Each Design_intent_modification_3d_position has feature_shape defined by zero or one Design_intent_modification_3d_shape objects. Each Design_intent_modification_3d_shape defines feature_shape for zero, one, or more Design_intent_modification_3d_position objects. This assertion is established through a SELECT type.

4.3.380 Design_intent_modification_3d_position to Axis_placement_3d

Each Design_intent_modification_3d_position has transformation defined by exactly one Axis_placement_3d. Each Axis_placement_3d defines transformation for zero, one, or more Design_intent_modification_3d_position objects.

4.3.381 Design_intent_modification_3d_position to Physical_unit_3d_shape

Each Design_intent_modification_3d_position has design_shape defined by exactly one Physical_unit_3d_shape. Each Physical_unit_3d_shape defines design_shape for zero, one, or more Design_intent_modification_3d_position objects.

4.3.382 Design_intent_modification_3d_shape to Design_intent_modification

Each Design_intent_modification_3d_shape has represented_design_intent_modification defined by exactly one Design_intent_modification. Each Design_intent_modification defines represented_design_intent_modification for zero, one, or more Design_intent_modification_3d_shape objects.

4.3.383 Design_intent_modification_non_planar_2d_shape to Design_intent_modification

Each Design_intent_modification_non_planar_2d_shape has represented_design_intent_modification defined by exactly one Design_intent_modification. Each Design_intent_modification defines represented_design_intent_modification for zero, one, or more Design_intent_modification_non_planar_2d_shape objects.

4.3.384 Design_intent_modification_planar_position to Design_intent_modification_styled_area_representation

Each Design_intent_modification_planar_position has feature_shape defined by zero or one Design_intent_modification_styled_area_representation objects. Each Design_intent_modification_styled_area_representation defines feature_shape for zero, one, or more Design_intent_modification_planar_position objects. This assertion is established through a SELECT type.

4.3.385 Design_intent_modification_planar_position to Design_intent_modification_planar_shape

Each Design_intent_modification_planar_position has feature_shape defined by zero or one Design_intent_modification_planar_shape objects. Each Design_intent_modification_planar_shape defines feature_shape for zero, one, or more Design_intent_modification_planar_position objects. This assertion is established through a SELECT type.

4.3.386 Design_intent_modification_planar_position to Axis_placement_2d

Each Design_intent_modification_planar_position has transformation defined by exactly one Axis_placement_2d. Each Axis_placement_2d defines transformation for zero, one, or more Design_intent_modification_planar_position objects.

4.3.387 Design_intent_modification_planar_position to Physical_unit_planar_shape

Each Design_intent_modification_planar_position has design_shape defined by exactly one Physical_unit_planar_shape. Each Physical_unit_planar_shape defines design_shape for zero, one, or more Design_intent_modification_planar_position objects.

4.3.388 Design_intent_modification_planar_shape to Design_intent_modification

Each Design_intent_modification_planar_shape has represented_design_intent_modification defined by exactly one Design_intent_modification. Each Design_intent_modification defines represented_design_intent_modification for zero, one, or more Design_intent_modification_planar_shape objects.

4.3.389 Design_intent_modification_sequence to Design_intent_modification

Each Design_intent_modification_sequence has subsequent_modification defined by zero or one Design_intent_modification objects. Each Design_intent_modification defines subsequent_modification for zero, one, or more Design_intent_modification_sequence objects. This assertion is established through a SELECT type. Each Design_intent_modification_sequence has precedent_modification defined by zero or one Design_intent_modification objects. Each Design_intent_modification defines precedent_modification for zero, one, or more Design_intent_modification_sequence objects. This assertion is established through a SELECT type.

4.3.390 Design_intent_modification_sequence to Material_removal_laminate_component

Each Design_intent_modification_sequence has subsequent_modification defined by zero or one Material_removal_laminate_component objects. Each Material_removal_laminate_component defines subsequent_modification for zero, one, or more Design_intent_modification_sequence objects. This assertion is established through a SELECT type. Each Design_intent_modification_sequence has precedent_modification defined by zero or one Material_removal_laminate_component objects. Each Material_removal_laminate_component defines precedent_modification for zero, one, or more Design_intent_modification_sequence objects. This assertion is established through a SELECT type.

4.3.391 Design_intent_modification_styled_area_representation to Fill_area_occurrence

Each Design_intent_modification_styled_area_representation has shape_styled_area_representation defined by zero or one Fill_area_occurrence objects. Each Fill_area_occurrence defines shape_styled_area_representation for zero, one, or more Design_intent_modification_styled_area_representation objects. This assertion is established through a SELECT type.

4.3.392 Design_intent_modification_styled_area_representation to Styled_curve_occurrence

Each Design_intent_modification_styled_area_representation has shape_styled_area_representation defined by zero or one Styled_curve_occurrence objects. Each Styled_curve_occurrence defines shape_styled_area_representation for zero, one, or more Design_intent_modification_styled_area_representation objects. This assertion is established through a SELECT type.

4.3.393 Design_intent_modification_styled_area_representation to Design_intent_modification

Each Design_intent_modification_styled_area_representation has represented_design_intent_modification defined by exactly one Design_intent_modification. Each Design_intent_modification defines represented_design_intent_modification for zero, one, or more Design_intent_modification_styled_area_representation objects.

4.3.394 Design_intent_modification_styled_area_representation to Design_intent_modification_planar_shape

Each Design_intent_modification_styled_area_representation has derived_planar_shape defined by one or more Design_intent_modification_planar_shape objects. Each Design_intent_modification_planar_shape defines derived_planar_shape for zero, one, or more Design_intent_modification_styled_area_representation objects.

4.3.395 Design_layer_stratum to Design_layer_technology

Each Design_layer_stratum has of_technology defined by exactly one Design_layer_technology. Each Design_layer_technology defines of_technology for zero, one, or more Design_layer_stratum objects.

4.3.396 Design_layer_technology to Length_data_element

Each Design_layer_technology has minimum_finished_feature_spacing defined by exactly one Length_data_element. Each Length_data_element defines minimum_finished_feature_spacing for zero, one, or more Design_layer_technology objects. Each Design_layer_technology has minimum_finished_feature_size defined by exactly one Length_data_element. Each Length_data_element defines minimum_finished_feature_size for zero, one, or more Design_layer_technology objects.

4.3.397 Design_object_management_relationship to Ee_product_definition

Each Design_object_management_relationship has current_design defined by exactly one Ee_product_definition. Each Ee_product_definition defines current_design for zero, one, or more Design_object_management_relationship objects. Each Design_object_management_relationship has previous_design defined by exactly one Ee_product_definition. Each Ee_product_definition defines previous_design for zero, one, or more Design_object_management_relationship objects.

4.3.398 Design_view_connection_zone_terminal_shape_relationship to Conductive_interconnect_element_terminal

Each Design_view_connection_zone_terminal_shape_relationship has associating_terminal defined by zero or one Conductive_interconnect_element_terminal objects. Each Conductive_interconnect_element_terminal defines associating_terminal for zero, one, or more Design_view_connection_zone_terminal_shape_relationship objects. This assertion is established through a SELECT type.

4.3.399 Design_view_connection_zone_terminal_shape_relationship to Interconnect_component_interface_terminal

Each Design_view_connection_zone_terminal_shape_relationship has associating_terminal defined by zero or one Interconnect_component_interface_terminal objects. Each Interconnect_component_interface_terminal defines associating_terminal for zero, one, or more Design_view_connection_zone_terminal_shape_relationship objects. This assertion is established through a SELECT type.

4.3.400 Design_view_connection_zone_terminal_shape_relationship to Interconnect_component_join_terminal

Each Design_view_connection_zone_terminal_shape_relationship has associating_terminal defined by zero or one Interconnect_component_join_terminal objects. Each Interconnect_component_join_terminal defines associating_terminal for zero, one, or more Design_view_connection_zone_terminal_shape_relationship objects. This assertion is established through a SELECT type.

4.3.401 Design_view_connection_zone_terminal_shape_relationship to Axis_placement

Each Design_view_connection_zone_terminal_shape_relationship has associated_usage_placement defined by exactly one Axis_placement. Each Axis_placement defines associated_usage_placement for zero, one, or more Design_view_connection_zone_terminal_shape_relationship objects.

4.3.402 Design_view_connection_zone_terminal_shape_relationship to Feature_shape_definition

Each Design_view_connection_zone_terminal_shape_relationship has associated_connection_zone_shape_definition defined by exactly one Feature_shape_definition. Each Feature_shape_definition defines associated_connection_zone_shape_definition for zero, one, or more Design_view_connection_zone_terminal_shape_relationship objects. Each Design_view_connection_zone_terminal_shape_relationship has associating_terminal_shape defined by exactly one Feature_shape_definition. Each Feature_shape_definition defines associating_terminal_shape for zero, one, or more Design_view_connection_zone_terminal_shape_relationship objects.

4.3.403 Design_view_connection_zone_terminal_shape_relationship to Connection_zone

Each Design_view_connection_zone_terminal_shape_relationship has associated_usage defined by exactly one Connection_zone. Each Connection_zone defines associated_usage for zero, one, or more Design_view_connection_zone_terminal_shape_relationship objects.

4.3.404 Design_view_terminal_component_shape_relationship to Conductive_interconnect_element

Each Design_view_terminal_component_shape_relationship has associating_component defined by zero or one Conductive_interconnect_element objects. Each Conductive_interconnect_element defines associating_component for zero, one, or more Design_view_terminal_component_shape_relationship objects. This assertion is established through a SELECT type.

4.3.405 Design_view_terminal_component_shape_relationship to Packaged_component

Each Design_view_terminal_component_shape_relationship has associating_component defined by zero or one Packaged_component objects. Each Packaged_component defines associating_component for zero, one, or more Design_view_terminal_component_shape_relationship objects. This assertion is established through a SELECT type.

4.3.406 Design_view_terminal_component_shape_relationship to Physical_component

Each Design_view_terminal_component_shape_relationship has associating_component defined by zero or one Physical_component objects. Each Physical_component defines associating_component for zero, one, or more Design_view_terminal_component_shape_relationship objects. This assertion is established through a SELECT type.

4.3.407 Design_view_terminal_component_shape_relationship to Axis_placement

Each Design_view_terminal_component_shape_relationship has associated_usage_placement defined by exactly one Axis_placement. Each Axis_placement defines associated_usage_placement for zero, one, or more Design_view_terminal_component_shape_relationship objects.

4.3.408 Design_view_terminal_component_shape_relationship to Feature_shape_definition

Each Design_view_terminal_component_shape_relationship has associated_terminal_shape_definition defined by exactly one Feature_shape_definition. Each Feature_shape_definition defines associated_terminal_shape_definition for zero, one, or more Design_view_terminal_component_shape_relationship objects. Each Design_view_terminal_component_shape_relationship has associating_component_shape defined by exactly one Feature_shape_definition. Each Feature_shape_definition defines associating_component_shape for zero, one, or more Design_view_terminal_component_shape_relationship objects.

4.3.409 Design_view_terminal_component_shape_relationship to Conductive_interconnect_element_terminal

Each Design_view_terminal_component_shape_relationship has associated_usage defined by zero or one Conductive_interconnect_element_terminal objects. Each Conductive_interconnect_element_terminal defines associated_usage for one or two Design_view_terminal_component_shape_relationship objects. This assertion is established through a SELECT type.

4.3.410 Design_view_terminal_component_shape_relationship to Interconnect_component_interface_terminal

Each Design_view_terminal_component_shape_relationship has associated_usage defined by zero or one Interconnect_component_interface_terminal objects. Each Interconnect_component_interface_terminal defines associated_usage for zero, one, or more Design_view_terminal_component_shape_relationship objects. This assertion is established through a SELECT type.

4.3.411 Design_view_terminal_component_shape_relationship to Interconnect_component_join_terminal

Each Design_view_terminal_component_shape_relationship has associated_usage defined by zero or one Interconnect_component_join_terminal objects. Each Interconnect_component_join_terminal defines associated_usage for zero, one, or more Design_view_terminal_component_shape_relationship objects. This assertion is established through a SELECT type.

4.3.412 Design_view_terminal_component_shape_relationship to Movable_packaged_component_join_terminal

Each Design_view_terminal_component_shape_relationship has associated_usage defined by zero or one Movable_packaged_component_join_terminal objects. Each Movable_packaged_component_join_terminal defines associated_usage for zero, one, or more Design_view_terminal_component_shape_relationship objects. This assertion is established through a SELECT type.

4.3.413 Device_2d_position to Physical_unit_planar_shape

Each Device_2d_position has device_shape defined by exactly one Physical_unit_planar_shape. Each Physical_unit_planar_shape defines device_shape for zero, one, or more Device_2d_position objects. Each Device_2d_position has part_shape defined by exactly one Physical_unit_planar_shape. Each Physical_unit_planar_shape defines part_shape for zero, one, or more Device_2d_position objects.

4.3.414 Device_2d_position to Axis_placement_2d

Each Device_2d_position has transformation defined by exactly one Axis_placement_2d. Each Axis_placement_2d defines transformation for zero, one, or more Device_2d_position objects.

4.3.415 Device_2d_position to Part_device

Each Device_2d_position has placed_device defined by exactly one Part_device. Each Part_device defines placed_device for zero or one Device_2d_position objects.

4.3.416 Device_3d_position to Physical_unit_3d_shape

Each Device_3d_position has device_shape defined by exactly one Physical_unit_3d_shape. Each Physical_unit_3d_shape defines device_shape for zero, one, or more Device_3d_position objects. Each Device_3d_position has part_shape defined by exactly one Physical_unit_3d_shape. Each Physical_unit_3d_shape defines part_shape for zero, one, or more Device_3d_position objects.

4.3.417 Device_3d_position to Axis_placement_3d

Each Device_3d_position has transformation defined by exactly one Axis_placement_3d. Each Axis_placement_3d defines transformation for zero, one, or more Device_3d_position objects.

4.3.418 Device_3d_position to Part_device

Each Device_3d_position has placed_device defined by exactly one Part_device. Each Part_device defines placed_device for zero or one Device_3d_position objects.

4.3.419 Device_terminal_map to Part_device_terminal

Each Device_terminal_map has mapped_device_terminal defined by exactly one Part_device_terminal. Each Part_device_terminal defines mapped_device_terminal for zero, one, or more Device_terminal_map objects.

4.3.420 Device_terminal_map to Packaged_part_terminal

Each Device_terminal_map has target_terminal defined by exactly one Packaged_part_terminal. Each Packaged_part_terminal defines target_terminal for zero, one, or more Device_terminal_map objects.

4.3.421 Device_terminal_map_relationship to Device_terminal_map

Each Device_terminal_map_relationship has relating_device_terminal_map defined by exactly one Device_terminal_map. Each Device_terminal_map defines relating_device_terminal_map for zero, one, or more Device_terminal_map_relationship objects. Each Device_terminal_map_relationship has related_device_terminal_map defined by exactly one Device_terminal_map. Each Device_terminal_map defines related_device_terminal_map for zero, one, or more Device_terminal_map_relationship objects.

4.3.422 Diametrical_boundary_size_characteristic to Tolerance_zone_circular_or_cylindrical_or_spherical_boundary

Each Diametrical_boundary_size_characteristic has sized_boundary defined by exactly one Tolerance_zone_circular_or_cylindrical_or_spherical_boundary. Each Tolerance_zone_circular_or_cylindrical_or_spherical_boundary defines sized_boundary for zero, one, or more Diametrical_boundary_size_characteristic objects.

4.3.423 Dielectric_crossover_area to Stratum_feature

Each Dielectric_crossover_area has resulting_dielectric_crossover defined by exactly one Stratum_feature. Each Stratum_feature defines resulting_dielectric_crossover for zero, one, or more Dielectric_crossover_area objects. Each Dielectric_crossover_area has relating_concept defined by exactly one Stratum_feature. Each Stratum_feature defines relating_concept for zero, one, or more Dielectric_crossover_area objects. Each Dielectric_crossover_area has related_concept defined by exactly one Stratum_feature. Each Stratum_feature defines related_concept for zero, one, or more Dielectric_crossover_area objects.

4.3.424 Dielectric_material_passage to Cutout

Each Dielectric_material_passage has precedent_passage defined by exactly one Cutout. Each Cutout defines precedent_passage for zero, one, or more Dielectric_material_passage objects.

4.3.425 Dielectric_material_passage to Ee_requirement_occurrence

Each Dielectric_material_passage has feature_material defined by zero or one Ee_requirement_occurrence objects. Each Ee_requirement_occurrence defines feature_material for zero, one, or more Dielectric_material_passage objects. This assertion is established through a SELECT type.

4.3.426 Dielectric_material_passage to Ee_material

Each Dielectric_material_passage has feature_material defined by zero or one Ee_material objects. Each Ee_material defines feature_material for zero, one, or more Dielectric_material_passage objects. This assertion is established through a SELECT type.

4.3.427 Dimensional_characteristic_representation to Dimensional_size

Each Dimensional_characteristic_representation has dimension defined by zero or one Dimensional_size objects. Each Dimensional_size defines dimension for zero, one, or more Dimensional_characteristic_representation objects. This assertion is established through a SELECT type.

4.3.428 Dimensional_characteristic_representation to Dimensional_location

Each Dimensional_characteristic_representation has dimension defined by zero or one Dimensional_location objects. Each Dimensional_location defines dimension for zero, one, or more Dimensional_characteristic_representation objects. This assertion is established through a SELECT type.

4.3.429 Dimensional_characteristic_representation to Shape_dimension_representation

Each Dimensional_characteristic_representation has representation defined by exactly one Shape_dimension_representation. Each Shape_dimension_representation defines representation for zero, one, or more Dimensional_characteristic_representation objects.

4.3.430 Dimensional_location to Shape_element_locating_relationship

Each Dimensional_location has located_elements defined by exactly one Shape_element_locating_relationship. Each Shape_element_locating_relationship defines located_elements for zero, one, or more Dimensional_location objects.

4.3.431 Dimensional_size to Shape_element

Each Dimensional_size has size_of defined by exactly one Shape_element. Each Shape_element defines size_of for zero, one, or more Dimensional_size objects.

4.3.432 Dimensional_size_based_on_opposing_boundaries to Composite_unit_shape_element

Each Dimensional_size_based_on_opposing_boundaries has size_of defined by exactly one Composite_unit_shape_element. Each Composite_unit_shape_element defines size_of for zero, one, or more Dimensional_size_based_on_opposing_boundaries objects.

4.3.433 Dimensional_size_based_on_opposing_boundaries to Shape_element_locating_relationship

Each Dimensional_size_based_on_opposing_boundaries has boundary_separation defined by exactly one Shape_element_locating_relationship. Each Shape_element_locating_relationship defines boundary_separation for zero, one, or more Dimensional_size_based_on_opposing_boundaries objects.

4.3.434 Dimension_along_curve to Shape_element

Each Dimension_along_curve has path defined by exactly one Shape_element. Each Shape_element defines path for zero, one, or more Dimension_along_curve objects.

4.3.435 Dimension_location_with_direction_vector to Axis_placement

Each Dimension_location_with_direction_vector has measurement_direction defined by zero or one Axis_placement objects. Each Axis_placement defines measurement_direction for zero, one, or more Dimension_location_with_direction_vector objects. This assertion is established through a SELECT type.

4.3.436 Dimension_location_with_direction_vector to Datum_based_vector_orientation

Each Dimension_location_with_direction_vector has measurement_direction defined by zero or one Datum_based_vector_orientation objects. Each Datum_based_vector_orientation defines measurement_direction for zero, one, or more Dimension_location_with_direction_vector objects. This assertion is established through a SELECT type.

4.3.437 Dimension_location_with_specified_datum_system to Datum_system_defining_conditions_without_material_conditions

Each Dimension_location_with_specified_datum_system has referenced_datum_system_defining_conditions defined by exactly one Datum_system_defining_conditions_without_material_conditions. Each Datum_system_defining_conditions_without_material_conditions defines referenced_datum_system_defining_conditions for zero, one, or more Dimension_location_with_specified_datum_system objects.

4.3.438 Dimension_qualifier to Dimensional_characteristic

Each Dimension_qualifier has qualified_dimensions defined by one or more Dimensional_characteristic objects. Each Dimensional_characteristic defines qualified_dimensions for zero, one, or more Dimension_qualifier objects.

4.3.439 Dimension_related_positional_boundary to Physical_feature_or_part_template

Each Dimension_related_positional_boundary has constrained_physical_feature defined by exactly one Physical_feature_or_part_template. Each Physical_feature_or_part_template defines constrained_physical_feature for zero, one, or more Dimension_related_positional_boundary objects.

4.3.440 Dimension_related_positional_boundary to Positional_boundary_member

Each Dimension_related_positional_boundary has boundary_members defined by one or more Positional_boundary_member objects. Each Positional_boundary_member defines boundary_members for zero, one, or more Dimension_related_positional_boundary objects.

4.3.441 Dimension_related_positional_boundary_definition to Positional_boundary_member_definition

Each Dimension_related_positional_boundary_definition has characterized_boundary_member_definitions defined by one or more Positional_boundary_member_definition objects. Each Positional_boundary_member_definition defines characterized_boundary_member_definitions for zero, one, or more Dimension_related_positional_boundary_definition objects.

4.3.442 Dimension_related_positional_boundary_definition to Dimension_related_positional_boundary

Each Dimension_related_positional_boundary_definition has defined_positional_boundary defined by exactly one Dimension_related_positional_boundary. Each Dimension_related_positional_boundary defines defined_positional_boundary for zero, one, or more Dimension_related_positional_boundary_definition objects.

