE EXPRESS specification:

```

4.2.904 Thermal_isolation_removal_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Thermal_isolation_removal_template is a type of Part_template (see 4.2.620) that describes the shape of material to be removed from a feature. The purposes predefined in this part of ISO 10303 include electrical and thermal isolation.

EXAMPLE 1 Figure 108 illustrates a template and associated parameters designed for electrical isolation. For a specific template, values will be assigned for the parameters and the explicit geometry will be representative of the assigned parameter values.

EXAMPLE 2 Figure 109 illustrates a template and associated parameters designed for thermal isolation. For a specific template, values will be assigned for the parameters and the explicit geometry will be representative of the assigned parameter values. In this example, an instance would be a complex instance including Composite_unit_shape_element (see 4.2.167) and Thermal_isolation_removal_template.

Physical characteristics are inherited from Part_template.

Reference_document is : IEC 61182-1

Note : Electrical Isolation

Figure 108 – Thermal_isolation_removal_template supports electrical isolation

Physical characteristics are inherited from Part_template.

Reference_document is : IEC 61182-1

Note : Thermal isolation

Figure 109 – Thermal_isolation_removal_template supports thermal isolation and electrical conduction

```

4.2.905 Thermal_isolation_requirement_assignment

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Thermal_isolation_requirement_assignment is a type of Managed_design_object (see 4.2.524). A Thermal_isolation_requirement_assignment is the relationship among requirements for thermal isolation and the resulting structure of the Interconnect_module (see 4.2.440) or the template.

The data associated with a Thermal_isolation_requirement_assignment are the following:

- angular_orientation_requirement;
- effective_current_capacity_requirement;
- resulting_structure;
- thermal_isolation_spacing_requirement.

4.2.905.1 angular_orientation_requirement

The angular_orientation_requirement specifies one role of the Ee_requirement_occurrence (see 4.2.330) for the Thermal_isolation_requirement_assignment.

4.2.905.2 effective_current_capacity_requirement

The effective_current_capacity_requirement specifies one role of the Ee_requirement_occurrence (see 4.2.330) for the Thermal_isolation_requirement_assignment.

4.2.905.3 resulting_structure

The resulting_structure specifies the role of the Thermal_isolation_removal_structure (see 4.2.903) or of the Thermal_isolation_removal_template (see 4.2.904) for the Thermal_isolation_requirement_assignment.

4.2.905.4 thermal_isolation_spacing_requirement

The thermal_isolation_spacing_requirement specifies one role of the Ee_requirement_occurrence (see 4.2.330) for the Thermal_isolation_requirement_assignment.

NOTE EXPRESS specification:

```

*)
ENTITY thermal_isolation_requirement_assignment
  SUBTYPE OF (managed_design_object);
    resulting_structure :
      thermal_isolation_removal_structure_or_template;
    thermal_isolation_spacing_requirement : layout_spacing_requirement_occurrence;
    effective_current_capacity_requirement : ee_requirement_occurrence;
    angular_orientation_requirement      : ee_requirement_occurrence;
END_ENTITY; -- thermal_isolation_requirement_assignment

( *
```

4.2.906 Thermal_network_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Thermal_network_definition is a type of Functional_unit_network_definition (see 4.2.402) for which the network nodal formulation is a representation of heat flow rather than current flow.

NOTE EXPRESS specification:

```

*)
ENTITY thermal_network_definition
  SUBTYPE OF (functional_unit_network_definition);
END_ENTITY; -- thermal_network_definition

( *
An approved thermal_network_definition shall be consistent with conservative laws.
( *
```

4.2.907 Thermal_requirement_allocation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Thermal_requirement_allocation is a type of Assembly_requirement_allocation (see 4.2.53) for which the Ee_requirement_occurrence (see 4.2.330) has thermal characteristics. A Thermal_requirement_allocation is the relationship between the Thermal_requirement_occurrence (see 4.2.908) and the Thermal_component (see 4.2.900) that satisfies it.

The data associated with a Thermal_requirement_allocation are the following:

- assembly_assignment;
- requirement.

4.2.907.1 assembly_assignment

The assembly_assignment specifies the role of the Thermal_component (see 4.2.900) for the Thermal_requirement_allocation.

4.2.907.2 requirement

The requirement specifies the role of the Thermal_requirement_occurrence (see 4.2.908) for the Thermal_requirement_allocation.

NOTE EXPRESS specification:

```

*)
ENTITY thermal_requirement_allocation
  SUBTYPE OF (assembly_requirement_allocation);

4.2.911 Tolerance_characteristic

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Tolerance_characteristic is a type of Coordinated_characteristic (see 4.2.197). A Tolerance_characteristic may be one of Maximum_tolerance_characteristic (see 4.2.542), Minimum_tolerance_characteristic (see 4.2.548), Plus_minus_tolerance_characteristic (see 4.2.691), Statistical_tolerance_characteristic (see 4.2.842), or Symmetrical_tolerance_characteristic (see 4.2.882).

The data associated with a Tolerance_characteristic are the following:

— component_characteristic.

4.2.911.1 component_characteristic

The component_characteristic specifies the role of the Numeric_parameter (see 4.2.565) for the Tolerance_characteristic. There shall be one or more Numeric_parameter for the Tolerance_characteristic.

NOTE Members of this application object are not exchanged to support geometric tolerancing.

NOTE EXPRESS specification:

```
*)
ENTITY tolerance_characteristic
  SUPERTYPE OF (ONEOF (minimum_tolerance_characteristic,

```

4.2.912 Tolerance_specific_restraint_condition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

The `Tolerance_specific_restraint_condition` is a type of `Restraint_condition` that is only applied to specified instances of `Geometric_tolerance` (see 4.2.419) and `Dimensional_characteristic` (see 4.2.298).

The data associated with a `Tolerance_specific_restraint_condition` are the following:

— `affected_tolerances`.

4.2.912.1 `affected_tolerances`

The `affected_tolerances` specifies the `Geometric_tolerance` (see 4.2.419) and `Dimensional_characteristic` (see 4.2.298) to which the restraint condition applies. There shall be one or more `Geometric_tolerance` or `Dimensional_characteristic` specified as the `affected_tolerances` by a `Tolerance_specific_restraint_condition`.

NOTE EXPRESS specification:

```
* )
ENTITY tolerance_specific_restraint_condition

4.2.913 `Tolerance_zone`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Tolerance_zone` is a type of `Non_feature_shape_element` (see 4.2.560) that is a region within which the toleranced `Shape_element` (see 4.2.810) must lie.

NOTE Tolerance zones are defined in clause 7 of ISO 1101.

The data associated with a `Tolerance_zone` are the following:

— `zone_boundary`;

— `zone_definition`.

4.2.913.1 `zone_boundary`

The `zone_boundary` specifies the `Tolerance_zone_boundary` (see 4.2.915) that define the limits of the `Tolerance_zone`.

4.2.913.2 zone_definition

The zone_definition is an inverse relationship that specifies that the existence of the Tolerance_zone is dependent on the existence of the Tolerance_zone_definition (see 4.2.920) that specifies the Tolerance_zone as its defined_tolerance_zone.

NOTE EXPRESS specification:

```

*)
ENTITY tolerance_zone

( *
```

4.2.914 Tolerance_zone_and_viewing_plane_orienting_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Tolerance_zone_and_viewing_plane_orienting_relationship is a type of Managed_design_object (see 4.2.524). A Tolerance_zone_and_viewing_plane_orienting_relationship is a relationship that associates a Tolerance_zone (see 4.2.913) with the Viewing_plane (see 4.2.956) by which it is oriented.

The data associated with a Tolerance_zone_and_viewing_plane_orienting_relationship are the following:

- oriented_tolerance_zone;
- orienting_viewing_plane;
- zone_orientation.

4.2.914.1 oriented_tolerance_zone

The oriented_tolerance_zone specifies the Tolerance_zone (see 4.2.913) that is oriented with respect to the Viewing_plane (see 4.2.956) specified as the orienting_viewing_plane.

4.2.914.2 orienting_viewing_plane

The orienting_viewing_plane specifies the Viewing_plane (see 4.2.956) by which the Tolerance_zone (see 4.2.913) that is specified as the oriented_tolerance_zone is oriented.

4.2.914.3 zone_orientation

The zone_orientation is an inverse relationship that specifies that the existence of the Tolerance_zone_and_viewing_plane_orienting_relationship is dependent on the existence of the Viewing_plane_based_orientation (see 4.2.957) that specifies the Tolerance_zone_and_viewing_plane_orienting_relationship as its orienting_relationship.

NOTE EXPRESS specification:

4.2.915 Tolerance_zone_boundary

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Tolerance_zone_boundary is a type of Non_feature_shape_element (see 4.2.560) that is a boundary of a Tolerance_zone (see 4.2.913). A Tolerance_zone_boundary is one of a Conical_tolerance_zone_boundary (see 4.2.178), a Tolerance_zone_circular_or_cylindrical_or_spherical_boundary (see 4.2.919), or a Tolerance_zone_opposing_boundary_set (see 4.2.926).

EXAMPLE 1 A pair of opposing planes may form a Tolerance_zone_boundary.

The data associated with a Tolerance_zone_boundary are the following:

- boundary_zone_definition;
- bounded_zone.

4.2.915.1 boundary_zone_definition

The boundary_zone_definition is an inverse relationship that specifies that the existence of the Tolerance_zone_boundary is dependent on the existence of the Tolerance_zone_boundary_definition (see 4.2.916) that specifies the Tolerance_zone_boundary as its defined_zone_boundary.

4.2.915.2 bounded_zone

The bounded_zone is an inverse relationship that specifies that the existence of the Tolerance_zone_boundary is dependent on the existence of the Tolerance_zone (see 4.2.913) that specifies the Tolerance_zone_boundary as its zone_boundary.

NOTE EXPRESS specification:

```

*)
ENTITY tolerance_zone_boundary

```

4.2.916 Tolerance_zone_boundary_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Tolerance_zone_boundary_definition is a type of Managed_design_object (see 4.2.524) that characterizes a Tolerance_zone_boundary (see 4.2.915). A Tolerance_zone_boundary_definition is either a Boundary_zone_definition_with_specified_size (see 4.2.79) or a Conical_tolerance_zone_boundary_definition (see 4.2.180).

The data associated with a Tolerance_zone_boundary_definition are the following:

- defined_zone_boundary;
- zone_definition.

4.2.916.1 defined_zone_boundary

The defined_zone_boundary specifies the Tolerance_zone_boundary (see 4.2.915) that is characterized by the Tolerance_zone_boundary_definition.

4.2.916.2 zone_definition

The zone_definition is an inverse relationship that specifies that the existence of the Tolerance_zone_boundary_definition is dependent on the existence of the Tolerance_zone_definition (see 4.2.920) that specifies the Tolerance_zone_boundary_definition as its boundary_definition.

NOTE EXPRESS specification:

```

*)

```

4.2.917 Tolerance_zone_boundary_member

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Tolerance_zone_boundary_member is a type of Non_feature_shape_element (see 4.2.560) that is one of the two explicitly identified members of a Tolerance_zone_explicit_opposing_boundary_set (see 4.2.923).

The data associated with a Tolerance_zone_boundary_member are the following:

— explicit_opposing_boundary_set.

4.2.917.1 explicit_opposing_boundary_set

The explicit_opposing_boundary_set is an inverse relationship that specifies that the existence of the Tolerance_zone_boundary_member is dependent on the existence of the Tolerance_zone_explicit_opposing_boundary_set (see 4.2.923) that specifies the Tolerance_zone_boundary_member as one of its boundary_members.

EXAMPLE 1 Tolerance_zone_boundary_members may be used to specify an unequally disposed profile tolerance (i.e., either a Profile_of_any_line_tolerance (see 4.2.744) or Profile_of_any_surface_tolerance).

Constraints:

WR1: The `Tolerance_zone_boundary_member` shall not be specified as the `offset_tolerance_zone_boundary_member` by more than one `Tolerance_zone_boundary_member_offset`.

NOTE EXPRESS specification:

```

*)
ENTITY tolerance_zone_boundary_member
  SUBTYPE OF (non_feature_shape_element);
  INVERSE
    explicit_opposing_boundary_set :
    tolerance_zone_explicit_opposing_boundary_set FOR boundary_members;
END_ENTITY; -- tolerance_zone_boundary_member

( *
```

4.2.918 Tolerance_zone_boundary_member_offset

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Tolerance_zone_boundary_member_offset` is a type of `Managed_design_object` (see 4.2.524). A `Tolerance_zone_boundary_member_offset` is a definition that characterizes the size and direction that a `Tolerance_zone_boundary_member` (see 4.2.917) is offset from the `True_profile` (see 4.2.934) of the tolerated `Physical_feature_or_part_template` (see 4.2.658).

The data associated with a `Tolerance_zone_boundary_member_offset` are the following:

- `boundary_definition`;
- `offset_tolerance_zone_boundary_member`;
- `offset_value`;
- `type_of_offset`.

4.2.918.1 boundary_definition

The `boundary_definition` is an inverse relationship that specifies that the existence of the `Tolerance_zone_boundary_member_offset` is dependent on the existence of the `Profile_boundary_definition_with_offsets` (see 4.2.743) that specifies the `Tolerance_zone_boundary_member_offset` as one of its `boundary_offsets`.

4.2.918.2 offset_tolerance_zone_boundary_member

The offset_tolerance_zone_boundary_member specifies the Tolerance_zone_boundary_member (see 4.2.917) the offset of which is characterized by the Tolerance_zone_boundary_member_offset.

4.2.918.3 offset_value

The offset_value specifies the Length_data_element (see 4.2.511) that represents distance the Tolerance_zone_boundary_member (see 4.2.917) is offset from the True_profile (see 4.2.934).

4.2.918.4 type_of_offset

The type_of_offset specifies a label that indicates the direction that the Tolerance_zone_boundary_member (see 4.2.917) is offset from the True_profile (see 4.2.934). The type_of_offset shall either be "away_from_material" or "towards_material".

Constraints:

WR1: The Tolerance_zone_explicit_opposing_boundary_set that is specified as the explicit_opposing_boundary_set by the Tolerance_zone_boundary_member that is specified as the offset_tolerance_zone_boundary_member shall be the same instance of Tolerance_zone_explicit_opposing_boundary_set that is specified as the defined_zone_boundary by the Profile_boundary_definition_with_offsets specified as the boundary_definition.

NOTE EXPRESS specification:

```

*)
ENTITY tolerance_zone_boundary_member_offset
  SUBTYPE OF (managed_design_object);
    offset_tolerance_zone_boundary_member : tolerance_zone_boundary_member;
    offset_value                          : length_data_element;
    type_of_offset                        : offset_types;
  INVERSE
    boundary_definition : profile_boundary_definition_with_offsets FOR
                          boundary_offsets;
END_ENTITY; -- tolerance_zone_boundary_member_offset

( *
```

4.2.919 Tolerance_zone_circular_or_cylindrical_or_spherical_boundary

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Tolerance_zone_circular_or_cylindrical_or_spherical_boundary` is a type of `Tolerance_zone_boundary` (see 4.2.915) that is circular, cylindrical, or spherical in form. The actual form of the `Tolerance_zone_boundary` is dictated by the type of tolerance and the form of the tolerated `Shape_element`.

The data associated with a `Tolerance_zone_circular_or_cylindrical_or_spherical_boundary` are the following:

— `size_characteristic`.

4.2.919.1 `size_characteristic`

A `size_characteristic` is an inverse relationship that specifies that the existence of the `Tolerance_zone_circular_or_cylindrical_or_spherical_boundary` is dependent on the existence of the `Diametrical_boundary_size_characteristic` (see 4.2.287) that specifies the `Tolerance_zone_circular_or_cylindrical_or_spherical_boundary` as its `sized_boundary`.

EXAMPLE 1 A cylindrical `Tolerance_zone_boundary` (see 4.2.915) could be defined by a position tolerance applied to an axis of a cylindrical hole.

NOTE EXPRESS specification:

```
*)
ENTITY tolerance_zone_circular_or_cylindrical_or_spherical_boundary
  SUBTYPE OF (tolerance_zone_boundary);
  INVERSE
    size_characteristic : diametrical_boundary_size_characteristic FOR
                          sized_boundary;
END_ENTITY; -- tolerance_zone_circular_or_cylindrical_or_spherical_boundary

( *
```

4.2.920 `Tolerance_zone_definition`

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Tolerance_zone_definition` is a type of `Managed_design_object` (see 4.2.524). A `Tolerance_zone_definition` may be a one of `Conical_tolerance_zone_definition` (see 4.2.182), `Projected_tolerance_zone_definition` (see 4.2.752), `Runout_tolerance_zone_definition_with_specified_angle` (see 4.2.796), or `Tolerance_zone_definition_with_per_unit_size_specification` (see 4.2.921). Additionally, a `Tolerance_zone_definition` may be a `Tolerance_zone_definition_with_specified_orientation` (see 4.2.922). A `Tolerance_zone_definition` is a definition that characterizes a `Tolerance_zone` (see 4.2.913).

The data associated with a Tolerance_zone_definition are the following:

- boundary_definition;
- defined_tolerance_zone;
- form.

4.2.920.1 boundary_definition

The boundary_definition specify the Tolerance_zone_boundary_definition (see 4.2.916) that defines the limits of the Tolerance_zone (see 4.2.913) for the Tolerance_zone_definition.

4.2.920.2 defined_tolerance_zone

The defined_tolerance_zone specifies the Tolerance_zone (see 4.2.913) that is characterized by the Tolerance_zone_definition.

4.2.920.3 form

The form specifies the Tolerance_zone_form (see 4.2.924) that characterizes the form of the specified Tolerance_zone (see 4.2.913). The form need not be specified for a particular Tolerance_zone_definition.

Constraints:

WR1: If the Tolerance_zone_form is specified, the Tolerance_zone specified as the characterized_tolerance_zone of the Tolerance_zone_form that is specified as the form shall be the same instance of Tolerance_zone as specified as the defined_tolerance_zone.

WR2: The Tolerance_zone_boundary specified as the defined_zone_boundary of the Tolerance_zone_boundary_definition that is specified as the boundary_definition shall be the same instances of Tolerance_zone_boundary as specified as the zone_boundary of the Tolerance_zone specified as the defined_tolerance_zone.

WR3: If the Tolerance_zone_definition is not a Conical_tolerance_zone_definition, the Tolerance_zone_definition shall be specified as the tolerance_zone_or_boundary_definition by exactly one Geometric_tolerance.

NOTE EXPRESS specification:

```

*)
ENTITY tolerance_zone_definition
  SUPERTYPE OF (ONEOF (projected_tolerance_zone_definition,
    runout_tolerance_zone_definition_with_specified_angle,
    tolerance_zone_definition_with_per_unit_size_specification,
    conical_tolerance_zone_definition,
    tolerance_zone_definition_with_specified_orientation))
  SUBTYPE OF (managed_design_object);
  defined_tolerance_zone : tolerance_zone;
  boundary_definition    : tolerance_zone_boundary_definition;
  form                   : OPTIONAL tolerance_zone_form;
END_ENTITY; -- tolerance_zone_definition

( *

```

4.2.921 Tolerance_zone_definition_with_per_unit_size_specification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Tolerance_zone_with_per_unit_size_specification is a type of Tolerance_zone_definition (see 4.2.920) in which the extent of the Tolerance_zone (see 4.2.913) is defined. A Tolerance_zone_with_per_unit_size_specification is used to define a Tolerance_zone when the design requirements are such that abrupt variations in the toleranced Shape_element (see 4.2.810) must be limited. In essence, the thickness, or the diameter, of the Tolerance_zone is defined by the Boundary_size_characteristic (see 4.2.78) and the extent is defined by the Tolerance_zone_per_unit_size_specification (see 4.2.927). Each element of the toleranced Shape_element that has the same extent as the Tolerance_zone must lie within the Tolerance_zone when the Tolerance_zone is positioned coincident with the element.

The data associated with a Tolerance_zone_definition_with_per_unit_size_specification are the following:

— per_unit_size_specification.

4.2.921.1 per_unit_size_specification

The per_unit_size_specification specifies the Tolerance_zone_per_unit_size_specification (see 4.2.927) that defines the extent of the specified Tolerance_zone (see 4.2.913) for the Tolerance_zone_definition_with_per_unit_size_specification.

EXAMPLE 1 A Straightness_tolerance may be applied on a per unit basis such that every 100 mm length of a toleranced axis must lie within a Tolerance_zone that is bounded by a cylindrical Tolerance_zone that is 3 mm in diameter.

Constraints:

WR1: The Tolerance_zone specified as the defined_tolerance_zone shall be the same instance of Tolerance_zone as specified as the specified_tolerance_zone by the Tolerance_zone_per_unit_size_specification that is specified as the per_unit_size_specification.

NOTE The attribute defined_tolerance_zone is declared in the Tolerance_zone_definition entity of which this entity is a subtype.

WR2: The Geometric_tolerance that specifies the Tolerance_zone_definition_with_per_unit_size_specification as the tolerance_zone_or_boundary_definition shall be one of Flatness_tolerance, Straightness_tolerance, Angularity_tolerance, Parallelism_tolerance, or Perpendicularity_tolerance.

NOTE EXPRESS specification:

```
*)
ENTITY tolerance_zone_definition_with_per_unit_size_specification
  SUBTYPE OF (tolerance_zone_definition);
    per_unit_size_specification : tolerance_zone_per_unit_size_specification;
END_ENTITY; -- tolerance_zone_definition_with_per_unit_size_specification

( *
```

4.2.922 Tolerance_zone_definition_with_specified_orientation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Tolerance_zone_definition_with_specified_orientation is a type of Tolerance_zone_definition (see 4.2.920) in which the orientation of the Tolerance_zone (see 4.2.913) is specified.

The data associated with a Tolerance_zone_definition_with_specified_orientation are the following:

— zone_orientation.

4.2.922.1 zone_orientation

The zone_orientation specifies either a Viewing_plane_based_orientation (see 4.2.957), a Datum_axis_related_orientation (see 4.2.217), or a Datum_based_vector_orientation (see 4.2.220) for the Tolerance_zone_definition_with_specified_orientation.

Constraints:

WR1: If a Datum_axis_related_orientation is specified as the zone_orientation, the Tolerance_zone specified as the defined_tolerance_zone shall be the same instance of Tolerance_zone as specified as the oriented_tolerance_zone by the Datum_axis_and_tolerance_zone_orienting_relationship that is specified as the orienting_relationship by the Datum_axis_related_orientation that is specified as the zone_orientation.

WR2: If a Viewing_plane_based_orientation is specified as the zone_orientation, the Tolerance_zone specified as the defined_tolerance_zone shall be the same instance of Tolerance_zone as specified as the oriented_tolerance_zone by the Tolerance_zone_and_viewing_plane_orienting_relationship that is specified as the orienting_relationship by the Viewing_plane_based_orientation that is specified as the zone_orientation.

WR3: The Tolerance_zone_definition_with_specified_orientation shall not be specified as a tolerance_zone_or_boundary_definition by either a Circular_runout_tolerance, a Circularity_tolerance, a Concentricity_and_coaxiality_tolerance, a Cylindricity_tolerance, a Flatness_tolerance, a Profile_of_any_surface_tolerance, a Symmetry_tolerance, or a Total_runout_tolerance.

NOTE EXPRESS specification:

```

*)
ENTITY tolerance_zone_definition_with_specified_orientation
  SUBTYPE OF (tolerance_zone_definition);
    zone_orientation : orientation_select;
END_ENTITY; -- tolerance_zone_definition_with_specified_orientation

( *
```

4.2.923 Tolerance_zone_explicit_opposing_boundary_set

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Tolerance_zone_explicit_opposing_boundary_set is a type of Tolerance_zone_opposing_boundary_set (see 4.2.926) in which the two opposing boundary members are explicitly identified.