4.3.443 Dimension_set to Dimensional_characteristic

Each Dimension_set has associated_dimensions defined by one or more Dimensional_characteristic objects. Each Dimensional_characteristic defines associated_dimensions for zero, one, or more Dimension_set objects.

4.3.444 Directed_axis to Shape_element

Each Directed_axis has end_shape_element defined by exactly one Shape_element. Each Shape_element defines end_shape_element for zero, one, or more Directed_axis objects. Each Directed_axis has start_shape_element defined by exactly one Shape_element. Each Shape_element defines start_shape_element for zero, one, or more Directed_axis objects.

4.3.445 Directed_axis to Centre_axis

Each Directed_axis has axis_to_be_oriented defined by exactly one Centre_axis. Each Centre_axis defines axis_to_be_oriented for zero, one, or more Directed_axis objects.

4.3.446 Direction_element to Datum_based_direction_vector

Each Direction_element has direction_of_half_datum_plane defined by exactly one Datum_based_direction_vector. Each Datum_based_direction_vector defines direction_of_half_datum_plane for zero, one, or more Direction_element objects. Each Direction_element has direction defined by exactly one Datum_based_direction_vector. Each Datum_based_direction_vector defines direction for zero, one, or more Direction_element objects.

4.3.447 Direction_element to Datum_plane

Each Direction_element has base_datum_plane defined by exactly one Datum_plane. Each Datum_plane defines base_datum_plane for zero, one, or more Direction_element objects.

4.3.448 Direction_element to Angle_data_element

Each Direction_element has angle_value defined by exactly one Angle_data_element. Each Angle_data_element defines angle_value for zero, one, or more Direction_element objects.

4.3.449 Documentation_layer_stratum to Documentation_layer_technology

Each Documentation_layer_stratum has of_technology defined by exactly one Documentation_layer_technology. Each Documentation_layer_technology defines of_technology for zero, one, or more Documentation_layer_stratum objects.

4.3.450 Edge_segment_cross_section to Part_template_3d_shape

Each Edge_segment_cross_section has projected_volume defined by exactly one Part_template_3d_shape. Each Part_template_3d_shape defines projected_volume for zero, one, or more Edge_segment_cross_section objects.

4.3.451 Edge_segment_cross_section to Edge_shape

Each Edge_segment_cross_section has surface_intersection_result defined by exactly one Edge_shape. Each Edge_shape defines surface_intersection_result for zero, one, or more Edge_segment_cross_section objects.

4.3.452 Ee_approval to Date_and_time

Each Ee_approval has signoff_date defined by zero or one Date_and_time objects. Each Date_and_time defines signoff_date for zero, one, or more Ee_approval objects. This assertion is established through a SELECT type.

4.3.453 Ee_approval to Date

Each Ee_approval has signoff_date defined by zero or one Date objects. Each Date defines signoff_date for zero, one, or more Ee_approval objects. This assertion is established through a SELECT type.

4.3.454 Ee_approval to Person_and_organization

Each Ee_approval has authorizer defined by zero or one Person_and_organization objects. Each Person_and_organization defines authorizer for zero, one, or more Ee_approval objects. This assertion is established through a SELECT type.

4.3.455 Ee_approval to Organization

Each Ee_approval has authorizer defined by zero or one Organization objects. Each Organization defines authorizer for zero, one, or more Ee_approval objects. This assertion is established through a SELECT type.

4.3.456 Ee_approval to Ee_text

Each Ee_approval has purpose defined by exactly one Ee_text. Each Ee_text defines purpose for zero, one, or more Ee_approval objects.

4.3.457 Ee_document to Person

Each Ee_document has author defined by one or more Person objects. Each Person defines author for zero, one, or more Ee_document objects.

4.3.458 Ee_document to Structured_text

Each Ee_document has text_usage defined by zero or one Structured_text objects. Each Structured_text defines text_usage for zero, one, or more Ee_document objects. This assertion is established through a SELECT type. Each Ee_document has key_phrase defined by one or more Structured_text objects. Each Structured_text defines key_phrase for zero, one, or more Ee_document objects.

4.3.459 Ee_document to Ee_text

Each Ee_document has text_usage defined by zero or one Ee_text objects. Each Ee_text defines text_usage for zero, one, or more Ee_document objects. This assertion is established through a SELECT type.

4.3.460 Ee_document to Security_classification

Each Ee_document has security_code defined by exactly one Security_classification. Each Security_classification defines security_code for zero, one, or more Ee_document objects.

4.3.461 Ee_document to Date_and_time

Each Ee_document has creation_date defined by exactly one Date_and_time. Each Date_and_time defines creation_date for zero, one, or more Ee_document objects. Each Ee_document has change_date defined by one or more Date_and_time objects. Each Date_and_time defines change_date for zero, one, or more Ee_document objects.

4.3.462 Ee_document to Ee_document_identifier

Each Ee_document has base_identifier defined by exactly one Ee_document_identifier. Each Ee_document_identifier defines base_identifier for zero, one, or more Ee_document objects.

4.3.463 Ee_document to Ee_approval

Each Ee_document has document_approval defined by exactly one Ee_approval. Each Ee_approval defines document_approval for zero, one, or more Ee_document objects.

4.3.464 Ee_document to Person_and_organization

Each Ee_document has publisher defined by zero or one Person_and_organization objects. Each Person_and_organization defines publisher for zero, one, or more Ee_document objects. This assertion is established through a SELECT type.

4.3.465 Ee_document to Organization

Each Ee_document has publisher defined by zero or one Organization objects. Each Organization defines publisher for zero, one, or more Ee_document objects. This assertion is established through a SELECT type.

4.3.466 Ee_material to Ee_document

Each Ee_material has registration_document defined by exactly one Ee_document. Each Ee_document defines registration_document for zero, one, or more Ee_material objects.

4.3.467 Ee_product to Person_and_organization

Each Ee_product has design_owner defined by zero or one Person_and_organization objects. Each Person_and_organization defines design_owner for zero, one, or more Ee_product objects. This assertion is established through a SELECT type.

4.3.468 Ee_product to Organization

Each Ee_product has design_owner defined by zero or one Organization objects. Each Organization defines design_owner for zero, one, or more Ee_product objects. This assertion is established through a SELECT type.

4.3.469 Ee_product to Ee_text

Each Ee_product has description defined by exactly one Ee_text. Each Ee_text defines description for zero, one, or more Ee_product objects.

4.3.470 Ee_product_category to Ee_document

Each Ee_product_category has reference_document defined by exactly one Ee_document. Each Ee_document defines reference_document for zero, one, or more Ee_product_category objects.

4.3.471 Ee_product_category to Parameter_assignment

Each Ee_product_category has category_specific_values defined by one or more Parameter_assignment objects. Each Parameter_assignment defines category_specific_values for zero, one, or more Ee_product_category objects.

4.3.472 Ee_product_category to Model_parameter

Each Ee_product_category has category_parameter defined by one or more Model_parameter objects. Each Model_parameter defines category_parameter for zero, one, or more Ee_product_category objects.

4.3.473 Ee_product_category_relationship to Ee_product_category

Each Ee_product_category_relationship has category defined by exactly one Ee_product_category. Each Ee_product_category defines category for zero, one, or more Ee_product_category_relationship objects. Each Ee_product_category_relationship has sub_category defined by exactly one Ee_product_category. Each Ee_product_category defines sub_category for zero, one, or more Ee_product_category_relationship objects.

4.3.474 Ee_product_configuration to Ee_product_model

Each Ee_product_configuration has model_of_product defined by exactly one Ee_product_model. Each Ee_product_model defines model_of_product for zero, one, or more Ee_product_configuration objects.

4.3.475 Ee_product_configuration to Ee_approval

Each Ee_product_configuration has product_configuration_approval defined by exactly one Ee_approval. Each Ee_approval defines product_configuration_approval for zero, one, or more Ee_product_configuration objects.

4.3.476 Ee_product_configuration to Person_and_organization

Each Ee_product_configuration has configuration_manager defined by zero or one Person_and_organization objects. Each Person_and_organization defines configuration_manager for zero, one, or more Ee_product_configuration objects. This assertion is established through a SELECT type.

4.3.477 Ee_product_configuration to Organization

Each Ee_product_configuration has configuration_manager defined by zero or one Organization objects. Each Organization defines configuration_manager for zero, one, or more Ee_product_configuration objects. This assertion is established through a SELECT type.

4.3.478 Ee_product_configuration to Ee_product_version

Each Ee_product_configuration has satisfying_product defined by one or more Ee_product_version objects. Each Ee_product_version defines satisfying_product for zero, one, or more Ee_product_configuration objects.

4.3.479 Ee_product_definition to Ee_document

Each Ee_product_definition has documentation defined by one or more Ee_document objects. Each Ee_document defines documentation for zero, one, or more Ee_product_definition objects.

4.3.480 Ee_product_definition to Date_and_time

Each Ee_product_definition has creation_date defined by exactly one Date_and_time. Each Date_and_time defines creation_date for zero, one, or more Ee_product_definition objects.

4.3.481 Ee_product_definition to Ee_approval

Each Ee_product_definition has product_definition_approval defined by exactly one Ee_approval. Each Ee_approval defines product_definition_approval for zero, one, or more Ee_product_definition objects.

4.3.482 Ee_product_definition to Ee_product_version

Each Ee_product_definition has version defined by exactly one Ee_product_version. Each Ee_product_version defines version for one or more Ee_product_definition objects.

4.3.483 Ee_product_definition to Ee_text

Each Ee_product_definition has context_description defined by exactly one Ee_text. Each Ee_text defines context_description for zero, one, or more Ee_product_definition objects.

4.3.484 Ee_product_definition to Security_classification

Each Ee_product_definition has security_code defined by exactly one Security_classification. Each Security_classification defines security_code for zero, one, or more Ee_product_definition objects.

4.3.485 Ee_product_definition to Person_and_organization

Each Ee_product_definition has creator defined by zero or one Person_and_organization objects. Each Person_and_organization defines creator for zero, one, or more Ee_product_definition objects. This assertion is established through a SELECT type.

4.3.486 Ee_product_definition to Organization

Each Ee_product_definition has creator defined by zero or one Organization objects. Each Organization defines creator for zero, one, or more Ee_product_definition objects. This assertion is established through a SELECT type.

4.3.487 Ee_product_definition_based_constraint_occurrence to Ee_product_definition

Each Ee_product_definition_based_constraint_occurrence has constraining_part defined by exactly one Ee_product_definition. Each Ee_product_definition defines constraining_part for zero, one, or more Ee_product_definition_based_constraint_occurrence objects.

4.3.488 Ee_product_model to Ee_text

Each Ee_product_model has model_name defined by exactly one Ee_text. Each Ee_text defines model_name for zero, one, or more Ee_product_model objects.

4.3.489 Ee_product_related_product_category to Ee_product

Each Ee_product_related_product_category has of_product defined by one or more Ee_product objects. Each Ee_product defines of_product for one or more Ee_product_related_product_category objects.

4.3.490 Ee_product_specific_parameter_value_assignment to Parameter_assignment

Each Ee_product_specific_parameter_value_assignment has assigned_parameter defined by exactly one Parameter_assignment. Each Parameter_assignment defines assigned_parameter for zero, one, or more Ee_product_specific_parameter_value_assignment objects.

4.3.491 Ee_product_specific_parameter_value_assignment to Ee_product

Each Ee_product_specific_parameter_value_assignment has of_product defined by exactly one Ee_product. Each Ee_product defines of_product for zero, one, or more Ee_product_specific_parameter_value_assignment objects.

4.3.492 Ee_product_specific_parameter_value_assignment to Ee_product_related_product_category

Each Ee_product_specific_parameter_value_assignment has associated_product_category defined by exactly one Ee_product_related_product_category. Each Ee_product_related_product_category defines associated_product_category for zero, one, or more Ee_product_specific_parameter_value_assignment objects.

4.3.493 Ee_product_version to Person_and_organization

Each Ee_product_version has design_supplier defined by zero or one Person_and_organization objects. Each Person_and_organization defines design_supplier for zero, one, or more Ee_product_version objects. This assertion is established through a SELECT type. Each Ee_product_version has product_supplier defined by zero or one Person_and_organization objects. Each Person_and_organization defines product_supplier for zero, one, or more Ee_product_version objects. This assertion is established through a SELECT type. Each Ee_product_version has creator defined by zero or one Person_and_organization objects. Each Person_and_organization defines creator for zero, one, or more Ee_product_version objects. This assertion is established through a SELECT type.

4.3.494 Ee_product_version to Organization

Each Ee_product_version has design_supplier defined by zero or one Organization objects. Each Organization defines design_supplier for zero, one, or more Ee_product_version objects. This assertion is established through a SELECT type. Each Ee_product_version has product_supplier defined by zero or one Organization objects. Each Organization defines product_supplier for zero, one, or more Ee_product_version objects. This assertion is established through a SELECT type. Each Ee_product_version has creator defined by zero or one Organization objects. Each Organization defines creator for zero, one, or more Ee_product_version objects. This assertion is established through a SELECT type.

4.3.495 Ee_product_version to Ee_approval

Each Ee_product_version has product_version_approval defined by exactly one Ee_approval. Each Ee_approval defines product_version_approval for zero, one, or more Ee_product_version objects.

4.3.496 Ee_product_version to Security_classification

Each Ee_product_version has security_code defined by exactly one Security_classification. Each Security_classification defines security_code for zero, one, or more Ee_product_version objects.

4.3.497 Ee_product_version to Ee_product

Each Ee_product_version has versioned_item defined by exactly one Ee_product. Each Ee_product defines versioned_item for one or more Ee_product_version objects.

4.3.498 Ee_product_version to Contract

Each Ee_product_version has authorizing_agreement defined by exactly one Contract. Each Contract defines authorizing_agreement for zero, one, or more Ee_product_version objects.

4.3.499 Ee_product_version_supersedence to Ee_product_version

Each Ee_product_version_supersedence has superseding_product_version defined by exactly one Ee_product_version. Each Ee_product_version defines superseding_product_version for zero, one, or more Ee_product_version_supersedence objects. Each Ee_product_version_supersedence has superseded_product_version defined by exactly one Ee_product_version. Each Ee_product_version defines superseded_product_version for zero, one, or more Ee_product_version_supersedence objects.

4.3.500 Ee_requirement_occurrence to Ee_text

Each Ee_requirement_occurrence has description defined by exactly one Ee_text. Each Ee_text defines description for zero, one, or more Ee_requirement_occurrence objects.

4.3.501 Ee_requirement_occurrence to Ee_material

Each Ee_requirement_occurrence has required_material defined by exactly one Ee_material. Each Ee_material defines required_material for zero, one, or more Ee_requirement_occurrence objects.

4.3.502 Ee_requirement_occurrence to Characteristic

Each Ee_requirement_occurrence has required_characteristic defined by one or more Characteristic objects. Each Characteristic defines required_characteristic for zero, one, or more Ee_requirement_occurrence objects.

4.3.503 Ee_requirement_occurrence to Ee_specification

Each Ee_requirement_occurrence has requirement_specification defined by one or more Ee_specification objects. Each Ee_specification defines requirement_specification for zero, one, or more Ee_requirement_occurrence objects. Each Ee_requirement_occurrence has required_specification defined by one or more Ee_specification objects. Each Ee_specification defines required_specification for zero, one, or more Ee_requirement_occurrence objects.

4.3.504 Ee_requirement_occurrence to Coordinated_characteristic

Each Ee_requirement_occurrence has required_coordinated_characteristic defined by one or more Coordinated_characteristic objects. Each Coordinated_characteristic defines required_coordinated_characteristic for zero, one, or more Ee_requirement_occurrence objects.

4.3.505 Ee_requirement_occurrence to Ee_product

Each Ee_requirement_occurrence has required_part defined by one or more Ee_product objects. Each Ee_product defines required_part for zero, one, or more Ee_requirement_occurrence objects.

4.3.506 Ee_requirement_occurrence to Functional_specification

Each Ee_requirement_occurrence has required_functional_specification defined by one or more Functional_specification objects. Each Functional_specification defines required_functional_specification for zero, one, or more Ee_requirement_occurrence objects.

4.3.507 Ee_requirement_occurrence to Analytical_representation

Each Ee_requirement_occurrence has required_analytical_representation defined by one or more Analytical_representation objects. Each Analytical_representation defines required_analytical_representation for zero, one, or more Ee_requirement_occurrence objects.

4.3.508 Ee_requirement_occurrence to Requirement_definition

Each Ee_requirement_occurrence has associated_definition defined by exactly one Requirement_definition. Each Requirement_definition defines associated_definition for zero, one, or more Ee_requirement_occurrence objects.

4.3.509 Ee_rule_complex_clause to Ee_rule_simple_clause

Each Ee_rule_complex_clause has conjunctive_content defined by one or more Ee_rule_simple_clause objects. Each Ee_rule_simple_clause defines conjunctive_content for zero, one, or more Ee_rule_complex_clause objects.

4.3.510 Ee_rule_conclusion_definition to Ee_rule_simple_clause

Each Ee_rule_conclusion_definition has conjunctive_content defined by one or more Ee_rule_simple_clause objects. Each Ee_rule_simple_clause defines conjunctive_content for zero, one, or more Ee_rule_conclusion_definition objects.

4.3.511 Ee_rule_conclusion_definition to Ee_rule_definition

Each Ee_rule_conclusion_definition has rule_definition defined by exactly one Ee_rule_definition. Each Ee_rule_definition defines rule_definition for zero, one, or more Ee_rule_conclusion_definition objects.

4.3.512 Ee_rule_definition to Ee_rule_version

Each Ee_rule_definition has defined_versioned_rule defined by exactly one Ee_rule_version. Each Ee_rule_version defines defined_versioned_rule for zero, one, or more Ee_rule_definition objects.

4.3.513 Ee_rule_function to Ee_specification

Each Ee_rule_function has source_code defined by exactly one Ee_specification. Each Ee_specification defines source_code for zero, one, or more Ee_rule_function objects.

4.3.514 Ee_rule_function to Ee_document

Each Ee_rule_function has reference_document defined by exactly one Ee_document. Each Ee_document defines reference_document for zero, one, or more Ee_rule_function objects.

4.3.515 Ee_rule_function to Model_parameter

Each Ee_rule_function has parameter defined by one or more Model_parameter objects. Each Model_parameter defines parameter for zero, one, or more Ee_rule_function objects.

4.3.516 Ee_rule_premise_definition to Ee_rule_complex_clause

Each Ee_rule_premise_definition has disjunctive_content defined by one or more Ee_rule_complex_clause objects. Each Ee_rule_complex_clause defines disjunctive_content for zero, one, or more Ee_rule_premise_definition objects.

4.3.517 Ee_rule_premise_definition to Ee_rule_definition

Each Ee_rule_premise_definition has rule_definition defined by exactly one Ee_rule_definition. Each Ee_rule_definition defines rule_definition for zero, one, or more Ee_rule_premise_definition objects.

4.3.518 Ee_rule_simple_clause to Parameter_assignment

Each Ee_rule_simple_clause has parameter defined by one or more Parameter_assignment objects. Each Parameter_assignment defines parameter for zero, one, or more Ee_rule_simple_clause objects.

4.3.519 Ee_rule_simple_clause to Ee_rule_function

Each Ee_rule_simple_clause has rule_function defined by exactly one Ee_rule_function. Each Ee_rule_function defines rule_function for zero, one, or more Ee_rule_simple_clause objects.

4.3.520 Ee_rule_version to Ee_document

Each Ee_rule_version has source defined by zero or one Ee_document objects. Each Ee_document defines source for zero, one, or more Ee_rule_version objects. This assertion is established through a SELECT type.

4.3.521 Ee_rule_version to Organization

Each Ee_rule_version has source defined by zero or one Organization objects. Each Organization defines source for zero, one, or more Ee_rule_version objects. This assertion is established through a SELECT type.

4.3.522 Ee_rule_version to Ee_rule

Each Ee_rule_version has configuration_managed_rule defined by exactly one Ee_rule. Each Ee_rule defines configuration_managed_rule for one or more Ee_rule_version objects.

4.3.523 Ee_specification to Person_and_organization

Each Ee_specification has source defined by zero or one Person_and_organization objects. Each Person_and_organization defines source for zero, one, or more Ee_specification objects. This assertion is established through a SELECT type.

4.3.524 Ee_specification to Organization

Each Ee_specification has source defined by zero or one Organization objects. Each Organization defines source for zero, one, or more Ee_specification objects. This assertion is established through a SELECT type.

4.3.525 Electrical_isolation_laminate_component to Electrical_isolation_removal_template

Each Electrical_isolation_laminate_component has usage_definition defined by exactly one Electrical_isolation_removal_template. Each Electrical_isolation_removal_template defines usage_definition for zero, one, or more Electrical_isolation_laminate_component objects.

4.3.526 Electrical_isolation_removal_structure to Ee_requirement_occurrence

Each Electrical_isolation_removal_structure has electrical_isolation_spacing_requirement defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines electrical_isolation_spacing_requirement for zero, one, or more Electrical_isolation_removal_structure objects.

4.3.527 Electrical_isolation_removal_template to Layout_spacing_requirement_occurrence

Each Electrical_isolation_removal_template has electrical_isolation_spacing_requirement defined by exactly one Layout_spacing_requirement_occurrence. Each Layout_spacing_requirement_occurrence defines electrical_isolation_spacing_requirement for zero, one, or more Electrical_isolation_removal_template objects.

4.3.528 Elliptic_area to Length_data_element

Each Elliptic_area has semi_axis_2 defined by exactly one Length_data_element. Each Length_data_element defines semi_axis_2 for zero, one, or more Elliptic_area objects. Each Elliptic_area has semi_axis_1 defined by exactly one Length_data_element. Each Length_data_element defines semi_axis_1 for zero, one, or more Elliptic_area objects.

4.3.529 Elliptic_area to Axis_placement_2d

Each Elliptic_area has position defined by exactly one Axis_placement_2d. Each Axis_placement_2d defines position for zero, one, or more Elliptic_area objects.

4.3.530 Embedded_component_terminal to Packaged_component

Each Embedded_component_terminal has associated_component defined by zero or one Packaged_component objects. Each Packaged_component defines associated_component for zero, one, or more Embedded_component_terminal objects. This assertion is established through a SELECT type.

4.3.531 Embedded_component_terminal to Bare_die_component

Each Embedded_component_terminal has associated_component defined by zero or one Bare_die_component objects. Each Bare_die_component defines associated_component for zero, one, or more Embedded_component_terminal objects. This assertion is established through a SELECT type.

4.3.532 Embedded_component_terminal to Bare_die_terminal

Each Embedded_component_terminal has definition defined by zero or one Bare_die_terminal objects. Each Bare_die_terminal defines definition for zero, one, or more Embedded_component_terminal objects. This assertion is established through a SELECT type.

4.3.533 Embedded_component_terminal to Packaged_part_terminal

Each Embedded_component_terminal has definition defined by zero or one Packaged_part_terminal objects. Each Packaged_part_terminal defines definition for zero, one, or more Embedded_component_terminal objects. This assertion is established through a SELECT type.

4.3.534 Engineering_make_from to Ee_product_definition

Each Engineering_make_from has resultant_design defined by exactly one Ee_product_definition. Each Ee_product_definition defines resultant_design for zero, one, or more Engineering_make_from objects. Each Engineering_make_from has base_design defined by exactly one Ee_product_definition. Each Ee_product_definition defines base_design for zero, one, or more Engineering_make_from objects.

4.3.535 Equivalent_functional_terminals_assignment to Functional_unit_usage_view_terminal_definition

Each Equivalent_functional_terminals_assignment has equivalent_terminals defined by two or more Functional_unit_usage_view_terminal_definition objects. Each Functional_unit_usage_view_terminal_definition defines equivalent_terminals for zero, one, or more Equivalent_functional_terminals_assignment objects.

4.3.536 Equivalent_functional_unit_definition_assignment to Functional_unit_definition

Each Equivalent_functional_unit_definition_assignment has equivalent_functional_unit_definitions defined by two or more Functional_unit_definition objects. Each Functional_unit_definition defines equivalent_functional_unit_definitions for zero, one, or more Equivalent_functional_unit_definition_assignment objects.

4.3.537 Evaluated_characteristic to Coordinated_characteristic

Each Evaluated_characteristic has product_characterization_data defined by one or more Coordinated_characteristic objects. Each Coordinated_characteristic defines product_characterization_data for zero, one, or more Evaluated_characteristic objects.

4.3.538 Evaluated_characteristic to Planned_characteristic

Each Evaluated_characteristic has evaluated_product_data defined by exactly one Planned_characteristic. Each Planned_characteristic defines evaluated_product_data for zero, one, or more Evaluated_characteristic objects.

4.3.539 Externally_defined_dimension_representation to Data_element

Each Externally_defined_dimension_representation has dimension_value defined by exactly one Data_element. Each Data_element defines dimension_value for zero, one, or more Externally_defined_dimension_representation objects.

4.3.540 Externally_defined_dimension_representation to External_definition

Each Externally_defined_dimension_representation has definitions defined by one or more External_definition objects. Each External_definition defines definitions for zero, one, or more Externally_defined_dimension_representation objects.

4.3.541 External_definition to Ee_document

Each External_definition has reference_document defined by zero or one Ee_document objects. Each Ee_document defines reference_document for zero, one, or more External_definition objects. This assertion is established through a SELECT type.

4.3.542 Fabrication_joint to Interconnect_module

Each Fabrication_joint has associated_interconnect_module defined by exactly one Interconnect_module. Each Interconnect_module defines associated_interconnect_module for zero, one, or more Fabrication_joint objects.

4.3.543 Fabrication_joint to Stratum_feature_template_component

Each Fabrication_joint has auxiliary_joint_material defined by exactly one Stratum_feature_template_component. Each Stratum_feature_template_component defines auxiliary_joint_material for zero, one, or more Fabrication_joint objects.

4.3.544 Fabrication_joint to Component_termination_passage_join_terminal

Each Fabrication_joint has fabrication_features_2 defined by zero or one Component_termination_passage_join_terminal objects. Each Component_termination_passage_join_terminal defines fabrication_features_2 for zero, one, or more Fabrication_joint objects. This assertion is established through a SELECT type. Each Fabrication_joint has fabrication_features_1 defined by zero or one Component_termination_passage_join_terminal objects. Each Component_termination_passage_join_terminal defines fabrication_features_1 for zero, one, or more Fabrication_joint objects. This assertion is established through a SELECT type.

4.3.545 Fabrication_joint to Via_terminal

Each Fabrication_joint has fabrication_features_2 defined by zero or one Via_terminal objects. Each Via_terminal defines fabrication_features_2 for zero, one, or more Fabrication_joint objects. This assertion is established through a SELECT type. Each Fabrication_joint has fabrication_features_1 defined by zero or one Via_terminal objects. Each Via_terminal defines fabrication_features_1 for zero, one, or more Fabrication_joint objects. This assertion is established through a SELECT type.

4.3.546 Fabrication_joint to Printed_component_join_terminal

Each Fabrication_joint has fabrication_features_2 defined by zero or one Printed_component_join_terminal objects. Each Printed_component_join_terminal defines fabrication_features_2 for zero, one, or more Fabrication_joint objects. This assertion is established through a SELECT type. Each Fabrication_joint has fabrication_features_1 defined by zero or one Printed_component_join_terminal objects. Each Printed_component_join_terminal defines fabrication_features_1 for zero, one, or more Fabrication_joint objects. This assertion is established through a SELECT type.

4.3.547 Fabrication_joint to Conductive_interconnect_element_terminal

Each Fabrication_joint has fabrication_features_2 defined by zero or one Conductive_interconnect_element_terminal objects. Each Conductive_interconnect_element_terminal defines fabrication_features_2 for zero, one, or more Fabrication_joint objects. This assertion is established through a SELECT type. Each Fabrication_joint has fabrication_features_1 defined by zero or one Conductive_interconnect_element_terminal objects. Each Conductive_interconnect_element_terminal defines fabrication_features_1 for zero, one, or more Fabrication_joint objects. This assertion is established through a SELECT type.

4.3.548 Fabrication_joint to Embedded_component_terminal

Each Fabrication_joint has fabrication_features_2 defined by zero or one Embedded_component_terminal objects. Each Embedded_component_terminal defines fabrication_features_2 for zero, one, or more Fabrication_joint objects. This assertion is established through a SELECT type. Each Fabrication_joint has fabrication_features_1 defined by zero or one Embedded_component_terminal objects. Each Embedded_component_terminal defines fabrication_features_1 for zero, one, or more Fabrication_joint objects. This assertion is established through a SELECT type.

4.3.549 Fabrication_joint to Land_join_terminal

Each Fabrication_joint has fabrication_features_2 defined by zero or one Land_join_terminal objects. Each Land_join_terminal defines fabrication_features_2 for zero, one, or more Fabrication_joint objects. This assertion is established through a SELECT type. Each Fabrication_joint has fabrication_features_1 defined by zero or one Land_join_terminal objects. Each Land_join_terminal defines fabrication_features_1 for zero, one, or more Fabrication_joint objects. This assertion is established through a SELECT type.

4.3.550 Fabrication_joint to Non_functional_land_join_terminal

Each Fabrication_joint has fabrication_features_2 defined by zero or one Non_functional_land_join_terminal objects. Each Non_functional_land_join_terminal defines fabrication_features_2 for zero, one, or more Fabrication_joint objects. This assertion is established through a SELECT type. Each Fabrication_joint has fabrication_features_1 defined by zero or one Non_functional_land_join_terminal objects. Each Non_functional_land_join_terminal defines fabrication_features_1 for zero, one, or more Fabrication_joint objects. This assertion is established through a SELECT type.

4.3.551 Feature_group_relationship to Part_feature

Each Feature_group_relationship has related_feature defined by exactly one Part_feature. Each Part_feature defines related_feature for zero, one, or more Feature_group_relationship objects.

4.3.552 Feature_group_relationship to Part_group_feature

Each Feature_group_relationship has relating_feature defined by exactly one Part_group_feature. Each Part_group_feature defines relating_feature for zero, one, or more Feature_group_relationship objects.

4.3.553 Filled_area_material_removal_laminate_component to Padstack_definition

Each Filled_area_material_removal_laminate_component has reference_padstack defined by exactly one Padstack_definition. Each Padstack_definition defines reference_padstack for zero, one, or more Filled_area_material_removal_laminate_component objects.

4.3.554 Filled_area_material_removal_structure to Conductive_filled_area

Each Filled_area_material_removal_structure has design_intent defined by exactly one Conductive_filled_area. Each Conductive_filled_area defines design_intent for zero, one, or more Filled_area_material_removal_structure objects.

4.3.555 Fill_area to Closed_curve

Each Fill_area has boundaries defined by one or more Closed_curve objects. Each Closed_curve defines boundaries for zero, one, or more Fill_area objects.

4.3.556 Fill_area_occurrence to Curve_style

Each Fill_area_occurrence has boundary_style defined by exactly one Curve_style. Each Curve_style defines boundary_style for zero, one, or more Fill_area_occurrence objects.

4.3.557 Fill_area_occurrence to Cartesian_point

Each Fill_area_occurrence has fill_style_target defined by exactly one Cartesian_point. Each Cartesian_point defines fill_style_target for zero, one, or more Fill_area_occurrence objects.

4.3.558 Fill_area_occurrence to Fill_area

Each Fill_area_occurrence has filled_area defined by exactly one Fill_area. Each Fill_area defines filled_area for zero, one, or more Fill_area_occurrence objects.

4.3.559 Fill_area_occurrence to Fill_area_style

Each Fill_area_occurrence has style defined by one or more Fill_area_style objects. Each Fill_area_style defines style for zero, one, or more Fill_area_occurrence objects.

4.3.560 Fill_area_style to Solid_fill_style

Each Fill_area_style has fill_style defined by zero or one Solid_fill_style objects. Each Solid_fill_style defines fill_style for zero, one, or more Fill_area_style objects. This assertion is established through a SELECT type.

4.3.561 Fill_area_style to Fill_area_style_tile

Each Fill_area_style has fill_style defined by zero or one Fill_area_style_tile objects. Each Fill_area_style_tile defines fill_style for zero, one, or more Fill_area_style objects. This assertion is established through a SELECT type.

4.3.562 Fill_area_style to Externally_defined_tile_style

Each Fill_area_style has fill_style defined by zero or one Externally_defined_tile_style objects. Each Externally_defined_tile_style defines fill_style for zero, one, or more Fill_area_style objects. This assertion is established through a SELECT type.

4.3.563 Fill_area_style to Externally_defined_hatch_style

Each Fill_area_style has fill_style defined by zero or one Externally_defined_hatch_style objects. Each Externally_defined_hatch_style defines fill_style for zero, one, or more Fill_area_style objects. This assertion is established through a SELECT type.

4.3.564 Fill_area_style to Fill_area_style_hatching

Each Fill_area_style has fill_style defined by zero or one Fill_area_style_hatching objects. Each Fill_area_style_hatching defines fill_style for zero, one, or more Fill_area_style objects. This assertion is established through a SELECT type.

4.3.565 Fill_area_style_hatching to Angle_data_element

Each Fill_area_style_hatching has hatch_line_angle defined by exactly one Angle_data_element. Each Angle_data_element defines hatch_line_angle for zero, one, or more Fill_area_style_hatching objects.

4.3.566 Fill_area_style_hatching to Cartesian_point

Each Fill_area_style_hatching has pattern_start defined by exactly one Cartesian_point. Each Cartesian_point defines pattern_start for zero, one, or more Fill_area_style_hatching objects. Each Fill_area_style_hatching has point_of_reference_hatch_line defined by exactly one Cartesian_point. Each Cartesian_point defines point_of_reference_hatch_line for zero, one, or more Fill_area_style_hatching objects.

4.3.567 Fill_area_style_hatching to Vector

Each Fill_area_style_hatching has start_of_next_hatch_line defined by exactly one Vector. Each Vector defines start_of_next_hatch_line for zero, one, or more Fill_area_style_hatching objects.

4.3.568 Fill_area_style_hatching to Curve_style

Each Fill_area_style_hatching has hatch_line_appearance defined by exactly one Curve_style. Each Curve_style defines hatch_line_appearance for zero, one, or more Fill_area_style_hatching objects.

4.3.569 Fill_area_style_tile to Externally_defined_tile

Each Fill_area_style_tile has tile defined by zero or one Externally_defined_tile objects. Each Externally_defined_tile defines tile for zero, one, or more Fill_area_style_tile objects. This assertion is established through a SELECT type.

4.3.570 Fill_area_style_tile to Fill_area_style_tile_symbol_with_style

Each Fill_area_style_tile has tile defined by zero or one Fill_area_style_tile_symbol_with_style objects. Each Fill_area_style_tile_symbol_with_style defines tile for zero, one, or more Fill_area_style_tile objects. This assertion is established through a SELECT type.

4.3.571 Fill_area_style_tile to Fill_area_style_tile_solid_region

Each Fill_area_style_tile has tile defined by zero or one Fill_area_style_tile_solid_region objects. Each Fill_area_style_tile_solid_region defines tile for zero, one, or more Fill_area_style_tile objects. This assertion is established through a SELECT type.

4.3.572 Fill_area_style_tile to Fill_area_style_tile_curve_with_style

Each Fill_area_style_tile has tile defined by zero or one Fill_area_style_tile_curve_with_style objects. Each Fill_area_style_tile_curve_with_style defines tile for zero, one, or more Fill_area_style_tile objects. This assertion is established through a SELECT type.

4.3.573 Fill_area_style_tile to Vector

Each Fill_area_style_tile has second_direction_repeat_factor defined by exactly one Vector. Each Vector defines second_direction_repeat_factor for zero, one, or more Fill_area_style_tile objects. Each Fill_area_style_tile has first_direction_repeat_factor defined by exactly one Vector. Each Vector defines first_direction_repeat_factor for zero, one, or more Fill_area_style_tile objects.

4.3.574 Footprint_definition to Connection_zone_map_identification

Each Footprint_definition has connection_zone_map defined by one or more Connection_zone_map_identification objects. Each Connection_zone_map_identification defines connection_zone_map for zero, one, or more Footprint_definition objects.

4.3.575 Footprint_definition to Reference_packaged_part_interconnect_implementation

Each Footprint_definition has reference_layout defined by exactly one Reference_packaged_part_interconnect_implementation. Each Reference_packaged_part_interconnect_implementation defines reference_layout for zero, one, or more Footprint_definition objects.

4.3.576 Footprint_definition to Assembly_group_component

Each Footprint_definition has reference_breakout defined by exactly one Assembly_group_component. Each Assembly_group_component defines reference_breakout for zero, one, or more Footprint_definition objects.

4.3.577 Footprint_definition to Padstack_definition

Each Footprint_definition has reference_padstack defined by one or more Padstack_definition objects. Each Padstack_definition defines reference_padstack for zero, one, or more Footprint_definition objects.

4.3.578 Footprint_definition to Package

Each Footprint_definition has reference_package defined by exactly one Package. Each Package defines reference_package for zero, one, or more Footprint_definition objects.

4.3.579 Frozen_assignment to Ee_approval

Each Frozen_assignment has assigned_approval defined by exactly one Ee_approval. Each Ee_approval defines assigned_approval for zero, one, or more Frozen_assignment objects.

4.3.580 Frozen_assignment to Frozen_design_object

Each Frozen_assignment has frozen_item defined by one or more Frozen_design_object objects. Each Frozen_design_object defines frozen_item for zero, one, or more Frozen_assignment objects.

4.3.581 Functional_specification to External_definition

Each Functional_specification has characteristic_category defined by exactly one External_definition. Each External_definition defines characteristic_category for zero, one, or more Functional_specification objects.

4.3.582 Functional_specification to Signal_specification

Each Functional_specification has characterizing_signal defined by exactly one Signal_specification. Each Signal_specification defines characterizing_signal for zero, one, or more Functional_specification objects. Each Functional_specification has reference_signal defined by exactly one Signal_specification. Each Signal_specification defines reference_signal for zero, one, or more Functional_specification objects.

4.3.583 Functional_specification to Functional_unit

Each Functional_specification has characterizing_functional_unit defined by exactly one Functional_unit. Each Functional_unit defines characterizing_functional_unit for zero, one, or more Functional_specification objects.

4.3.584 Functional_specification to Functional_specification_definition

Each Functional_specification has associated_definition defined by exactly one Functional_specification_definition. Each Functional_specification_definition defines associated_definition for one or more Functional_specification objects.

4.3.585 Functional_terminal_group_assignment to Scalar_terminal_definition

Each Functional_terminal_group_assignment has functional_usage_view_terminal defined by exactly one Scalar_terminal_definition. Each Scalar_terminal_definition defines functional_usage_view_terminal for zero, one, or more Functional_terminal_group_assignment objects.

4.3.586 Functional_terminal_group_assignment to Functional_terminal_group

Each Functional_terminal_group_assignment has composed_group defined by exactly one Functional_terminal_group. Each Functional_terminal_group defines composed_group for zero, one, or more Functional_terminal_group_assignment objects.

4.3.587 Functional_unit to Parameter_assignment

Each Functional_unit has functional_property defined by one or more Parameter_assignment objects. Each Parameter_assignment defines functional_property for zero, one, or more Functional_unit objects.

4.3.588 Functional_unit to Functional_unit_network_definition

Each Functional_unit has composed_network defined by exactly one Functional_unit_network_definition. Each Functional_unit_network_definition defines composed_network for zero, one, or more Functional_unit objects.

4.3.589 Functional_unit to Functional_unit_definition

Each Functional_unit has definition defined by exactly one Functional_unit_definition. Each Functional_unit_definition defines definition for zero, one, or more Functional_unit objects.

4.3.590 Functional_unit_definition to Analytical_representation

Each Functional_unit_definition has analytical_functional_unit_representation defined by one or more Analytical_representation objects. Each Analytical_representation defines analytical_functional_unit_representation for zero, one, or more Functional_unit_definition objects.

4.3.591 Functional_unit_network_definition to Functional_unit_usage_view

Each Functional_unit_network_definition has usage_view defined by exactly one Functional_unit_usage_view. Each Functional_unit_usage_view defines usage_view for zero, one, or more Functional_unit_network_definition objects.

4.3.592 Functional_unit_network_node_definition to Functional_unit_network_definition

Each Functional_unit_network_node_definition has associated_functional_unit_definition defined by exactly one Functional_unit_network_definition. Each Functional_unit_network_definition defines associated_functional_unit_definition for zero, one, or more Functional_unit_network_node_definition objects.

4.3.593 Functional_unit_network_terminal_definition_bus_assignment to Functional_unit_usage_view_terminal_definition

Each Functional_unit_network_terminal_definition_bus_assignment has connected_terminal defined by exactly one Functional_unit_usage_view_terminal_definition. Each Functional_unit_usage_view_terminal_definition defines connected_terminal for zero, one, or more Functional_unit_network_terminal_definition_bus_assignment objects.

4.3.594 Functional_unit_network_terminal_definition_bus_assignment to Bus_structural_definition

Each Functional_unit_network_terminal_definition_bus_assignment has connected_bus defined by exactly one Bus_structural_definition. Each Bus_structural_definition defines connected_bus for zero or one Functional_unit_network_terminal_definition_bus_assignment objects.

4.3.595 Functional_unit_network_terminal_definition_node_assignment to Functional_unit_usage_view_terminal_definition

Each Functional_unit_network_terminal_definition_node_assignment has connected_terminal defined by exactly one Functional_unit_usage_view_terminal_definition. Each Functional_unit_usage_view_terminal_definition defines connected_terminal for zero, one, or more Functional_unit_network_terminal_definition_node_assignment objects.

4.3.596 Functional_unit_network_terminal_definition_node_assignment to Functional_unit_network_node_definition

Each Functional_unit_network_terminal_definition_node_assignment has composed_node defined by exactly one Functional_unit_network_node_definition. Each Functional_unit_network_node_definition defines composed_node for zero or one Functional_unit_network_terminal_definition_node_assignment objects.

4.3.597 Functional_unit_requirement_allocation to Functional_unit

Each Functional_unit_requirement_allocation has functional_unit_assignment defined by exactly one Functional_unit. Each Functional_unit defines functional_unit_assignment for zero, one, or more Functional_unit_requirement_allocation objects.

4.3.598 Functional_unit_requirement_allocation to Ee_requirement_occurrence

Each Functional_unit_requirement_allocation has functional_requirement defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines functional_requirement for zero, one, or more Functional_unit_requirement_allocation objects.