The data associated with a Tolerance_zone_explicit_opposing_boundary_set are the following:

— boundary_members.

4.2.923.1 boundary_members

The boundary_members specify the Tolerance_zone_boundary_member (see 4.2.917) that comprise the Tolerance_zone_explicit_opposing_boundary_set. There shall be exactly two Tolerance_zone_boundary_members specified as boundary_members for a Tolerance_zone_explicit_opposing_boundary_set.

NOTE EXPRESS specification:

```
*)
ENTITY tolerance_zone_explicit_opposing_boundary_set
  SUBTYPE OF (tolerance_zone_opposing_boundary_set);
  boundary_members : SET [2:2] OF tolerance_zone_boundary_member;
END_ENTITY; -- tolerance_zone_explicit_opposing_boundary_set

( *
```

4.2.924 Tolerance_zone_form

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Tolerance_zone_form is a type of Managed_design_object (see 4.2.524). A Tolerance_zone_form is a definition that characterizes of the form of the Tolerance_zone (see 4.2.913).

The data associated with a Tolerance_zone_form are the following:

- characterized_tolerance_zone;
- name;
- zone_definition.

4.2.924.1 characterized_tolerance_zone

The characterized_tolerance_zone specifies the Tolerance_zone (see 4.2.913) for which the Tolerance_zone_form is defined.

4.2.924.2 name

The name specifies the identifying label of the Tolerance_zone_form.

EXAMPLE 1 The name of the Tolerance_zone_form might be "cylindrical" for a Tolerance_zone that is defined by a Perpendicularity_tolerance.

4.2.924.3 zone_definition

The zone_definition is an inverse relationship that specifies that the existence of the Tolerance_zone_form is dependent on the existence of the Tolerance_zone_definition (see 4.2.920) that specifies the Tolerance_zone_form as its form.

NOTE EXPRESS specification:

```

*)
ENTITY tolerance_zone_form
  SUBTYPE OF (managed_design_object);
    characterized_tolerance_zone : tolerance_zone;
    name                          : label;

    zone_definition : tolerance_zone_definition FOR form;
END_ENTITY; -- tolerance_zone_form

```

(*

4.2.925 Tolerance_zone_implicit_opposing_boundary_set

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Tolerance_zone_implicit_opposing_boundary_set is a type of Tolerance_zone_opposing_boundary_set (see 4.2.926) in which the two opposing boundary members are not explicitly identified.

NOTE EXPRESS specification:

```

*)
ENTITY tolerance_zone_implicit_opposing_boundary_set
  SUBTYPE OF (tolerance_zone_opposing_boundary_set);
END_ENTITY; -- tolerance_zone_implicit_opposing_boundary_set

```

(*

4.2.926 Tolerance_zone_opposing_boundary_set

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Tolerance_zone_opposing_boundary_set is a type of Tolerance_zone_boundary (see 4.2.915) that consists of a set of two like boundary members that are separated by a constant distance. A Tolerance_zone_opposing_boundary_set is either a Tolerance_zone_explicit_opposing_boundary_set (see 4.2.923) or a Tolerance_zone_implicit_opposing_boundary_set (see 4.2.925).

The data associated with a Tolerance_zone_opposing_boundary_set are the following:

— size_characteristic.

4.2.926.1 size_characteristic

The size_characteristic is an inverse relationship that specifies that the existence of the Tolerance_zone_opposing_boundary_set is dependent on the existence of the Opposing_boundary_set_size_characteristic (see 4.2.568) that specifies the Tolerance_zone_opposing_boundary_set as its sized_boundary_set.

EXAMPLE 1 Two opposing planes comprise the Tolerance_zone_boundary_set that is defined when a Flatness_tolerance (see 4.2.386) is applied to the top surface of a printed circuit board. The size_characteristic specifies the separation between the two opposing planes.

NOTE EXPRESS specification:

```

*)
ENTITY tolerance_zone_opposing_boundary_set
  ABSTRACT SUPERTYPE OF (ONEOF (
    tolerance_zone_explicit_opposing_boundary_set,
    tolerance_zone_implicit_opposing_boundary_set))

```

4.2.927 Tolerance_zone_per_unit_size_specification

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Tolerance_zone_per_unit_size_specification is a type of Managed_design_object (see 4.2.524). A Tolerance_zone_per_unit_size_specification is a specification of the Tolerance_zone_boundary (see 4.2.915) that defines the extent of the Tolerance_zone_boundary.

The data associated with a Tolerance_zone_per_unit_size_specification are the following:

- per_unit_size ;
- specified_tolerance_zone;
- zone_definition.

4.2.927.1 per_unit_size

The per_unit_size specifies the role of the Length_data_element (see 4.2.511) that represents the extent of the Tolerance_zone (see 4.2.913) for the Tolerance_zone_per_unit_size_specification. There may be one or two Length_data_elements specified as the per_unit_size for the Tolerance_zone_per_unit_size_specification. If one Length_data_element is specified, it represents the linear extent of the Tolerance_zone. If two Length_data_elements are specified, they represent the rectangular extent of the Tolerance_zone.

4.2.927.2 specified_tolerance_zone

The specified_tolerance_zone specifies the Tolerance_zone (see 4.2.913) the extent of which is defined by the Tolerance_zone_per_unit_size_specification.

4.2.927.3 zone_definition

The zone_definition is an inverse relationship that specifies that the existence of the Tolerance_zone_per_unit_size_specification is dependent on the existence of the Tolerance_zone_definition_with_per_unit_size_specification (see 4.2.921) that specifies the Tolerance_zone_per_unit_size_specification as its per_unit_size_specification.

NOTE EXPRESS specification:

```

*)
ENTITY tolerance_zone_per_unit_size_specification

4.2.928 Topological_junction

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Topological_junction is a type of Managed_design_object (see 4.2.524). A Topological_junction is used when at least three Component_terminal (see 4.2.137) are connected and the explicit topology must be stated.

The data associated with a Topological_junction are the following:

- name;
- scope.

4.2.928.1 name

The name identifies the Topological_junction.

4.2.928.2 scope

The scope specifies the role of the Physical_connectivity_structure_definition (see 4.2.657) for the Topological_junction.

Constraints:

UR1: The combination of the name and the scope shall be unique within a population of Topological_junction.

NOTE EXPRESS specification:

```
*)
ENTITY topological_junction
  SUBTYPE OF (managed_design_object);
    scope : physical_connectivity_structure_definition;
    name  : ee_name;
  UNIQUE
    UR1 : name, scope;
END_ENTITY; -- topological_junction

( *
```

4.2.929 Total_runout_tolerance

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Total_runout_tolerance` is a type of `Geometric_tolerance_with_referenced_datum_system` (see 4.2.422) that specifies or partially specifies the design requirement on the run-out of a `Physical_feature_or_part_template` (see 4.2.658) in relation to a `Datum_axis` (see 4.2.215) of a `Datum_system` (see 4.2.236). Where run-out is the quality or state of having perfect form and axial alignment in relation to an axis. A `Total_runout_tolerance` may either be applied normal to the surface or at a specified angle with respect to the `Datum_axis`. If the `Total_runout_tolerance` is applied at a specified angle the `Tolerance_zone_definition` (see 4.2.920) is a `Runout_tolerance_zone_definition_with_specified_angle` (see 4.2.796). The `Physical_feature_or_part_template` may be either coaxial or normal to the `Datum_axis`.

NOTE Total run-out tolerance is defined in terms of tolerance zone definitions in 14.14 of ISO 1101.

Constraints:

WR1: The `Shape_element` specified as the `toleranced_shape_element` shall be a `Physical_feature_or_part_template`.

NOTE The attribute `toleranced_shape_element` is declared in the `Geometric_tolerance` entity of which this entity is a subtype.

WR2: The `Total_runout_tolerance` shall not be a `Geometric_tolerance_with_applied_material_condition_property`.

WR3: There shall be at most two `Datum` in the `Datum_system` the definition of which is specified by the `datum_system_definition`.

NOTE The attribute `datum_system_definition` is declared in the `Geometric_tolerance_with_referenced_datum_system` entity of which this entity is a subtype.

WR4: There shall be a `Datum_axis` in the `Datum_system` the definition of which is specified by the `datum_system_definition`.

WR5: The `Datum_system_defining_conditions` that is specified as the `datum_system_definition` shall be a `Datum_system_defining_conditions_without_material_conditions`.

WR6: The `Total_runout_tolerance` shall specify a `Tolerance_zone_definition` as its `tolerance_zone_or_boundary_definition`; and that `Tolerance_zone_definition` shall specify a `Tolerance_zone_boundary_definition_with_specified_size` as its `boundary_definition`; and that `Tolerance_zone_boundary_definition_with_specified_size` shall specify an `Opposing_boundary_set_size_characteristic` as its `specified_boundary_size`.

IP1: The form of the `toleranced Physical_feature_or_part_template` shall be consistent with the form of a physical feature for which the application of a total run-out tolerance is sensible.

NOTE EXPRESS specification:

```
*)
ENTITY total_runout_tolerance
  SUBTYPE OF (geometric_tolerance_with_referenced_datum_system);
END_ENTITY; -- total_runout_tolerance

4.2.930 Trace_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Trace_template is a type of Part_template (see 4.2.620) whose purpose is to define the width of a Conductive_interconnect_element (see 4.2.171) and the style of the ends and corners of that Conductive_interconnect_element. A Trace_template may be a Default_trace_template (see 4.2.252). A Trace_template shall not specify a curve_font on the Curve_style (see 4.2.205) specified by trace_style.

EXAMPLE 1 Figure 110 illustrates the cross-section view related to a Trace_template. The parameters included in the illustration are included in the Model_parameter (see 4.2.549) for the associated Analytical_model (see 4.2.14) and will be assigned specific values through Parameter_assignment (see 4.2.603) and associated Analytical_representation (see 4.2.22) application objects.

The data associated with a Trace_template are the following:

— trace_style.

4.2.930.1 trace_style

The trace_style specifies the role of the Curve_style for the Trace_template.

NOTE The Trace_template uses the parametric information in Curve_style, not the graphical presentation information.

NOTE EXPRESS specification:

```
*)
ENTITY trace_template
  SUPERTYPE OF (default_trace_template)
  SUBTYPE OF (part_template);
  trace_style : curve_style;
END_ENTITY; -- trace_template

( *
```

4.2.931 Transmission_line_functional_unit_terminal_allocation

Figure 110 – Trace_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Transmission_line_functional_unit_terminal_allocation` is a type of `Managed_design_object` (see 4.2.524).
A `Transmission_line_functional_unit_terminal_allocation` is the relationship between the occurrence of a `Functional_unit_terminal` (see 4.2.407) of a transmission line and the physical implementation of that occurrence as a `Printed_component_join_terminal` (see 4.2.722).

The data associated with a `Transmission_line_functional_unit_terminal_allocation` are the following:

- `functional_unit_design_path`;
- `implementation`;
- `transmission_line_functional_unit_terminal`.

4.2.931.1 functional_unit_design_path

The `functional_unit_design_path` specifies the `Transmission_line_functional_unit_to_routed_printed_component_allocation` (see 4.2.932) path from the `Functional_unit_terminal` (see 4.2.407) to the `Printed_component_join_terminal` (see 4.2.722) for the `Transmission_line_functional_unit_terminal_allocation`.

4.2.931.2 implementation

The `implementation` specifies the role of the `Printed_component_join_terminal` (see 4.2.722) for the `Transmission_line_functional_unit_terminal_allocation`.

4.2.931.3 transmission_line_functional_unit_terminal

The `transmission_line_functional_unit_terminal` specifies the role of the `Functional_unit_terminal` (see 4.2.407) for this `Transmission_line_functional_unit_terminal_allocation`.

Constraints:

UR1: The combination of the `implementation` and `transmission_line_functional_unit_terminal` shall be unique within a population of `Transmission_line_functional_unit_terminal_allocation`.

NOTE EXPRESS specification:

```

*)
ENTITY transmission_line_functional_unit_terminal_allocation
  SUBTYPE OF (managed_design_object);
    implementation                : printed_component_join_terminal;
    transmission_line_functional_unit_terminal : functional_unit_terminal;
    functional_unit_design_path    :
transmission_line_functional_unit_to_routed_printed_component_allocation;
  UNIQUE
    UR1 : implementation, transmission_line_functional_unit_terminal;
END_ENTITY; -- transmission_line_functional_unit_terminal_allocation

( *

```

4.2.932 Transmission_line_functional_unit_to_routed_printed_component_allocation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Transmission_line_functional_unit_to_routed_printed_component_allocation is a type of Design_functional_unit_allocation_to_assembly_component (see 4.2.263). A transmission_line_functional_unit_to_routed_printed_component_allocation is the allocation of the functional requirements specified by a member of Functional_unit_definition (see 4.2.401) in a hierarchical definition to the Conductive_interconnect_element (see 4.2.171).

The data associated with a Transmission_line_functional_unit_to_routed_printed_component_allocation are the following:

— implementation.

4.2.932.1 implementation

The implementation specifies the role of the Routed_printed_component (see 4.2.779) for the Transmission_line_functional_unit_to_routed_printed_component_allocation.

NOTE EXPRESS specification:

```

*)
ENTITY transmission_line_functional_unit_to_routed_printed_component_allocation
  SUBTYPE OF (design_functional_unit_allocation_to_assembly_component);
  SELF\design_functional_unit_allocation_to_assembly_component.implementation :
  routed_printed_component;
END_ENTITY;
-- transmission_line_functional_unit_to_routed_printed_component_allocation

--tt tc1 wd12 modified
--tt tc1 wd9 modified
( *
```

4.2.933 Trimmed_line

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Trimmed_line is a type of Curve (see 4.2.203) that has a defined, finite extent. The Trimmed_line shall be interpreted as a trimmed curve.

NOTE The Trimmed_line is necessary to support the specification of precise, metric geometry.

NOTE EXPRESS specification:

```

*)
ENTITY trimmed_line
  SUBTYPE OF (curve);
  start_point : cartesian_point;
  end_point : cartesian_point;
END_ENTITY; -- trimmed_line

( *
```

4.2.934 True_profile

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A True_profile is a type of Managed_design_object (see 4.2.524). A True_profile is a definition that characterizes the theoretically exact shape of a Physical_feature_or_part_template (see 4.2.658).

The data associated with a True_profile are the following:

- boundary_definition;
- profile_representation;
- profiled_surface.

4.2.934.1 boundary_definition

The boundary_definition is an inverse relationship that specifies that the existence of the True_profile is dependent on the existence of the Profile_boundary_definition (see 4.2.742) that specifies the True_profile as its basic_profile. There shall be one or more Profile_boundary_definition for a True_profile.

4.2.934.2 profile_representation

The profile_representation specifies one of a Bound_volume_shape (see 4.2.76), a Dimension_set (see 4.2.297), an Ee_document (see 4.2.316), or an Ee_rule_function (see 4.2.334) that represents the True_profile.

4.2.934.3 profiled_surface

The profiled_surface specifies the Physical_feature_or_part_template (see 4.2.658) that is characterized by the True_profile

NOTE EXPRESS specification:

```

*)
ENTITY true_profile
  SUBTYPE OF (managed_design_object);
  profiled_surface      : physical_feature_or_part_template;
  profile_representation : true_profile_representations;
  INVERSE
    boundary_definition : SET [1:?] OF profile_boundary_definition FOR
                                basic_profile;
END_ENTITY; -- true_profile

( *
```

4.2.935 Type_qualifier

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Type_qualifier is a type of Managed_design_object (see 4.2.524) which specifies an uncertainty. The uncertainty is defined in clause 2 of "The Guide to the Expression of Uncertainty in Measurement".

NOTE EXPRESS specification:

```
*)
ENTITY type_qualifier
  SUBTYPE OF (managed_design_object);
  name : label;
END_ENTITY;
(*
```

4.2.936 Uncertainty_qualifier

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Uncertainty_qualifier is a type of Managed_design_object (see 4.2.524). The uncertainty may be Standard_uncertainty or Qualitative_uncertainty. The uncertainty is defined in clause 2 of "The Guide to the Expression of Uncertainty in Measurement".

NOTE EXPRESS specification:

```
*)
ENTITY uncertainty_qualifier
  SUPERTYPE OF (ONEOF(standard_uncertainty, qualitative_uncertainty))
  SUBTYPE OF (managed_design_object);
  measure_name : text;
  description : text;
END_ENTITY;
(*
```

4.2.937 Unrouted_conductive_interconnect_element

An Unrouted_conductive_interconnect_element is a type of Unrouted_conductive_interconnect_element (see 4.2.937). The data provided by Unrouted_conductive_interconnect_element is provided to identify an unrouted portion of a Physical_network (see 4.2.660).

The data associated with an Unrouted_conductive_interconnect_element are the following:

— connected_point.

4.2.937.1 connected_point

The connected_point specifies the role of the Layer_connection_point_link (see 4.2.500) for the Unrouted_conductive_interconnect_element. There shall be one or more Layer_connection_point_link for an Unrouted_conductive_interconnect_element. No Layer_connection_point_link shall be specified more than once as a connected_point for an Unrouted_conductive_interconnect_element.

NOTE EXPRESS specification:

```

*)
ENTITY unrouted_conductive_interconnect_element
  SUBTYPE OF (conductive_interconnect_element);
  connected_points : SET [1:?] OF layer_connection_point_link;
WHERE
  WR1: NOT(EXISTS(SELF\conductive_interconnect_element.composed_conductor));
END_ENTITY; -- unrouted_conductive_interconnect_element
( *

```

4.2.938 Unrouted_join_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Unrouted_join_relationship is a type of Join_relationship (see 4.2.479), in which the terminals referenced, Laminate_component_join_terminal (see 4.2.486), have not been converted into another type of Join_relationship. An Unrouted_join_relationship is an identification of items that are unrouted in a Physical_network.

NOTE EXPRESS specification:

```

*)
ENTITY unrouted_join_relationship
  SUBTYPE OF (join_relationship);
  unrouted_terminals : SET [2:?] OF laminate_component_join_terminal;
END_ENTITY; -- unrouted_join_relationship
( *

```

4.2.939 Unsupported_passage

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Unsupported_passage is a type of Inter_stratum_feature (see 4.2.432) that has no metallization in the realization of its walls.

The data associated with an Unsupported_passage are the following:

— usage_definition.

4.2.939.1 usage_definition

The usage_definition specifies the role of the Unsupported_passage_template (see 4.2.941) for the Unsupported_passage.

Constraints:

WR1: An Unsupported_passage shall be an inner feature.

NOTE EXPRESS specification:

```
*)  
ENTITY unsupported_passage  
    SUBTYPE OF (inter_stratum_feature);  
    SELF\assembly_component.usage_definition : unsupported_passage_template;  
END_ENTITY; -- unsupported_passage  
  
(*
```

4.2.940 Unsupported_passage_dependent_non_functional_land

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Unsupported_passage_dependent_non_functional_land is a type of Non_functional_land (see 4.2.562) whose shape is dependent upon the shape of an Unsupported_passage.

The data associated with an Unsupported_passage_dependent_non_functional_land are the following:

- reference_passage;
- usage_definition.

4.2.940.1 reference_passage

The reference_passage specifies the role of the Unsupported_passage (see 4.2.939) for the Unsupported_passage_dependent_non_functional_land.

4.2.940.2 usage_definition

The usage_definition specifies the role of the Default_unsupported_passage_based_land_physical_template (see 4.2.253) for the Unsupported_passage_dependent_non_functional_land.

NOTE EXPRESS specification:

```

*)
ENTITY unsupported_passage_dependent_non_functional_land
  SUBTYPE OF (non_functional_land);
    reference_passage : unsupported_passage;
    SELF\assembly_component.usage_definition :
default_unsupported_passage_based_land_physical_template;
END_ENTITY; -- unsupported_passage_dependent_non_functional_land

( *

```

4.2.941 Unsupported_passage_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

An Unsupported_passage_template is a type of Inter_stratum_feature_template (see 4.2.435).

NOTE The Unsupported_passage_template associates shape information with the passage_technology parametric property information. "Unsupported" carries the meaning that the passage is not mechanically or electrically supported by deposited sidewalls.

The data associated with an Unsupported_passage_template are the following:

— of_passage_technology.

4.2.941.1 of_passage_technology

The of_passage_technology specifies the role of the Default_unsupported_passage_definition (see 4.2.254) for the Unsupported_passage_template.

NOTE EXPRESS specification:

```

*)
ENTITY unsupported_passage_template
  SUPERTYPE OF (ONEOF (counterbore_passage_template,
    countersunk_passage_template, blind_passage_template))
  SUBTYPE OF (inter_stratum_feature_template);
    SELF\inter_stratum_feature_template.of_passage_technology :
default_unsupported_passage_definition;
END_ENTITY; -- unsupported_passage_template

( *

```

4.2.942 Usage_concept_usage_relationship

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Usage_concept_usage_relationship` is a type of `Managed_design_object` (see 4.2.524). A `Usage_concept_usage_relationship` is the association between a `Component_termination_passage_template_terminal` (see 4.2.153), a `Land_template_terminal` (see 4.2.496), a `Part_feature` (see 4.2.609), a `Part_template` (see 4.2.620), a `Physical_unit_usage_view` (see 4.2.672), a `Printed_part_template_terminal` (see 4.2.737), or a `Via_template_terminal` (see 4.2.953), as a source and a `Component_termination_passage_template_terminal`, a `Land_template_terminal`, a `Part_feature`, a `Part_template`, a `Physical_unit_usage_view`, a `Printed_part_template_terminal` or a `Via_template_terminal` as a target. This relationship positions and orients the geometric model of the source into the model of the target using a transformation.

The data associated with an `Usage_concept_usage_relationship` are the following:

- `associated_usage`;
- `associated_usage_placement`;
- `associating_usage`.

4.2.942.1 `associated_usage`

The `associated_usage` specifies either a `Component_termination_passage_template_terminal` (see 4.2.153), a `Land_template_terminal` (see 4.2.496), a `Part_feature` (see 4.2.609), a `Part_template` (see 4.2.620), a `Physical_unit_usage_view` (see 4.2.672), a `Printed_part_template_terminal` (see 4.2.737), or a `Via_template_terminal` (see 4.2.953) as the target item for the `Usage_concept_usage_relationship`.

4.2.942.2 `associated_usage_placement`

The `associated_usage_placement` specifies the `Axis_placement` (see 4.2.56) of the target item in the coordinate system of the source item for the `Usage_concept_usage_relationship`, including any transformation required.

4.2.942.3 `associating_usage`

The `associating_usage` specifies either a `Component_termination_passage_template_terminal` (see 4.2.153), a `Land_template_terminal` (see 4.2.496), a `Part_feature` (see 4.2.609), a `Part_template` (see 4.2.620), a `Physical_unit_usage_view` (see 4.2.672), a `Printed_part_template_terminal` (see 4.2.737), or a `Via_template_terminal` (see 4.2.953) as the source item for the `Usage_concept_usage_relationship`.

Constraints:

WR1: No member specified by `associated_usage` or by `associating_usage` shall be an ancestor or descendant of itself.

IP1: All necessary geometric model relationships to support this requirement shall be included.