4.3.599 Functional_unit_terminal to Functional_unit_usage_view_terminal_definition

Each Functional_unit_terminal has definition defined by exactly one Functional_unit_usage_view_terminal_definition. Each Functional_unit_usage_view_terminal_definition defines definition for zero, one, or more Functional_unit_terminal objects.

4.3.600 Functional_unit_terminal to Functional_unit

Each Functional_unit_terminal has accessed_functional_unit defined by exactly one Functional_unit. Each Functional_unit defines accessed_functional_unit for one or more Functional_unit_terminal objects.

4.3.601 Functional_unit_terminal_bus_assignment to Functional_unit_terminal

Each Functional_unit_terminal_bus_assignment has connected_terminal defined by exactly one Functional_unit_terminal. Each Functional_unit_terminal defines connected_terminal for zero or one Functional_unit_terminal_bus_assignment objects.

4.3.602 Functional_unit_terminal_bus_assignment to Bus_structural_definition

Each Functional_unit_terminal_bus_assignment has connected_bus defined by exactly one Bus_structural_definition. Each Bus_structural_definition defines connected_bus for zero, one, or more Functional_unit_terminal_bus_assignment objects.

4.3.603 Functional_unit_terminal_node_assignment to Functional_unit_terminal

Each Functional_unit_terminal_node_assignment has connected_terminal defined by exactly one Functional_unit_terminal. Each Functional_unit_terminal defines connected_terminal for zero or one Functional_unit_terminal_node_assignment objects.

4.3.604 Functional_unit_terminal_node_assignment to Functional_unit_network_node_definition

Each Functional_unit_terminal_node_assignment has composed_node defined by exactly one Functional_unit_network_node_definition. Each Functional_unit_network_node_definition defines composed_node for zero, one, or more Functional_unit_terminal_node_assignment objects.

4.3.605 Functional_unit_usage_view_terminal_definition to Functional_unit_usage_view

Each Functional_unit_usage_view_terminal_definition has associated_functional_unit_definition defined by exactly one Functional_unit_usage_view. Each Functional_unit_usage_view defines associated_functional_unit_definition for one or more Functional_unit_usage_view_terminal_definition objects.

4.3.606 Functional_unit_usage_view_terminal_definition_make_from_relationship to Functional_unit_usage_view_terminal_definition

Each Functional_unit_usage_view_terminal_definition_make_from_relationship has resultant_feature defined by exactly one Functional_unit_usage_view_terminal_definition. Each Functional_unit_usage_view_terminal_definition defines resultant_feature for zero, one, or more Functional_unit_usage_view_terminal_definition_make_from_relationship objects. Each Functional_unit_usage_view_terminal_definition_make_from_relationship has reusable_feature defined by exactly one Functional_unit_usage_view_terminal_definition. Each Functional_unit_usage_view_terminal_definition defines reusable_feature for zero, one, or more Functional_unit_usage_view_terminal_definition_make_from_relationship objects.

4.3.607 Functional_unit_usage_view_terminal_definition_make_from_relationship to Engineering_make_from

Each Functional_unit_usage_view_terminal_definition_make_from_relationship has associated_make_from defined by exactly one Engineering_make_from. Each Engineering_make_from defines associated_make_from for zero, one, or more Functional_unit_usage_view_terminal_definition_make_from_relationship objects.

4.3.608 Functional_usage_view_to_part_terminal_assignment to Scalar_terminal_definition

Each Functional_usage_view_to_part_terminal_assignment has functional_usage_view_terminal defined by exactly one Scalar_terminal_definition. Each Scalar_terminal_definition defines functional_usage_view_terminal for zero, one, or more Functional_usage_view_to_part_terminal_assignment objects.

4.3.609 Functional_usage_view_to_part_terminal_assignment to Part_terminal

Each Functional_usage_view_to_part_terminal_assignment has physical_usage_view_terminal defined by exactly one Part_terminal. Each Part_terminal defines physical_usage_view_terminal for zero or one Functional_usage_view_to_part_terminal_assignment objects.

4.3.610 Functional_usage_view_to_printed_part_template_terminal_assignment to Scalar_terminal_definition

Each Functional_usage_view_to_printed_part_template_terminal_assignment has functional_usage_view_terminal defined by exactly one Scalar_terminal_definition. Each Scalar_terminal_definition defines functional_usage_view_terminal for zero, one, or more Functional_usage_view_to_printed_part_template_terminal_assignment objects.

4.3.611 Functional_usage_view_to_printed_part_template_terminal_assignment to Printed_part_template_terminal

Each Functional_usage_view_to_printed_part_template_terminal_assignment has physical_usage_view_terminal defined by exactly one Printed_part_template_terminal. Each Printed_part_template_terminal defines physical_usage_view_terminal for zero or one Functional_usage_view_to_printed_part_template_terminal_assignment objects.

4.3.612 Gate_path_swap_specification to Design_functional_unit_allocation_to_reference_functional_unit

Each Gate_path_swap_specification has previous_design_object defined by exactly one Design_functional_unit_allocation_to_reference_functional_unit. Each Design_functional_unit_allocation_to_reference_functional_unit defines previous_design_object for zero, one, or more Gate_path_swap_specification objects. Each Gate_path_swap_specification has current_design_object defined by exactly one Design_functional_unit_allocation_to_reference_functional_unit. Each Design_functional_unit_allocation_to_reference_functional_unit defines current_design_object for zero, one, or more Gate_path_swap_specification objects.

4.3.613 Geometric_representation_relationship to Shape_definition

Each Geometric_representation_relationship has shape_2 defined by exactly one Shape_definition. Each Shape_definition defines shape_2 for zero, one, or more Geometric_representation_relationship objects. Each Geometric_representation_relationship has shape_1 defined by exactly one Shape_definition. Each Shape_definition defines shape_1 for zero, one, or more Geometric_representation_relationship objects.

4.3.614 Geometric_tolerance to Centre_axis

Each Geometric_tolerance has toleranced_shape_element defined by zero or one Centre_axis objects. Each Centre_axis defines toleranced_shape_element for zero, one, or more Geometric_tolerance objects. This assertion is established through a SELECT type.

4.3.615 Geometric_tolerance to Centre_plane

Each Geometric_tolerance has toleranced_shape_element defined by zero or one Centre_plane objects. Each Centre_plane defines toleranced_shape_element for zero, one, or more Geometric_tolerance objects. This assertion is established through a SELECT type.

4.3.616 Geometric_tolerance to Centre_point

Each Geometric_tolerance has toleranced_shape_element defined by zero or one Centre_point objects. Each Centre_point defines toleranced_shape_element for zero, one, or more Geometric_tolerance objects. This assertion is established through a SELECT type.

4.3.617 Geometric_tolerance to Tangent_plane

Each Geometric_tolerance has toleranced_shape_element defined by zero or one Tangent_plane objects. Each Tangent_plane defines toleranced_shape_element for zero, one, or more Geometric_tolerance objects. This assertion is established through a SELECT type.

4.3.618 Geometric_tolerance to Physical_feature_or_part_template

Each Geometric_tolerance has toleranced_shape_element defined by zero or one Physical_feature_or_part_template objects. Each Physical_feature_or_part_template defines toleranced_shape_element for zero, one, or more Geometric_tolerance objects. This assertion is established through a SELECT type.

4.3.619 Geometric_tolerance to Tolerance_zone_definition

Each Geometric_tolerance has tolerance_zone_or_boundary_definition defined by zero or one Tolerance_zone_definition objects. Each Tolerance_zone_definition defines tolerance_zone_or_boundary_definition for zero, one, or more Geometric_tolerance objects. This assertion is established through a SELECT type.

4.3.620 Geometric_tolerance to Profile_related_positional_boundary_definition

Each Geometric_tolerance has tolerance_zone_or_boundary_definition defined by zero or one Profile_related_positional_boundary_definition objects. Each Profile_related_positional_boundary_definition defines tolerance_zone_or_boundary_definition for zero, one, or more Geometric_tolerance objects. This assertion is established through a SELECT type.

4.3.621 Geometric_tolerance to Positional_boundary_member_definition

Each Geometric_tolerance has tolerance_zone_or_boundary_definition defined by zero or one Positional_boundary_member_definition objects. Each Positional_boundary_member_definition defines tolerance_zone_or_boundary_definition for zero, one, or more Geometric_tolerance objects. This assertion is established through a SELECT type.

4.3.622 Geometric_tolerance to Conical_tolerance_zone_boundary_diametrical_size_characteristic

Each Geometric_tolerance has tolerance_zone_or_boundary_definition defined by zero or one Conical_tolerance_zone_boundary_diametrical_size_characteristic objects. Each Conical_tolerance_zone_boundary_diametrical_size_characteristic defines tolerance_zone_or_boundary_definition for zero, one, or more Geometric_tolerance objects. This assertion is established through a SELECT type.

4.3.623 Geometric_tolerance_qualifier to Geometric_tolerance

Each Geometric_tolerance_qualifier has qualified_geometric_tolerances defined by one or more Geometric_tolerance objects. Each Geometric_tolerance defines qualified_geometric_tolerances for zero, one, or more Geometric_tolerance_qualifier objects.

4.3.624 Geometric_tolerance_with_referenced_datum_system to Datum_system_defining_conditions

Each Geometric_tolerance_with_referenced_datum_system has datum_system_definition defined by exactly one Datum_system_defining_conditions. Each Datum_system_defining_conditions defines datum_system_definition for zero, one, or more Geometric_tolerance_with_referenced_datum_system objects.

4.3.625 Interconnect_component_interface_terminal to Connection_zone

Each Interconnect_component_interface_terminal has connection defined by exactly one Connection_zone. Each Connection_zone defines connection for zero, one, or more Interconnect_component_interface_terminal objects.

4.3.626 Interconnect_component_join_terminal to Physical_component

Each Interconnect_component_join_terminal has associated_component defined by exactly one Physical_component. Each Physical_component defines associated_component for zero, one, or more Interconnect_component_join_terminal objects.

4.3.627 Interconnect_component_join_terminal to Connection_zone

Each Interconnect_component_join_terminal has connection defined by exactly one Connection_zone. Each Connection_zone defines connection for zero, one, or more Interconnect_component_join_terminal objects.

4.3.628 Interconnect_module to Assembly_module

Each Interconnect_module has assembly_design_requirement defined by one or more Assembly_module objects. Each Assembly_module defines assembly_design_requirement for zero, one, or more Interconnect_module objects.

4.3.629 Interconnect_module_cavity_surface to Interconnect_module_surface_feature

Each Interconnect_module_cavity_surface has reference_surface defined by exactly one Interconnect_module_surface_feature. Each Interconnect_module_surface_feature defines reference_surface for zero, one, or more Interconnect_module_cavity_surface objects.

4.3.630 Interconnect_module_component to Interconnect_module_usage_view

Each Interconnect_module_component has usage_definition defined by exactly one Interconnect_module_usage_view. Each Interconnect_module_usage_view defines usage_definition for zero, one, or more Interconnect_module_component objects.

4.3.631 Interconnect_module_component_stratum_based_terminal to Interconnect_module_stratum_based_terminal

Each Interconnect_module_component_stratum_based_terminal has definition defined by exactly one Interconnect_module_stratum_based_terminal. Each Interconnect_module_stratum_based_terminal defines definition for zero, one, or more Interconnect_module_component_stratum_based_terminal objects.

4.3.632 Interconnect_module_component_surface_feature to Interconnect_module_surface_feature

Each Interconnect_module_component_surface_feature has definition defined by exactly one Interconnect_module_surface_feature. Each Interconnect_module_surface_feature defines definition for zero, one, or more Interconnect_module_component_surface_feature objects.

4.3.633 Interconnect_module_component_terminal to Interconnect_module_component

Each Interconnect_module_component_terminal has associated_component defined by exactly one Interconnect_module_component. Each Interconnect_module_component defines associated_component for two or more Interconnect_module_component_terminal objects.

4.3.634 Interconnect_module_component_terminal to Interconnect_module_terminal

Each Interconnect_module_component_terminal has definition defined by exactly one Interconnect_module_terminal. Each Interconnect_module_terminal defines definition for zero, one, or more Interconnect_module_component_terminal objects.

4.3.635 Interconnect_module_constraint_region to Inter_stratum_extent

Each Interconnect_module_constraint_region has associated_stratum_extent defined by one or more Inter_stratum_extent objects. Each Inter_stratum_extent defines associated_stratum_extent for zero, one, or more Interconnect_module_constraint_region objects.

4.3.636 Interconnect_module_constraint_region to Ee_requirement_occurrence

Each Interconnect_module_constraint_region has requirement defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines requirement for zero, one, or more Interconnect_module_constraint_region objects.

4.3.637 Interconnect_module_constraint_region to Interconnect_module

Each Interconnect_module_constraint_region has scope defined by exactly one Interconnect_module. Each Interconnect_module defines scope for zero, one, or more Interconnect_module_constraint_region objects.

4.3.638 Interconnect_module_constraint_region to Via

Each Interconnect_module_constraint_region has non_conformant_interconnect_module_design_object defined by zero or one Via objects. Each Via defines non_conformant_interconnect_module_design_object for zero, one, or more Interconnect_module_constraint_region objects. This assertion is established through a SELECT type.

4.3.639 Interconnect_module_constraint_region to Cutout

Each Interconnect_module_constraint_region has non_conformant_interconnect_module_design_object defined by zero or one Cutout objects. Each Cutout defines non_conformant_interconnect_module_design_object for zero, one, or more Interconnect_module_constraint_region objects. This assertion is established through a SELECT type.

4.3.640 Interconnect_module_constraint_region to Component_termination_passage

Each Interconnect_module_constraint_region has non_conformant_interconnect_module_design_object defined by zero or one Component_termination_passage objects. Each Component_termination_passage defines non_conformant_interconnect_module_design_object for zero, one, or more Interconnect_module_constraint_region objects. This assertion is established through a SELECT type.

4.3.641 Interconnect_module_constraint_region to Land

Each Interconnect_module_constraint_region has non_conformant_interconnect_module_design_object defined by zero or one Land objects. Each Land defines non_conformant_interconnect_module_design_object for zero, one, or more Interconnect_module_constraint_region objects. This assertion is established through a SELECT type.

4.3.642 Interconnect_module_constraint_region to Conductor

Each Interconnect_module_constraint_region has non_conformant_interconnect_module_design_object defined by zero or one Conductor objects. Each Conductor defines non_conformant_interconnect_module_design_object for zero, one, or more Interconnect_module_constraint_region objects. This assertion is established through a SELECT type.

4.3.643 Interconnect_module_constraint_region to Conductive_filled_area

Each Interconnect_module_constraint_region has non_conformant_interconnect_module_design_object defined by zero or one Conductive_filled_area objects. Each Conductive_filled_area defines non_conformant_interconnect_module_design_object for zero, one, or more Interconnect_module_constraint_region objects. This assertion is established through a SELECT type.

4.3.644 Interconnect_module_constraint_region to Stratum_feature

Each Interconnect_module_constraint_region has non_conformant_interconnect_module_design_object defined by zero or one Stratum_feature objects. Each Stratum_feature defines non_conformant_interconnect_module_design_object for zero, one, or more Interconnect_module_constraint_region objects. This assertion is established through a SELECT type.

4.3.645 Interconnect_module_constraint_region to Laminate_component

Each Interconnect_module_constraint_region has non_conformant_interconnect_module_design_object defined by zero or one Laminate_component objects. Each Laminate_component defines non_conformant_interconnect_module_design_object for zero, one, or more Interconnect_module_constraint_region objects. This assertion is established through a SELECT type.

4.3.646 Interconnect_module_constraint_region to Inter_stratum_feature

Each Interconnect_module_constraint_region has non_conformant_interconnect_module_design_object defined by zero or one Inter_stratum_feature objects. Each Inter_stratum_feature defines non_conformant_interconnect_module_design_object for zero, one, or more Interconnect_module_constraint_region objects. This assertion is established through a SELECT type.

4.3.647 Interconnect_module_constraint_region to Non_functional_land

Each Interconnect_module_constraint_region has non_conformant_interconnect_module_design_object defined by zero or one Non_functional_land objects. Each Non_functional_land defines non_conformant_interconnect_module_design_object for zero, one, or more Interconnect_module_constraint_region objects. This assertion is established through a SELECT type.

4.3.648 Interconnect_module_cutout_segment_surface to Edge_segment_vertex

Each Interconnect_module_cutout_segment_surface has end_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines end_vertex for zero, one, or more Interconnect_module_cutout_segment_surface objects. Each Interconnect_module_cutout_segment_surface has start_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines start_vertex for zero, one, or more Interconnect_module_cutout_segment_surface objects.

4.3.649 Interconnect_module_cutout_segment_surface to Interconnect_module_cutout_surface

Each Interconnect_module_cutout_segment_surface has composed_surface defined by exactly one Interconnect_module_cutout_surface. Each Interconnect_module_cutout_surface defines composed_surface for zero, one, or more Interconnect_module_cutout_segment_surface objects.

4.3.650 Interconnect_module_edge_segment to Inter_stratum_feature_edge_segment_template

Each Interconnect_module_edge_segment has usage_definition defined by exactly one Inter_stratum_feature_edge_segment_template. Each Inter_stratum_feature_edge_segment_template defines usage_definition for zero, one, or more Interconnect_module_edge_segment objects.

4.3.651 Interconnect_module_edge_segment to Edge_segment_vertex

Each Interconnect_module_edge_segment has end_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines end_vertex for zero, one, or more Interconnect_module_edge_segment objects. Each Interconnect_module_edge_segment has start_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines start_vertex for zero, one, or more Interconnect_module_edge_segment objects.

4.3.652 Interconnect_module_edge_segment to Interconnect_module_edge

Each Interconnect_module_edge_segment has composed_edge defined by exactly one Interconnect_module_edge. Each Interconnect_module_edge defines composed_edge for zero, one, or more Interconnect_module_edge_segment objects.

4.3.653 Interconnect_module_edge_segment_surface to Edge_segment_vertex

Each Interconnect_module_edge_segment_surface has end_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines end_vertex for zero, one, or more Interconnect_module_edge_segment_surface objects. Each Interconnect_module_edge_segment_surface has start_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines start_vertex for zero, one, or more Interconnect_module_edge_segment_surface objects.

4.3.654 Interconnect_module_edge_segment_surface to Interconnect_module_edge_surface

Each Interconnect_module_edge_segment_surface has composed_surface defined by exactly one Interconnect_module_edge_surface. Each Interconnect_module_edge_surface defines composed_surface for zero, one, or more Interconnect_module_edge_segment_surface objects.

4.3.655 Interconnect_module_macro_component to Interconnect_module

Each Interconnect_module_macro_component has design_definition defined by exactly one Interconnect_module. Each Interconnect_module defines design_definition for zero, one, or more Interconnect_module_macro_component objects.

4.3.656 Interconnect_module_macro_component_join_terminal to Interconnect_module_macro_component

Each Interconnect_module_macro_component_join_terminal has associated_component defined by exactly one Interconnect_module_macro_component. Each Interconnect_module_macro_component defines associated_component for one or more Interconnect_module_macro_component_join_terminal objects.

4.3.657 Interconnect_module_macro_component_join_terminal to Interconnect_module_join_terminal

Each Interconnect_module_macro_component_join_terminal has definition defined by exactly one Interconnect_module_join_terminal. Each Interconnect_module_join_terminal defines definition for zero, one, or more Interconnect_module_macro_component_join_terminal objects.

4.3.658 Interconnect_module_product_assembly_view_fabrication_joint to Interconnect_module_component_stratum_based_terminal

Each Interconnect_module_product_assembly_view_fabrication_joint has joined_terminal defined by one or more Interconnect_module_component_stratum_based_terminal objects. Each Interconnect_module_component_stratum_based_terminal defines joined_terminal for zero, one, or more Interconnect_module_product_assembly_view_fabrication_joint objects.

4.3.659 Interconnect_module_stratum_assembly_relationship to Stratum

Each Interconnect_module_stratum_assembly_relationship has component defined by exactly one Stratum. Each Stratum defines component for one or more Interconnect_module_stratum_assembly_relationship objects.

4.3.660 Interconnect_module_stratum_assembly_relationship to Interconnect_module

Each Interconnect_module_stratum_assembly_relationship has assembly defined by exactly one Interconnect_module. Each Interconnect_module defines assembly for zero, one, or more Interconnect_module_stratum_assembly_relationship objects.

4.3.661 Interconnect_module_surface_feature to Interconnect_module_usage_view

Each Interconnect_module_surface_feature has associated_definition defined by exactly one Interconnect_module_usage_view. Each Interconnect_module_usage_view defines associated_definition for zero, one, or more Interconnect_module_surface_feature objects.

4.3.662 Interconnect_module_terminal to Interconnect_module_usage_view

Each Interconnect_module_terminal has associated_definition defined by exactly one Interconnect_module_usage_view. Each Interconnect_module_usage_view defines associated_definition for zero, one, or more Interconnect_module_terminal objects.

4.3.663 Interconnect_module_terminal to Connection_zone

Each Interconnect_module_terminal has terminal_connection_zone defined by one or more Connection_zone objects. Each Connection_zone defines terminal_connection_zone for zero, one, or more Interconnect_module_terminal objects.

4.3.664 Interconnect_module_terminal_surface_constituent_relationship to Interconnect_module_terminal

Each Interconnect_module_terminal_surface_constituent_relationship has related_shape_element defined by exactly one Interconnect_module_terminal. Each Interconnect_module_terminal defines related_shape_element for zero, one, or more Interconnect_module_terminal_surface_constituent_relationship objects.

4.3.665 Interconnect_module_terminal_surface_constituent_relationship to Interconnect_module_surface_feature

Each Interconnect_module_terminal_surface_constituent_relationship has relating_shape_element defined by exactly one Interconnect_module_surface_feature. Each Interconnect_module_surface_feature defines relating_shape_element for zero, one, or more Interconnect_module_terminal_surface_constituent_relationship objects.

4.3.666 Interconnect_module_usage_view to Functional_unit_usage_view

Each Interconnect_module_usage_view has implemented_function defined by exactly one Functional_unit_usage_view. Each Functional_unit_usage_view defines implemented_function for zero, one, or more Interconnect_module_usage_view objects.

4.3.667 Interconnect_module_usage_view to Located_interconnect_module_thickness_requirement

Each Interconnect_module_usage_view has located_thickness_requirement defined by one or more Located_interconnect_module_thickness_requirement objects. Each Located_interconnect_module_thickness_requirement defines located_thickness_requirement for one or more Interconnect_module_usage_view objects.

4.3.668 Interconnect_module_usage_view to Restraint_condition

Each Interconnect_module_usage_view has measurement_condition defined by exactly one Restraint_condition. Each Restraint_condition defines measurement_condition for zero, one, or more Interconnect_module_usage_view objects.

4.3.669 Interconnect_module_usage_view to Length_data_element

Each Interconnect_module_usage_view has maximum_thickness_over_dielectric_requirement defined by exactly one Length_data_element. Each Length_data_element defines maximum_thickness_over_dielectric_requirement for zero, one, or more Interconnect_module_usage_view objects. Each Interconnect_module_usage_view has minimum_thickness_over_dielectric_requirement defined by exactly one Length_data_element. Each Length_data_element defines minimum_thickness_over_dielectric_requirement for zero, one, or more Interconnect_module_usage_view objects. Each Interconnect_module_usage_view has maximum_thickness_over_metal_requirement defined by exactly one Length_data_element. Each Length_data_element defines maximum_thickness_over_metal_requirement for zero, one, or more Interconnect_module_usage_view objects. Each Interconnect_module_usage_view has minimum_thickness_over_metal_requirement defined by exactly one Length_data_element. Each Length_data_element defines minimum_thickness_over_metal_requirement for zero, one, or more Interconnect_module_usage_view objects.

4.3.670 Interfaced_group_component to Interface_component

Each Interfaced_group_component has group_interface_component defined by one or more Interface_component objects. Each Interface_component defines group_interface_component for zero, one, or more Interfaced_group_component objects.

4.3.671 Interface_access_material_removal_laminate_component to Laminate_component_interface_terminal

Each Interface_access_material_removal_laminate_component has accessed_interface defined by exactly one Laminate_component_interface_terminal. Each Laminate_component_interface_terminal defines accessed_interface for zero, one, or more Interface_access_material_removal_laminate_component objects.

4.3.672 Interface_access_stratum_feature_template_component to Laminate_component_interface_terminal

Each Interface_access_stratum_feature_template_component has accessed_interface defined by exactly one Laminate_component_interface_terminal. Each Laminate_component_interface_terminal defines accessed_interface for zero, one, or more Interface_access_stratum_feature_template_component objects.

4.3.673 Interface_component_allocation to Mating_connector_component

Each Interface_component_allocation has mating_requirement defined by exactly one Mating_connector_component. Each Mating_connector_component defines mating_requirement for zero, one, or more Interface_component_allocation objects.

4.3.674 Interface_component_allocation to Interface_component

Each Interface_component_allocation has mating_solution defined by exactly one Interface_component. Each Interface_component defines mating_solution for zero, one, or more Interface_component_allocation objects.

4.3.675 Interface_mounted_join to Physical_component_terminal

Each Interface_mounted_join has access_to_interface_mounted_component defined by exactly one Physical_component_terminal. Each Physical_component_terminal defines access_to_interface_mounted_component for zero, one, or more Interface_mounted_join objects.

4.3.676 Interface_mounted_join to Packaged_connector_component_interface_terminal

Each Interface_mounted_join has connection_to_interconnect_module_component defined by exactly one Packaged_connector_component_interface_terminal. Each Packaged_connector_component_interface_terminal defines connection_to_interconnect_module_component for zero, one, or more Interface_mounted_join objects.

4.3.677 Interface_requirement_occurrence to Next_higher_assembly_interface_requirement

Each Interface_requirement_occurrence has interface_to_next_higher_assembly defined by exactly one Next_higher_assembly_interface_requirement. Each Next_higher_assembly_interface_requirement defines interface_to_next_higher_assembly for zero, one, or more Interface_requirement_occurrence objects.

4.3.678 Internal_probe_access_area to Stratum_feature

Each Internal_probe_access_area has stratum_feature_implementation defined by exactly one Stratum_feature. Each Stratum_feature defines stratum_feature_implementation for zero, one, or more Internal_probe_access_area objects.

4.3.679 Internal_stratum_access to Via

Each Internal_stratum_access has inter_stratum_feature defined by exactly one Via. Each Via defines inter_stratum_feature for zero, one, or more Internal_stratum_access objects.

4.3.680 Internal_stratum_access to Internal_probe_access_area

Each Internal_stratum_access has connected_probe defined by exactly one Internal_probe_access_area. Each Internal_probe_access_area defines connected_probe for zero, one, or more Internal_stratum_access objects.

4.3.681 Inter_stratum_extent to Stratum

Each Inter_stratum_extent has to_stratum defined by exactly one Stratum. Each Stratum defines to_stratum for zero, one, or more Inter_stratum_extent objects. Each Inter_stratum_extent has from_stratum defined by exactly one Stratum. Each Stratum defines from_stratum for zero, one, or more Inter_stratum_extent objects.

4.3.682 Inter_stratum_feature to Inter_stratum_feature_template

Each Inter_stratum_feature has usage_definition defined by exactly one Inter_stratum_feature_template. Each Inter_stratum_feature_template defines usage_definition for zero, one, or more Inter_stratum_feature objects.

4.3.683 Inter_stratum_feature_edge_segment_template to Edge_segment_cross_section

Each Inter_stratum_feature_edge_segment_template has cross_section defined by exactly one Edge_segment_cross_section. Each Edge_segment_cross_section defines cross_section for zero, one, or more Inter_stratum_feature_edge_segment_template objects.

4.3.684 Inter_stratum_feature_edge_segment_template to Trimmed_line

Each Inter_stratum_feature_edge_segment_template has reference_path defined by exactly one Trimmed_line. Each Trimmed_line defines reference_path for zero, one, or more Inter_stratum_feature_edge_segment_template objects.

4.3.685 Inter_stratum_feature_edge_segment_template to Edge_segment_vertex

Each Inter_stratum_feature_edge_segment_template has end_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines end_vertex for zero, one, or more Inter_stratum_feature_edge_segment_template objects. Each Inter_stratum_feature_edge_segment_template has start_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines start_vertex for zero, one, or more Inter_stratum_feature_edge_segment_template objects.

4.3.686 Inter_stratum_feature_edge_segment_template to Inter_stratum_feature_edge_template

Each Inter_stratum_feature_edge_segment_template has composed_edge defined by exactly one Inter_stratum_feature_edge_template. Each Inter_stratum_feature_edge_template defines composed_edge for two or more Inter_stratum_feature_edge_segment_template objects.

4.3.687 Inter_stratum_feature_template to Passage_technology

Each Inter_stratum_feature_template has of_passage_technology defined by exactly one Passage_technology. Each Passage_technology defines of_passage_technology for zero, one, or more Inter_stratum_feature_template objects.

4.3.688 Inter_stratum_join_implementation to Inter_stratum_join_relationship

Each Inter_stratum_join_implementation has topological_requirement defined by exactly one Inter_stratum_join_relationship. Each Inter_stratum_join_relationship defines topological_requirement for zero, one, or more Inter_stratum_join_implementation objects.

4.3.689 Inter_stratum_join_relationship to Layer_connection_point

Each Inter_stratum_join_relationship has points_to_be_connected defined by two or more Layer_connection_point objects. Each Layer_connection_point defines points_to_be_connected for zero or one Inter_stratum_join_relationship objects.

4.3.690 Intra_stratum_join_relationship to Layer_connection_point

Each Intra_stratum_join_relationship has points_to_be_connected defined by two or more Layer_connection_point objects. Each Layer_connection_point defines points_to_be_connected for zero, one, or more Intra_stratum_join_relationship objects.

4.3.691 Item_restricted_requirement_occurrence to Laminate_component

Each Item_restricted_requirement_occurrence has basis defined by zero or one Laminate_component objects. Each Laminate_component defines basis for zero, one, or more Item_restricted_requirement_occurrence objects. This assertion is established through a SELECT type.

4.3.692 Item_restricted_requirement_occurrence to Inter_stratum_feature

Each Item_restricted_requirement_occurrence has basis defined by zero or one Inter_stratum_feature objects. Each Inter_stratum_feature defines basis for zero, one, or more Item_restricted_requirement_occurrence objects. This assertion is established through a SELECT type.

4.3.693 Item_restricted_requirement_occurrence to Stratum_feature

Each Item_restricted_requirement_occurrence has basis defined by zero or one Stratum_feature objects. Each Stratum_feature defines basis for zero, one, or more Item_restricted_requirement_occurrence objects. This assertion is established through a SELECT type.

4.3.694 Item_restricted_requirement_occurrence to Stratum

Each Item_restricted_requirement_occurrence has basis defined by zero or one Stratum objects. Each Stratum defines basis for zero, one, or more Item_restricted_requirement_occurrence objects. This assertion is established through a SELECT type.

4.3.695 Item_restricted_requirement_occurrence to Stratum_surface

Each Item_restricted_requirement_occurrence has basis defined by zero or one Stratum_surface objects. Each Stratum_surface defines basis for zero, one, or more Item_restricted_requirement_occurrence objects. This assertion is established through a SELECT type.

4.3.696 Item_restricted_requirement_occurrence to Ee_requirement_occurrence

Each Item_restricted_requirement_occurrence has basis defined by zero or one Ee_requirement_occurrence objects. Each Ee_requirement_occurrence defines basis for zero, one, or more Item_restricted_requirement_occurrence objects. This assertion is established through a SELECT type.

4.3.697 Item_restricted_requirement_occurrence to Part_feature

Each Item_restricted_requirement_occurrence has basis defined by zero or one Part_feature objects. Each Part_feature defines basis for zero, one, or more Item_restricted_requirement_occurrence objects. This assertion is established through a SELECT type.

4.3.698 Item_restricted_requirement_occurrence to Assembly_component

Each Item_restricted_requirement_occurrence has basis defined by zero or one Assembly_component objects. Each Assembly_component defines basis for zero, one, or more Item_restricted_requirement_occurrence objects. This assertion is established through a SELECT type.

4.3.699 Item_restricted_requirement_occurrence to Component_external_reference

Each Item_restricted_requirement_occurrence has basis defined by zero or one Component_external_reference objects. Each Component_external_reference defines basis for zero, one, or more Item_restricted_requirement_occurrence objects. This assertion is established through a SELECT type.

4.3.700 Item_restricted_requirement_occurrence to Component_feature

Each Item_restricted_requirement_occurrence has basis defined by zero or one Component_feature objects. Each Component_feature defines basis for zero, one, or more Item_restricted_requirement_occurrence objects. This assertion is established through a SELECT type.

4.3.701 Item_restricted_requirement_occurrence to Component_feature_external_reference

Each Item_restricted_requirement_occurrence has basis defined by zero or one Component_feature_external_reference objects. Each Component_feature_external_reference defines basis for zero, one, or more Item_restricted_requirement_occurrence objects. This assertion is established through a SELECT type.

4.3.702 Join_relationship to Interconnect_module

Each Join_relationship has associated_layout defined by exactly one Interconnect_module. Each Interconnect_module defines associated_layout for zero, one, or more Join_relationship objects.

4.3.703 Join_two_physical_connectivity_definition_supporting_inter_stratum_feature to Physical_connectivity_definition

Each Join_two_physical_connectivity_definition_supporting_inter_stratum_feature has joined_definitions defined by exactly two Physical_connectivity_definition objects. Each Physical_connectivity_definition defines joined_definitions for zero, one, or more Join_two_physical_connectivity_definition_supporting_inter_stratum_feature objects.

4.3.704 Join_two_physical_connectivity_definition_supporting_printed_component to Physical_connectivity_definition

Each Join_two_physical_connectivity_definition_supporting_printed_component has joined_definitions defined by exactly two Physical_connectivity_definition objects. Each Physical_connectivity_definition defines joined_definitions for zero, one, or more Join_two_physical_connectivity_definition_supporting_printed_component objects.

4.3.705 Junction_vertex_allocation to Topological_junction

Each Junction_vertex_allocation has required_vertex defined by exactly one Topological_junction. Each Topological_junction defines required_vertex for zero, one, or more Junction_vertex_allocation objects.

4.3.706 Junction_vertex_allocation to Inter_stratum_join_relationship

Each Junction_vertex_allocation has implementation_point defined by zero or one Inter_stratum_join_relationship objects. Each Inter_stratum_join_relationship defines implementation_point for zero, one, or more Junction_vertex_allocation objects. This assertion is established through a SELECT type.

4.3.707 Junction_vertex_allocation to Explicitly_located_layer_connection_point

Each Junction_vertex_allocation has implementation_point defined by zero or one Explicitly_located_layer_connection_point objects. Each Explicitly_located_layer_connection_point defines implementation_point for zero, one, or more Junction_vertex_allocation objects. This assertion is established through a SELECT type.

4.3.708 Laminate_component to Part_template

Each Laminate_component has usage_definition defined by exactly one Part_template. Each Part_template defines usage_definition for zero, one, or more Laminate_component objects.

4.3.709 Laminate_component to External_definition

Each Laminate_component has cad_layer defined by exactly one External_definition. Each External_definition defines cad_layer for zero, one, or more Laminate_component objects.

4.3.710 Laminate_group_component_make_from_relationship to Stratum_make_from_relationship

Each Laminate_group_component_make_from_relationship has stratum_mapping defined by one or more Stratum_make_from_relationship objects. Each Stratum_make_from_relationship defines stratum_mapping for zero, one, or more Laminate_group_component_make_from_relationship objects.

4.3.711 Laminate_group_component_make_from_relationship to Assembly_group_component

Each Laminate_group_component_make_from_relationship has resultant_component defined by exactly one Assembly_group_component. Each Assembly_group_component defines resultant_component for zero, one, or more Laminate_group_component_make_from_relationship objects. Each Laminate_group_component_make_from_relationship has reusable_component defined by exactly one Assembly_group_component. Each Assembly_group_component defines reusable_component for zero, one, or more Laminate_group_component_make_from_relationship objects.

4.3.712 Laminate_text_component to Stratum_feature

Each Laminate_text_component has stratum_feature_implementation defined by one or more Stratum_feature objects. Each Stratum_feature defines stratum_feature_implementation for zero, one, or more Laminate_text_component objects.

4.3.713 Laminate_text_component to Part_text_template

Each Laminate_text_component has usage_definition defined by exactly one Part_text_template. Each Part_text_template defines usage_definition for zero, one, or more Laminate_text_component objects.

4.3.714 Land to Land_physical_template

Each Land has usage_definition defined by exactly one Land_physical_template. Each Land_physical_template defines usage_definition for zero, one, or more Land objects. Each Land has alternate_land_definition defined by exactly one Land_physical_template. Each Land_physical_template defines alternate_land_definition for zero, one, or more Land objects.

4.3.715 Land_interface_terminal to Land

Each Land_interface_terminal has associated_component defined by exactly one Land. Each Land defines associated_component for zero, one, or more Land_interface_terminal objects.

4.3.716 Land_interface_terminal to Land_template_interface_terminal

Each Land_interface_terminal has definition defined by exactly one Land_template_interface_terminal. Each Land_template_interface_terminal defines definition for zero, one, or more Land_interface_terminal objects.

4.3.717 Land_join_terminal to Land

Each Land_join_terminal has associated_component defined by exactly one Land. Each Land defines associated_component for one or more Land_join_terminal objects.

4.3.718 Land_join_terminal to Land_template_join_terminal

Each Land_join_terminal has definition defined by exactly one Land_template_join_terminal. Each Land_template_join_terminal defines definition for zero, one, or more Land_join_terminal objects.

4.3.719 Land_physical_template to External_definition

Each Land_physical_template has pre_defined_classification_code defined by exactly one External_definition. Each External_definition defines pre_defined_classification_code for zero, one, or more Land_physical_template objects.

4.3.720 Land_template_terminal to Connection_zone

Each Land_template_terminal has terminal_connection_zone defined by one or more Connection_zone objects. Each Connection_zone defines terminal_connection_zone for zero, one, or more Land_template_terminal objects.

4.3.721 Land_template_terminal to Land_physical_template

Each Land_template_terminal has associated_definition defined by exactly one Land_physical_template. Each Land_physical_template defines associated_definition for two or more Land_template_terminal objects.

4.3.722 Layer to External_definition

Each Layer has layer_usage defined by exactly one External_definition. Each External_definition defines layer_usage for zero, one, or more Layer objects.

4.3.723 Layer to Inter_stratum_extent

Each Layer has extent defined by exactly one Inter_stratum_extent. Each Inter_stratum_extent defines extent for zero, one, or more Layer objects.

4.3.724 Layer_connection_point to Design_layer_stratum

Each Layer_connection_point has resident_design_layer_stratum defined by exactly one Design_layer_stratum. Each Design_layer_stratum defines resident_design_layer_stratum for one or more Layer_connection_point objects.

4.3.725 Layer_connection_point to Cartesian_point

Each Layer_connection_point has location_3d defined by exactly one Cartesian_point. Each Cartesian_point defines location_3d for zero, one, or more Layer_connection_point objects. Each Layer_connection_point has location_2d defined by exactly one Cartesian_point. Each Cartesian_point defines location_2d for zero, one, or more Layer_connection_point objects.

4.3.726 Layer_connection_point_link to Layer_connection_point

Each Layer_connection_point_link has subsequent_point defined by exactly one Layer_connection_point. Each Layer_connection_point defines subsequent_point for zero, one, or more Layer_connection_point_link objects. Each Layer_connection_point_link has precedent_point defined by exactly one Layer_connection_point. Each Layer_connection_point defines precedent_point for zero, one, or more Layer_connection_point_link objects.

4.3.727 Layer_connection_point_link to Stratum

Each Layer_connection_point_link has associated_stratum defined by exactly one Stratum. Each Stratum defines associated_stratum for zero, one, or more Layer_connection_point_link objects.

4.3.728 Layer_qualified_layout_spacing_requirement_occurrence to Inter_stratum_extent

Each Layer_qualified_layout_spacing_requirement_occurrence has layer_context defined by one or more Inter_stratum_extent objects. Each Inter_stratum_extent defines layer_context for zero, one, or more Layer_qualified_layout_spacing_requirement_occurrence objects.

4.3.729 Layout_land_width_tolerance_requirement_occurrence to Length_data_element

Each Layout_land_width_tolerance_requirement_occurrence has maximum_negative_deviation defined by exactly one Length_data_element. Each Length_data_element defines maximum_negative_deviation for zero, one, or more Layout_land_width_tolerance_requirement_occurrence objects.

4.3.730 Layout_land_width_tolerance_requirement_occurrence to Pitch_class

Each Layout_land_width_tolerance_requirement_occurrence has mating_feature_pitch_class defined by exactly one Pitch_class. Each Pitch_class defines mating_feature_pitch_class for zero, one, or more Layout_land_width_tolerance_requirement_occurrence objects.

4.3.731 Layout_line_width_tolerance_requirement_occurrence to Length_data_element

Each Layout_line_width_tolerance_requirement_occurrence has maximum_positive_deviation defined by exactly one Length_data_element. Each Length_data_element defines maximum_positive_deviation for zero, one, or more Layout_line_width_tolerance_requirement_occurrence objects. Each Layout_line_width_tolerance_requirement_occurrence has maximum_negative_deviation defined by exactly one Length_data_element. Each Length_data_element defines maximum_negative_deviation for zero, one, or more Layout_line_width_tolerance_requirement_occurrence objects.

4.3.732 Layout_line_width_tolerance_requirement_occurrence to Line_width_class

Each Layout_line_width_tolerance_requirement_occurrence has tolerance_line_width_class defined by exactly one Line_width_class. Each Line_width_class defines tolerance_line_width_class for zero, one, or more Layout_line_width_tolerance_requirement_occurrence objects.

4.3.733 Layout_line_width_tolerance_requirement_occurrence to Stratum_technology

Each Layout_line_width_tolerance_requirement_occurrence has characterized_stratum_technology defined by exactly one Stratum_technology. Each Stratum_technology defines characterized_stratum_technology for zero, one, or more Layout_line_width_tolerance_requirement_occurrence objects.

4.3.734 Layout_macro_component to Layout_macro_floor_plan_template

Each Layout_macro_component has usage_definition defined by exactly one Layout_macro_floor_plan_template. Each Layout_macro_floor_plan_template defines usage_definition for zero, one, or more Layout_macro_component objects.

4.3.735 Layout_macro_component to Layout_macro_definition

Each Layout_macro_component has design_definition defined by exactly one Layout_macro_definition. Each Layout_macro_definition defines design_definition for zero, one, or more Layout_macro_component objects.