NOTE EXPRESS specification:

```

*)
ENTITY usage_concept_usage_relationship
  SUBTYPE OF (managed_design_object);
    associating_non_feature_usage_shape : OPTIONAL non_feature_shape_definition;
    associating_usage_shape      : OPTIONAL part_template_or_physical_unit_shape_select;
    associated_usage              : usage_concept;
    associated_shape_definition : shape_definition;
    associated_usage_placement : axis_placement_or_cto2d;
WHERE
  WR1: (EXISTS (associating_non_feature_usage_shape)) XOR
        (EXISTS (associating_usage_shape));
  WR2: NOT(EXISTS (associating_non_feature_usage_shape)) OR
        ('AP210_ARM.NON_FEATURE_SHAPE_DEFINITION'
         IN TYPEOF(associated_shape_definition));
  WR3: NOT(EXISTS (associating_usage_shape)) OR
        ('AP210_ARM.FEATURE_SHAPE_DEFINITION'
         IN TYPEOF(associated_shape_definition));
  WR4: NOT('AP210_ARM.CARTESIAN_TRANSFORMATION_OPERATOR_2D' IN
          TYPEOF(associated_usage_placement)) OR
        NOT(EXISTS(associating_usage_shape));
END_ENTITY; -- usage_concept_usage_relationship
( *

```

4.2.943 Usage_view_connection_zone_terminal_shape_relationship

A Usage_view_connection_zone_terminal_shape_relationship is a type of Managed_design_object (see 4.2.524). This relationship positions and orients the geometric model of a Connection_zone into the model of feature using a transformation. The interpretation of the associated_connection_zone_shape_definition shall be that it shall be a shape_representation for the Connection_zone in the role of associated_usage.

The data associated with an Usage_view_connection_zone_terminal_shape_relationship are the following:

- associating_terminal_shape;
- associated_usage;
- associated_connection_zone_shape_definition;
- associated_usage_placement.

4.2.943.1 associating_terminal_shape

The associating_terminal_shape specifies the Feature_shape_definition (see 4.2.372) that is the model shape for the Usage_view_connection_zone_terminal_shape_relationship.

4.2.943.2 associated_usage

The associated_usage specifies the Connection_zone (see 4.2.185) that is the target item for the Usage_view_connection_zone_terminal_shape_relationship.

4.2.943.3 associated_connection_zone_shape_definition

The associated_connection_zone_shape_definition specifies the Connection_zone_shape (see ??) that is the source shape for the Usage_view_connection_zone_terminal_shape_relationship.

4.2.943.4 associated_usage_placement

The associated_usage_placement specifies the Axis_placement (see 4.2.56) that is the target in the coordinate system of the model for the Usage_view_connection_zone_terminal_shape_relationship, including any transformation required.

NOTE EXPRESS specification:

```

*)
ENTITY usage_view_connection_zone_terminal_shape_relationship
  SUBTYPE OF (managed_design_object);
    associating_terminal_shape          : feature_shape_definition;
    associated_usage                     : connection_zone;
    associated_connection_zone_shape_definition : feature_shape_definition;
    associated_usage_placement           : axis_placement;
WHERE
  WR1: associating_terminal_shape :#60;#62;;
    associated_connection_zone_shape_definition;
  END_ENTITY; -- usage_view_connection_zone_terminal_shape_relationship

```

4.2.944 User_defined_dimension_qualifier

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A User_defined_dimension_qualifier is a type of Dimension_qualifier (see 4.2.294) that requires a more detailed description than those stated for a Pre_defined_dimension_qualifier (see 4.2.707).

The data associated with an User_defined_dimension_qualifier are the following:

- description;
- name.

4.2.944.1 description

The description specifies the text that describes the manner in which the Dimensional_characteristic (see 4.2.298) that are specified as the qualified_dimensions are qualified by the User_defined_dimension_qualifier.

NOTE The attribute qualified_dimensions is declared in the Dimension_qualifier entity of which this entity is a subtype.

4.2.944.2 name

The name specifies the label for the User_defined_dimension_qualifier by which it is referred.

NOTE EXPRESS specification:

```
*)
ENTITY user_defined_dimension_qualifier
  SUBTYPE OF (dimension_qualifier);
  description : text;
  name       : text;
END_ENTITY; -- user_defined_dimension_qualifier

( *
```

4.2.945 User_defined_geometric_tolerance_qualifier

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A User_defined_geometric_tolerance_qualifier is a type of Geometric_tolerance_qualifier (see 4.2.420) that requires a more detailed description than those stated for a Pre_defined_geometric_tolerance_qualifier (see 4.2.708).

The data associated with an User_defined_geometric_tolerance_qualifier are the following:

- description;
- name.

4.2.945.1 description

The description specifies the text that describes the manner in which the Geometric_tolerance (see 4.2.419) that are specified as the qualified_geometric_tolerances are qualified by the User_defined_geometric_tolerance_qualifier.

NOTE The attribute qualified_geometric_tolerances is declared in the Geometric_tolerance_qualifier entity of which this entity is a subtype.

4.2.945.2 name

The name specifies the label for the User_defined_geometric_tolerance_qualifier by which it is referred.

NOTE EXPRESS specification:

```
*)
ENTITY user_defined_geometric_tolerance_qualifier
  SUBTYPE OF (geometric_tolerance_qualifier);
  description : text;
  name       : text;
END_ENTITY; -- user_defined_geometric_tolerance_qualifier

( *
```

4.2.946 Vector

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Vector is a type of Managed_design_object (see 4.2.524). A Vector is a quantity that has magnitude and direction and that is commonly represented by a directed line segment whose length represents the magnitude and whose orientation in space represents the direction.

NOTE EXPRESS specification:

```
*)
ENTITY vector
  SUBTYPE OF (managed_design_object);
END_ENTITY; -- vector

( *
```

4.2.947 Via

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Via is a type of Plated_passage (see 4.2.690). A Via is one of a Blind_via (see 4.2.71), a Buried_via (see 4.2.81), or an Interfacial_connection (see 4.2.474). Via is defined in IEC 60050-541.

EXAMPLE 1 Figure 111 illustrates a padstack that contains a Via.

The data associated with a Via are the following:

— usage_definition.

**Figure 111 – Via**

4.2.947.1 usage_definition

The usage_definition specifies the role of the Via_template (see 4.2.952) for the Via.

Constraints:

WR1: A Via shall not interface to an external device. This fact shall be represented by a value of the attribute feature_of_size on the supertype Inter_stratum_feature being set to "FALSE".

NOTE EXPRESS specification:

```
*)
ENTITY via

4.2.948 Via_and_contact_size_dependent_land

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Via_and_contact_size_dependent_land is a type of Land (see 4.2.490) whose shape is dependent upon a Via (see 4.2.947) as well as the size of a Component terminal (see 4.2.137).

The data associated with a Via_and_contact_size_dependent_land are the following:

- interface_access_mechanism;
- reference_via;
- usage_definition.

4.2.948.1 interface_access_mechanism

The interface_access_mechanism is an inverse relationship that specifies that the existence of the Via_and_contact_size_dependent_land is dependent on the existence of the Land_interface_terminal (see 4.2.491) that specifies the Via_and_contact_size_dependent_land as its associated_component. This relationship is for external access only.

4.2.948.2 reference_via

The reference_via specifies the role of the Via (see 4.2.947) for the Via_and_contact_size_dependent_land.

4.2.948.3 usage_definition

The usage_definition specifies the role of the Default_attachment_size_and_via_based_land_physical_template (see 4.2.246) for the Via_and_contact_size_dependent_land.

NOTE EXPRESS specification:

```

*)
ENTITY via_and_contact_size_dependent_land
  SUBTYPE OF (land);
    SELF\assembly_component.usage_definition :

```

4.2.949 Via_and_contact_size_dependent_non_functional_land

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Via_and_contact_size_dependent_non_functional_land is a type of Non_functional_land (see 4.2.562) whose shape is dependent on a Via (see 4.2.947) as well as the size of a Component terminal (see 4.2.137).

NOTE The shape is primarily a function of the mating terminal.

The data associated with a Via_and_contact_size_dependent_non_functional_land are the following:

- interface_access_mechanism;
- reference_via;
- usage_definition.

4.2.949.1 interface_access_mechanism

The `interface_access_mechanism` is an inverse relationship that specifies that the existence of the `Via_and_contact_size_dependent_non_functional_land` is dependent on the existence of the `Non_functional_land_interface_terminal` (see 4.2.563) that specifies the `Via_and_contact_size_dependent_non_functional_land` as its `associated_component`. This relationship is for external access only.

4.2.949.2 reference_via

The `reference_via` specifies the role of the `Via` (see 4.2.947) for the `Via_and_contact_size_dependent_non_functional_land`.

4.2.949.3 usage_definition

The `usage_definition` specifies the role of the `Default_via_based_land_physical_template` (see 4.2.255) for the `Via_and_contact_size_dependent_non_functional_land`.

NOTE EXPRESS specification:

```

*)
ENTITY via_and_contact_size_dependent_non_functional_land

```

4.2.950 Via_dependent_land

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Via_dependent_land` is a type of `Land` (see 4.2.490) whose shape is dependent only on a `Via` (see 4.2.947).

The data associated with a `Via_dependent_land` are the following:

- `reference_via`;
- `usage_definition`.

4.2.950.1 reference_via

The reference_via specifies the role of the Via (see 4.2.947) for the Via_dependent_land.

4.2.950.2 usage_definition

The usage_definition specifies the role of the Default_via_based_land_physical_template (see 4.2.255) for the Via_dependent_land.

NOTE EXPRESS specification:

```

*)
ENTITY via_dependent_land
  SUBTYPE OF (land);
    reference_via                      : via;
    SELF\assembly_component.usage_definition :
default_via_based_land_physical_template;
END_ENTITY; -- via_dependent_land

( *
```

4.2.951 Via_dependent_non_functional_land

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Via_dependent_non_functional_land is a type of Non_functional_land (see 4.2.562) whose shape is dependent only on a Via (see 4.2.947).

The data associated with a Via_dependent_non_functional_land are the following:

- reference_via;
- usage_definition.

4.2.951.1 reference_via

The reference_via specifies the role of the Via (see 4.2.947) for the Via_dependent_non_functional_land.

4.2.951.2 usage_definition

The usage_definition specifies the role of the Default_via_based_land_physical_template (see 4.2.255) for the Via_dependent_non_functional_land.

NOTE EXPRESS specification:

```

*)
ENTITY via_dependent_non_functional_land
  SUBTYPE OF (non_functional_land);
    reference_via : via;
    SELF\assembly_component.usage_definition :
default_via_based_land_physical_template;
END_ENTITY; -- via_dependent_non_functional_land

( *

```

4.2.952 Via_template

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Via_template is a type of Inter_stratum_feature_template (see 4.2.435).

NOTE A Via_template provides a template for a plated passage that supports the realization of connectivity. The access_mechanisms attribute relates the Via_template to two or more terminals, thereby capturing complete connectivity information.

The data associated with a Via_template are the following:

- access_mechanisms;
- of_passage_technology.

4.2.952.1 access_mechanisms

The access_mechanisms is an inverse relationship that specifies that the existence of the Via_template is dependent on the existence of the Via_template_terminal (see 4.2.953) that specifies the Via_template as its associated_definition. There shall be two or more Via_template_terminals for a Via_template.

4.2.952.2 of_passage_technology

The of_passage_technology specifies the role of the Default_via_definition (see 4.2.256) for the Via_template.

NOTE EXPRESS specification:

```

*)
ENTITY via_template
  SUBTYPE OF (inter_stratum_feature_template);
  SELF\inter_stratum_feature_template.of_passage_technology :
  default_via_definition;
  INVERSE
    access_mechanisms : SET [2:?] OF via_template_terminal FOR
    associated_definition;
END_ENTITY; -- via_template

( *
```

4.2.953 Via_template_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Via_template_terminal` is a type of `Shape_element` (see 4.2.810). A `Via_template_terminal` is a terminal in a `Via_template` (see 4.2.952). A `Via_template_terminal` is a terminal that is congruent with the exterior surface of the cylinder of the `Via` (see 4.2.947), including material covered by joined members of `Land` (see 4.2.490). The fabrication join capability is optionally constrained by a set of `Stratum` (see 4.2.845).

The data associated with a `Via_template_terminal` are the following:

- `associated_definition`;
- `disallowed_inter_stratum_extent`;
- `name`;
- `terminal_connection_zone`.

EXAMPLE 1 Figure 112 illustrates an abstraction of the cylinder associated with a `Via` and the associated terminal. Because a `Via` is always an internal design object, there are no interface or join subtypes. A usage view is included that defines the terminal to be just the external wall of the `Via`.

4.2.953.1 associated_definition

The `associated_definition` specifies the role of the `Via_template` (see 4.2.952) for the `Via_template_terminal`.

Figure 112 – Via_template_terminal

4.2.953.2 **disallowed_inter_stratum_extent**

The `disallowed_inter_stratum_extent` specifies the `Inter_stratum_extent` (see 4.2.431) for which a connection to the `Via_template_terminal` is disallowed. The `disallowed_inter_stratum_extent` need not be supplied for a `Via_template_terminal`. There may be more than one `Inter_stratum_extent` for a `Via_template_terminal`.

4.2.953.3 **name**

The name identifies the `Via_template_terminal`.

4.2.953.4 **terminal_connection_zone**

The `terminal_connection_zone` specifies the role of the `Connection_zone` (see 4.2.185) for the `Via_template_terminal`. There may be one or more `Connection_zone` for the `Via_template_terminal`. The `terminal_connection_zone` is optional and need not be supplied if the data is unavailable in the source system. If the data is available in the source system, the data shall be provided.

Constraints:

UR1: The combination of the name and `associated_definition` shall be unique within a population of `Via_template_terminal`.

NOTE EXPRESS specification:

```

*)
ENTITY via_template_terminal
  SUBTYPE OF (shape_element);
    associated_definition          : via_template;
    disallowed_inter_stratum_extent : OPTIONAL inter_stratum_extent;
    SELF\shape_element.name       : ee_name;
    terminal_connection_zone       : OPTIONAL SET [1:?] OF connection_zone;
INVERSE
  terminal_shape          : SET [0:1] OF usage_concept_usage_relationship FOR
  associated_usage;
  UNIQUE
    UR1 : name, associated_definition;
END_ENTITY; -- via_template_terminal

( *
```

4.2.954 **Via_terminal**

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `Via_terminal` is a type of `Component_terminal` (see 4.2.137). A `Via_terminal` is associated with the larger diameter wall of the `Via` that geometrically approximates a hollow cylinder with some thickness.

NOTE Since the `Via` itself is not allowed to interface to an item external to the interconnect, there is no concept of a join or interface terminal associated with a `Via`. The `Via_terminal` is collocated with and congruent with the entire external wall of the cylinder and may be fastened to as often as necessary.

The data associated with a `Via_terminal` are the following:

- `associated_component`;
- `definition`.

4.2.954.1 associated_component

The `associated_component` specifies the role of the `Via` (see 4.2.947) for the `Via_terminal`.

4.2.954.2 definition

The `definition` specifies the role of the `Via_template_terminal` (see 4.2.953) for the `Via_terminal`.

NOTE EXPRESS specification:

```
*)
ENTITY via_terminal
  SUBTYPE OF (laminar_component_feature);
    SELF\component_feature.definition          : via_template_terminal;
    SELF\component_feature.associated_component : via;
END_ENTITY; -- via_terminal

(*
```

4.2.955 View_level_non_feature_shape_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A `View_level_non_feature_shape_definition` is a type of `Non_feature_shape_definition` (see 4.2.559).

The data associated with a `View_level_non_feature_shape_definition` are the following:

- `model_shape`.

4.2.955.1 model_shape

The `model_shape` specifies the role of the `Feature_shape_definition` (see 4.2.372) for the `View_level_non_feature_shape_definition`.

NOTE EXPRESS specification:

```

*)
ENTITY view_level_non_feature_shape_definition
  SUBTYPE OF (non_feature_shape_definition);
  SELF\non_feature_shape_definition.model_shape : view_shape_select;
END_ENTITY; -- view_level_non_feature_shape_definition
( *

```

4.2.956 Viewing_plane

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Viewing_plane is a type of Non_feature_shape_element (see 4.2.560) that is a plane to which a Tolerance_zone_boundary (see 4.2.915) is oriented.

The data associated with a Viewing_plane are the following:

— viewing_plane_specification.

4.2.956.1 viewing_plane_specification

A viewing_plane_specification is an inverse relationship that specifies that the existence of the Viewing_plane is dependent on the existence of the Viewing_plane_definition (see 4.2.958) that specifies the Viewing_plane as its defined_viewing_plane.

NOTE EXPRESS specification:

```

*)
ENTITY viewing_plane
  SUBTYPE OF (non_feature_shape_element);
  INVERSE
    viewing_plane_specification : viewing_plane_definition FOR
                                defined_viewing_plane;
END_ENTITY; -- viewing_plane
( *

```

4.2.957 Viewing_plane_based_orientation

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Viewing_plane_based_orientation is a type of Managed_design_object (see 4.2.524). A Viewing_plane_based_orientation is a definition that characterizes the orientation of a Tolerance_zone (see 4.2.913) with respect to a Viewing_plane (see 4.2.956).

The data associated with a Viewing_plane_based_orientation are the following:

- orienting_relationship;
- viewing_plane_specification.

4.2.957.1 orienting_relationship

The orienting_relationship specifies the Tolerance_zone_and_viewing_plane_orienting_relationship (see 4.2.914) that associates the Tolerance_zone (see 4.2.913) with the Viewing_plane (see 4.2.956) with which it is oriented.

4.2.957.2 viewing_plane_specification

The viewing_plane_specification specifies a Viewing_plane_definition (see 4.2.958) that characterizes the Viewing_plane (see 4.2.956) with which the Tolerance_zone (see 4.2.913) is oriented.

Constraints:

WR1: The Viewing_plane_based_orientation shall be specified as the zone_orientation by exactly one Tolerance_zone_definition_with_specified_orientation.

WR2: The Viewing_plane specified as the defined_viewing_plane by the Viewing_plane_definition that is specified as the viewing_plane_specification shall be the same instance of Viewing_plane as specified as the orienting_viewing_plane by the Tolerance_zone_and_viewing_plane_orienting_relationship that is specified as the orienting_relationship.

NOTE EXPRESS specification:

```

*)
ENTITY viewing_plane_based_orientation
  SUBTYPE OF (managed_design_object);
    orienting_relationship      :
tolerance_zone_and_viewing_plane_orienting_relationship;
    viewing_plane_specification : viewing_plane_definition;
END_ENTITY; -- viewing_plane_based_orientation

( *
```

4.2.958 Viewing_plane_definition

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Viewing_plane_definition is a type of Managed_design_object (see 4.2.524). A Viewing_plane_definition is a definition that characterizes a Viewing_plane (see 4.2.956).

The data associated with a `Viewing_plane_definition` are the following:

- `defined_viewing_plane`;
- `viewing_plane_representation`;
- `zone_orientation`.

4.2.958.1 `defined_viewing_plane`

The `defined_viewing_plane` specifies the `Viewing_plane` (see 4.2.956) that is characterized by the `Viewing_plane_definition`, and with which the specified `Tolerance_zone` (see 4.2.913) is oriented.

4.2.958.2 `viewing_plane_representation`

The `viewing_plane_representation` specifies the `Axis_placement` (see 4.2.56) that characterizes the `Viewing_plane` (see 4.2.956) for the `Viewing_plane_definition`.

4.2.958.3 `zone_orientation`

The `zone_orientation` is an inverse relationship that specifies that the existence of the `Viewing_plane_definition` is dependent on the existence of the `Viewing_plane_based_orientation` (see 4.2.957) that specifies the `Viewing_plane_definition` as its `viewing_plane_specification`.

NOTE EXPRESS specification:

```

4.2.960 Volume_shape_intersection

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Volume_shape_intersection is a type of Managed_design_object (see 4.2.524). A Volume_shape_intersection may be one of Edge_segment_cross_section (see 4.2.311), or Pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship (see 4.2.714), or Pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship (see 4.2.712), or Pre_defined_parallel_datum_axis_symbol_3d_2d_relationship (see 4.2.710). A Volume_shape_intersection is the projection into two dimensions of a three-dimensional shape based on the intersection of a plane with the three-dimensional shape.

The data associated with a Volume_shape_intersection are the following:

- orientation_intersection_plane;
- planar_shape_origin;
- projected_volume;
- surface_projection.

4.2.960.1 orientation_intersection_plane

The orientation_intersection_plane specifies the role of the Axis_placement_3d (see 4.2.58) for the Volume_shape_intersection. The Z axis of the Axis_placement_3d shall define the normal of the plane.

4.2.960.2 planar_shape_origin

The planar_shape_origin specifies the role of the Axis_placement_2d (see 4.2.57) for the Volume_shape_intersection. The Axis_placement_2d shall define the two dimensional coordinate system.

4.2.960.3 projected_volume

The projected_volume specifies the role of the Bound_volume_shape (see 4.2.76) for the Volume_shape_intersection.

4.2.960.4 surface_projection

The surface_intersection_result specifies the role of the Planar_projected_shape (see 4.2.677) for the Volume_shape_intersection.

NOTE EXPRESS specification:

4.2.963 Wire_terminal

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Wire_terminal is a type of a Package_terminal (see 4.2.581) whose core_material is inherently flexible and ready for installation to a Pca (see 4.2.639) without prior formal preparation by shape modification. The shape of the Wire_terminal is incompletely defined in the library.

NOTE The Feature_shape_occurrence (see ??) inherited by the terminal may be the same Feature_shape_occurrence that is specified by the associated Connection_zone (see 4.2.185). In this case the whole terminal is the Connection_zone.

The data associated with a Wire_terminal are the following:

- internal_connection_zone;
- maximum_wire_terminal_length;
- minimum_wire_terminal_length.

4.2.963.1 internal_connection_zone

The internal_connection_zone specifies the role of a Connection_zone (see 4.2.185) for the Wire_terminal. There shall be one or more Connection_zone for the Wire_terminal. The internal_connection_zone is mandatory because it locates the end of the wire that is the attachment area on the package body.

4.2.963.2 maximum_wire_terminal_length

The maximum_wire_terminal_length specifies the Length_data_element (see 4.2.511) for the maximum length of the Wire_terminal.

4.2.963.3 minimum_wire_terminal_length

The minimum_wire_terminal_length specifies the Length_data_element (see 4.2.511) for the minimum length of the Wire_terminal.

NOTE EXPRESS specification:

```

*)
ENTITY wire_terminal
  SUBTYPE OF (package_terminal);

```

4.2.964 Work_order

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Work_order is a type of Managed_design_object (see 4.2.524). A Work_order is one of a Change_order (see 4.2.96) or a Start_order (see 4.2.838), and is a document that authorizes work in the development of an initial or modified design of a product. A Work_order is the result of the processing of one or more Work_request (see 4.2.965).

The data associated with a Work_order are the following:

- additional_data;
- analysis_data;
- authorizing_agreement;
- initiator;
- referenced_work_request;
- release_date;
- resulting_product;
- start_date;
- work_order_approval;
- work_order_id.

4.2.964.1 additional_data

The additional_data specifies the Ee_text (see 4.2.339) that provides additional pertinent information that was compiled during the development of the related set of Work_request (see 4.2.965) for the Work_order. The additional_data need not be specified for a particular Work_order.

4.2.964.2 analysis_data

The analysis_data specifies the Ee_text (see 4.2.339) for the result of an assessment performed to validate the design or modification in a related set of Work_requests for the Work_order. The analysis_data need not be specified for a particular Work_order.

4.2.964.3 authorizing_agreement

The authorizing_agreement specifies the role of the Contract (see 4.2.196) for the Work_order. The authorizing_agreement need not be provided for a Work_order.

4.2.964.4 initiator

The initiator specifies either the Person_and_organization (see 4.2.647) or the Organization (see 4.2.569), that initiates the Work_order. There shall be one or more Person_and_organization or Organization for the Work_order.

4.2.964.5 referenced_work_request

The referenced_work_request specifies the Organization (see 4.2.569) that initiated this Work_order. There shall be one or more Organization (see 4.2.569) for a Work_order.

4.2.964.6 release_date

The release_date specifies either the Date (see 4.2.212) or the Date_and_time (see 4.2.213) upon which the Work_order is released.

4.2.964.7 resulting_product

The resulting_product specifies the Ee_product_version (see 4.2.328) of the objects that are the subject of the Work_order. There shall be one or more Ee_product_version for a Work_order.

4.2.964.8 start_date

The start_date specifies either the Date (see 4.2.212) or the Date_and_time (see 4.2.213) upon which the Work_order is begun.

4.2.964.9 work_order_approval

The work_order_approval specifies the Ee_approval (see 4.2.314) that applies to the Work_order.

4.2.964.10 work_order_id

The work_order_id specifies the identifier of the Work_order.

Constraints:

UR1: The work_order_id shall be unique within a population of Work_order.

WR1: The resulting_product and the referenced_work_request shall specify the same Ee_product_version.

NOTE EXPRESS specification:

```

4.2.965 Work_request

NOTE The text description for this Application Object has not been fully updated to agree with the EXPRESS.

A Work_request is a type of Managed_design_object (see 4.2.524). A Work_request is either a Change_request (see 4.2.97) or a Start_request (see 4.2.839), a document that identifies the work to be done to initiate or redefine the design of a part.

The data associated with a Work_request are the following:

- description;
- implementation_order;
- initiator;
- reason;
- referenced_product;
- request_date;
- request_recipient;
- status;
- work_request_approval;
- work_request_id.

4.2.965.1 description

The description specifies the Ee_text (see 4.2.339) information of the work to be done to create or change the design of a product by a Work_request.

4.2.965.2 implementation_order

The implementation_order is an inverse relationship that specifies the Work_order (see 4.2.964) that specifies the Work_request as its referenced_work_request. There shall be no more than one Work_order for a Work_request.

4.2.965.3 initiator

The initiator specifies either the Person_and_organization (see 4.2.647) or the Organization that initiates the Work_request. There shall be one or more Person_and_organization or Organization (see 4.2.569) for a Work_request.

4.2.965.4 reason

The reason specifies the Ee_text (see 4.2.339) or the Evaluated_characteristic (see 4.2.356) which is the purpose for generating the Work_request.

4.2.965.5 referenced_product

The referenced_product specifies the specific Ee_product_version (see 4.2.328) that shall be the subject of the Work_request. There shall be one or more Ee_product_version for the Work_request.

4.2.965.6 request_date

The request_date specifies either the Date (see 4.2.212) or the Date_and_time (see 4.2.213) when the Work_request was initiated.

4.2.965.7 request_recipient

The request_recipient specifies either the Person_and_organization (see 4.2.647) or the Organization (see 4.2.569) that will receive the Work_request and take whatever action is called out in it. There shall be one or more Person_and_organization or Organization for a Work_request.

4.2.965.8 status

The status specifies the text that describes the current level of completion of the Work_request.

EXAMPLE 1 Example values for the status of a Work_request may be proposed, in-work, issued, and hold.

4.2.965.9 work_request_approval

The work_request_approval specifies the Ee_approval (see 4.2.314) for the Work_request before it is to be acted upon.

4.2.965.10 work_request_id

The work_request_id specifies the Ee_text (see 4.2.339) identifier for the proposed work on a product's design.

Constraints:

UR1: The work_request_id shall be unique in a population of Work_request.

IP1: The work_request_id shall be unique in a population of Work_request in an Organization.

IP2: Each member of Work_request shall have at least one member of Change_request or Start_request in the role of change_or_start_request.

NOTE EXPRESS specification:

```

*)
ENTITY work_request

4.3 Application assertions

This subclause specifies the application assertions for the application protocol. Application assertions specify the relationships between application objects, the cardinality of the relationships, and the rules required for the integrity and validity of the application objects and UoFs. The application assertions and their definitions are given below.

4.3.1 Add_design_object_management_relationship to Managed_design_object

Each Add_design_object_management_relationship has current_design_object defined by exactly one Managed_design_object. Each Managed_design_object defines current_design_object for zero, one, or more Add_design_object_management_relationship objects.

4.3.2 Adjacent_stratum_surface_definition to Stratum_surface

Each Adjacent_stratum_surface_definition has subsequent_surface defined by exactly one Stratum_surface. Each Stratum_surface defines subsequent_surface for zero, one, or more Adjacent_stratum_surface_definition objects. Each Adjacent_stratum_surface_definition has precedent_surface defined by exactly one Stratum_surface. Each Stratum_surface defines precedent_surface for zero, one, or more Adjacent_stratum_surface_definition objects.

4.3.3 Adjacent_stratum_surface_embedded_component_surface_definition to Stratum_surface

Each Adjacent_stratum_surface_embedded_component_surface_definition has subsequent_item defined by zero or one Stratum_surface objects. Each Stratum_surface defines subsequent_item for zero, one, or more Adjacent_stratum_surface_embedded_component_surface_definition objects. This assertion is established through a SELECT type. Each Adjacent_stratum_surface_embedded_component_surface_definition has precedent_item defined by zero or one Stratum_surface objects. Each Stratum_surface defines precedent_item for zero, one, or more Adjacent_stratum_surface_embedded_component_surface_definition objects. This assertion is established through a SELECT type.

4.3.4 Adjacent_stratum_surface_embedded_component_surface_definition to Component_feature

Each Adjacent_stratum_surface_embedded_component_surface_definition has subsequent_item defined by zero or one Component_feature objects. Each Component_feature defines subsequent_item for zero, one, or more Adjacent_stratum_surface_embedded_component_surface_definition objects. This assertion is established through a SELECT type. Each Adjacent_stratum_surface_embedded_component_surface_definition has precedent_item defined by zero or one Component_feature objects. Each Component_feature defines precedent_item for zero, one, or more Adjacent_stratum_surface_embedded_component_surface_definition objects. This assertion is established through a SELECT type.

4.3.5 Aggregate_connectivity_requirement to Design_composition_path

Each Aggregate_connectivity_requirement has design_definition_path defined by zero or one Design_composition_path objects. Each Design_composition_path defines design_definition_path for zero, one, or more Aggregate_connectivity_requirement objects. This assertion is established through a SELECT type.

4.3.6 Aggregate_connectivity_requirement to Functional_unit_network_definition

Each Aggregate_connectivity_requirement has design_definition_path defined by zero or one Functional_unit_network_definition objects. Each Functional_unit_network_definition defines design_definition_path for zero, one, or more Aggregate_connectivity_requirement objects. This assertion is established through a SELECT type.

4.3.7 Aggregate_connectivity_requirement to Functional_unit_network_node_definition

Each Aggregate_connectivity_requirement has connectivity_requirement defined by exactly one Functional_unit_network_node_definition. Each Functional_unit_network_node_definition defines connectivity_requirement for zero, one, or more Aggregate_connectivity_requirement objects.

4.3.8 Altered_package to Package

Each Altered_package has package_to_be_altered defined by exactly one Package. Each Package defines package_to_be_altered for zero, one, or more Altered_package objects.

4.3.9 Altered_packaged_part to Packaged_part

Each Altered_packaged_part has base_packaged_part defined by exactly one Packaged_part. Each Packaged_part defines base_packaged_part for zero, one, or more Altered_packaged_part objects.

4.3.10 Altered_packaged_part to Altered_package

Each Altered_packaged_part has used_package defined by exactly one Altered_package. Each Altered_package defines used_package for zero, one, or more Altered_packaged_part objects.

4.3.11 Altered_package_terminal to Altered_package

Each Altered_package_terminal has associated_definition defined by exactly one Altered_package. Each Altered_package defines associated_definition for zero, one, or more Altered_package_terminal objects.

4.3.12 Altered_package_terminal to Package_terminal

Each Altered_package_terminal has terminal_to_be_altered defined by exactly one Package_terminal. Each Package_terminal defines terminal_to_be_altered for zero, one, or more Altered_package_terminal objects.

4.3.13 Alternate_product to Ee_product

Each Alternate_product has defined_alternate_product defined by exactly one Ee_product. Each Ee_product defines defined_alternate_product for zero, one, or more Alternate_product objects.

4.3.14 Alternate_select_product to Contract

Each Alternate_select_product has authorizing_agreement defined by exactly one Contract. Each Contract defines authorizing_agreement for zero, one, or more Alternate_select_product objects.

4.3.15 Alternate_select_product to Ee_product

Each Alternate_select_product has defining_base_product defined by exactly one Ee_product. Each Ee_product defines defining_base_product for zero, one, or more Alternate_select_product objects. Each Alternate_select_product has defined_alternate_product defined by one or more Ee_product objects. Each Ee_product defines defined_alternate_product for zero, one, or more Alternate_select_product objects.

4.3.16 Analytical_model to Analytical_model_definition

Each Analytical_model has associated_definition defined by exactly one Analytical_model_definition. Each Analytical_model_definition defines associated_definition for zero, one, or more Analytical_model objects.

4.3.17 Analytical_model to Ee_specification

Each Analytical_model has source_code defined by exactly one Ee_specification. Each Ee_specification defines source_code for zero, one, or more Analytical_model objects.

4.3.18 Analytical_model to Model_parameter

Each Analytical_model has parameter defined by one or more Model_parameter objects. Each Model_parameter defines parameter for zero, one, or more Analytical_model objects.

4.3.19 Analytical_model to Ee_document

Each Analytical_model has reference_document defined by exactly one Ee_document. Each Ee_document defines reference_document for zero, one, or more Analytical_model objects.

4.3.20 Analytical_model to Language_reference_manual

Each Analytical_model has representation_language defined by exactly one Language_reference_manual. Each Language_reference_manual defines representation_language for zero, one, or more Analytical_model objects.

4.3.21 Analytical_model_make_from_relationship to Analytical_model

Each Analytical_model_make_from_relationship has resultant_model defined by exactly one Analytical_model. Each Analytical_model defines resultant_model for zero, one, or more Analytical_model_make_from_relationship objects. Each Analytical_model_make_from_relationship has reusable_model defined by exactly one Analytical_model. Each Analytical_model defines reusable_model for zero, one, or more Analytical_model_make_from_relationship objects.

4.3.22 Analytical_model_port to Analytical_model

Each Analytical_model_port has accessed_analytical_model defined by exactly one Analytical_model. Each Analytical_model defines accessed_analytical_model for one or more Analytical_model_port objects.

4.3.23 Analytical_model_port_assignment to Analytical_model_port

Each Analytical_model_port_assignment has assigned_analytical_model_port defined by exactly one Analytical_model_port. Each Analytical_model_port defines assigned_analytical_model_port for zero, one, or more Analytical_model_port_assignment objects.

4.3.24 Analytical_model_port_assignment to Functional_unit_usage_view_terminal_definition

Each Analytical_model_port_assignment has assigned_functional_unit_terminal defined by exactly one Functional_unit_usage_view_terminal_definition. Each Functional_unit_usage_view_terminal_definition defines assigned_functional_unit_terminal for zero, one, or more Analytical_model_port_assignment objects.

4.3.25 Analytical_model_port_make_from_relationship to Analytical_model_port

Each Analytical_model_port_make_from_relationship has resultant_feature defined by exactly one Analytical_model_port. Each Analytical_model_port defines resultant_feature for zero, one, or more Analytical_model_port_make_from_relationship objects. Each Analytical_model_port_make_from_relationship has reusable_feature defined by exactly one Analytical_model_port. Each Analytical_model_port defines reusable_feature for zero, one, or more Analytical_model_port_make_from_relationship objects.

4.3.26 Analytical_model_port_make_from_relationship to Analytical_model_make_from_relationship

Each Analytical_model_port_make_from_relationship has associated_make_from defined by exactly one Analytical_model_make_from_relationship. Each Analytical_model_make_from_relationship defines associated_make_from for zero, one, or more Analytical_model_port_make_from_relationship objects.

4.3.27 Analytical_representation to Analytical_model

Each Analytical_representation has model_representation defined by exactly one Analytical_model. Each Analytical_model defines model_representation for zero, one, or more Analytical_representation objects.

4.3.28 Analytical_representation to Parameter_assignment

Each Analytical_representation has model_parameter_assignment defined by one or more Parameter_assignment objects. Each Parameter_assignment defines model_parameter_assignment for zero, one, or more Analytical_representation objects.

4.3.29 Angular_dimension_with_direction_vector to Axis_placement

Each Angular_dimension_with_direction_vector has measurement_orientation defined by zero or one Axis_placement objects. Each Axis_placement defines measurement_orientation for zero, one, or more Angular_dimension_with_direction_vector objects. This assertion is established through a SELECT type.

4.3.30 Angular_dimension_with_direction_vector to Datum_based_vector_orientation

Each Angular_dimension_with_direction_vector has measurement_orientation defined by zero or one Datum_based_vector_orientation objects. Each Datum_based_vector_orientation defines measurement_orientation for zero, one, or more Angular_dimension_with_direction_vector objects. This assertion is established through a SELECT type.

4.3.31 Assembled_with_bonding to Assembly_bond_definition

Each Assembled_with_bonding has default_bond_definition defined by exactly one Assembly_bond_definition. Each Assembly_bond_definition defines default_bond_definition for zero, one, or more Assembled_with_bonding objects.

4.3.32 Assembled_with_fasteners to Assembly_group_component

Each Assembled_with_fasteners has associated_assembly defined by exactly one Assembly_group_component. Each Assembly_group_component defines associated_assembly for zero, one, or more Assembled_with_fasteners objects.

4.3.33 Assembly_alternate_product to Physical_unit_design_view

Each Assembly_alternate_product has basis_context defined by exactly one Physical_unit_design_view. Each Physical_unit_design_view defines basis_context for zero, one, or more Assembly_alternate_product objects.

4.3.34 Assembly_bond_definition to Part_feature

Each Assembly_bond_definition has bonded_feature_2 defined by exactly one Part_feature. Each Part_feature defines bonded_feature_2 for zero, one, or more Assembly_bond_definition objects. Each Assembly_bond_definition has bonded_feature_1 defined by exactly one Part_feature. Each Part_feature defines bonded_feature_1 for zero, one, or more Assembly_bond_definition objects.

4.3.35 Assembly_bond_definition to Ee_material

Each Assembly_bond_definition has bond_material defined by exactly one Ee_material. Each Ee_material defines bond_material for zero, one, or more Assembly_bond_definition objects.

4.3.36 Assembly_bond_definition to External_definition

Each Assembly_bond_definition has bond_category defined by exactly one External_definition. Each External_definition defines bond_category for zero, one, or more Assembly_bond_definition objects.

4.3.37 Assembly_bond_definition to Externally_defined_ee_product_definition

Each Assembly_bond_definition has associated_definition defined by exactly one Externally_defined_ee_product_definition. Each Externally_defined_ee_product_definition defines associated_definition for zero, one, or more Assembly_bond_definition objects.

4.3.38 Assembly_bond_definition to Analytical_representation

Each Assembly_bond_definition has analytical_assembly_bond_representation defined by one or more Analytical_representation objects. Each Analytical_representation defines analytical_assembly_bond_representation for zero, one, or more Assembly_bond_definition objects.

4.3.39 Assembly_component to Part_template

Each Assembly_component has usage_definition defined by zero or one Part_template objects. Each Part_template defines usage_definition for zero, one, or more Assembly_component objects. This assertion is established through a SELECT type.

4.3.40 Assembly_component to Physical_unit

Each Assembly_component has usage_definition defined by zero or one Physical_unit objects. Each Physical_unit defines usage_definition for zero, one, or more Assembly_component objects. This assertion is established through a SELECT type.

4.3.41 Assembly_component_2d_shape to Assembly_component

Each Assembly_component_2d_shape has shape_characterized_component defined by one or more Assembly_component objects. Each Assembly_component defines shape_characterized_component for zero or one Assembly_component_2d_shape objects.

4.3.42 Assembly_component_3d_shape to Assembly_component

Each Assembly_component_3d_shape has shape_characterized_component defined by one or more Assembly_component objects. Each Assembly_component defines shape_characterized_component for zero or one Assembly_component_3d_shape objects.

4.3.43 Assembly_component_non_planar_shape to Assembly_component

Each Assembly_component_non_planar_shape has shape_characterized_component defined by one or more Assembly_component objects. Each Assembly_component defines shape_characterized_component for zero or one Assembly_component_non_planar_shape objects.

4.3.44 Assembly_component_placement_link to Assembly_component

Each Assembly_component_placement_link has subsequent_element defined by exactly one Assembly_component. Each Assembly_component defines subsequent_element for zero, one, or more Assembly_component_placement_link objects. Each Assembly_component_placement_link has precedent_element defined by exactly one Assembly_component. Each Assembly_component defines precedent_element for zero, one, or more Assembly_component_placement_link objects.

4.3.45 Assembly_composition_relationship to Ee_material

Each Assembly_composition_relationship has assembly_bonding_agent defined by one or more Ee_material objects. Each Ee_material defines assembly_bonding_agent for zero, one, or more Assembly_composition_relationship objects.

4.3.46 Assembly_composition_relationship to Security_classification

Each Assembly_composition_relationship has security_code defined by exactly one Security_classification. Each Security_classification defines security_code for zero, one, or more Assembly_composition_relationship objects.

4.3.47 Assembly_composition_relationship to Assembly_component

Each Assembly_composition_relationship has component defined by exactly one Assembly_component. Each Assembly_component defines component for one or more Assembly_composition_relationship objects.

4.3.48 Assembly_composition_relationship to Physical_unit_design_view

Each Assembly_composition_relationship has assembly defined by exactly one Physical_unit_design_view. Each Physical_unit_design_view defines assembly for zero, one, or more Assembly_composition_relationship objects.

4.3.49 Assembly_joint to Assembly_module

Each Assembly_joint has associated_assembly defined by zero or one Assembly_module objects. Each Assembly_module defines associated_assembly for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type.

4.3.50 Assembly_joint to Assembly_group_component

Each Assembly_joint has associated_assembly defined by zero or one Assembly_group_component objects. Each Assembly_group_component defines associated_assembly for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type.

4.3.51 Assembly_joint to Interconnect_component_join_terminal

Each Assembly_joint has assembly_features_2 defined by zero or one Interconnect_component_join_terminal objects. Each Interconnect_component_join_terminal defines assembly_features_2 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type. Each Assembly_joint has assembly_features_1 defined by zero or one Interconnect_component_join_terminal objects. Each Interconnect_component_join_terminal defines assembly_features_1 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type.

4.3.52 Assembly_joint to Interconnect_component_interface_terminal

Each Assembly_joint has assembly_features_2 defined by zero or one Interconnect_component_interface_terminal objects. Each Interconnect_component_interface_terminal defines assembly_features_2 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type. Each Assembly_joint has assembly_features_1 defined by zero or one Interconnect_component_interface_terminal objects. Each Interconnect_component_interface_terminal defines assembly_features_1 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type.

4.3.53 Assembly_joint to Packaged_connector_component_interface_terminal

Each Assembly_joint has assembly_features_2 defined by zero or one Packaged_connector_component_interface_terminal objects. Each Packaged_connector_component_interface_terminal defines assembly_features_2 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type. Each Assembly_joint has assembly_features_1 defined by zero or one Packaged_connector_component_interface_terminal objects. Each Packaged_connector_component_interface_terminal defines assembly_features_1 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type.

4.3.54 Assembly_joint to Package_terminal_occurrence

Each Assembly_joint has assembly_features_2 defined by zero or one Package_terminal_occurrence objects. Each Package_terminal_occurrence defines assembly_features_2 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type. Each Assembly_joint has assembly_features_1 defined by zero or one Package_terminal_occurrence objects. Each Package_terminal_occurrence defines assembly_features_1 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type.

4.3.55 Assembly_joint to Bare_die_component_terminal

Each Assembly_joint has assembly_features_2 defined by zero or one Bare_die_component_terminal objects. Each Bare_die_component_terminal defines assembly_features_2 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type. Each Assembly_joint has assembly_features_1 defined by zero or one Bare_die_component_terminal objects. Each Bare_die_component_terminal defines assembly_features_1 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type.

4.3.56 **Assembly_joint to Packaged_component_join_terminal**

Each Assembly_joint has assembly_features_2 defined by zero or one Packaged_component_join_terminal objects. Each Packaged_component_join_terminal defines assembly_features_2 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type. Each Assembly_joint has assembly_features_1 defined by zero or one Packaged_component_join_terminal objects. Each Packaged_component_join_terminal defines assembly_features_1 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type.

4.3.57 **Assembly_joint to Assembly_module_component_terminal**

Each Assembly_joint has assembly_features_2 defined by zero or one Assembly_module_component_terminal objects. Each Assembly_module_component_terminal defines assembly_features_2 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type. Each Assembly_joint has assembly_features_1 defined by zero or one Assembly_module_component_terminal objects. Each Assembly_module_component_terminal defines assembly_features_1 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type.

4.3.58 **Assembly_joint to Interconnect_module_component_surface_feature**

Each Assembly_joint has assembly_features_2 defined by zero or one Interconnect_module_component_surface_feature objects. Each Interconnect_module_component_surface_feature defines assembly_features_2 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type. Each Assembly_joint has assembly_features_1 defined by zero or one Interconnect_module_component_surface_feature objects. Each Interconnect_module_component_surface_feature defines assembly_features_1 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type.

4.3.59 **Assembly_joint to Interconnect_module_component_terminal**

Each Assembly_joint has assembly_features_2 defined by zero or one Interconnect_module_component_terminal objects. Each Interconnect_module_component_terminal defines assembly_features_2 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type. Each Assembly_joint has assembly_features_1 defined by zero or one Interconnect_module_component_terminal objects. Each Interconnect_module_component_terminal defines assembly_features_1 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type.

4.3.60 **Assembly_joint to Component_mounting_feature**

Each Assembly_joint has assembly_features_2 defined by zero or one Component_mounting_feature objects. Each Component_mounting_feature defines assembly_features_2 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type. Each Assembly_joint has assembly_features_1 defined by zero or one Component_mounting_feature objects. Each Component_mounting_feature defines assembly_features_1 for zero, one, or more Assembly_joint objects. This assertion is established through a SELECT type.

4.3.61 Assembly_material_composition_relationship to Security_classification

Each Assembly_material_composition_relationship has security_code defined by exactly one Security_classification. Each Security_classification defines security_code for zero, one, or more Assembly_material_composition_relationship objects.

4.3.62 Assembly_material_composition_relationship to Ee_material

Each Assembly_material_composition_relationship has component_material defined by exactly one Ee_material. Each Ee_material defines component_material for zero, one, or more Assembly_material_composition_relationship objects.

4.3.63 Assembly_material_composition_relationship to Physical_unit_design_view

Each Assembly_material_composition_relationship has assembly defined by exactly one Physical_unit_design_view. Each Physical_unit_design_view defines assembly for zero, one, or more Assembly_material_composition_relationship objects.

4.3.64 Assembly_material_composition_relationship to Data_element

Each Assembly_material_composition_relationship has quantity defined by exactly one Data_element. Each Data_element defines quantity for zero, one, or more Assembly_material_composition_relationship objects.

4.3.65 Assembly_module_component to Assembly_module_usage_view

Each Assembly_module_component has usage_definition defined by exactly one Assembly_module_usage_view. Each Assembly_module_usage_view defines usage_definition for zero, one, or more Assembly_module_component objects.

4.3.66 Assembly_module_component_terminal to Assembly_module_component

Each Assembly_module_component_terminal has associated_component defined by exactly one Assembly_module_component. Each Assembly_module_component defines associated_component for two or more Assembly_module_component_terminal objects.

4.3.67 Assembly_module_component_terminal to Assembly_module_terminal

Each Assembly_module_component_terminal has definition defined by exactly one Assembly_module_terminal. Each Assembly_module_terminal defines definition for zero, one, or more Assembly_module_component_terminal objects.

4.3.68 Assembly_module_macro_component to Assembly_module

Each Assembly_module_macro_component has design_definition defined by exactly one Assembly_module. Each Assembly_module defines design_definition for zero, one, or more Assembly_module_macro_component objects.