4.3.736 Layout_macro_definition to Layout_macro_floor_plan_template

Each Layout_macro_definition has floor_layout_view defined by exactly one Layout_macro_floor_plan_template. Each Layout_macro_floor_plan_template defines floor_layout_view for zero or one Layout_macro_definition objects.

4.3.737 Layout_macro_definition_terminal_to_usage_terminal_assignment to Component_termination_passage_join_terminal

Each Layout_macro_definition_terminal_to_usage_terminal_assignment has assigned_design_object defined by zero or one Component_termination_passage_join_terminal objects. Each Component_termination_passage_join_terminal defines assigned_design_object for zero, one, or more Layout_macro_definition_terminal_to_usage_terminal_assignment objects. This assertion is established through a SELECT type.

4.3.738 Layout_macro_definition_terminal_to_usage_terminal_assignment to Via_terminal

Each Layout_macro_definition_terminal_to_usage_terminal_assignment has assigned_design_object defined by zero or one Via_terminal objects. Each Via_terminal defines assigned_design_object for zero, one, or more Layout_macro_definition_terminal_to_usage_terminal_assignment objects. This assertion is established through a SELECT type.

4.3.739 Layout_macro_definition_terminal_to_usage_terminal_assignment to Printed_component_join_terminal

Each Layout_macro_definition_terminal_to_usage_terminal_assignment has assigned_design_object defined by zero or one Printed_component_join_terminal objects. Each Printed_component_join_terminal defines assigned_design_object for zero, one, or more Layout_macro_definition_terminal_to_usage_terminal_assignment objects. This assertion is established through a SELECT type.

4.3.740 Layout_macro_definition_terminal_to_usage_terminal_assignment to Conductive_interconnect_element_terminal

Each Layout_macro_definition_terminal_to_usage_terminal_assignment has assigned_design_object defined by zero or one Conductive_interconnect_element_terminal objects. Each Conductive_interconnect_element_terminal defines assigned_design_object for zero, one, or more Layout_macro_definition_terminal_to_usage_terminal_assignment objects. This assertion is established through a SELECT type.

4.3.741 Layout_macro_definition_terminal_to_usage_terminal_assignment to Embedded_component_terminal

Each Layout_macro_definition_terminal_to_usage_terminal_assignment has assigned_design_object defined by zero or one Embedded_component_terminal objects. Each Embedded_component_terminal defines assigned_design_object for zero, one, or more Layout_macro_definition_terminal_to_usage_terminal_assignment objects. This assertion is established through a SELECT type.

4.3.742 Layout_macro_definition_terminal_to_usage_terminal_assignment to Land_join_terminal

Each Layout_macro_definition_terminal_to_usage_terminal_assignment has assigned_design_object defined by zero or one Land_join_terminal objects. Each Land_join_terminal defines assigned_design_object for zero, one, or more Layout_macro_definition_terminal_to_usage_terminal_assignment objects. This assertion is established through a SELECT type.

4.3.743 Layout_macro_definition_terminal_to_usage_terminal_assignment to Non_functional_land_join_terminal

Each Layout_macro_definition_terminal_to_usage_terminal_assignment has assigned_design_object defined by zero or one Non_functional_land_join_terminal objects. Each Non_functional_land_join_terminal defines assigned_design_object for zero, one, or more Layout_macro_definition_terminal_to_usage_terminal_assignment objects. This assertion is established through a SELECT type.

4.3.744 Layout_macro_definition_terminal_to_usage_terminal_assignment to Printed_part_template_terminal

Each Layout_macro_definition_terminal_to_usage_terminal_assignment has defined_template_feature defined by exactly one Printed_part_template_terminal. Each Printed_part_template_terminal defines defined_template_feature for zero, one, or more Layout_macro_definition_terminal_to_usage_terminal_assignment objects.

4.3.745 Layout_macro_floor_plan_template to Layout_macro_definition_terminal_to_usage_terminal_assignment

Each Layout_macro_floor_plan_template has access_maps defined by one or more Layout_macro_definition_terminal_to_usage_terminal_assignment objects. Each Layout_macro_definition_terminal_to_usage_terminal_assignment defines access_maps for zero, one, or more Layout_macro_floor_plan_template objects.

4.3.746 Layout_spacing_requirement_non_conforming_design_object to Layout_spacing_requirement_occurrence

Each Layout_spacing_requirement_non_conforming_design_object has design_requirement defined by exactly one Layout_spacing_requirement_occurrence. Each Layout_spacing_requirement_occurrence defines design_requirement for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects.

4.3.747 Layout_spacing_requirement_non_conforming_design_object to Assembly_component

Each Layout_spacing_requirement_non_conforming_design_object has reference_design_object defined by zero or one Assembly_component objects. Each Assembly_component defines reference_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type. Each Layout_spacing_requirement_non_conforming_design_object has non_conformant_design_object defined by zero or one Assembly_component objects. Each Assembly_component defines non_conformant_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type.

4.3.748 Layout_spacing_requirement_non_conforming_design_object to Component_feature

Each Layout_spacing_requirement_non_conforming_design_object has reference_design_object defined by zero or one Component_feature objects. Each Component_feature defines reference_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type. Each Layout_spacing_requirement_non_conforming_design_object has non_conformant_design_object defined by zero or one Component_feature objects. Each Component_feature defines non_conformant_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type.

4.3.749 Layout_spacing_requirement_non_conforming_design_object to Via

Each Layout_spacing_requirement_non_conforming_design_object has reference_design_object defined by zero or one Via objects. Each Via defines reference_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type. Each Layout_spacing_requirement_non_conforming_design_object has non_conformant_design_object defined by zero or one Via objects. Each Via defines non_conformant_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type.

4.3.750 Layout_spacing_requirement_non_conforming_design_object to Cutout

Each Layout_spacing_requirement_non_conforming_design_object has reference_design_object defined by zero or one Cutout objects. Each Cutout defines reference_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type. Each Layout_spacing_requirement_non_conforming_design_object has non_conformant_design_object defined by zero or one Cutout objects. Each Cutout defines non_conformant_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type.

4.3.751 Layout_spacing_requirement_non_conforming_design_object to Component_termination_passage

Each Layout_spacing_requirement_non_conforming_design_object has reference_design_object defined by zero or one Component_termination_passage objects. Each Component_termination_passage defines reference_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type. Each Layout_spacing_requirement_non_conforming_design_object has non_conformant_design_object defined by zero or one Component_termination_passage objects. Each Component_termination_passage defines non_conformant_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type.

4.3.752 Layout_spacing_requirement_non_conforming_design_object to Land

Each Layout_spacing_requirement_non_conforming_design_object has reference_design_object defined by zero or one Land objects. Each Land defines reference_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type. Each Layout_spacing_requirement_non_conforming_design_object has non_conformant_design_object defined by zero or one Land objects. Each Land defines non_conformant_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type.

4.3.753 Layout_spacing_requirement_non_conforming_design_object to Conductor

Each Layout_spacing_requirement_non_conforming_design_object has reference_design_object defined by zero or one Conductor objects. Each Conductor defines reference_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type. Each Layout_spacing_requirement_non_conforming_design_object has non_conformant_design_object defined by zero or one Conductor objects. Each Conductor defines non_conformant_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type.

4.3.754 Layout_spacing_requirement_non_conforming_design_object to Conductive_filled_area

Each Layout_spacing_requirement_non_conforming_design_object has reference_design_object defined by zero or one Conductive_filled_area objects. Each Conductive_filled_area defines reference_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type. Each Layout_spacing_requirement_non_conforming_design_object has non_conformant_design_object defined by zero or one Conductive_filled_area objects. Each Conductive_filled_area defines non_conformant_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type.

4.3.755 Layout_spacing_requirement_non_conforming_design_object to Stratum_feature

Each Layout_spacing_requirement_non_conforming_design_object has reference_design_object defined by zero or one Stratum_feature objects. Each Stratum_feature defines reference_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type. Each Layout_spacing_requirement_non_conforming_design_object has non_conformant_design_object defined by zero or one Stratum_feature objects. Each Stratum_feature defines non_conformant_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type.

4.3.756 Layout_spacing_requirement_non_conforming_design_object to Laminate_component

Each Layout_spacing_requirement_non_conforming_design_object has reference_design_object defined by zero or one Laminate_component objects. Each Laminate_component defines reference_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type. Each Layout_spacing_requirement_non_conforming_design_object has non_conformant_design_object defined by zero or one Laminate_component objects. Each Laminate_component defines non_conformant_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type.

4.3.757 Layout_spacing_requirement_non_conforming_design_object to Inter_stratum_feature

Each Layout_spacing_requirement_non_conforming_design_object has reference_design_object defined by zero or one Inter_stratum_feature objects. Each Inter_stratum_feature defines reference_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type. Each Layout_spacing_requirement_non_conforming_design_object has non_conformant_design_object defined by zero or one Inter_stratum_feature objects. Each Inter_stratum_feature defines non_conformant_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type.

4.3.758 Layout_spacing_requirement_non_conforming_design_object to Non_functional_land

Each Layout_spacing_requirement_non_conforming_design_object has reference_design_object defined by zero or one Non_functional_land objects. Each Non_functional_land defines reference_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type. Each Layout_spacing_requirement_non_conforming_design_object has non_conformant_design_object defined by zero or one Non_functional_land objects. Each Non_functional_land defines non_conformant_design_object for zero, one, or more Layout_spacing_requirement_non_conforming_design_object objects. This assertion is established through a SELECT type.

4.3.759 Layout_spacing_requirement_occurrence to Minimum_tolerance_characteristic

Each Layout_spacing_requirement_occurrence has minimum_spacing defined by exactly one Minimum_tolerance_characteristic. Each Minimum_tolerance_characteristic defines minimum_spacing for zero, one, or more Layout_spacing_requirement_occurrence objects.

4.3.760 Length_trimmed_terminal to Length_data_element

Each Length_trimmed_terminal has minimum_trimmed_length defined by exactly one Length_data_element. Each Length_data_element defines minimum_trimmed_length for zero, one, or more Length_trimmed_terminal objects. Each Length_trimmed_terminal has maximum_trimmed_length defined by exactly one Length_data_element. Each Length_data_element defines maximum_trimmed_length for zero, one, or more Length_trimmed_terminal objects.

4.3.761 Limit_dimension_representation to Data_element

Each Limit_dimension_representation has lower_dimension_value defined by exactly one Data_element. Each Data_element defines lower_dimension_value for zero, one, or more Limit_dimension_representation objects. Each Limit_dimension_representation has upper_dimension_value defined by exactly one Data_element. Each Data_element defines upper_dimension_value for zero, one, or more Limit_dimension_representation objects.

4.3.762 Linear_array_placement_group_component to Length_data_element

Each Linear_array_placement_group_component has terminus_node_positive_x_displacement defined by exactly one Length_data_element. Each Length_data_element defines terminus_node_positive_x_displacement for zero, one, or more Linear_array_placement_group_component objects. Each Linear_array_placement_group_component has initial_node_positive_x_displacement defined by exactly one Length_data_element. Each Length_data_element defines initial_node_positive_x_displacement for zero, one, or more Linear_array_placement_group_component objects.

4.3.763 Linear_array_placement_group_component to Assembly_component_placement_link

Each Linear_array_placement_group_component has element defined by one or more Assembly_component_placement_link objects. Each Assembly_component_placement_link defines element for zero, one, or more Linear_array_placement_group_component objects.

4.3.764 Linear_array_placement_group_component_link to Linear_array_placement_group_component

Each Linear_array_placement_group_component_link has subsequent_element defined by exactly one Linear_array_placement_group_component. Each Linear_array_placement_group_component defines subsequent_element for zero, one, or more Linear_array_placement_group_component_link objects. Each Linear_array_placement_group_component_link has precedent_element defined by exactly one Linear_array_placement_group_component. Each Linear_array_placement_group_component defines precedent_element for zero, one, or more Linear_array_placement_group_component_link objects.

4.3.765 Line_width_class to Range_characteristic

Each Line_width_class has class_member defined by exactly one Range_characteristic. Each Range_characteristic defines class_member for zero, one, or more Line_width_class objects.

4.3.766 List_characteristic to Characteristic

Each List_characteristic has values defined by one or more Characteristic objects. Each Characteristic defines values for zero, one, or more List_characteristic objects.

4.3.767 Located_interconnect_module_thickness_requirement to Length_data_element

Each Located_interconnect_module_thickness_requirement has minimum_thickness_requirement defined by exactly one Length_data_element. Each Length_data_element defines minimum_thickness_requirement for zero, one, or more Located_interconnect_module_thickness_requirement objects. Each Located_interconnect_module_thickness_requirement has maximum_thickness_requirement defined by exactly one Length_data_element. Each Length_data_element defines maximum_thickness_requirement for zero, one, or more Located_interconnect_module_thickness_requirement objects.

4.3.768 Located_interconnect_module_thickness_requirement to Axis_placement

Each Located_interconnect_module_thickness_requirement has reference_location defined by exactly one Axis_placement. Each Axis_placement defines reference_location for zero, one, or more Located_interconnect_module_thickness_requirement objects.

4.3.769 Marking to Ee_specification

Each Marking has marking_specification defined by exactly one Ee_specification. Each Ee_specification defines marking_specification for zero, one, or more Marking objects.

4.3.770 Marking to Styled_text

Each Marking has message_representation_text defined by exactly one Styled_text. Each Styled_text defines message_representation_text for zero, one, or more Marking objects.

4.3.771 Marking to Feature_shape_definition

Each Marking has message_representation defined by exactly one Feature_shape_definition. Each Feature_shape_definition defines message_representation for zero, one, or more Marking objects.

4.3.772 Marking to Axis_placement

Each Marking has placement defined by exactly one Axis_placement. Each Axis_placement defines placement for zero, one, or more Marking objects.

4.3.773 Marking to Ee_material

Each Marking has marking_material defined by exactly one Ee_material. Each Ee_material defines marking_material for zero, one, or more Marking objects.

4.3.774 Marking to Part_template_3d_shape

Each Marking has marked_device_shape defined by zero or one Part_template_3d_shape objects. Each Part_template_3d_shape defines marked_device_shape for zero, one, or more Marking objects. This assertion is established through a SELECT type.

4.3.775 Marking to Physical_unit_3d_shape

Each Marking has marked_device_shape defined by zero or one Physical_unit_3d_shape objects. Each Physical_unit_3d_shape defines marked_device_shape for zero, one, or more Marking objects. This assertion is established through a SELECT type.

4.3.776 Marking to Part_template_non_planar_2d_shape

Each Marking has marked_device_shape defined by zero or one Part_template_non_planar_2d_shape objects. Each Part_template_non_planar_2d_shape defines marked_device_shape for zero, one, or more Marking objects. This assertion is established through a SELECT type.

4.3.777 Marking to Part_template_planar_shape

Each Marking has marked_device_shape defined by zero or one Part_template_planar_shape objects. Each Part_template_planar_shape defines marked_device_shape for zero, one, or more Marking objects. This assertion is established through a SELECT type.

4.3.778 Marking to Physical_unit_planar_shape

Each Marking has marked_device_shape defined by zero or one Physical_unit_planar_shape objects. Each Physical_unit_planar_shape defines marked_device_shape for zero, one, or more Marking objects. This assertion is established through a SELECT type.

4.3.779 Marking to Configuration_controlled_message

Each Marking has marked_message defined by zero or one Configuration_controlled_message objects. Each Configuration_controlled_message defines marked_message for zero, one, or more Marking objects. This assertion is established through a SELECT type.

4.3.780 Marking to Ee_text

Each Marking has marked_message defined by zero or one Ee_text objects. Each Ee_text defines marked_message for zero, one, or more Marking objects. This assertion is established through a SELECT type.

4.3.781 Material_addition_feature to Material_addition_feature_template

Each Material_addition_feature has material_addition_shape defined by exactly one Material_addition_feature_template. Each Material_addition_feature_template defines material_addition_shape for zero, one, or more Material_addition_feature objects.

4.3.782 Material_addition_feature_template to Stratum_technology

Each Material_addition_feature_template has of_stratum_technology defined by exactly one Stratum_technology. Each Stratum_technology defines of_stratum_technology for zero, one, or more Material_addition_feature_template objects.

4.3.783 Material_assembly_relationship to Ee_material

Each Material_assembly_relationship has assembly defined by exactly one Ee_material. Each Ee_material defines assembly for zero, one, or more Material_assembly_relationship objects. Each Material_assembly_relationship has component defined by exactly one Ee_material. Each Ee_material defines component for zero, one, or more Material_assembly_relationship objects.

4.3.784 Material_composition_relationship to Ee_material

Each Material_composition_relationship has relating_product defined by exactly one Ee_material. Each Ee_material defines relating_product for zero, one, or more Material_composition_relationship objects. Each Material_composition_relationship has related_product defined by exactly one Ee_material. Each Ee_material defines related_product for zero, one, or more Material_composition_relationship objects.

4.3.785 Material_composition_relationship to Data_element

Each Material_composition_relationship has constituent_amount defined by exactly one Data_element. Each Data_element defines constituent_amount for zero, one, or more Material_composition_relationship objects.

4.3.786 Material_composition_relationship to Ee_text

Each Material_composition_relationship has determination_method defined by exactly one Ee_text. Each Ee_text defines determination_method for zero, one, or more Material_composition_relationship objects.

4.3.787 Material_removal_feature to Material_removal_feature_template

Each Material_removal_feature has material_removal_shape defined by exactly one Material_removal_feature_template. Each Material_removal_feature_template defines material_removal_shape for zero, one, or more Material_removal_feature objects.

4.3.788 Material_removal_feature_template to Stratum_technology

Each Material_removal_feature_template has of_stratum_technology defined by exactly one Stratum_technology. Each Stratum_technology defines of_stratum_technology for zero, one, or more Material_removal_feature_template objects.

4.3.789 Material_removal_laminate_component to Stratum_feature

Each Material_removal_laminate_component has design_intent defined by exactly one Stratum_feature. Each Stratum_feature defines design_intent for zero, one, or more Material_removal_laminate_component objects.

4.3.790 Material_removal_laminate_component to Material_removal_feature_template

Each Material_removal_laminate_component has usage_definition defined by exactly one Material_removal_feature_template. Each Material_removal_feature_template defines usage_definition for zero, one, or more Material_removal_laminate_component objects.

4.3.791 Mating_connector_component to Ee_specification

Each Mating_connector_component has definition defined by zero or one Ee_specification objects. Each Ee_specification defines definition for zero, one, or more Mating_connector_component objects. This assertion is established through a SELECT type.

4.3.792 Mating_connector_component to Printed_connector_template

Each Mating_connector_component has definition defined by zero or one Printed_connector_template objects. Each Printed_connector_template defines definition for zero, one, or more Mating_connector_component objects. This assertion is established through a SELECT type.

4.3.793 Mating_connector_component to Packaged_connector

Each Mating_connector_component has definition defined by zero or one Packaged_connector objects. Each Packaged_connector defines definition for zero, one, or more Mating_connector_component objects. This assertion is established through a SELECT type.

4.3.794 Mating_connector_placement_relationship to Axis_placement

Each Mating_connector_placement_relationship has connector_placement defined by exactly one Axis_placement. Each Axis_placement defines connector_placement for zero, one, or more Mating_connector_placement_relationship objects.

4.3.795 Mating_connector_placement_relationship to Next_higher_assembly_interface_requirement

Each Mating_connector_placement_relationship has interface_context defined by exactly one Next_higher_assembly_interface_requirement. Each Next_higher_assembly_interface_requirement defines interface_context for zero, one, or more Mating_connector_placement_relationship objects.

4.3.796 Mating_connector_placement_relationship to Mating_connector_component

Each Mating_connector_placement_relationship has placed_connector defined by exactly one Mating_connector_component. Each Mating_connector_component defines placed_connector for zero, one, or more Mating_connector_placement_relationship objects.

4.3.797 Mating_connector_termination to Ee_requirement_occurrence

Each Mating_connector_termination has signal_definition defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines signal_definition for zero, one, or more Mating_connector_termination objects.

4.3.798 Mating_connector_termination to Mating_connector_component

Each Mating_connector_termination has accessed_connector defined by exactly one Mating_connector_component. Each Mating_connector_component defines accessed_connector for zero, one, or more Mating_connector_termination objects.

4.3.799 Mating_connector_termination to Packaged_part_terminal

Each Mating_connector_termination has definition defined by zero or one Packaged_part_terminal objects. Each Packaged_part_terminal defines definition for zero, one, or more Mating_connector_termination objects. This assertion is established through a SELECT type.

4.3.800 Mating_connector_termination to Printed_part_template_terminal

Each Mating_connector_termination has definition defined by zero or one Printed_part_template_terminal objects. Each Printed_part_template_terminal defines definition for zero, one, or more Mating_connector_termination objects. This assertion is established through a SELECT type.

4.3.801 Maximum_tolerance_characteristic to Numeric_parameter

Each Maximum_tolerance_characteristic has component_characteristic defined by exactly one Numeric_parameter. Each Numeric_parameter defines component_characteristic for zero, one, or more Maximum_tolerance_characteristic objects.

4.3.802 Minimally_defined_bare_die_terminal to Bare_die

Each Minimally_defined_bare_die_terminal has associated_definition defined by exactly one Bare_die. Each Bare_die defines associated_definition for two or more Minimally_defined_bare_die_terminal objects.