4.3.69 Assembly_module_macro_component_join_terminal to Assembly_module_macro_component

Each Assembly_module_macro_component_join_terminal has associated_component defined by exactly one Assembly_module_macro_component. Each Assembly_module_macro_component defines associated_component for one or more Assembly_module_macro_component_join_terminal objects.

4.3.70 Assembly_module_macro_component_join_terminal to Assembly_module_join_terminal

Each Assembly_module_macro_component_join_terminal has definition defined by exactly one Assembly_module_join_terminal. Each Assembly_module_join_terminal defines definition for zero, one, or more Assembly_module_macro_component_join_terminal objects.

4.3.71 Assembly_module_terminal to Connection_zone

Each Assembly_module_terminal has terminal_connection_zone defined by one or more Connection_zone objects. Each Connection_zone defines terminal_connection_zone for zero, one, or more Assembly_module_terminal objects.

4.3.72 Assembly_module_terminal to Assembly_module_usage_view_connector_relationship

Each Assembly_module_terminal has related_connector defined by exactly one Assembly_module_usage_view_connector_relationship. Each Assembly_module_usage_view_connector_relationship defines related_connector for zero, one, or more Assembly_module_terminal objects.

4.3.73 Assembly_module_terminal to Packaged_part_interface_terminal

Each Assembly_module_terminal has reference_terminal defined by exactly one Packaged_part_interface_terminal. Each Packaged_part_interface_terminal defines reference_terminal for zero, one, or more Assembly_module_terminal objects.

4.3.74 Assembly_module_terminal to Assembly_module_usage_view

Each Assembly_module_terminal has associated_definition defined by exactly one Assembly_module_usage_view. Each Assembly_module_usage_view defines associated_definition for two or more Assembly_module_terminal objects.

4.3.75 Assembly_module_usage_view to Datum_based_length_measure

Each Assembly_module_usage_view has maximum_positive_component_height defined by exactly one Datum_based_length_measure. Each Datum_based_length_measure defines maximum_positive_component_height for zero, one, or more Assembly_module_usage_view objects. Each Assembly_module_usage_view has maximum_negative_component_height defined by exactly one Datum_based_length_measure. Each Datum_based_length_measure defines maximum_negative_component_height for zero, one, or more Assembly_module_usage_view objects.

4.3.76 Assembly_module_usage_view to Functional_unit_usage_view

Each Assembly_module_usage_view has implemented_function defined by exactly one Functional_unit_usage_view. Each Functional_unit_usage_view defines implemented_function for zero, one, or more Assembly_module_usage_view objects.

4.3.77 Assembly_module_usage_view_connector_relationship to Packaged_connector

Each Assembly_module_usage_view_connector_relationship has associated_usage defined by exactly one Packaged_connector. Each Packaged_connector defines associated_usage for zero, one, or more Assembly_module_usage_view_connector_relationship objects.

4.3.78 Assembly_module_usage_view_connector_relationship to Assembly_module_usage_view

Each Assembly_module_usage_view_connector_relationship has associating_usage defined by exactly one Assembly_module_usage_view. Each Assembly_module_usage_view defines associating_usage for zero, one, or more Assembly_module_usage_view_connector_relationship objects.

4.3.79 Assembly_requirement_allocation to Ee_requirement_occurrence

Each Assembly_requirement_allocation has requirement defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines requirement for zero, one, or more Assembly_requirement_allocation objects.

4.3.80 Assembly_requirement_allocation to Assembly_component

Each Assembly_requirement_allocation has assembly_assignment defined by zero or one Assembly_component objects. Each Assembly_component defines assembly_assignment for zero, one, or more Assembly_requirement_allocation objects. This assertion is established through a SELECT type.

4.3.81 Assembly_requirement_allocation to Assembly_joint

Each Assembly_requirement_allocation has assembly_assignment defined by zero or one Assembly_joint objects. Each Assembly_joint defines assembly_assignment for zero, one, or more Assembly_requirement_allocation objects. This assertion is established through a SELECT type.

4.3.82 Assembly_requirement_allocation to Component_feature

Each Assembly_requirement_allocation has assembly_assignment defined by zero or one Component_feature objects. Each Component_feature defines assembly_assignment for zero, one, or more Assembly_requirement_allocation objects. This assertion is established through a SELECT type.

4.3.83 Assembly_separation_requirement_allocation to Assembly_component

Each Assembly_separation_requirement_allocation has disjoint_assignment defined by zero or one Assembly_component objects. Each Assembly_component defines disjoint_assignment for zero, one, or more Assembly_separation_requirement_allocation objects. This assertion is established through a SELECT type.

4.3.84 Assembly_separation_requirement_allocation to Assembly_joint

Each Assembly_separation_requirement_allocation has disjoint_assignment defined by zero or one Assembly_joint objects. Each Assembly_joint defines disjoint_assignment for zero, one, or more Assembly_separation_requirement_allocation objects. This assertion is established through a SELECT type.

4.3.85 Assembly_separation_requirement_allocation to Component_feature

Each Assembly_separation_requirement_allocation has disjoint_assignment defined by zero or one Component_feature objects. Each Component_feature defines disjoint_assignment for zero, one, or more Assembly_separation_requirement_allocation objects. This assertion is established through a SELECT type.

4.3.86 Axis_placement to Cartesian_point

Each Axis_placement has translation defined by exactly one Cartesian_point. Each Cartesian_point defines translation for zero, one, or more Axis_placement objects.

4.3.87 Axis_placement to Orientation

Each Axis_placement has device_orientation defined by exactly one Orientation. Each Orientation defines device_orientation for zero, one, or more Axis_placement objects.

4.3.88 Bare_die to Functional_unit_usage_view

Each Bare_die has implemented_function defined by exactly one Functional_unit_usage_view. Each Functional_unit_usage_view defines implemented_function for zero, one, or more Bare_die objects.

4.3.89 Bare_die to Technology

Each Bare_die has unit_technology defined by exactly one Technology. Each Technology defines unit_technology for zero, one, or more Bare_die objects.

4.3.90 Bare_die to Seating_plane

Each Bare_die has die_seating_plane defined by exactly one Seating_plane. Each Seating_plane defines die_seating_plane for zero, one, or more Bare_die objects.

4.3.91 Bare_die to Cartesian_point

Each Bare_die has maximum_material_condition_centroid_location defined by exactly one Cartesian_point. Each Cartesian_point defines maximum_material_condition_centroid_location for zero, one, or more Bare_die objects. Each Bare_die has least_material_condition_centroid_location defined by exactly one Cartesian_point. Each Cartesian_point defines least_material_condition_centroid_location for zero, one, or more Bare_die objects.

4.3.92 Bare_die to Length_data_element

Each Bare_die has maximum_height_above_seating_plane defined by exactly one Length_data_element. Each Length_data_element defines maximum_height_above_seating_plane for zero, one, or more Bare_die objects.

4.3.93 Bare_die_bottom_surface to Bare_die

Each Bare_die_bottom_surface has associated_definition defined by exactly one Bare_die. Each Bare_die defines associated_definition for zero, one, or more Bare_die_bottom_surface objects.

4.3.94 Bare_die_component to Bare_die

Each Bare_die_component has usage_definition defined by exactly one Bare_die. Each Bare_die defines usage_definition for zero, one, or more Bare_die_component objects.

4.3.95 Bare_die_component_terminal to Bare_die_component

Each Bare_die_component_terminal has associated_component defined by exactly one Bare_die_component. Each Bare_die_component defines associated_component for zero, one, or more Bare_die_component_terminal objects.

4.3.96 Bare_die_component_terminal to Bare_die_terminal

Each Bare_die_component_terminal has definition defined by exactly one Bare_die_terminal. Each Bare_die_terminal defines definition for zero, one, or more Bare_die_component_terminal objects.

4.3.97 Bare_die_edge_segment_surface to Bare_die

Each Bare_die_edge_segment_surface has associated_definition defined by exactly one Bare_die. Each Bare_die defines associated_definition for zero, one, or more Bare_die_edge_segment_surface objects.

4.3.98 Bare_die_edge_segment_surface to Edge_segment_vertex

Each Bare_die_edge_segment_surface has end_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines end_vertex for zero, one, or more Bare_die_edge_segment_surface objects. Each Bare_die_edge_segment_surface has start_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines start_vertex for zero, one, or more Bare_die_edge_segment_surface objects.

4.3.99 Bare_die_edge_segment_surface to Bare_die_edge_surface

Each Bare_die_edge_segment_surface has composed_surface defined by exactly one Bare_die_edge_surface. Each Bare_die_edge_surface defines composed_surface for zero, one, or more Bare_die_edge_segment_surface objects.

4.3.100 Bare_die_edge_surface to Bare_die

Each Bare_die_edge_surface has associated_definition defined by exactly one Bare_die. Each Bare_die defines associated_definition for zero, one, or more Bare_die_edge_surface objects.

4.3.101 Bare_die_terminal to Connection_zone_interface_plane_relationship

Each Bare_die_terminal has seating_plane_zone defined by exactly one Connection_zone_interface_plane_relationship. Each Connection_zone_interface_plane_relationship defines seating_plane_zone for zero or one Bare_die_terminal objects.

4.3.102 Bare_die_terminal to Connection_zone

Each Bare_die_terminal has external_connection_area defined by one or more Connection_zone objects. Each Connection_zone defines external_connection_area for zero, one, or more Bare_die_terminal objects.

4.3.103 Bare_die_terminal to Ee_material

Each Bare_die_terminal has material defined by exactly one Ee_material. Each Ee_material defines material for zero, one, or more Bare_die_terminal objects.

4.3.104 Bare_die_terminal_surface_constituent_relationship to Bare_die_terminal

Each Bare_die_terminal_surface_constituent_relationship has related_shape_element defined by exactly one Bare_die_terminal. Each Bare_die_terminal defines related_shape_element for zero, one, or more Bare_die_terminal_surface_constituent_relationship objects.

4.3.105 Bare_die_terminal_surface_constituent_relationship to Bare_die_surface

Each Bare_die_terminal_surface_constituent_relationship has relating_shape_element defined by exactly one Bare_die_surface. Each Bare_die_surface defines relating_shape_element for zero, one, or more Bare_die_terminal_surface_constituent_relationship objects.

4.3.106 Bare_die_top_surface to Bare_die

Each Bare_die_top_surface has associated_definition defined by exactly one Bare_die. Each Bare_die defines associated_definition for zero, one, or more Bare_die_top_surface objects.

4.3.107 Bevel_edge_feature_shape to Angle_data_element

Each Bevel_edge_feature_shape has maximum_bevel_angle defined by exactly one Angle_data_element. Each Angle_data_element defines maximum_bevel_angle for zero, one, or more Bevel_edge_feature_shape objects. Each Bevel_edge_feature_shape has minimum_bevel_angle defined by exactly one Angle_data_element. Each Angle_data_element defines minimum_bevel_angle for zero, one, or more Bevel_edge_feature_shape objects.

4.3.108 Bevel_edge_feature_shape to Length_data_element

Each Bevel_edge_feature_shape has maximum_bevel_width defined by exactly one Length_data_element. Each Length_data_element defines maximum_bevel_width for zero, one, or more Bevel_edge_feature_shape objects. Each Bevel_edge_feature_shape has minimum_bevel_width defined by exactly one Length_data_element. Each Length_data_element defines minimum_bevel_width for zero, one, or more Bevel_edge_feature_shape objects.

4.3.109 Blind_passage_template to Shape_dimension_representation

Each Blind_passage_template has bottom_distance_from_datum_reference defined by exactly one Shape_dimension_representation. Each Shape_dimension_representation defines bottom_distance_from_datum_reference for zero, one, or more Blind_passage_template objects.

4.3.110 Blind_passage_template to Stratum_surface

Each Blind_passage_template has datum_reference defined by exactly one Stratum_surface. Each Stratum_surface defines datum_reference for zero, one, or more Blind_passage_template objects.

4.3.111 Bonded_conductive_base_blind_via to Stratum_feature_conductive_join

Each Bonded_conductive_base_blind_via has features_join defined by exactly one Stratum_feature_conductive_join. Each Stratum_feature_conductive_join defines features_join for zero or one Bonded_conductive_base_blind_via objects.

4.3.112 Bond_assembly_position to Axis_placement_3d

Each Bond_assembly_position has bond_definition_placement defined by exactly one Axis_placement_3d. Each Axis_placement_3d defines bond_definition_placement for zero, one, or more Bond_assembly_position objects.

4.3.113 Bond_assembly_position to Default_assembly_bond_shape

Each Bond_assembly_position has bond_model defined by exactly one Default_assembly_bond_shape. Each Default_assembly_bond_shape defines bond_model for zero, one, or more Bond_assembly_position objects.

4.3.114 Bond_assembly_position to Physical_unit_3d_shape

Each Bond_assembly_position has assembly_model defined by exactly one Physical_unit_3d_shape. Each Physical_unit_3d_shape defines assembly_model for zero, one, or more Bond_assembly_position objects.

4.3.115 Bond_assembly_position to Assembled_with_bonding

Each Bond_assembly_position has bond defined by exactly one Assembled_with_bonding. Each Assembled_with_bonding defines bond for zero or one Bond_assembly_position objects.

4.3.116 Boolean_csg_result to Csg_primitive

Each Boolean_csg_result has operand_2 defined by zero or one Csg_primitive objects. Each Csg_primitive defines operand_2 for zero, one, or more Boolean_csg_result objects. This assertion is established through a SELECT type. Each Boolean_csg_result has operand_1 defined by zero or one Csg_primitive objects. Each Csg_primitive defines operand_1 for zero, one, or more Boolean_csg_result objects. This assertion is established through a SELECT type.

4.3.117 Boolean_csg_result to Bound_volume_shape

Each Boolean_csg_result has operand_2 defined by zero or one Bound_volume_shape objects. Each Bound_volume_shape defines operand_2 for zero, one, or more Boolean_csg_result objects. This assertion is established through a SELECT type. Each Boolean_csg_result has operand_1 defined by zero or one Bound_volume_shape objects. Each Bound_volume_shape defines operand_1 for zero, one, or more Boolean_csg_result objects. This assertion is established through a SELECT type.

4.3.118 Boolean_csg_result to Boolean_csg_result

Each Boolean_csg_result has operand_2 defined by zero or one Boolean_csg_result objects. Each Boolean_csg_result defines operand_2 for zero, one, or more Boolean_csg_result objects. This assertion is established through a SELECT type. Each Boolean_csg_result has operand_1 defined by zero or one Boolean_csg_result objects. Each Boolean_csg_result defines operand_1 for zero, one, or more Boolean_csg_result objects. This assertion is established through a SELECT type.

4.3.119 Boolean_csg_result to Primitive_2d

Each Boolean_csg_result has operand_2 defined by zero or one Primitive_2d objects. Each Primitive_2d defines operand_2 for zero, one, or more Boolean_csg_result objects. This assertion is established through a SELECT type. Each Boolean_csg_result has operand_1 defined by zero or one Primitive_2d objects. Each Primitive_2d defines operand_1 for zero, one, or more Boolean_csg_result objects. This assertion is established through a SELECT type.

4.3.120 Boundary_based_position_tolerance to Profile_of_any_surface_tolerance_with_referenced_datum_system

Each Boundary_based_position_tolerance has profile_control defined by exactly one Profile_of_any_surface_tolerance_with_referenced_datum_system. Each Profile_of_any_surface_tolerance_with_referenced_datum_system defines profile_control for zero, one, or more Boundary_based_position_tolerance objects.

4.3.121 Boundary_size_characteristic to Length_data_element

Each Boundary_size_characteristic has maximum_tolerance_value defined by exactly one Length_data_element. Each Length_data_element defines maximum_tolerance_value for zero, one, or more Boundary_size_characteristic objects. Each Boundary_size_characteristic has tolerance_value defined by exactly one Length_data_element. Each Length_data_element defines tolerance_value for zero, one, or more Boundary_size_characteristic objects.

4.3.122 Boundary_zone_definition_with_specified_size to Boundary_size_characteristic

Each Boundary_zone_definition_with_specified_size has specified_boundary_size defined by exactly one Boundary_size_characteristic. Each Boundary_size_characteristic defines specified_boundary_size for zero, one, or more Boundary_zone_definition_with_specified_size objects.

4.3.123 Bounding_curve to Trimmed_line

Each Bounding_curve has basis_curve defined by exactly one Trimmed_line. Each Trimmed_line defines basis_curve for zero, one, or more Bounding_curve objects.

4.3.124 Bounding_curve to External_definition

Each Bounding_curve has mapping_function defined by exactly one External_definition. Each External_definition defines mapping_function for zero, one, or more Bounding_curve objects.

4.3.125 **Bus_element_link to Functional_unit_network_node_definition**

Each Bus_element_link has subsequent_element defined by zero or one Functional_unit_network_node_definition objects. Each Functional_unit_network_node_definition defines subsequent_element for zero, one, or more Bus_element_link objects. This assertion is established through a SELECT type. Each Bus_element_link has precedent_element defined by zero or one Functional_unit_network_node_definition objects. Each Functional_unit_network_node_definition defines precedent_element for zero, one, or more Bus_element_link objects. This assertion is established through a SELECT type.

4.3.126 **Bus_element_link to Bus_structural_definition**

Each Bus_element_link has subsequent_element defined by zero or one Bus_structural_definition objects. Each Bus_structural_definition defines subsequent_element for zero, one, or more Bus_element_link objects. This assertion is established through a SELECT type. Each Bus_element_link has precedent_element defined by zero or one Bus_structural_definition objects. Each Bus_structural_definition defines precedent_element for zero, one, or more Bus_element_link objects. This assertion is established through a SELECT type.

4.3.127 **Bus_structural_definition to Bus_element_link**

Each Bus_structural_definition has composition defined by one or more Bus_element_link objects. Each Bus_element_link defines composition for zero, one, or more Bus_structural_definition objects.

4.3.128 **Cartesian_coordinate_system to Angle_data_element**

Each Cartesian_coordinate_system has angular_uncertainty defined by exactly one Angle_data_element. Each Angle_data_element defines angular_uncertainty for zero, one, or more Cartesian_coordinate_system objects.

4.3.129 **Cartesian_coordinate_system to Length_data_element**

Each Cartesian_coordinate_system has length_uncertainty defined by exactly one Length_data_element. Each Length_data_element defines length_uncertainty for zero, one, or more Cartesian_coordinate_system objects.

4.3.130 **Cartesian_transformation_operator_2d to Cartesian_point**

Each Cartesian_transformation_operator_2d has translation defined by exactly one Cartesian_point. Each Cartesian_point defines translation for zero, one, or more Cartesian_transformation_operator_2d objects.

4.3.131 **Cartesian_transformation_operator_2d to Orientation**

Each Cartesian_transformation_operator_2d has device_orientation defined by exactly one Orientation. Each Orientation defines device_orientation for zero, one, or more Cartesian_transformation_operator_2d objects.

4.3.132 Certification to Date_and_time

Each Certification has certification_date defined by zero or one Date_and_time objects. Each Date_and_time defines certification_date for zero, one, or more Certification objects. This assertion is established through a SELECT type.

4.3.133 Certification to Date

Each Certification has certification_date defined by zero or one Date objects. Each Date defines certification_date for zero, one, or more Certification objects. This assertion is established through a SELECT type.

4.3.134 Certification to Supplied_product_version

Each Certification has certified_product_version defined by exactly one Supplied_product_version. Each Supplied_product_version defines certified_product_version for zero or one Certification objects.

4.3.135 Certification to Ee_text

Each Certification has certification_number defined by exactly one Ee_text. Each Ee_text defines certification_number for zero, one, or more Certification objects.

4.3.136 Certification to Ee_approval

Each Certification has certification_approval defined by exactly one Ee_approval. Each Ee_approval defines certification_approval for zero, one, or more Certification objects.

4.3.137 Change_design_object_management_relationship to Managed_design_object

Each Change_design_object_management_relationship has previous_design_object defined by exactly one Managed_design_object. Each Managed_design_object defines previous_design_object for zero, one, or more Change_design_object_management_relationship objects. Each Change_design_object_management_relationship has current_design_object defined by exactly one Managed_design_object. Each Managed_design_object defines current_design_object for zero, one, or more Change_design_object_management_relationship objects.

4.3.138 Change_order to Ee_text

Each Change_order has adopted_solution defined by zero or one Ee_text objects. Each Ee_text defines adopted_solution for zero, one, or more Change_order objects. This assertion is established through a SELECT type.

4.3.139 Change_order to Design_object_management_relationship

Each Change_order has adopted_solution defined by zero or one Design_object_management_relationship objects. Each Design_object_management_relationship defines adopted_solution for zero, one, or more Change_order objects. This assertion is established through a SELECT type.

4.3.140 Change_request to Ee_text

Each Change_request has consequence defined by one or more Ee_text objects. Each Ee_text defines consequence for zero, one, or more Change_request objects. Each Change_request has recommended_solution defined by zero or one Ee_text objects. Each Ee_text defines recommended_solution for zero, one, or more Change_request objects. This assertion is established through a SELECT type.

4.3.141 Change_request to Design_object_management_relationship

Each Change_request has recommended_solution defined by zero or one Design_object_management_relationship objects. Each Design_object_management_relationship defines recommended_solution for zero, one, or more Change_request objects. This assertion is established through a SELECT type.

4.3.142 Characteristic to External_definition

Each Characteristic has property_value defined by zero or one External_definition objects. Each External_definition defines property_value for zero, one, or more Characteristic objects. This assertion is established through a SELECT type.

4.3.143 Characteristic to Compound_characteristic_definition

Each Characteristic has property_value defined by zero or one Compound_characteristic_definition objects. Each Compound_characteristic_definition defines property_value for zero, one, or more Characteristic objects. This assertion is established through a SELECT type.

4.3.144 Characteristic to Data_element

Each Characteristic has property_value defined by zero or one Data_element objects. Each Data_element defines property_value for zero, one, or more Characteristic objects. This assertion is established through a SELECT type.

4.3.145 Characteristic to Ee_document

Each Characteristic has reference_document defined by exactly one Ee_document. Each Ee_document defines reference_document for zero, one, or more Characteristic objects.

4.3.146 Characteristic_data_set to Set_characteristic

Each Characteristic_data_set has property_value defined by exactly one Set_characteristic. Each Set_characteristic defines property_value for zero, one, or more Characteristic_data_set objects.

4.3.147 Characteristic_data_table to List_characteristic

Each Characteristic_data_table has property_value defined by exactly one List_characteristic. Each List_characteristic defines property_value for zero, one, or more Characteristic_data_table objects.

4.3.148 Circular_area to Length_data_element

Each Circular_area has radius defined by exactly one Length_data_element. Each Length_data_element defines radius for zero, one, or more Circular_area objects.

4.3.149 Circular_area to Cartesian_point

Each Circular_area has centre defined by exactly one Cartesian_point. Each Cartesian_point defines centre for zero, one, or more Circular_area objects.

4.3.150 Component_2d_edge_location to Assembly_joint

Each Component_2d_edge_location has mounting_surface_assembly_joint defined by exactly one Assembly_joint. Each Assembly_joint defines mounting_surface_assembly_joint for zero, one, or more Component_2d_edge_location objects. Each Component_2d_edge_location has reference_terminal_assembly_joint defined by exactly one Assembly_joint. Each Assembly_joint defines reference_terminal_assembly_joint for zero, one, or more Component_2d_edge_location objects.

4.3.151 Component_2d_embedded_location to Fabrication_joint

Each Component_2d_embedded_location has reference_terminal defined by exactly one Fabrication_joint. Each Fabrication_joint defines reference_terminal for zero, one, or more Component_2d_embedded_location objects.

4.3.152 Component_2d_embedded_location to Adjacent_stratum_surface_embedded_component_surface_definition

Each Component_2d_embedded_location has subsequent_surface defined by exactly one Adjacent_stratum_surface_embedded_component_surface_definition. Each Adjacent_stratum_surface_embedded_component_surface_definition defines subsequent_surface for zero, one, or more Component_2d_embedded_location objects. Each Component_2d_embedded_location has precedent_surface defined by exactly one Adjacent_stratum_surface_embedded_component_surface_definition. Each Adjacent_stratum_surface_embedded_component_surface_definition defines precedent_surface for zero, one, or more Component_2d_embedded_location objects.

4.3.153 Component_2d_location to Cartesian_transformation_operator_2d

Each Component_2d_location has transformation defined by exactly one Cartesian_transformation_operator_2d. Each Cartesian_transformation_operator_2d defines transformation for zero, one, or more Component_2d_location objects.

4.3.154 Component_2d_stacked_location to Assembly_joint

Each Component_2d_stacked_location has mounting_joint defined by exactly one Assembly_joint. Each Assembly_joint defines mounting_joint for zero, one, or more Component_2d_stacked_location objects.

4.3.155 Component_2d_surface_location to Assembly_joint

Each Component_2d_surface_location has mounting_surface_assembly_joint defined by exactly one Assembly_joint. Each Assembly_joint defines mounting_surface_assembly_joint for zero, one, or more Component_2d_surface_location objects.

4.3.156 Component_3d_location to Axis_placement_3d

Each Component_3d_location has transformation defined by exactly one Axis_placement_3d. Each Axis_placement_3d defines transformation for zero, one, or more Component_3d_location objects.

4.3.157 Component_assembly_2d_position to Next_higher_assembly_relationship

Each Component_assembly_2d_position has component defined by exactly one Next_higher_assembly_relationship. Each Next_higher_assembly_relationship defines component for zero or one Component_assembly_2d_position objects.

4.3.158 Component_assembly_2d_position to Physical_unit_planar_shape

Each Component_assembly_2d_position has assembly_model defined by exactly one Physical_unit_planar_shape. Each Physical_unit_planar_shape defines assembly_model for zero, one, or more Component_assembly_2d_position objects.

4.3.159 Component_assembly_2d_position to Component_2d_location

Each Component_assembly_2d_position has transformation defined by exactly one Component_2d_location. Each Component_2d_location defines transformation for zero, one, or more Component_assembly_2d_position objects.

4.3.160 Component_assembly_2d_position to Assembly_component_2d_shape

Each Component_assembly_2d_position has component_model defined by exactly one Assembly_component_2d_shape. Each Assembly_component_2d_shape defines component_model for zero, one, or more Component_assembly_2d_position objects.

4.3.161 Component_assembly_3d_position to Next_higher_assembly_relationship

Each Component_assembly_3d_position has component defined by exactly one Next_higher_assembly_relationship. Each Next_higher_assembly_relationship defines component for zero or one Component_assembly_3d_position objects.

4.3.162 Component_assembly_3d_position to Physical_unit_3d_shape

Each Component_assembly_3d_position has assembly_model defined by exactly one Physical_unit_3d_shape. Each Physical_unit_3d_shape defines assembly_model for zero, one, or more Component_assembly_3d_position objects.

4.3.163 Component_assembly_3d_position to Component_3d_location

Each Component_assembly_3d_position has transformation defined by exactly one Component_3d_location. Each Component_3d_location defines transformation for zero, one, or more Component_assembly_3d_position objects.

4.3.164 Component_assembly_3d_position to Assembly_component_3d_shape

Each Component_assembly_3d_position has component_model defined by exactly one Assembly_component_3d_shape. Each Assembly_component_3d_shape defines component_model for zero, one, or more Component_assembly_3d_position objects.

4.3.165 Component_assembly_non_planar_position to Next_higher_assembly_relationship

Each Component_assembly_non_planar_position has component defined by exactly one Next_higher_assembly_relationship. Each Next_higher_assembly_relationship defines component for zero, one, or more Component_assembly_non_planar_position objects.

4.3.166 Component_assembly_non_planar_position to Physical_unit_3d_shape

Each Component_assembly_non_planar_position has assembly_model defined by exactly one Physical_unit_3d_shape. Each Physical_unit_3d_shape defines assembly_model for zero, one, or more Component_assembly_non_planar_position objects.

4.3.167 Component_assembly_non_planar_position to Component_non_planar_location

Each Component_assembly_non_planar_position has transformation defined by exactly one Component_non_planar_location. Each Component_non_planar_location defines transformation for zero, one, or more Component_assembly_non_planar_position objects.

4.3.168 Component_assembly_non_planar_position to Assembly_component_non_planar_shape

Each Component_assembly_non_planar_position has component_model defined by exactly one Assembly_component_non_planar_shape. Each Assembly_component_non_planar_shape defines component_model for zero, one, or more Component_assembly_non_planar_position objects.

4.3.169 Component_based_annotation_symbol_placement_relationship to Special_symbol_laminate_component

Each Component_based_annotation_symbol_placement_relationship has related_stratum_concept defined by exactly one Special_symbol_laminate_component. Each Special_symbol_laminate_component defines related_stratum_concept for zero, one, or more Component_based_annotation_symbol_placement_relationship objects.

4.3.170 Component_based_annotation_text_relationship to Laminate_text_string_component

Each Component_based_annotation_text_relationship has related_stratum_concept defined by exactly one Laminate_text_string_component. Each Laminate_text_string_component defines related_stratum_concept for zero, one, or more Component_based_annotation_text_relationship objects.

4.3.171 Component_feature to Assembly_component

Each Component_feature has associated_component defined by exactly one Assembly_component. Each Assembly_component defines associated_component for zero, one, or more Component_feature objects.

4.3.172 Component_feature to Land_template_terminal

Each Component_feature has definition defined by zero or one Land_template_terminal objects. Each Land_template_terminal defines definition for zero, one, or more Component_feature objects. This assertion is established through a SELECT type.

4.3.173 Component_feature to Component_termination_passage_template_terminal

Each Component_feature has definition defined by zero or one Component_termination_passage_template_terminal objects. Each Component_termination_passage_template_terminal defines definition for zero, one, or more Component_feature objects. This assertion is established through a SELECT type.

4.3.174 Component_feature to Part_feature

Each Component_feature has definition defined by zero or one Part_feature objects. Each Part_feature defines definition for zero, one, or more Component_feature objects. This assertion is established through a SELECT type.

4.3.175 Component_feature to Printed_part_template_terminal

Each Component_feature has definition defined by zero or one Printed_part_template_terminal objects. Each Printed_part_template_terminal defines definition for zero, one, or more Component_feature objects. This assertion is established through a SELECT type.

4.3.176 Component_feature to Part_terminal_external_reference

Each Component_feature has definition defined by zero or one Part_terminal_external_reference objects. Each Part_terminal_external_reference defines definition for zero, one, or more Component_feature objects. This assertion is established through a SELECT type.

4.3.177 Component_feature to Via_template_terminal

Each Component_feature has definition defined by zero or one Via_template_terminal objects. Each Via_template_terminal defines definition for zero, one, or more Component_feature objects. This assertion is established through a SELECT type.

4.3.178 Component_feature_external_reference to Component_external_reference

Each Component_feature_external_reference has associated_component defined by exactly one Component_external_reference. Each Component_external_reference defines associated_component for zero, one, or more Component_feature_external_reference objects.

4.3.179 Component_feature_make_from_relationship to Component_feature

Each Component_feature_make_from_relationship has resultant_feature defined by exactly one Component_feature. Each Component_feature defines resultant_feature for zero, one, or more Component_feature_make_from_relationship objects. Each Component_feature_make_from_relationship has reusable_feature defined by exactly one Component_feature. Each Component_feature defines reusable_feature for zero, one, or more Component_feature_make_from_relationship objects.

4.3.180 Component_feature_relationship to Component_feature

Each Component_feature_relationship has relating_component_feature defined by exactly one Component_feature. Each Component_feature defines relating_component_feature for zero, one, or more Component_feature_relationship objects. Each Component_feature_relationship has related_component_feature defined by exactly one Component_feature. Each Component_feature defines related_component_feature for zero, one, or more Component_feature_relationship objects.

4.3.181 Component_feature_to_layout_feature_relationship to Ee_requirement_occurrence

Each Component_feature_to_layout_feature_relationship has requirement defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines requirement for zero, one, or more Component_feature_to_layout_feature_relationship objects.

4.3.182 Component_feature_to_layout_feature_relationship to Assembly_component

Each Component_feature_to_layout_feature_relationship has relating_feature defined by zero or one Assembly_component objects. Each Assembly_component defines relating_feature for zero, one, or more Component_feature_to_layout_feature_relationship objects. This assertion is established through a SELECT type.

4.3.183 Component_feature_to_layout_feature_relationship to Component_external_reference

Each Component_feature_to_layout_feature_relationship has relating_feature defined by zero or one Component_external_reference objects. Each Component_external_reference defines relating_feature for zero, one, or more Component_feature_to_layout_feature_relationship objects. This assertion is established through a SELECT type.

4.3.184 Component_feature_to_layout_feature_relationship to Component_feature

Each Component_feature_to_layout_feature_relationship has relating_feature defined by zero or one Component_feature objects. Each Component_feature defines relating_feature for zero, one, or more Component_feature_to_layout_feature_relationship objects. This assertion is established through a SELECT type.

4.3.185 Component_feature_to_layout_feature_relationship to Component_feature_external_reference

Each Component_feature_to_layout_feature_relationship has relating_feature defined by zero or one Component_feature_external_reference objects. Each Component_feature_external_reference defines relating_feature for zero, one, or more Component_feature_to_layout_feature_relationship objects. This assertion is established through a SELECT type.

4.3.186 Component_feature_to_layout_feature_relationship to Laminate_component

Each Component_feature_to_layout_feature_relationship has related_stratum_concept defined by zero or one Laminate_component objects. Each Laminate_component defines related_stratum_concept for zero, one, or more Component_feature_to_layout_feature_relationship objects. This assertion is established through a SELECT type.

4.3.187 Component_feature_to_layout_feature_relationship to Inter_stratum_feature

Each Component_feature_to_layout_feature_relationship has related_stratum_concept defined by zero or one Inter_stratum_feature objects. Each Inter_stratum_feature defines related_stratum_concept for zero, one, or more Component_feature_to_layout_feature_relationship objects. This assertion is established through a SELECT type.

4.3.188 Component_feature_to_layout_feature_relationship to Stratum_feature

Each Component_feature_to_layout_feature_relationship has related_stratum_concept defined by zero or one Stratum_feature objects. Each Stratum_feature defines related_stratum_concept for zero, one, or more Component_feature_to_layout_feature_relationship objects. This assertion is established through a SELECT type.

4.3.189 Component_feature_to_layout_feature_relationship to Stratum

Each Component_feature_to_layout_feature_relationship has related_stratum_concept defined by zero or one Stratum objects. Each Stratum defines related_stratum_concept for zero, one, or more Component_feature_to_layout_feature_relationship objects. This assertion is established through a SELECT type.

4.3.190 Component_feature_to_layout_feature_relationship to Stratum_surface

Each Component_feature_to_layout_feature_relationship has related_stratum_concept defined by zero or one Stratum_surface objects. Each Stratum_surface defines related_stratum_concept for zero, one, or more Component_feature_to_layout_feature_relationship objects. This assertion is established through a SELECT type.

4.3.191 Component_feature_to_physical_usage_view_assignment to Component_feature

Each Component_feature_to_physical_usage_view_assignment has assigned_design_object defined by exactly one Component_feature. Each Component_feature defines assigned_design_object for zero or one Component_feature_to_physical_usage_view_assignment objects.

4.3.192 Component_feature_to_physical_usage_view_assignment to Part_feature

Each Component_feature_to_physical_usage_view_assignment has defined_part_feature defined by exactly one Part_feature. Each Part_feature defines defined_part_feature for zero or one Component_feature_to_physical_usage_view_assignment objects.

4.3.193 Component_group_assignment to Assembly_component

Each Component_group_assignment has assigned_component defined by exactly one Assembly_component. Each Assembly_component defines assigned_component for zero, one, or more Component_group_assignment objects.

4.3.194 Component_group_assignment to Placement_group

Each Component_group_assignment has associated_group defined by exactly one Placement_group. Each Placement_group defines associated_group for zero, one, or more Component_group_assignment objects.

4.3.195 Component_interface_terminal to Interface_component

Each Component_interface_terminal has associated_component defined by exactly one Interface_component. Each Interface_component defines associated_component for one or more Component_interface_terminal objects.

4.3.196 Component_make_from_relationship to Assembly_component

Each Component_make_from_relationship has resultant_component defined by exactly one Assembly_component. Each Assembly_component defines resultant_component for zero, one, or more Component_make_from_relationship objects. Each Component_make_from_relationship has reusable_component defined by exactly one Assembly_component. Each Assembly_component defines reusable_component for zero, one, or more Component_make_from_relationship objects.

4.3.197 Component_mounting_clearance_relationship to Length_data_element

Each Component_mounting_clearance_relationship has maximum_mounting_clearance defined by exactly one Length_data_element. Each Length_data_element defines maximum_mounting_clearance for zero, one, or more Component_mounting_clearance_relationship objects. Each Component_mounting_clearance_relationship has minimum_mounting_clearance defined by exactly one Length_data_element. Each Length_data_element defines minimum_mounting_clearance for zero, one, or more Component_mounting_clearance_relationship objects.

4.3.198 Component_mounting_clearance_relationship to Component_feature_relationship

Each Component_mounting_clearance_relationship has feature_relationship defined by exactly one Component_feature_relationship. Each Component_feature_relationship defines feature_relationship for zero, one, or more Component_mounting_clearance_relationship objects.

4.3.199 Component_mounting_feature to Part_mounting_feature

Each Component_mounting_feature has definition defined by exactly one Part_mounting_feature. Each Part_mounting_feature defines definition for zero, one, or more Component_mounting_feature objects.

4.3.200 Component_non_planar_location to Axis_placement_3d

Each Component_non_planar_location has transformation defined by exactly one Axis_placement_3d. Each Axis_placement_3d defines transformation for zero, one, or more Component_non_planar_location objects.

4.3.201 Component_overlap_relationship to Length_data_element

Each Component_overlap_relationship has maximum_added_clearance defined by exactly one Length_data_element. Each Length_data_element defines maximum_added_clearance for zero, one, or more Component_overlap_relationship objects. Each Component_overlap_relationship has minimum_added_clearance defined by exactly one Length_data_element. Each Length_data_element defines minimum_added_clearance for zero, one, or more Component_overlap_relationship objects.

4.3.202 Component_overlap_relationship to Next_higher_assembly_relationship

Each Component_overlap_relationship has current_component defined by exactly one Next_higher_assembly_relationship. Each Next_higher_assembly_relationship defines current_component for zero, one, or more Component_overlap_relationship objects. Each Component_overlap_relationship has previously_placed_component defined by exactly one Next_higher_assembly_relationship. Each Next_higher_assembly_relationship defines previously_placed_component for zero, one, or more Component_overlap_relationship objects.

4.3.203 Component_placement_restriction_assignment to Datum_based_length_measure

Each Component_placement_restriction_assignment has minimum_mounting_clearance defined by exactly one Datum_based_length_measure. Each Datum_based_length_measure defines minimum_mounting_clearance for zero, one, or more Component_placement_restriction_assignment objects. Each Component_placement_restriction_assignment has maximum_mounting_clearance defined by exactly one Datum_based_length_measure. Each Datum_based_length_measure defines maximum_mounting_clearance for zero, one, or more Component_placement_restriction_assignment objects. Each Component_placement_restriction_assignment has maximum_positive_component_height defined by exactly one Datum_based_length_measure. Each Datum_based_length_measure defines maximum_positive_component_height for zero, one, or more Component_placement_restriction_assignment objects. Each Component_placement_restriction_assignment has maximum_negative_component_height defined by exactly one Datum_based_length_measure. Each Datum_based_length_measure defines maximum_negative_component_height for zero, one, or more Component_placement_restriction_assignment objects.

4.3.204 Component_placement_restriction_assignment to Item_restricted_requirement_occurrence

Each Component_placement_restriction_assignment has requirement defined by exactly one Item_restricted_requirement_occurrence. Each Item_restricted_requirement_occurrence defines requirement for zero, one, or more Component_placement_restriction_assignment objects.

4.3.205 Component_placement_restriction_assignment to Mounting_restriction_volume

Each Component_placement_restriction_assignment has volume defined by exactly one Mounting_restriction_volume. Each Mounting_restriction_volume defines volume for zero, one, or more Component_placement_restriction_assignment objects.

4.3.206 Component_placement_restriction_assignment to Mounting_restriction_area

Each Component_placement_restriction_assignment has area defined by exactly one Mounting_restriction_area. Each Mounting_restriction_area defines area for zero, one, or more Component_placement_restriction_assignment objects.

4.3.207 Component_swap_specification to Design_functional_unit_allocation_to_assembly_component

Each Component_swap_specification has previous_design_object defined by exactly one Design_functional_unit_allocation_to_assembly_component. Each Design_functional_unit_allocation_to_assembly_component defines previous_design_object for zero, one, or more Component_swap_specification objects. Each Component_swap_specification has current_design_object defined by exactly one Design_functional_unit_allocation_to_assembly_component. Each Design_functional_unit_allocation_to_assembly_component defines current_design_object for zero, one, or more Component_swap_specification objects.

4.3.208 Component_termination_passage to Component_termination_passage_template

Each Component_termination_passage has usage_definition defined by exactly one Component_termination_passage_template. Each Component_termination_passage_template defines usage_definition for zero, one, or more Component_termination_passage objects.

4.3.209 Component_termination_passage_and_contact_size_dependent_land to Component_termination_passage

Each Component_termination_passage_and_contact_size_dependent_land has reference_passage defined by exactly one Component_termination_passage. Each Component_termination_passage defines reference_passage for zero, one, or more Component_termination_passage_and_contact_size_dependent_land objects.

4.3.210 Component_termination_passage_and_contact_size_dependent_land to Default_attachment_size_and_component_termination_passage_based_land_physical_template

Each Component_termination_passage_and_contact_size_dependent_land has usage_definition defined by exactly one Default_attachment_size_and_component_termination_passage_based_land_physical_template. Each Default_attachment_size_and_component_termination_passage_based_land_physical_template defines usage_definition for zero, one, or more Component_termination_passage_and_contact_size_dependent_land objects.

4.3.211**Component_termination_passage_and_contact_size_dependent_non_functional_land to Component_termination_passage**

Each Component_termination_passage_and_contact_size_dependent_non_functional_land has reference_passage defined by exactly one Component_termination_passage. Each Component_termination_passage defines reference_passage for zero, one, or more Component_termination_passage_and_contact_size_dependent_non_functional_land objects.

4.3.212**Component_termination_passage_and_contact_size_dependent_non_functional_land to Default_attachment_size_and_component_termination_passage_based_land_physical_template**

Each Component_termination_passage_and_contact_size_dependent_non_functional_land has usage_definition defined by exactly one Default_attachment_size_and_component_termination_passage_based_land_physical_template. Each Default_attachment_size_and_component_termination_passage_based_land_physical_template defines usage_definition for zero, one, or more Component_termination_passage_and_contact_size_dependent_non_functional_land objects.

4.3.213 Component_termination_passage_dependent_land to Default_component_termination_passage_based_land_physical_template

Each Component_termination_passage_dependent_land has usage_definition defined by exactly one Default_component_termination_passage_based_land_physical_template. Each Default_component_termination_passage_based_land_physical_template defines usage_definition for zero, one, or more Component_termination_passage_dependent_land objects.

4.3.214 Component_termination_passage_dependent_land to Component_termination_passage

Each Component_termination_passage_dependent_land has reference_passage defined by exactly one Component_termination_passage. Each Component_termination_passage defines reference_passage for zero, one, or more Component_termination_passage_dependent_land objects.

4.3.215 Component_termination_passage_dependent_non_functional_land to Default_component_termination_passage_based_land_physical_template

Each Component_termination_passage_dependent_non_functional_land has usage_definition defined by exactly one Default_component_termination_passage_based_land_physical_template. Each Default_component_termination_passage_based_land_physical_template defines usage_definition for zero, one, or more Component_termination_passage_dependent_non_functional_land objects.

4.3.216 Component_termination_passage_dependent_non_functional_land to Component_termination_passage

Each Component_termination_passage_dependent_non_functional_land has reference_passage defined by exactly one Component_termination_passage. Each Component_termination_passage defines reference_passage for zero, one, or more Component_termination_passage_dependent_non_functional_land objects.

4.3.217 Component_termination_passage_interface_terminal to Component_termination_passage

Each Component_termination_passage_interface_terminal has associated_component defined by exactly one Component_termination_passage. Each Component_termination_passage defines associated_component for zero, one, or more Component_termination_passage_interface_terminal objects.

4.3.218 Component_termination_passage_interface_terminal to Component_termination_passage_template_interface_terminal

Each Component_termination_passage_interface_terminal has definition defined by exactly one Component_termination_passage_template_interface_terminal. Each Component_termination_passage_template_interface_terminal defines definition for zero, one, or more Component_termination_passage_interface_terminal objects.

4.3.219 Component_termination_passage_join_terminal to Component_termination_passage

Each Component_termination_passage_join_terminal has associated_component defined by exactly one Component_termination_passage. Each Component_termination_passage defines associated_component for one or more Component_termination_passage_join_terminal objects.

4.3.220 Component_termination_passage_join_terminal to Component_termination_passage_template_join_terminal

Each Component_termination_passage_join_terminal has definition defined by exactly one Component_termination_passage_template_join_terminal. Each Component_termination_passage_template_join_terminal defines definition for zero, one, or more Component_termination_passage_join_terminal objects.

4.3.221 Component_termination_passage_template to Default_component_termination_passage_definition

Each Component_termination_passage_template has of_passage_technology defined by exactly one Default_component_termination_passage_definition. Each Default_component_termination_passage_definition defines of_passage_technology for zero, one, or more Component_termination_passage_template objects.

4.3.222 Component_termination_passage_template_join_terminal to Inter_stratum_extent

Each Component_termination_passage_template_join_terminal has disallowed_inter_stratum_extent defined by one or more Inter_stratum_extent objects. Each Inter_stratum_extent defines disallowed_inter_stratum_extent for zero, one, or more Component_termination_passage_template_join_terminal objects.

4.3.223 Component_termination_passage_template_terminal to Connection_zone

Each Component_termination_passage_template_terminal has terminal_connection_zone defined by one or more Connection_zone objects. Each Connection_zone defines terminal_connection_zone for zero, one, or more Component_termination_passage_template_terminal objects.

4.3.224 Component_termination_passage_template_terminal to Component_termination_passage_template

Each Component_termination_passage_template_terminal has associated_definition defined by exactly one Component_termination_passage_template. Each Component_termination_passage_template defines associated_definition for two or more Component_termination_passage_template_terminal objects.

4.3.225 Composite_curve to Composite_curve_segment

Each Composite_curve has curve_segment defined by one or more Composite_curve_segment objects. Each Composite_curve_segment defines curve_segment for one or more Composite_curve objects.

4.3.226 Composite_curve_segment to Curve

Each Composite_curve_segment has segment_curve defined by exactly one Curve. Each Curve defines segment_curve for zero, one, or more Composite_curve_segment objects.

4.3.227 Composite_feature_relating_position_tolerance to Composite_feature_locating_position_tolerance

Each Composite_feature_relating_position_tolerance has refined_control defined by zero or one Composite_feature_locating_position_tolerance objects. Each Composite_feature_locating_position_tolerance defines refined_control for zero, one, or more Composite_feature_relating_position_tolerance objects. This assertion is established through a SELECT type.

4.3.228 Composite_feature_relating_position_tolerance to Composite_feature_relating_position_tolerance

Each Composite_feature_relating_position_tolerance has refined_control defined by zero or one Composite_feature_relating_position_tolerance objects. Each Composite_feature_relating_position_tolerance defines refined_control for zero, one, or more Composite_feature_relating_position_tolerance objects. This assertion is established through a SELECT type.