4.3.803 Minimally_defined_component_terminal to Part_terminal_external_reference

Each Minimally_defined_component_terminal has definition defined by exactly one Part_terminal_external_reference. Each Part_terminal_external_reference defines definition for zero, one, or more Minimally_defined_component_terminal objects.

4.3.804 Minimum_tolerance_characteristic to Numeric_parameter

Each Minimum_tolerance_characteristic has component_characteristic defined by exactly one Numeric_parameter. Each Numeric_parameter defines component_characteristic for zero, one, or more Minimum_tolerance_characteristic objects.

4.3.805 Model_parameter to Coordinated_characteristic

Each Model_parameter has default_value defined by zero or one Coordinated_characteristic objects. Each Coordinated_characteristic defines default_value for zero, one, or more Model_parameter objects. This assertion is established through a SELECT type. Each Model_parameter has valid_range defined by one or more Coordinated_characteristic objects. Each Coordinated_characteristic defines valid_range for zero, one, or more Model_parameter objects.

4.3.806 Model_parameter to Characteristic

Each Model_parameter has default_value defined by zero or one Characteristic objects. Each Characteristic defines default_value for zero, one, or more Model_parameter objects. This assertion is established through a SELECT type.

4.3.807 Model_parameter to Ee_document

Each Model_parameter has reference_document defined by exactly one Ee_document. Each Ee_document defines reference_document for zero, one, or more Model_parameter objects.

4.3.808 Mounting_restriction_area to Assembly_module

Each Mounting_restriction_area has scope defined by exactly one Assembly_module. Each Assembly_module defines scope for zero, one, or more Mounting_restriction_area objects.

4.3.809 Mounting_restriction_area to Interconnect_module_component_surface_feature

Each Mounting_restriction_area has mounting_surface defined by exactly one Interconnect_module_component_surface_feature. Each Interconnect_module_component_surface_feature defines mounting_surface for zero, one, or more Mounting_restriction_area objects.

4.3.810 Mounting_restriction_volume to Assembly_module

Each Mounting_restriction_volume has scope defined by exactly one Assembly_module. Each Assembly_module defines scope for zero, one, or more Mounting_restriction_volume objects.

4.3.811 Mounting_restriction_volume to Interconnect_module_component_surface_feature

Each Mounting_restriction_volume has mounting_surface defined by exactly one Interconnect_module_component_surface_feature. Each Interconnect_module_component_surface_feature defines mounting_surface for zero, one, or more Mounting_restriction_volume objects.

4.3.812 Movable_packaged_component_join_terminal to Length_data_element

Each Movable_packaged_component_join_terminal has minimum_wire_terminal_length defined by exactly one Length_data_element. Each Length_data_element defines minimum_wire_terminal_length for zero, one, or more Movable_packaged_component_join_terminal objects. Each Movable_packaged_component_join_terminal has maximum_wire_terminal_length defined by exactly one Length_data_element. Each Length_data_element defines maximum_wire_terminal_length for zero, one, or more Movable_packaged_component_join_terminal objects.

4.3.813 Multi_layer_material_removal_laminate_component to Layer

Each Multi_layer_material_removal_laminate_component has derived_layer_geometry defined by exactly one Layer. Each Layer defines derived_layer_geometry for zero, one, or more Multi_layer_material_removal_laminate_component objects.

4.3.814 Multi_layer_stratum_feature to Layer

Each Multi_layer_stratum_feature has derived_layer_geometry defined by exactly one Layer. Each Layer defines derived_layer_geometry for zero, one, or more Multi_layer_stratum_feature objects.

4.3.815 Multi_layer_stratum_feature_template_component to Layer

Each Multi_layer_stratum_feature_template_component has derived_layer_geometry defined by exactly one Layer. Each Layer defines derived_layer_geometry for zero, one, or more Multi_layer_stratum_feature_template_component objects.

4.3.816 Next_higher_assembly_interface_requirement to Ee_product_version

Each Next_higher_assembly_interface_requirement has version_of_next_higher_assembly defined by exactly one Ee_product_version. Each Ee_product_version defines version_of_next_higher_assembly for zero, one, or more Next_higher_assembly_interface_requirement objects.

4.3.817 Next_higher_assembly_interface_requirement to Bound_volume_shape

Each Next_higher_assembly_interface_requirement has shape defined by exactly one Bound_volume_shape. Each Bound_volume_shape defines shape for zero, one, or more Next_higher_assembly_interface_requirement objects.

4.3.818 Next_higher_assembly_relationship to Data_element

Each Next_higher_assembly_relationship has quantity defined by exactly one Data_element. Each Data_element defines quantity for zero, one, or more Next_higher_assembly_relationship objects.

4.3.819 Non_conductive_cross_section_template to Length_data_element

Each Non_conductive_cross_section_template has nominal_width defined by exactly one Length_data_element. Each Length_data_element defines nominal_width for zero, one, or more Non_conductive_cross_section_template objects.

4.3.820 Non_conductive_cross_section_template to Stratum_technology

Each Non_conductive_cross_section_template has template_technology defined by exactly one Stratum_technology. Each Stratum_technology defines template_technology for zero, one, or more Non_conductive_cross_section_template objects.

4.3.821 Non_feature_shape_definition to Feature_shape_definition

Each Non_feature_shape_definition has model_shape defined by exactly one Feature_shape_definition. Each Feature_shape_definition defines model_shape for zero, one, or more Non_feature_shape_definition objects.

4.3.822 Non_feature_shape_definition to Non_feature_shape_element

Each Non_feature_shape_definition has associated_element defined by exactly one Non_feature_shape_element. Each Non_feature_shape_element defines associated_element for zero, one, or more Non_feature_shape_definition objects.

4.3.823 Non_feature_shape_element to Footprint_definition

Each Non_feature_shape_element has scope defined by zero or one Footprint_definition objects. Each Footprint_definition defines scope for zero, one, or more Non_feature_shape_element objects. This assertion is established through a SELECT type.

4.3.824 Non_feature_shape_element to Padstack_definition

Each Non_feature_shape_element has scope defined by zero or one Padstack_definition objects. Each Padstack_definition defines scope for zero, one, or more Non_feature_shape_element objects. This assertion is established through a SELECT type.

4.3.825 Non_feature_shape_element to Physical_unit

Each Non_feature_shape_element has scope defined by zero or one Physical_unit objects. Each Physical_unit defines scope for zero, one, or more Non_feature_shape_element objects. This assertion is established through a SELECT type.

4.3.826 Non_feature_shape_element to Stratum

Each Non_feature_shape_element has scope defined by zero or one Stratum objects. Each Stratum defines scope for zero, one, or more Non_feature_shape_element objects. This assertion is established through a SELECT type.

4.3.827 Non_feature_shape_element to Template_definition

Each Non_feature_shape_element has scope defined by zero or one Template_definition objects. Each Template_definition defines scope for zero, one, or more Non_feature_shape_element objects. This assertion is established through a SELECT type.

4.3.828 Non_feature_shape_element_relationship to Non_feature_shape_element

Each Non_feature_shape_element_relationship has relating_shape_element defined by exactly one Non_feature_shape_element. Each Non_feature_shape_element defines relating_shape_element for zero, one, or more Non_feature_shape_element_relationship objects. Each Non_feature_shape_element_relationship has related_shape_element defined by exactly one Non_feature_shape_element. Each Non_feature_shape_element defines related_shape_element for zero, one, or more Non_feature_shape_element_relationship objects.

4.3.829 Non_functional_land to Land_physical_template

Each Non_functional_land has usage_definition defined by exactly one Land_physical_template. Each Land_physical_template defines usage_definition for zero, one, or more Non_functional_land objects. Each Non_functional_land has alternate_land_definition defined by exactly one Land_physical_template. Each Land_physical_template defines alternate_land_definition for zero, one, or more Non_functional_land objects.

4.3.830 Non_functional_land_interface_terminal to Non_functional_land

Each Non_functional_land_interface_terminal has associated_component defined by exactly one Non_functional_land. Each Non_functional_land defines associated_component for zero, one, or more Non_functional_land_interface_terminal objects.

4.3.831 Non_functional_land_interface_terminal to Land_template_interface_terminal

Each Non_functional_land_interface_terminal has definition defined by exactly one Land_template_interface_terminal. Each Land_template_interface_terminal defines definition for zero, one, or more Non_functional_land_interface_terminal objects.

4.3.832 Non_functional_land_join_terminal to Non_functional_land

Each Non_functional_land_join_terminal has associated_component defined by exactly one Non_functional_land. Each Non_functional_land defines associated_component for one or more Non_functional_land_join_terminal objects.

4.3.833 Non_functional_land_join_terminal to Land_template_join_terminal

Each Non_functional_land_join_terminal has definition defined by exactly one Land_template_join_terminal. Each Land_template_join_terminal defines definition for zero, one, or more Non_functional_land_join_terminal objects.

4.3.834 Numeric_parameter to Data_element

Each Numeric_parameter has property_value defined by exactly one Data_element. Each Data_element defines property_value for zero, one, or more Numeric_parameter objects.

4.3.835 Operational_requirement_occurrence_relationship to Ee_requirement_occurrence

Each Operational_requirement_occurrence_relationship has related_requirement_occurrence defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines related_requirement_occurrence for zero, one, or more Operational_requirement_occurrence_relationship objects. Each Operational_requirement_occurrence_relationship has relating_requirement_occurrence defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines relating_requirement_occurrence for zero, one, or more Operational_requirement_occurrence_relationship objects.

4.3.836 Opposing_boundary_set_size_characteristic to Tolerance_zone_opposing_boundary_set

Each Opposing_boundary_set_size_characteristic has sized_boundary_set defined by exactly one Tolerance_zone_opposing_boundary_set. Each Tolerance_zone_opposing_boundary_set defines sized_boundary_set for zero, one, or more Opposing_boundary_set_size_characteristic objects.

4.3.837 Owner_assignment to Person_and_organization

Each Owner_assignment has assigned_owner defined by exactly one Person_and_organization. Each Person_and_organization defines assigned_owner for zero, one, or more Owner_assignment objects.

4.3.838 Owner_assignment to Owned_design_object

Each Owner_assignment has owned_item defined by one or more Owned_design_object objects. Each Owned_design_object defines owned_item for zero, one, or more Owner_assignment objects.

4.3.839 Package to Datum_usage_in_datum_system_relationship

Each Package has of_derived_datum_system_definining_relationship defined by one, two, or three Datum_usage_in_datum_system_relationship objects. Each Datum_usage_in_datum_system_relationship defines of_derived_datum_system_definining_relationship for zero, one, or more Package objects.

4.3.840 Package to Datum_feature_usage_in_datum_system_relationship

Each Package has of_defining_datum_system_relationship defined by one, two, or three Datum_feature_usage_in_datum_system_relationship objects. Each Datum_feature_usage_in_datum_system_relationship defines of_defining_datum_system_relationship for zero, one, or more Package objects.

4.3.841 Package to Datum_reference_frame

Each Package has of_datum_reference_frame defined by exactly one Datum_reference_frame. Each Datum_reference_frame defines of_datum_reference_frame for zero, one, or more Package objects.

4.3.842 Package to Length_data_element

Each Package has least_lead_length_below_seating_plane defined by exactly one Length_data_element. Each Length_data_element defines least_lead_length_below_seating_plane for zero, one, or more Package objects. Each Package has maximum_lead_length_below_seating_plane defined by exactly one Length_data_element. Each Length_data_element defines maximum_lead_length_below_seating_plane for zero, one, or more Package objects. Each Package has minimum_body_clearance_below_seating_plane defined by exactly one Length_data_element. Each Length_data_element defines minimum_body_clearance_below_seating_plane for zero, one, or more Package objects. Each Package has minimum_body_clearance_above_seating_plane defined by exactly one Length_data_element. Each Length_data_element defines minimum_body_clearance_above_seating_plane for zero, one, or more Package objects. Each Package has maximum_body_clearance_below_seating_plane defined by exactly one Length_data_element. Each Length_data_element defines maximum_body_clearance_below_seating_plane for zero, one, or more Package objects. Each Package has maximum_body_clearance_above_seating_plane defined by exactly one Length_data_element. Each Length_data_element defines maximum_body_clearance_above_seating_plane for zero, one, or more Package objects. Each Package has maximum_body_height_below_seating_plane defined by exactly one Length_data_element. Each Length_data_element defines maximum_body_height_below_seating_plane for zero, one, or more Package objects. Each Package has maximum_body_height_above_seating_plane defined by exactly one Length_data_element. Each Length_data_element defines maximum_body_height_above_seating_plane for zero, one, or more Package objects.

4.3.843 Package to Cartesian_point

Each Package has maximum_material_condition_centroid_location defined by exactly one Cartesian_point. Each Cartesian_point defines maximum_material_condition_centroid_location for zero, one, or more Package objects. Each Package has least_material_condition_centroid_location defined by exactly one Cartesian_point. Each Cartesian_point defines least_material_condition_centroid_location for zero, one, or more Package objects.

4.3.844 Package to Seating_plane

Each Package has package_seating_plane defined by exactly one Seating_plane. Each Seating_plane defines package_seating_plane for zero, one, or more Package objects.

4.3.845 Package to Registered_style

Each Package has case_style defined by one or more Registered_style objects. Each Registered_style defines case_style for zero, one, or more Package objects.

4.3.846 Packaged_component to Altered_package

Each Packaged_component has selected_package_alternate defined by exactly one Altered_package. Each Altered_package defines selected_package_alternate for zero, one, or more Packaged_component objects.

4.3.847 Packaged_component to Packaged_part

Each Packaged_component has usage_definition defined by exactly one Packaged_part. Each Packaged_part defines usage_definition for zero, one, or more Packaged_component objects.

4.3.848 Packaged_component_join_terminal to Packaged_component

Each Packaged_component_join_terminal has associated_component defined by exactly one Packaged_component. Each Packaged_component defines associated_component for one or more Packaged_component_join_terminal objects.

4.3.849 Packaged_component_join_terminal to Packaged_part_join_terminal

Each Packaged_component_join_terminal has definition defined by exactly one Packaged_part_join_terminal. Each Packaged_part_join_terminal defines definition for zero, one, or more Packaged_component_join_terminal objects.

4.3.850 Packaged_connector to Seating_plane

Each Packaged_connector has interface_plane defined by exactly one Seating_plane. Each Seating_plane defines interface_plane for zero, one, or more Packaged_connector objects.

4.3.851 Packaged_connector_component to Packaged_connector

Each Packaged_connector_component has usage_definition defined by exactly one Packaged_connector. Each Packaged_connector defines usage_definition for zero, one, or more Packaged_connector_component objects.

4.3.852 Packaged_connector_component_interface_terminal to Packaged_connector_component

Each Packaged_connector_component_interface_terminal has associated_component defined by exactly one Packaged_connector_component. Each Packaged_connector_component defines associated_component for one or more Packaged_connector_component_interface_terminal objects.

4.3.853 Packaged_connector_component_interface_terminal to Packaged_part_interface_terminal

Each Packaged_connector_component_interface_terminal has definition defined by exactly one Packaged_part_interface_terminal. Each Packaged_part_interface_terminal defines definition for zero, one, or more Packaged_connector_component_interface_terminal objects.

4.3.854 Packaged_connector_terminal_relationship to Packaged_part_interface_terminal

Each Packaged_connector_terminal_relationship has interface_terminal defined by exactly one Packaged_part_interface_terminal. Each Packaged_part_interface_terminal defines interface_terminal for one or more Packaged_connector_terminal_relationship objects.

4.3.855 Packaged_connector_terminal_relationship to Packaged_part_join_terminal

Each Packaged_connector_terminal_relationship has join_terminal defined by exactly one Packaged_part_join_terminal. Each Packaged_part_join_terminal defines join_terminal for zero or one Packaged_connector_terminal_relationship objects.

4.3.856 Packaged_connector_terminal_relationship to Packaged_connector

Each Packaged_connector_terminal_relationship has connector defined by exactly one Packaged_connector. Each Packaged_connector defines connector for one or more Packaged_connector_terminal_relationship objects.

4.3.857 Packaged_part to Functional_unit_usage_view

Each Packaged_part has implemented_function defined by exactly one Functional_unit_usage_view. Each Functional_unit_usage_view defines implemented_function for zero, one, or more Packaged_part objects.

4.3.858 Packaged_part to Ee_material

Each Packaged_part has potting_compound defined by exactly one Ee_material. Each Ee_material defines potting_compound for zero, one, or more Packaged_part objects.

4.3.859 Packaged_part to Package

Each Packaged_part has used_package defined by zero or one Package objects. Each Package defines used_package for zero, one, or more Packaged_part objects. This assertion is established through a SELECT type.

4.3.860 Packaged_part to Package_external_reference

Each Packaged_part has used_package defined by zero or one Package_external_reference objects. Each Package_external_reference defines used_package for zero, one, or more Packaged_part objects. This assertion is established through a SELECT type.

4.3.861 Packaged_part_terminal to Packaged_part

Each Packaged_part_terminal has associated_definition defined by exactly one Packaged_part. Each Packaged_part defines associated_definition for zero, one, or more Packaged_part_terminal objects.

4.3.862 Packaged_part_terminal to Package_terminal

Each Packaged_part_terminal has terminal_of_package defined by zero or one Package_terminal objects. Each Package_terminal defines terminal_of_package for zero, one, or more Packaged_part_terminal objects. This assertion is established through a SELECT type.

4.3.863 Packaged_part_terminal to Package_terminal_external_reference

Each Packaged_part_terminal has terminal_of_package defined by zero or one Package_terminal_external_reference objects. Each Package_terminal_external_reference defines terminal_of_package for zero, one, or more Packaged_part_terminal objects. This assertion is established through a SELECT type.

4.3.864 Package_body to Package

Each Package_body has associated_definition defined by exactly one Package. Each Package defines associated_definition for zero or one Package_body objects.

4.3.865 Package_body to Ee_material

Each Package_body has body_material defined by exactly one Ee_material. Each Ee_material defines body_material for zero, one, or more Package_body objects.

4.3.866 Package_body_edge_segment_surface to Edge_segment_vertex

Each Package_body_edge_segment_surface has end_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines end_vertex for zero, one, or more Package_body_edge_segment_surface objects. Each Package_body_edge_segment_surface has start_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines start_vertex for zero, one, or more Package_body_edge_segment_surface objects.

4.3.867 Package_body_edge_segment_surface to Package_body_edge_surface

Each Package_body_edge_segment_surface has composed_surface defined by exactly one Package_body_edge_surface. Each Package_body_edge_surface defines composed_surface for zero, one, or more Package_body_edge_segment_surface objects.

4.3.868 Package_body_surface to Package_body

Each Package_body_surface has associated_package_body defined by exactly one Package_body. Each Package_body defines associated_package_body for zero, one, or more Package_body_surface objects.

4.3.869 Package_terminal to Connection_zone_interface_plane_relationship

Each Package_terminal has seating_plane_zone defined by exactly one Connection_zone_interface_plane_relationship. Each Connection_zone_interface_plane_relationship defines seating_plane_zone for zero or one Package_terminal objects.

4.3.870 Package_terminal to Length_data_element

Each Package_terminal has maximum_terminal_diametrical_extent defined by exactly one Length_data_element. Each Length_data_element defines maximum_terminal_diametrical_extent for zero, one, or more Package_terminal objects. Each Package_terminal has minimum_terminal_diametrical_extent defined by exactly one Length_data_element. Each Length_data_element defines minimum_terminal_diametrical_extent for zero, one, or more Package_terminal objects.

4.3.871 Package_terminal to Material_assembly_relationship

Each Package_terminal has terminal_core_material defined by exactly one Material_assembly_relationship. Each Material_assembly_relationship defines terminal_core_material for zero, one, or more Package_terminal objects. Each Package_terminal has terminal_surface_material defined by exactly one Material_assembly_relationship. Each Material_assembly_relationship defines terminal_surface_material for zero, one, or more Package_terminal objects.

4.3.872 Package_terminal to Characteristic

Each Package_terminal has terminal_characteristic defined by one or more Characteristic objects. Each Characteristic defines terminal_characteristic for zero, one, or more Package_terminal objects.

4.3.873 Package_terminal to Analytical_representation

Each Package_terminal has model_representation defined by one or more Analytical_representation objects. Each Analytical_representation defines model_representation for zero, one, or more Package_terminal objects.

4.3.874 Package_terminal to Connection_zone

Each Package_terminal has internal_connection_zone defined by one or more Connection_zone objects. Each Connection_zone defines internal_connection_zone for zero, one, or more Package_terminal objects. Each Package_terminal has external_connection_zone defined by one or more Connection_zone objects. Each Connection_zone defines external_connection_zone for zero, one, or more Package_terminal objects.

4.3.875 Package_terminal to Package

Each Package_terminal has associated_definition defined by exactly one Package. Each Package defines associated_definition for zero, one, or more Package_terminal objects.

4.3.876 Package_terminal_external_reference to Package_external_reference

Each Package_terminal_external_reference has associated_definition defined by exactly one Package_external_reference. Each Package_external_reference defines associated_definition for zero, one, or more Package_terminal_external_reference objects.

4.3.877 Package_terminal_occurrence to Packaged_component

Each Package_terminal_occurrence has associated_component defined by exactly one Packaged_component. Each Packaged_component defines associated_component for zero, one, or more Package_terminal_occurrence objects.