4.3.229 Composite_linear_profile_refinement_tolerance to Composite_linear_profile_locating_tolerance

Each Composite_linear_profile_refinement_tolerance has refined_control defined by zero or one Composite_linear_profile_locating_tolerance objects. Each Composite_linear_profile_locating_tolerance defines refined_control for zero, one, or more Composite_linear_profile_refinement_tolerance objects. This assertion is established through a SELECT type.

4.3.230 Composite_linear_profile_refinement_tolerance to Composite_linear_profile_refinement_tolerance

Each Composite_linear_profile_refinement_tolerance has refined_control defined by zero or one Composite_linear_profile_refinement_tolerance objects. Each Composite_linear_profile_refinement_tolerance defines refined_control for zero, one, or more Composite_linear_profile_refinement_tolerance objects. This assertion is established through a SELECT type.

4.3.231 Composite_signal_property_relationship to External_definition

Each Composite_signal_property_relationship has aggregation_operation defined by exactly one External_definition. Each External_definition defines aggregation_operation for zero, one, or more Composite_signal_property_relationship objects.

4.3.232 Composite_signal_property_relationship to Signal_property

Each Composite_signal_property_relationship has signal_property_structural_element defined by exactly one Signal_property. Each Signal_property defines signal_property_structural_element for zero, one, or more Composite_signal_property_relationship objects.

4.3.233 Composite_signal_property_relationship to Composite_signal_property

Each Composite_signal_property_relationship has composition defined by exactly one Composite_signal_property. Each Composite_signal_property defines composition for one or more Composite_signal_property_relationship objects.

4.3.234 Composite_surface_profile_refinement_tolerance to Composite_surface_profile_locating_tolerance

Each Composite_surface_profile_refinement_tolerance has refined_control defined by zero or one Composite_surface_profile_locating_tolerance objects. Each Composite_surface_profile_locating_tolerance defines refined_control for zero, one, or more Composite_surface_profile_refinement_tolerance objects. This assertion is established through a SELECT type.

4.3.235 Composite_surface_profile_refinement_tolerance to Composite_surface_profile_refinement_tolerance

Each Composite_surface_profile_refinement_tolerance has refined_control defined by zero or one Composite_surface_profile_refinement_tolerance objects. Each Composite_surface_profile_refinement_tolerance defines refined_control for zero, one, or more Composite_surface_profile_refinement_tolerance objects. This assertion is established through a SELECT type.

4.3.236 Compound_characteristic to Compound_characteristic_definition

Each Compound_characteristic has property_value defined by exactly one Compound_characteristic_definition. Each Compound_characteristic_definition defines property_value for zero, one, or more Compound_characteristic objects.

4.3.237 Conductive_interconnect_element to Stratum_feature

Each Conductive_interconnect_element has composed_conductor defined by exactly one Stratum_feature. Each Stratum_feature defines composed_conductor for zero, one, or more Conductive_interconnect_element objects.

4.3.238 Conductive_interconnect_element_terminal to Connection_zone

Each Conductive_interconnect_element_terminal has connection defined by exactly one Connection_zone. Each Connection_zone defines connection for zero, one, or more Conductive_interconnect_element_terminal objects.

4.3.239 Conductive_interconnect_element_terminal to Conductive_interconnect_element

Each Conductive_interconnect_element_terminal has associated_component defined by exactly one Conductive_interconnect_element. Each Conductive_interconnect_element defines associated_component for exactly two Conductive_interconnect_element_terminal objects.

4.3.240 Conductive_interconnect_element_with_pre_defined_transitions to Layer_connection_point_link

Each Conductive_interconnect_element_with_pre_defined_transitions has connected_points defined by one or more Layer_connection_point_link objects. Each Layer_connection_point_link defines connected_points for zero, one, or more Conductive_interconnect_element_with_pre_defined_transitions objects.

4.3.241 Conductive_interconnect_element_with_pre_defined_transitions to Curve

Each Conductive_interconnect_element_with_pre_defined_transitions has centreline_shape defined by exactly one Curve. Each Curve defines centreline_shape for zero, one, or more Conductive_interconnect_element_with_pre_defined_transitions objects.

4.3.242 Conductive_interconnect_element_with_pre_defined_transitions to Trace_template

Each `Conductive_interconnect_element_with_pre_defined_transitions` has `usage_definition` defined by exactly one `Trace_template`. Each `Trace_template` defines `usage_definition` for zero, one, or more `Conductive_interconnect_element_with_pre_defined_transitions` objects.

4.3.243 Conductive_interconnect_element_with_user_defined_single_transition to Layer_connection_point

Each `Conductive_interconnect_element_with_user_defined_single_transition` has `end_terminus` defined by exactly one `Layer_connection_point`. Each `Layer_connection_point` defines `end_terminus` for zero, one, or more `Conductive_interconnect_element_with_user_defined_single_transition` objects. Each `Conductive_interconnect_element_with_user_defined_single_transition` has `start_terminus` defined by exactly one `Layer_connection_point`. Each `Layer_connection_point` defines `start_terminus` for zero, one, or more `Conductive_interconnect_element_with_user_defined_single_transition` objects.

4.3.244 Conductive_interconnect_element_with_user_defined_single_transition to Bounding_curve

Each `Conductive_interconnect_element_with_user_defined_single_transition` has `right_curve_shape_representation` defined by zero or one `Bounding_curve` objects. Each `Bounding_curve` defines `right_curve_shape_representation` for zero, one, or more `Conductive_interconnect_element_with_user_defined_single_transition` objects. This assertion is established through a `SELECT` type. Each `Conductive_interconnect_element_with_user_defined_single_transition` has `left_curve_shape_representation` defined by zero or one `Bounding_curve` objects. Each `Bounding_curve` defines `left_curve_shape_representation` for zero, one, or more `Conductive_interconnect_element_with_user_defined_single_transition` objects. This assertion is established through a `SELECT` type.

4.3.245 Conductive_interconnect_element_with_user_defined_single_transition to Trimmed_line

Each `Conductive_interconnect_element_with_user_defined_single_transition` has `right_curve_shape_representation` defined by zero or one `Trimmed_line` objects. Each `Trimmed_line` defines `right_curve_shape_representation` for zero, one, or more `Conductive_interconnect_element_with_user_defined_single_transition` objects. This assertion is established through a `SELECT` type. Each `Conductive_interconnect_element_with_user_defined_single_transition` has `left_curve_shape_representation` defined by zero or one `Trimmed_line` objects. Each `Trimmed_line` defines `left_curve_shape_representation` for zero, one, or more `Conductive_interconnect_element_with_user_defined_single_transition` objects. This assertion is established through a `SELECT` type.

4.3.246 Conductive_interconnect_element_with_user_defined_single_transition to Trace_template

Each Conductive_interconnect_element_with_user_defined_single_transition has end_definition defined by exactly one Trace_template. Each Trace_template defines end_definition for zero, one, or more Conductive_interconnect_element_with_user_defined_single_transition objects. Each Conductive_interconnect_element_with_user_defined_single_transition has start_definition defined by exactly one Trace_template. Each Trace_template defines start_definition for zero, one, or more Conductive_interconnect_element_with_user_defined_single_transition objects.

4.3.247 Conductor to Intra_stratum_join_relationship

Each Conductor has implementation_requirement defined by exactly one Intra_stratum_join_relationship. Each Intra_stratum_join_relationship defines implementation_requirement for zero or one Conductor objects.

4.3.248 Conductor to Design_layer_stratum

Each Conductor has resident_stratum defined by exactly one Design_layer_stratum. Each Design_layer_stratum defines resident_stratum for zero, one, or more Conductor objects.

4.3.249 Configuration_controlled_message to Organization

Each Configuration_controlled_message has message_source defined by zero or one Organization objects. Each Organization defines message_source for zero, one, or more Configuration_controlled_message objects. This assertion is established through a SELECT type.

4.3.250 Configuration_controlled_message to Ee_approval

Each Configuration_controlled_message has message_source defined by zero or one Ee_approval objects. Each Ee_approval defines message_source for zero, one, or more Configuration_controlled_message objects. This assertion is established through a SELECT type.

4.3.251 Configuration_controlled_message to Ee_product_version

Each Configuration_controlled_message has message_source defined by zero or one Ee_product_version objects. Each Ee_product_version defines message_source for zero, one, or more Configuration_controlled_message objects. This assertion is established through a SELECT type.

4.3.252 Conical_tolerance_zone_boundary_and_surface_relationship to Physical_feature_or_part_template

Each Conical_tolerance_zone_boundary_and_surface_relationship has terminating_surface defined by exactly one Physical_feature_or_part_template. Each Physical_feature_or_part_template defines terminating_surface for zero, one, or more Conical_tolerance_zone_boundary_and_surface_relationship objects.

4.3.253 Conical_tolerance_zone_boundary_and_surface_relationship to Conical_tolerance_zone_boundary

Each Conical_tolerance_zone_boundary_and_surface_relationship has sized_tolerance_zone_boundary defined by exactly one Conical_tolerance_zone_boundary. Each Conical_tolerance_zone_boundary defines sized_tolerance_zone_boundary for exactly two Conical_tolerance_zone_boundary_and_surface_relationship objects.

4.3.254 Conical_tolerance_zone_boundary_definition to Conical_tolerance_zone_boundary

Each Conical_tolerance_zone_boundary_definition has defined_zone_boundary defined by exactly one Conical_tolerance_zone_boundary. Each Conical_tolerance_zone_boundary defines defined_zone_boundary for zero, one, or more Conical_tolerance_zone_boundary_definition objects.

4.3.255 Conical_tolerance_zone_boundary_definition to Conical_tolerance_zone_boundary_diametrical_size_characteristic

Each Conical_tolerance_zone_boundary_definition has boundary_sizes defined by exactly two Conical_tolerance_zone_boundary_diametrical_size_characteristic objects. Each Conical_tolerance_zone_boundary_diametrical_size_characteristic defines boundary_sizes for zero, one, or more Conical_tolerance_zone_boundary_definition objects.

4.3.256 Conical_tolerance_zone_boundary_diametrical_size_characteristic to Length_data_element

Each Conical_tolerance_zone_boundary_diametrical_size_characteristic has tolerance_value defined by exactly one Length_data_element. Each Length_data_element defines tolerance_value for zero, one, or more Conical_tolerance_zone_boundary_diametrical_size_characteristic objects.

4.3.257 Conical_tolerance_zone_boundary_diametrical_size_characteristic to Conical_tolerance_zone_boundary_and_surface_relationship

Each Conical_tolerance_zone_boundary_diametrical_size_characteristic has sized_boundary_at_surface defined by exactly one Conical_tolerance_zone_boundary_and_surface_relationship. Each Conical_tolerance_zone_boundary_and_surface_relationship defines sized_boundary_at_surface for zero, one, or more Conical_tolerance_zone_boundary_diametrical_size_characteristic objects.

4.3.258 Conical_tolerance_zone_definition to Conical_tolerance_zone_boundary_definition

Each Conical_tolerance_zone_definition has boundary_definition defined by exactly one Conical_tolerance_zone_boundary_definition. Each Conical_tolerance_zone_boundary_definition defines boundary_definition for zero, one, or more Conical_tolerance_zone_definition objects.

4.3.259 Connected_area_component to Layer_connection_point

Each Connected_area_component has associated_layer_connection_point defined by one or more Layer_connection_point objects. Each Layer_connection_point defines associated_layer_connection_point for zero, one, or more Connected_area_component objects.

4.3.260 Connected_filled_area to Intra_stratum_join_relationship

Each Connected_filled_area has implementation_requirement defined by exactly one Intra_stratum_join_relationship. Each Intra_stratum_join_relationship defines implementation_requirement for zero or one Connected_filled_area objects.

4.3.261 Connected_filled_area to Design_layer_stratum

Each Connected_filled_area has resident_stratum defined by exactly one Design_layer_stratum. Each Design_layer_stratum defines resident_stratum for zero, one, or more Connected_filled_area objects.

4.3.262 Connection_zone to Ee_colour

Each Connection_zone has representation_colour defined by exactly one Ee_colour. Each Ee_colour defines representation_colour for zero, one, or more Connection_zone objects.

4.3.263 Connection_zone_based_assembly_joint to Connection_zone

Each Connection_zone_based_assembly_joint has zone_2 defined by exactly one Connection_zone. Each Connection_zone defines zone_2 for zero, one, or more Connection_zone_based_assembly_joint objects. Each Connection_zone_based_assembly_joint has zone_1 defined by exactly one Connection_zone. Each Connection_zone defines zone_1 for zero, one, or more Connection_zone_based_assembly_joint objects.

4.3.264 Connection_zone_interface_plane_relationship to Connection_zone

Each Connection_zone_interface_plane_relationship has derived_zone defined by exactly one Connection_zone. Each Connection_zone defines derived_zone for zero, one, or more Connection_zone_interface_plane_relationship objects. Each Connection_zone_interface_plane_relationship has mating_zone defined by exactly one Connection_zone. Each Connection_zone defines mating_zone for zero, one, or more Connection_zone_interface_plane_relationship objects.

4.3.265 Connection_zone_interface_plane_relationship to Seating_plane

Each Connection_zone_interface_plane_relationship has interface_plane defined by exactly one Seating_plane. Each Seating_plane defines interface_plane for zero, one, or more Connection_zone_interface_plane_relationship objects.

4.3.266 Connection_zone_map_identification to Usage_view_connection_zone_terminal_shape_relationship

Each Connection_zone_map_identification has mapped_connection_zone_shape defined by exactly one Usage_view_connection_zone_terminal_shape_relationship. Each Usage_view_connection_zone_terminal_shape_relationship defines mapped_connection_zone_shape for zero, one, or more Connection_zone_map_identification objects. Each Connection_zone_map_identification has reference_connection_zone_shape defined by exactly one Usage_view_connection_zone_terminal_shape_relationship. Each Usage_view_connection_zone_terminal_shape_relationship defines reference_connection_zone_shape for zero, one, or more Connection_zone_map_identification objects.

4.3.267 Connection_zone_model_port_assignment to Analytical_model_port

Each Connection_zone_model_port_assignment has target defined by exactly one Analytical_model_port. Each Analytical_model_port defines target for zero, one, or more Connection_zone_model_port_assignment objects.

4.3.268 Connection_zone_model_port_assignment to Connection_zone

Each Connection_zone_model_port_assignment has source defined by exactly one Connection_zone. Each Connection_zone defines source for zero, one, or more Connection_zone_model_port_assignment objects.

4.3.269 Connectivity_allocation to Aggregate_connectivity_requirement

Each Connectivity_allocation has connectivity_requirement defined by exactly one Aggregate_connectivity_requirement. Each Aggregate_connectivity_requirement defines connectivity_requirement for zero, one, or more Connectivity_allocation objects.

4.3.270 Connectivity_allocation to Physical_connectivity_definition

Each Connectivity_allocation has implementation defined by exactly one Physical_connectivity_definition. Each Physical_connectivity_definition defines implementation for zero, one, or more Connectivity_allocation objects.

4.3.271 Connectivity_allocation_to_physical_network to Aggregate_connectivity_requirement

Each Connectivity_allocation_to_physical_network has connectivity_requirement defined by exactly one Aggregate_connectivity_requirement. Each Aggregate_connectivity_requirement defines connectivity_requirement for zero, one, or more Connectivity_allocation_to_physical_network objects.

4.3.272 Connectivity_allocation_to_physical_network to Physical_network

Each Connectivity_allocation_to_physical_network has implementation defined by exactly one Physical_network. Each Physical_network defines implementation for zero, one, or more Connectivity_allocation_to_physical_network objects.

4.3.273 Contact_size_dependent_land to Default_attachment_size_based_land_physical_template

Each Contact_size_dependent_land has usage_definition defined by exactly one Default_attachment_size_based_land_physical_template. Each Default_attachment_size_based_land_physical_template defines usage_definition for zero, one, or more Contact_size_dependent_land objects.

4.3.274 Contact_size_dependent_non_functional_land to Default_attachment_size_based_land_physical_template

Each Contact_size_dependent_non_functional_land has usage_definition defined by exactly one Default_attachment_size_based_land_physical_template. Each Default_attachment_size_based_land_physical_template defines usage_definition for zero, one, or more Contact_size_dependent_non_functional_land objects.

4.3.275 Contract to Date_and_time

Each Contract has contract_date defined by zero or one Date_and_time objects. Each Date_and_time defines contract_date for zero, one, or more Contract objects. This assertion is established through a SELECT type.

4.3.276 Contract to Date

Each Contract has contract_date defined by zero or one Date objects. Each Date defines contract_date for zero, one, or more Contract objects. This assertion is established through a SELECT type.

4.3.277 Contract to Ee_approval

Each Contract has contract_approval defined by exactly one Ee_approval. Each Ee_approval defines contract_approval for zero, one, or more Contract objects.

4.3.278 Contract to Ee_text

Each Contract has contract_number defined by exactly one Ee_text. Each Ee_text defines contract_number for zero, one, or more Contract objects.

4.3.279 Contract to Person_and_organization

Each Contract has contractor defined by zero or one Person_and_organization objects. Each Person_and_organization defines contractor for zero, one, or more Contract objects. This assertion is established through a SELECT type.

4.3.280 Contract to Organization

Each Contract has contractor defined by zero or one Organization objects. Each Organization defines contractor for zero, one, or more Contract objects. This assertion is established through a SELECT type.

4.3.281 Coordinated_characteristic to Ee_document

Each Coordinated_characteristic has reference_document defined by exactly one Ee_document. Each Ee_document defines reference_document for zero, one, or more Coordinated_characteristic objects.

4.3.282 Coordinated_characteristic to Characteristic

Each Coordinated_characteristic has component_characteristic defined by one or more Characteristic objects. Each Characteristic defines component_characteristic for zero, one, or more Coordinated_characteristic objects.

4.3.283 Counterbore_passage_template to Blind_passage_template

Each Counterbore_passage_template has larger_passage defined by exactly one Blind_passage_template. Each Blind_passage_template defines larger_passage for zero, one, or more Counterbore_passage_template objects.

4.3.284 Counterbore_passage_template to Unsupported_passage_template

Each Counterbore_passage_template has smaller_passage defined by exactly one Unsupported_passage_template. Each Unsupported_passage_template defines smaller_passage for zero, one, or more Counterbore_passage_template objects.

4.3.285 Countersunk_passage_template to Blind_passage_template

Each Countersunk_passage_template has tapered_passage defined by exactly one Blind_passage_template. Each Blind_passage_template defines tapered_passage for zero, one, or more Countersunk_passage_template objects.

4.3.286 Countersunk_passage_template to Unsupported_passage_template

Each Countersunk_passage_template has constant_diameter_passage defined by exactly one Unsupported_passage_template. Each Unsupported_passage_template defines constant_diameter_passage for zero, one, or more Countersunk_passage_template objects.

4.3.287 Curve_style to Curve_style_font_and_scaling

Each Curve_style has curve_font defined by zero or one Curve_style_font_and_scaling objects. Each Curve_style_font_and_scaling defines curve_font for zero, one, or more Curve_style objects. This assertion is established through a SELECT type.

4.3.288 Curve_style to Solid_curve

Each Curve_style has curve_font defined by zero or one Solid_curve objects. Each Solid_curve defines curve_font for zero, one, or more Curve_style objects. This assertion is established through a SELECT type.

4.3.289 Curve_style to Externally_defined_curve_font

Each Curve_style has curve_font defined by zero or one Externally_defined_curve_font objects. Each Externally_defined_curve_font defines curve_font for zero, one, or more Curve_style objects. This assertion is established through a SELECT type.

4.3.290 Curve_style to Curve_style_font

Each Curve_style has curve_font defined by zero or one Curve_style_font objects. Each Curve_style_font defines curve_font for zero, one, or more Curve_style objects. This assertion is established through a SELECT type.

4.3.291 Curve_style to Length_data_element

Each Curve_style has curve_width defined by exactly one Length_data_element. Each Length_data_element defines curve_width for zero, one, or more Curve_style objects.

4.3.292 Curve_style_font_and_scaling to Solid_curve

Each Curve_style_font_and_scaling has curve_font defined by zero or one Solid_curve objects. Each Solid_curve defines curve_font for zero, one, or more Curve_style_font_and_scaling objects. This assertion is established through a SELECT type.

4.3.293 Curve_style_font_and_scaling to Externally_defined_curve_font

Each Curve_style_font_and_scaling has curve_font defined by zero or one Externally_defined_curve_font objects. Each Externally_defined_curve_font defines curve_font for zero, one, or more Curve_style_font_and_scaling objects. This assertion is established through a SELECT type.

4.3.294 Curve_style_font_and_scaling to Curve_style_font

Each Curve_style_font_and_scaling has curve_font defined by zero or one Curve_style_font objects. Each Curve_style_font defines curve_font for zero, one, or more Curve_style_font_and_scaling objects. This assertion is established through a SELECT type.

4.3.295 Cutout_edge_segment to Inter_stratum_feature_edge_segment_template

Each Cutout_edge_segment has usage_definition defined by exactly one Inter_stratum_feature_edge_segment_template. Each Inter_stratum_feature_edge_segment_template defines usage_definition for zero, one, or more Cutout_edge_segment objects.

4.3.296 Cutout_edge_segment to Edge_segment_vertex

Each Cutout_edge_segment has end_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines end_vertex for zero, one, or more Cutout_edge_segment objects. Each Cutout_edge_segment has start_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines start_vertex for zero, one, or more Cutout_edge_segment objects.

4.3.297 Cutout_edge_segment to Cutout

Each Cutout_edge_segment has composed_cutout defined by exactly one Cutout. Each Cutout defines composed_cutout for zero, one, or more Cutout_edge_segment objects.

4.3.298 Datum_axis_and_tolerance_zone_orienting_relationship to Datum_axis

Each Datum_axis_and_tolerance_zone_orienting_relationship has orienting_datum_axis defined by exactly one Datum_axis. Each Datum_axis defines orienting_datum_axis for zero, one, or more Datum_axis_and_tolerance_zone_orienting_relationship objects.

4.3.299 Datum_axis_and_tolerance_zone_orienting_relationship to Tolerance_zone

Each Datum_axis_and_tolerance_zone_orienting_relationship has oriented_tolerance_zone defined by exactly one Tolerance_zone. Each Tolerance_zone defines oriented_tolerance_zone for zero, one, or more Datum_axis_and_tolerance_zone_orienting_relationship objects.

4.3.300 Datum_axis_related_orientation to Datum_axis_and_tolerance_zone_orienting_relationship

Each Datum_axis_related_orientation has orienting_relationship defined by exactly one Datum_axis_and_tolerance_zone_orienting_relationship. Each Datum_axis_and_tolerance_zone_orienting_relationship defines orienting_relationship for zero, one, or more Datum_axis_related_orientation objects.

4.3.301 Datum_based_direction_vector to Datum_plane

Each Datum_based_direction_vector has vector_of defined by exactly one Datum_plane. Each Datum_plane defines vector_of for zero, one, or more Datum_based_direction_vector objects.

4.3.302 Datum_based_direction_vector to Axis_placement

Each Datum_based_direction_vector has direction_vector_representation defined by exactly one Axis_placement. Each Axis_placement defines direction_vector_representation for zero, one, or more Datum_based_direction_vector objects.

4.3.303 Datum_based_length_measure to Datum_plane

Each Datum_based_length_measure has of_datum defined by exactly one Datum_plane. Each Datum_plane defines of_datum for zero, one, or more Datum_based_length_measure objects.

4.3.304 Datum_based_length_measure to Orientation

Each Datum_based_length_measure has measure_orientation defined by zero or one Orientation objects. Each Orientation defines measure_orientation for zero, one, or more Datum_based_length_measure objects. This assertion is established through a SELECT type.

4.3.305 Datum_based_length_measure to Length_data_element

Each Datum_based_length_measure has measure defined by exactly one Length_data_element. Each Length_data_element defines measure for zero, one, or more Datum_based_length_measure objects.

4.3.306 Datum_based_vector_orientation to Direction_element

Each Datum_based_vector_orientation has direction_components defined by exactly two Direction_element objects. Each Direction_element defines direction_components for one or more Datum_based_vector_orientation objects.

4.3.307 Datum_difference_analytical_model_port_assignment to Datum_difference

Each Datum_difference_analytical_model_port_assignment has of_datum_difference defined by exactly one Datum_difference. Each Datum_difference defines of_datum_difference for zero, one, or more Datum_difference_analytical_model_port_assignment objects.

4.3.308 Datum_difference_analytical_model_port_assignment to Analytical_model_port

Each Datum_difference_analytical_model_port_assignment has assigned_analytical_model_port defined by exactly one Analytical_model_port. Each Analytical_model_port defines assigned_analytical_model_port for zero, one, or more Datum_difference_analytical_model_port_assignment objects.

4.3.309 Datum_difference_based_characteristic to Datum_difference

Each Datum_difference_based_characteristic has of_datum_difference defined by exactly one Datum_difference. Each Datum_difference defines of_datum_difference for zero, one, or more Datum_difference_based_characteristic objects.

4.3.310 Datum_difference_based_model_parameter to Datum_difference

Each Datum_difference_based_model_parameter has of_datum_difference defined by exactly one Datum_difference. Each Datum_difference defines of_datum_difference for zero, one, or more Datum_difference_based_model_parameter objects.

4.3.311 Datum_difference_functional_unit_usage_view_terminal_assignment to Datum_difference

Each Datum_difference_functional_unit_usage_view_terminal_assignment has assigned_datum_difference defined by exactly one Datum_difference. Each Datum_difference defines assigned_datum_difference for zero, one, or more Datum_difference_functional_unit_usage_view_terminal_assignment objects.

4.3.312 Datum_difference_functional_unit_usage_view_terminal_assignment to Functional_unit_usage_view_terminal_definition

Each Datum_difference_functional_unit_usage_view_terminal_assignment has assigned_functional_terminal_definition defined by exactly one Functional_unit_usage_view_terminal_definition. Each Functional_unit_usage_view_terminal_definition defines assigned_functional_terminal_definition for zero, one, or more Datum_difference_functional_unit_usage_view_terminal_assignment objects.

4.3.313 Datum_feature_material_condition_property to Datum_feature_usage_in_datum_system_relationship

Each Datum_feature_material_condition_property has applied_to defined by exactly one Datum_feature_usage_in_datum_system_relationship. Each Datum_feature_usage_in_datum_system_relationship defines applied_to for zero, one, or more Datum_feature_material_condition_property objects.

4.3.314 Datum_feature_usage_in_common_datum_relationship to Common_datum

Each Datum_feature_usage_in_common_datum_relationship has relating_shape_element defined by exactly one Common_datum. Each Common_datum defines relating_shape_element for zero, one, or more Datum_feature_usage_in_common_datum_relationship objects.

4.3.315 Datum_feature_usage_in_datum_relationship to Datum_feature

Each Datum_feature_usage_in_datum_relationship has related_shape_element defined by exactly one Datum_feature. Each Datum_feature defines related_shape_element for one or more Datum_feature_usage_in_datum_relationship objects.

4.3.316 Datum_feature_usage_in_datum_relationship to Datum

Each Datum_feature_usage_in_datum_relationship has relating_shape_element defined by exactly one Datum. Each Datum defines relating_shape_element for zero, one, or more Datum_feature_usage_in_datum_relationship objects.

4.3.317 Datum_feature_usage_in_datum_system_relationship to Datum_feature

Each Datum_feature_usage_in_datum_system_relationship has used_datum_feature defined by exactly one Datum_feature. Each Datum_feature defines used_datum_feature for zero, one, or more Datum_feature_usage_in_datum_system_relationship objects.

4.3.318 Datum_feature_usage_in_datum_system_relationship to Datum_system

Each Datum_feature_usage_in_datum_system_relationship has established_datum_system defined by exactly one Datum_system. Each Datum_system defines established_datum_system for zero, one, or more Datum_feature_usage_in_datum_system_relationship objects.

4.3.319 Datum_feature_usage_in_single_datum_relationship to Single_datum

Each Datum_feature_usage_in_single_datum_relationship has relating_shape_element defined by exactly one Single_datum. Each Single_datum defines relating_shape_element for zero, one, or more Datum_feature_usage_in_single_datum_relationship objects.

4.3.320 Datum_point to Volume_shape_intersection

Each Datum_point has associated_volume_shape_intersection defined by exactly one Volume_shape_intersection. Each Volume_shape_intersection defines associated_volume_shape_intersection for zero, one, or more Datum_point objects.

4.3.321 Datum_point to Cartesian_point

Each Datum_point has location_in_3d defined by exactly one Cartesian_point. Each Cartesian_point defines location_in_3d for zero, one, or more Datum_point objects. Each Datum_point has location_in_2d defined by exactly one Cartesian_point. Each Cartesian_point defines location_in_2d for zero, one, or more Datum_point objects.

4.3.322 Datum_precedence_assignment to Datum_usage_in_datum_system_relationship

Each Datum_precedence_assignment has assigned_to defined by exactly one Datum_usage_in_datum_system_relationship. Each Datum_usage_in_datum_system_relationship defines assigned_to for zero, one, or more Datum_precedence_assignment objects.

4.3.323 Datum_reference_frame to Datum_point

Each Datum_reference_frame has reference_origin defined by exactly one Datum_point. Each Datum_point defines reference_origin for zero, one, or more Datum_reference_frame objects.

4.3.324 Datum_reference_frame to Perpendicular_shape_element_relationship

Each Datum_reference_frame has reference_axis_pairs defined by exactly three Perpendicular_shape_element_relationship objects. Each Perpendicular_shape_element_relationship defines reference_axis_pairs for zero, one, or more Datum_reference_frame objects. Each Datum_reference_frame has reference_plane_pairs defined by exactly three Perpendicular_shape_element_relationship objects. Each Perpendicular_shape_element_relationship defines reference_plane_pairs for zero, one, or more Datum_reference_frame objects.

4.3.325 Datum_reference_frame to Datum_axis

Each Datum_reference_frame has reference_axes defined by exactly three Datum_axis objects. Each Datum_axis defines reference_axes for zero, one, or more Datum_reference_frame objects.

4.3.326 Datum_reference_frame to Datum_plane

Each Datum_reference_frame has reference_planes defined by exactly three Datum_plane objects. Each Datum_plane defines reference_planes for zero, one, or more Datum_reference_frame objects.

4.3.327 Datum_system to Datum_reference_frame

Each Datum_system has established_datum_reference_frame defined by exactly one Datum_reference_frame. Each Datum_reference_frame defines established_datum_reference_frame for one or more Datum_system objects.

4.3.328 Datum_system_defining_conditions to Datum_precedence_assignment

Each Datum_system_defining_conditions has assigned_datum_precedences defined by one, two, or three Datum_precedence_assignment objects. Each Datum_precedence_assignment defines assigned_datum_precedences for zero, one, or more Datum_system_defining_conditions objects.

4.3.329 Datum_system_defining_conditions to Datum_system

Each Datum_system_defining_conditions has conditions_of defined by exactly one Datum_system. Each Datum_system defines conditions_of for zero, one, or more Datum_system_defining_conditions objects.

4.3.330 Datum_system_defining_conditions_with_material_conditions to Datum_feature_material_condition_property

Each Datum_system_defining_conditions_with_material_conditions has applied_material_condition_properties defined by one or more Datum_feature_material_condition_property objects. Each Datum_feature_material_condition_property defines applied_material_condition_properties for zero, one, or more Datum_system_defining_conditions_with_material_conditions objects.

4.3.331 Datum_target_usage_in_datum_target_set_relationship to Datum_target

Each Datum_target_usage_in_datum_target_set_relationship has used_datum_target defined by exactly one Datum_target. Each Datum_target defines used_datum_target for one or more Datum_target_usage_in_datum_target_set_relationship objects.

4.3.332 Datum_target_usage_in_datum_target_set_relationship to Datum_target_set

Each Datum_target_usage_in_datum_target_set_relationship has defined_datum_target_set defined by exactly one Datum_target_set. Each Datum_target_set defines defined_datum_target_set for one or more Datum_target_usage_in_datum_target_set_relationship objects.

4.3.333 Datum_usage_in_datum_system_relationship to Datum

Each Datum_usage_in_datum_system_relationship has used_datum defined by exactly one Datum. Each Datum defines used_datum for zero, one, or more Datum_usage_in_datum_system_relationship objects.

4.3.334 Datum_usage_in_datum_system_relationship to Datum_system

Each Datum_usage_in_datum_system_relationship has established_datum_system defined by exactly one Datum_system. Each Datum_system defines established_datum_system for one, two, or three Datum_usage_in_datum_system_relationship objects.

4.3.335 Default_assembly_bond_shape to Assembly_bond_definition

Each Default_assembly_bond_shape has characterized_bond_definition defined by exactly one Assembly_bond_definition. Each Assembly_bond_definition defines characterized_bond_definition for zero or one Default_assembly_bond_shape objects.

4.3.336 Default_attachment_size_based_land_physical_template to Connection_zone

Each Default_attachment_size_based_land_physical_template has maximum_attachment_region_size defined by exactly one Connection_zone. Each Connection_zone defines maximum_attachment_region_size for zero, one, or more Default_attachment_size_based_land_physical_template objects. Each Default_attachment_size_based_land_physical_template has minimum_attachment_region_size defined by exactly one Connection_zone. Each Connection_zone defines minimum_attachment_region_size for zero, one, or more Default_attachment_size_based_land_physical_template objects.

4.3.337 Default_component_termination_passage_based_land_physical_template to Default_component_termination_passage_definition

Each Default_component_termination_passage_based_land_physical_template has of_passage_technology defined by exactly one Default_component_termination_passage_definition. Each Default_component_termination_passage_definition defines of_passage_technology for zero, one, or more Default_component_termination_passage_based_land_physical_template objects.

4.3.338 Default_component_termination_passage_definition to Length_data_element

Each Default_component_termination_passage_definition has minimum_as_finished_passage_extent defined by exactly one Length_data_element. Each Length_data_element defines minimum_as_finished_passage_extent for zero, one, or more Default_component_termination_passage_definition objects. Each Default_component_termination_passage_definition has minimum_as_finished_deposition_thickness defined by exactly one Length_data_element. Each Length_data_element defines minimum_as_finished_deposition_thickness for zero, one, or more Default_component_termination_passage_definition objects. Each Default_component_termination_passage_definition has maximum_allowed_component_terminal_extent defined by exactly one Length_data_element. Each Length_data_element defines maximum_allowed_component_terminal_extent for zero, one, or more Default_component_termination_passage_definition objects. Each Default_component_termination_passage_definition has minimum_allowed_component_terminal_extent defined by exactly one Length_data_element. Each Length_data_element defines minimum_allowed_component_terminal_extent for zero, one, or more Default_component_termination_passage_definition objects.

4.3.339 Default_component_termination_passage_definition to Ee_material

Each Default_component_termination_passage_definition has deposition_material defined by exactly one Ee_material. Each Ee_material defines deposition_material for zero, one, or more Default_component_termination_passage_definition objects.

4.3.340 Default_land_physical_template to Design_layer_technology

Each Default_land_physical_template has of_stratum_technology defined by exactly one Design_layer_technology. Each Design_layer_technology defines of_stratum_technology for zero, one, or more Default_land_physical_template objects.

4.3.341 Default_passage_based_land_physical_template to Length_data_element

Each Default_passage_based_land_physical_template has minimum_annular_ring defined by exactly one Length_data_element. Each Length_data_element defines minimum_annular_ring for zero, one, or more Default_passage_based_land_physical_template objects. Each Default_passage_based_land_physical_template has minimum_fabrication_allowance defined by exactly one Length_data_element. Each Length_data_element defines minimum_fabrication_allowance for zero, one, or more Default_passage_based_land_physical_template objects.

4.3.342 Default_passage_based_land_physical_template to Inter_stratum_extent

Each Default_passage_based_land_physical_template has of_stratum_extent defined by exactly one Inter_stratum_extent. Each Inter_stratum_extent defines of_stratum_extent for zero, one, or more Default_passage_based_land_physical_template objects.

4.3.343 Default_passage_based_land_physical_template to Passage_technology

Each Default_passage_based_land_physical_template has of_passage_technology defined by exactly one Passage_technology. Each Passage_technology defines of_passage_technology for zero, one, or more Default_passage_based_land_physical_template objects.

4.3.344 Default_trace_template to Stratum_technology

Each Default_trace_template has of_stratum_technology defined by exactly one Stratum_technology. Each Stratum_technology defines of_stratum_technology for zero, one, or more Default_trace_template objects.

4.3.345 Default_unsupported_passage_based_land_physical_template to Default_unsupported_passage_definition

Each Default_unsupported_passage_based_land_physical_template has of_passage_technology defined by exactly one Default_unsupported_passage_definition. Each Default_unsupported_passage_definition defines of_passage_technology for zero, one, or more Default_unsupported_passage_based_land_physical_template objects.

4.3.346 Default_unsupported_passage_definition to Length_data_element

Each Default_unsupported_passage_definition has minimum_as_finished_passage_extent defined by exactly one Length_data_element. Each Length_data_element defines minimum_as_finished_passage_extent for zero, one, or more Default_unsupported_passage_definition objects.

4.3.347 Default_via_based_land_physical_template to Default_via_definition

Each Default_via_based_land_physical_template has of_passage_technology defined by exactly one Default_via_definition. Each Default_via_definition defines of_passage_technology for zero, one, or more Default_via_based_land_physical_template objects.

4.3.348 Default_via_definition to Length_data_element

Each Default_via_definition has minimum_as_finished_passage_extent defined by exactly one Length_data_element. Each Length_data_element defines minimum_as_finished_passage_extent for zero, one, or more Default_via_definition objects. Each Default_via_definition has minimum_as_finished_deposition_thickness defined by exactly one Length_data_element. Each Length_data_element defines minimum_as_finished_deposition_thickness for zero, one, or more Default_via_definition objects.

4.3.349 Default_via_definition to Ee_material

Each Default_via_definition has deposition_material defined by exactly one Ee_material. Each Ee_material defines deposition_material for zero, one, or more Default_via_definition objects.

4.3.350 Delete_design_object_management_relationship to Managed_design_object

Each Delete_design_object_management_relationship has previous_design_object defined by exactly one Managed_design_object. Each Managed_design_object defines previous_design_object for zero, one, or more Delete_design_object_management_relationship objects.

4.3.351 Dependently_located_layer_connection_point to Inter_stratum_feature

Each Dependently_located_layer_connection_point has associated_design_object defined by zero or one Inter_stratum_feature objects. Each Inter_stratum_feature defines associated_design_object for zero, one, or more Dependently_located_layer_connection_point objects. This assertion is established through a SELECT type.

4.3.352 Dependently_located_layer_connection_point to Embedded_component_terminal

Each Dependently_located_layer_connection_point has associated_design_object defined by zero or one Embedded_component_terminal objects. Each Embedded_component_terminal defines associated_design_object for zero, one, or more Dependently_located_layer_connection_point objects. This assertion is established through a SELECT type.

4.3.353 Dependently_located_layer_connection_point to Interconnect_module_macro_component_join_terminal

Each Dependently_located_layer_connection_point has associated_design_object defined by zero or one Interconnect_module_macro_component_join_terminal objects. Each Interconnect_module_macro_component_join_terminal defines associated_design_object for zero, one, or more Dependently_located_layer_connection_point objects. This assertion is established through a SELECT type.

4.3.354 Dependently_located_layer_connection_point to Interconnect_module_terminal

Each Dependently_located_layer_connection_point has associated_design_object defined by zero or one Interconnect_module_terminal objects. Each Interconnect_module_terminal defines associated_design_object for zero, one, or more Dependently_located_layer_connection_point objects. This assertion is established through a SELECT type.

4.3.355 Dependently_located_layer_connection_point to Printed_component_join_terminal

Each Dependently_located_layer_connection_point has associated_design_object defined by zero or one Printed_component_join_terminal objects. Each Printed_component_join_terminal defines associated_design_object for zero, one, or more Dependently_located_layer_connection_point objects. This assertion is established through a SELECT type.

4.3.356 Dependent_material_removal_feature_template to Default_land_physical_template

Each `Dependent_material_removal_feature_template` has `associated_template` defined by exactly one `Default_land_physical_template`. Each `Default_land_physical_template` defines `associated_template` for zero, one, or more `Dependent_material_removal_feature_template` objects.

4.3.357 Design_composition_path to Functional_unit

Each `Design_composition_path` has `design_functional_unit` defined by exactly one `Functional_unit`. Each `Functional_unit` defines `design_functional_unit` for zero, one, or more `Design_composition_path` objects. Each `Design_composition_path` has `path_element` defined by one or more `Functional_unit` objects. Each `Functional_unit` defines `path_element` for zero, one, or more `Design_composition_path` objects.

4.3.358 Design_functional_unit_allocation_to_assembly_component to Coordinated_characteristic

Each `Design_functional_unit_allocation_to_assembly_component` has `of_property` defined by one or more `Coordinated_characteristic` objects. Each `Coordinated_characteristic` defines `of_property` for zero, one, or more `Design_functional_unit_allocation_to_assembly_component` objects.

4.3.359 Design_functional_unit_allocation_to_assembly_component to Assembly_component

Each `Design_functional_unit_allocation_to_assembly_component` has `implementation` defined by exactly one `Assembly_component`. Each `Assembly_component` defines `implementation` for zero, one, or more `Design_functional_unit_allocation_to_assembly_component` objects.

4.3.360 Design_functional_unit_allocation_to_assembly_component to Design_composition_path

Each `Design_functional_unit_allocation_to_assembly_component` has `functional_design_definition_path` defined by exactly one `Design_composition_path`. Each `Design_composition_path` defines `functional_design_definition_path` for zero, one, or more `Design_functional_unit_allocation_to_assembly_component` objects.

4.3.361 Design_functional_unit_allocation_to_assembly_joint to Assembly_joint

Each `Design_functional_unit_allocation_to_assembly_joint` has `implementation` defined by exactly one `Assembly_joint`. Each `Assembly_joint` defines `implementation` for zero, one, or more `Design_functional_unit_allocation_to_assembly_joint` objects.

4.3.362 Design_functional_unit_allocation_to_assembly_joint to Design_composition_path

Each Design_functional_unit_allocation_to_assembly_joint has functional_design_definition_path defined by exactly one Design_composition_path. Each Design_composition_path defines functional_design_definition_path for zero, one, or more Design_functional_unit_allocation_to_assembly_joint objects.

4.3.363 Design_functional_unit_allocation_to_fabrication_joint to Fabrication_joint

Each Design_functional_unit_allocation_to_fabrication_joint has implementation defined by exactly one Fabrication_joint. Each Fabrication_joint defines implementation for zero, one, or more Design_functional_unit_allocation_to_fabrication_joint objects.

4.3.364 Design_functional_unit_allocation_to_fabrication_joint to Design_composition_path

Each Design_functional_unit_allocation_to_fabrication_joint has functional_design_definition_path defined by exactly one Design_composition_path. Each Design_composition_path defines functional_design_definition_path for zero, one, or more Design_functional_unit_allocation_to_fabrication_joint objects.

4.3.365 Design_functional_unit_allocation_to_reference_functional_unit to Design_composition_path

Each Design_functional_unit_allocation_to_reference_functional_unit has design_definition_path defined by exactly one Design_composition_path. Each Design_composition_path defines design_definition_path for zero, one, or more Design_functional_unit_allocation_to_reference_functional_unit objects.

4.3.366 Design_functional_unit_allocation_to_reference_functional_unit to Reference_composition_path

Each Design_functional_unit_allocation_to_reference_functional_unit has reference_definition_path defined by exactly one Reference_composition_path. Each Reference_composition_path defines reference_definition_path for zero, one, or more Design_functional_unit_allocation_to_reference_functional_unit objects.

4.3.367 Design_intent_modification to Laminate_component

Each Design_intent_modification has modification_causal_item defined by zero or one Laminate_component objects. Each Laminate_component defines modification_causal_item for zero, one, or more Design_intent_modification objects. This assertion is established through a SELECT type.

4.3.368 Design_intent_modification to Inter_stratum_feature

Each Design_intent_modification has modification_causal_item defined by zero or one Inter_stratum_feature objects. Each Inter_stratum_feature defines modification_causal_item for zero, one, or more Design_intent_modification objects. This assertion is established through a SELECT type.

4.3.369 Design_intent_modification to Stratum_feature

Each Design_intent_modification has modification_causal_item defined by zero or one Stratum_feature objects. Each Stratum_feature defines modification_causal_item for zero, one, or more Design_intent_modification objects. This assertion is established through a SELECT type. Each Design_intent_modification has design_intent defined by exactly one Stratum_feature. Each Stratum_feature defines design_intent for zero, one, or more Design_intent_modification objects.

4.3.370 Design_intent_modification to Stratum

Each Design_intent_modification has modification_causal_item defined by zero or one Stratum objects. Each Stratum defines modification_causal_item for zero, one, or more Design_intent_modification objects. This assertion is established through a SELECT type.

4.3.371 Design_intent_modification to Stratum_surface

Each Design_intent_modification has modification_causal_item defined by zero or one Stratum_surface objects. Each Stratum_surface defines modification_causal_item for zero, one, or more Design_intent_modification objects. This assertion is established through a SELECT type.

4.3.372 Design_intent_modification to Ee_requirement_occurrence

Each Design_intent_modification has modification_causal_item defined by zero or one Ee_requirement_occurrence objects. Each Ee_requirement_occurrence defines modification_causal_item for zero, one, or more Design_intent_modification objects. This assertion is established through a SELECT type.

4.3.373 Design_intent_modification to Part_feature

Each Design_intent_modification has modification_causal_item defined by zero or one Part_feature objects. Each Part_feature defines modification_causal_item for zero, one, or more Design_intent_modification objects. This assertion is established through a SELECT type.

4.3.374 Design_intent_modification to Assembly_component

Each Design_intent_modification has modification_causal_item defined by zero or one Assembly_component objects. Each Assembly_component defines modification_causal_item for zero, one, or more Design_intent_modification objects. This assertion is established through a SELECT type.

4.3.375 Design_intent_modification to Component_external_reference

Each Design_intent_modification has modification_causal_item defined by zero or one Component_external_reference objects. Each Component_external_reference defines modification_causal_item for zero, one, or more Design_intent_modification objects. This assertion is established through a SELECT type.

4.3.376 Design_intent_modification to Component_feature

Each Design_intent_modification has modification_causal_item defined by zero or one Component_feature objects. Each Component_feature defines modification_causal_item for zero, one, or more Design_intent_modification objects. This assertion is established through a SELECT type.

4.3.377 Design_intent_modification to Component_feature_external_reference

Each Design_intent_modification has modification_causal_item defined by zero or one Component_feature_external_reference objects. Each Component_feature_external_reference defines modification_causal_item for zero, one, or more Design_intent_modification objects. This assertion is established through a SELECT type.

4.3.378 Design_intent_modification_3d_position to Design_intent_modification_non_planar_2d_shape

Each Design_intent_modification_3d_position has feature_shape defined by zero or one Design_intent_modification_non_planar_2d_shape objects. Each Design_intent_modification_non_planar_2d_shape defines feature_shape for zero, one, or more Design_intent_modification_3d_position objects. This assertion is established through a SELECT type.

4.3.379 Design_intent_modification_3d_position to Design_intent_modification_3d_shape