4.3.878 Package_terminal_occurrence to Package_terminal

Each Package_terminal_occurrence has definition defined by exactly one Package_terminal. Each Package_terminal defines definition for zero, one, or more Package_terminal_occurrence objects.

4.3.879 Package_terminal_surface_constituent_relationship to Package_terminal

Each Package_terminal_surface_constituent_relationship has related_shape_element defined by exactly one Package_terminal. Each Package_terminal defines related_shape_element for zero, one, or more Package_terminal_surface_constituent_relationship objects.

4.3.880 Package_terminal_surface_constituent_relationship to Package_body_surface

Each Package_terminal_surface_constituent_relationship has relating_shape_element defined by exactly one Package_body_surface. Each Package_body_surface defines relating_shape_element for zero, one, or more Package_terminal_surface_constituent_relationship objects.

4.3.881 Padstack_definition to Package_terminal

Each Padstack_definition has reference_package_terminal defined by one or more Package_terminal objects. Each Package_terminal defines reference_package_terminal for zero, one, or more Padstack_definition objects.

4.3.882 Padstack_definition to Template_stratum_assignment

Each Padstack_definition has specific_stratum_assignment defined by one or more Template_stratum_assignment objects. Each Template_stratum_assignment defines specific_stratum_assignment for zero, one, or more Padstack_definition objects.

4.3.883 Padstack_definition to Stratum_feature_template

Each Padstack_definition has of_stratum_feature_template defined by one or more Stratum_feature_template objects. Each Stratum_feature_template defines of_stratum_feature_template for zero, one, or more Padstack_definition objects.

4.3.884 Padstack_definition to Dependent_material_removal_feature_template

Each Padstack_definition has isolation_template defined by one or more Dependent_material_removal_feature_template objects. Each Dependent_material_removal_feature_template defines isolation_template for zero, one, or more Padstack_definition objects.

4.3.885 Padstack_definition to Default_land_physical_template

Each Padstack_definition has land_template defined by one or more Default_land_physical_template objects. Each Default_land_physical_template defines land_template for zero, one, or more Padstack_definition objects.

4.3.886 Padstack_definition to Material_addition_feature_template

Each Padstack_definition has addition_template defined by one or more Material_addition_feature_template objects. Each Material_addition_feature_template defines addition_template for zero, one, or more Padstack_definition objects.

4.3.887 Padstack_definition to Passage_technology

Each Padstack_definition has material_stackup defined by exactly one Passage_technology. Each Passage_technology defines material_stackup for zero, one, or more Padstack_definition objects.

4.3.888 Parameter_assignment to Model_parameter

Each Parameter_assignment has assigned_parameter defined by exactly one Model_parameter. Each Model_parameter defines assigned_parameter for zero, one, or more Parameter_assignment objects.

4.3.889 Parameter_assignment to Coordinated_characteristic

Each Parameter_assignment has parameter_value defined by zero or one Coordinated_characteristic objects. Each Coordinated_characteristic defines parameter_value for zero, one, or more Parameter_assignment objects. This assertion is established through a SELECT type.

4.3.890 Parameter_assignment to Characteristic

Each Parameter_assignment has parameter_value defined by zero or one Characteristic objects. Each Characteristic defines parameter_value for zero, one, or more Parameter_assignment objects. This assertion is established through a SELECT type.

4.3.891 Participant_date_and_time_assignment to Date_and_time

Each Participant_date_and_time_assignment has action_date_and_time defined by exactly one Date_and_time. Each Date_and_time defines action_date_and_time for zero, one, or more Participant_date_and_time_assignment objects.

4.3.892 Participant_date_and_time_assignment to Person_and_organization

Each Participant_date_and_time_assignment has action_participant defined by exactly one Person_and_organization. Each Person_and_organization defines action_participant for zero, one, or more Participant_date_and_time_assignment objects.

4.3.893 Part_connected_terminals_definition to Part_terminal

Each Part_connected_terminals_definition has connected_terminals defined by two or more Part_terminal objects. Each Part_terminal defines connected_terminals for zero or one Part_connected_terminals_definition objects.

4.3.894 Part_connected_terminals_definition to Physical_unit_usage_view

Each Part_connected_terminals_definition has associated_definition defined by exactly one Physical_unit_usage_view. Each Physical_unit_usage_view defines associated_definition for zero, one, or more Part_connected_terminals_definition objects.

4.3.895 Part_device to Ee_material

Each Part_device has bonding_agent defined by exactly one Ee_material. Each Ee_material defines bonding_agent for zero, one, or more Part_device objects.

4.3.896 Part_device to Bare_die

Each Part_device has included_device defined by exactly one Bare_die. Each Bare_die defines included_device for zero, one, or more Part_device objects.

4.3.897 Part_device to Packaged_part

Each Part_device has defined_packaged_part defined by exactly one Packaged_part. Each Packaged_part defines defined_packaged_part for zero, one, or more Part_device objects.

4.3.898 Part_device_terminal to Part_device

Each Part_device_terminal has terminated_device defined by exactly one Part_device. Each Part_device defines terminated_device for zero, one, or more Part_device_terminal objects.

4.3.899 Part_device_terminal to Minimally_defined_bare_die_terminal

Each Part_device_terminal has used_bare_die_terminal defined by exactly one Minimally_defined_bare_die_terminal. Each Minimally_defined_bare_die_terminal defines used_bare_die_terminal for zero, one, or more Part_device_terminal objects.

4.3.900 Part_device_terminal_model_port_assignment to Analytical_model_port

Each Part_device_terminal_model_port_assignment has internal_port defined by exactly one Analytical_model_port. Each Analytical_model_port defines internal_port for zero, one, or more Part_device_terminal_model_port_assignment objects.

4.3.901 Part_device_terminal_model_port_assignment to Part_device_terminal

Each Part_device_terminal_model_port_assignment has internal_connection defined by exactly one Part_device_terminal. Each Part_device_terminal defines internal_connection for zero, one, or more Part_device_terminal_model_port_assignment objects.

4.3.902 Part_feature to Part_feature

Each Part_feature has precedent_feature defined by exactly one Part_feature. Each Part_feature defines precedent_feature for zero, one, or more Part_feature objects.

4.3.903 Part_feature to Physical_unit_usage_view

Each Part_feature has associated_definition defined by exactly one Physical_unit_usage_view. Each Physical_unit_usage_view defines associated_definition for zero, one, or more Part_feature objects.

4.3.904 Part_feature_make_from_relationship to Part_feature

Each Part_feature_make_from_relationship has resultant_feature defined by exactly one Part_feature. Each Part_feature defines resultant_feature for zero, one, or more Part_feature_make_from_relationship objects. Each Part_feature_make_from_relationship has reusable_feature defined by exactly one Part_feature. Each Part_feature defines reusable_feature for zero, one, or more Part_feature_make_from_relationship objects.

4.3.905 Part_feature_make_from_relationship to Engineering_make_from

Each Part_feature_make_from_relationship has associated_make_from defined by exactly one Engineering_make_from. Each Engineering_make_from defines associated_make_from for zero, one, or more Part_feature_make_from_relationship objects.

4.3.906 Part_feature_model_port_assignment to Analytical_model_port

Each Part_feature_model_port_assignment has target defined by exactly one Analytical_model_port. Each Analytical_model_port defines target for zero, one, or more Part_feature_model_port_assignment objects.

4.3.907 Part_feature_model_port_assignment to Part_feature

Each Part_feature_model_port_assignment has source defined by exactly one Part_feature. Each Part_feature defines source for zero, one, or more Part_feature_model_port_assignment objects.

4.3.908 Part_feature_placement_link to Part_feature

Each Part_feature_placement_link has subsequent_element defined by exactly one Part_feature. Each Part_feature defines subsequent_element for zero, one, or more Part_feature_placement_link objects. Each Part_feature_placement_link has precedent_element defined by exactly one Part_feature. Each Part_feature defines precedent_element for zero, one, or more Part_feature_placement_link objects.

4.3.909 Part_interface_access_feature to Connection_zone

Each Part_interface_access_feature has interface_access_area defined by one or more Connection_zone objects. Each Connection_zone defines interface_access_area for zero, one, or more Part_interface_access_feature objects.

4.3.910 Part_interface_access_feature to Part_feature

Each Part_interface_access_feature has accessed_interface defined by exactly one Part_feature. Each Part_feature defines accessed_interface for zero, one, or more Part_interface_access_feature objects.

4.3.911 Part_linear_array_feature to Length_data_element

Each Part_linear_array_feature has terminus_node_positive_x_displacement defined by exactly one Length_data_element. Each Length_data_element defines terminus_node_positive_x_displacement for zero, one, or more Part_linear_array_feature objects. Each Part_linear_array_feature has initial_node_positive_x_displacement defined by exactly one Length_data_element. Each Length_data_element defines initial_node_positive_x_displacement for zero, one, or more Part_linear_array_feature objects.

4.3.912 Part_linear_array_feature to Part_feature_placement_link

Each Part_linear_array_feature has element defined by one or more Part_feature_placement_link objects. Each Part_feature_placement_link defines element for zero, one, or more Part_linear_array_feature objects.

4.3.913 Part_linear_array_feature_link to Part_linear_array_feature

Each Part_linear_array_feature_link has subsequent_element defined by exactly one Part_linear_array_feature. Each Part_linear_array_feature defines subsequent_element for zero, one, or more Part_linear_array_feature_link objects. Each Part_linear_array_feature_link has precedent_element defined by exactly one Part_linear_array_feature. Each Part_linear_array_feature defines precedent_element for zero, one, or more Part_linear_array_feature_link objects.

4.3.914 Part_mating_feature to Connection_zone

Each Part_mating_feature has mating_area defined by one or more Connection_zone objects. Each Connection_zone defines mating_area for zero, one, or more Part_mating_feature objects.

4.3.915 Part_mounting_feature to Connection_zone

Each Part_mounting_feature has mounting_area defined by one or more Connection_zone objects. Each Connection_zone defines mounting_area for zero, one, or more Part_mounting_feature objects.

4.3.916 Part_rectangular_array_feature to Length_data_element

Each Part_rectangular_array_feature has terminus_row_positive_y_displacement defined by exactly one Length_data_element. Each Length_data_element defines terminus_row_positive_y_displacement for zero, one, or more Part_rectangular_array_feature objects. Each Part_rectangular_array_feature has initial_row_positive_y_displacement defined by exactly one Length_data_element. Each Length_data_element defines initial_row_positive_y_displacement for zero, one, or more Part_rectangular_array_feature objects.

4.3.917 Part_rectangular_array_feature to Part_linear_array_feature_link

Each Part_rectangular_array_feature has element defined by one or more Part_linear_array_feature_link objects. Each Part_linear_array_feature_link defines element for zero, one, or more Part_rectangular_array_feature objects.

4.3.918 Part_template to Template_definition

Each Part_template has associated_definition defined by exactly one Template_definition. Each Template_definition defines associated_definition for zero, one, or more Part_template objects.

4.3.919 Part_template to Analytical_representation

Each Part_template has analytical_part_template_representation defined by one or more Analytical_representation objects. Each Analytical_representation defines analytical_part_template_representation for zero, one, or more Part_template objects.

4.3.920 Part_template to Coordinated_characteristic

Each Part_template has physical_characteristic defined by zero or one Coordinated_characteristic objects. Each Coordinated_characteristic defines physical_characteristic for zero, one, or more Part_template objects. This assertion is established through a SELECT type.

4.3.921 Part_template to Characteristic

Each Part_template has physical_characteristic defined by zero or one Characteristic objects. Each Characteristic defines physical_characteristic for zero, one, or more Part_template objects. This assertion is established through a SELECT type.

4.3.922 Part_template to Analytical_model

Each Part_template has part_template_analytical_model defined by exactly one Analytical_model. Each Analytical_model defines part_template_analytical_model for zero, one, or more Part_template objects.

4.3.923 Part_template_3d_keepout_shape to Cartesian_point

Each Part_template_3d_keepout_shape has centroid_location defined by exactly one Cartesian_point. Each Cartesian_point defines centroid_location for zero, one, or more Part_template_3d_keepout_shape objects.

4.3.924 Part_template_3d_keepout_shape to External_definition

Each Part_template_3d_keepout_shape has shape_purpose defined by zero or one External_definition objects. Each External_definition defines shape_purpose for zero, one, or more Part_template_3d_keepout_shape objects. This assertion is established through a SELECT type.

4.3.925 Part_template_3d_keepout_shape to Part_template

Each Part_template_3d_keepout_shape has shape_characterized_part_template defined by exactly one Part_template. Each Part_template defines shape_characterized_part_template for zero, one, or more Part_template_3d_keepout_shape objects.

4.3.926 Part_template_3d_keepout_shape to Ee_requirement_occurrence

Each Part_template_3d_keepout_shape has application_technology_constraint defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines application_technology_constraint for zero, one, or more Part_template_3d_keepout_shape objects.

4.3.927 Part_template_3d_shape to Part_template

Each Part_template_3d_shape has shape_characterized_part_template defined by exactly one Part_template. Each Part_template defines shape_characterized_part_template for zero, one, or more Part_template_3d_shape objects.

4.3.928 Part_template_non_planar_2d_shape to Part_template

Each Part_template_non_planar_2d_shape has shape_characterized_part_template defined by exactly one Part_template. Each Part_template defines shape_characterized_part_template for zero, one, or more Part_template_non_planar_2d_shape objects.

4.3.929 Part_template_non_planar_2d_shape to Axis_placement_3d

Each Part_template_non_planar_2d_shape has transformation defined by exactly one Axis_placement_3d. Each Axis_placement_3d defines transformation for zero, one, or more Part_template_non_planar_2d_shape objects.

4.3.930 Part_template_or_physical_unit_2d_shape_representation_relationship to Part_template_planar_shape

Each Part_template_or_physical_unit_2d_shape_representation_relationship has related_part_shape defined by zero or one Part_template_planar_shape objects. Each Part_template_planar_shape defines related_part_shape for zero, one, or more Part_template_or_physical_unit_2d_shape_representation_relationship objects. This assertion is established through a SELECT type. Each Part_template_or_physical_unit_2d_shape_representation_relationship has principal_part_shape defined by zero or one Part_template_planar_shape objects. Each Part_template_planar_shape defines principal_part_shape for zero, one, or more Part_template_or_physical_unit_2d_shape_representation_relationship objects. This assertion is established through a SELECT type.

4.3.931 Part_template_or_physical_unit_2d_shape_representation_relationship to Physical_unit_planar_shape

Each Part_template_or_physical_unit_2d_shape_representation_relationship has related_part_shape defined by zero or one Physical_unit_planar_shape objects. Each Physical_unit_planar_shape defines related_part_shape for zero, one, or more Part_template_or_physical_unit_2d_shape_representation_relationship objects. This assertion is established through a SELECT type. Each Part_template_or_physical_unit_2d_shape_representation_relationship has principal_part_shape defined by zero or one Physical_unit_planar_shape objects. Each Physical_unit_planar_shape defines principal_part_shape for zero, one, or more Part_template_or_physical_unit_2d_shape_representation_relationship objects. This assertion is established through a SELECT type.

4.3.932 Part_template_or_physical_unit_3d_shape_representation_relationship to Part_template_3d_shape

Each Part_template_or_physical_unit_3d_shape_representation_relationship has related_part_shape defined by zero or one Part_template_3d_shape objects. Each Part_template_3d_shape defines related_part_shape for zero, one, or more Part_template_or_physical_unit_3d_shape_representation_relationship objects. This assertion is established through a SELECT type. Each Part_template_or_physical_unit_3d_shape_representation_relationship has principal_part_shape defined by zero or one Part_template_3d_shape objects. Each Part_template_3d_shape defines principal_part_shape for zero, one, or more Part_template_or_physical_unit_3d_shape_representation_relationship objects. This assertion is established through a SELECT type.

4.3.933 Part_template_or_physical_unit_3d_shape_representation_relationship to Part_template_non_planar_2d_shape

Each Part_template_or_physical_unit_3d_shape_representation_relationship has related_part_shape defined by zero or one Part_template_non_planar_2d_shape objects. Each Part_template_non_planar_2d_shape defines related_part_shape for zero, one, or more Part_template_or_physical_unit_3d_shape_representation_relationship objects. This assertion is established through a SELECT type. Each Part_template_or_physical_unit_3d_shape_representation_relationship has principal_part_shape defined by zero or one Part_template_non_planar_2d_shape objects. Each Part_template_non_planar_2d_shape defines principal_part_shape for zero, one, or more Part_template_or_physical_unit_3d_shape_representation_relationship objects. This assertion is established through a SELECT type.

4.3.934 Part_template_or_physical_unit_3d_shape_representation_relationship to Physical_unit_3d_shape

Each Part_template_or_physical_unit_3d_shape_representation_relationship has related_part_shape defined by zero or one Physical_unit_3d_shape objects. Each Physical_unit_3d_shape defines related_part_shape for zero, one, or more Part_template_or_physical_unit_3d_shape_representation_relationship objects. This assertion is established through a SELECT type. Each Part_template_or_physical_unit_3d_shape_representation_relationship has principal_part_shape defined by zero or one Physical_unit_3d_shape objects. Each Physical_unit_3d_shape defines principal_part_shape for zero, one, or more Part_template_or_physical_unit_3d_shape_representation_relationship objects. This assertion is established through a SELECT type.

4.3.935 Part_template_planar_keepout_shape to External_definition

Each Part_template_planar_keepout_shape has shape_purpose defined by zero or one External_definition objects. Each External_definition defines shape_purpose for zero, one, or more Part_template_planar_keepout_shape objects. This assertion is established through a SELECT type.

4.3.936 Part_template_planar_keepout_shape to Cartesian_point

Each Part_template_planar_keepout_shape has centroid_location defined by exactly one Cartesian_point. Each Cartesian_point defines centroid_location for zero, one, or more Part_template_planar_keepout_shape objects.

4.3.937 Part_template_planar_keepout_shape to Part_template

Each Part_template_planar_keepout_shape has shape_characterized_part_template defined by exactly one Part_template. Each Part_template defines shape_characterized_part_template for zero, one, or more Part_template_planar_keepout_shape objects.

4.3.938 Part_template_planar_keepout_shape to Ee_requirement_occurrence

Each Part_template_planar_keepout_shape has application_technology_constraint defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines application_technology_constraint for zero, one, or more Part_template_planar_keepout_shape objects.

4.3.939 Part_template_planar_shape to Part_template

Each Part_template_planar_shape has shape_characterized_part_template defined by exactly one Part_template. Each Part_template defines shape_characterized_part_template for zero, one, or more Part_template_planar_shape objects.

4.3.940 Part_terminal_external_reference to Part_template

Each Part_terminal_external_reference has associated_definition defined by zero or one Part_template objects. Each Part_template defines associated_definition for zero, one, or more Part_terminal_external_reference objects. This assertion is established through a SELECT type.

4.3.941 Part_terminal_external_reference to Physical_unit

Each Part_terminal_external_reference has associated_definition defined by zero or one Physical_unit objects. Each Physical_unit defines associated_definition for zero, one, or more Part_terminal_external_reference objects. This assertion is established through a SELECT type.

4.3.942 Part_text_template to Length_data_element

Each Part_text_template has stroke_width defined by exactly one Length_data_element. Each Length_data_element defines stroke_width for zero, one, or more Part_text_template objects. Each Part_text_template has maximum_font_vertical_extent defined by exactly one Length_data_element. Each Length_data_element defines maximum_font_vertical_extent for zero, one, or more Part_text_template objects. Each Part_text_template has maximum_font_horizontal_extent defined by exactly one Length_data_element. Each Length_data_element defines maximum_font_horizontal_extent for zero, one, or more Part_text_template objects.

4.3.943 Part_text_template to Angle_data_element

Each Part_text_template has slant_angle defined by exactly one Angle_data_element. Each Angle_data_element defines slant_angle for zero, one, or more Part_text_template objects.

4.3.944 Part_text_template to Registered_font

Each Part_text_template has font defined by zero or one Registered_font objects. Each Registered_font defines font for zero, one, or more Part_text_template objects. This assertion is established through a SELECT type.

4.3.945 Part_text_template to Font_definition

Each Part_text_template has font defined by zero or one Font_definition objects. Each Font_definition defines font for zero, one, or more Part_text_template objects. This assertion is established through a SELECT type.

4.3.946 Passage_technology to Process_specification

Each Passage_technology has specification defined by exactly one Process_specification. Each Process_specification defines specification for zero, one, or more Passage_technology objects.

4.3.947 Passage_technology to Length_data_element

Each Passage_technology has minimum_as_finished_deposition_thickness defined by exactly one Length_data_element. Each Length_data_element defines minimum_as_finished_deposition_thickness for zero, one, or more Passage_technology objects. Each Passage_technology has maximum_as_finished_deposition_thickness defined by exactly one Length_data_element. Each Length_data_element defines maximum_as_finished_deposition_thickness for zero, one, or more Passage_technology objects. Each Passage_technology has minimum_as_finished_passage_extent defined by exactly one Length_data_element. Each Length_data_element defines minimum_as_finished_passage_extent for zero, one, or more Passage_technology objects. Each Passage_technology has maximum_as_finished_passage_extent defined by exactly one Length_data_element. Each Length_data_element defines maximum_as_finished_passage_extent for zero, one, or more Passage_technology objects.

4.3.948 Passage_technology to Ee_material

Each Passage_technology has deposition_material defined by exactly one Ee_material. Each Ee_material defines deposition_material for zero, one, or more Passage_technology objects.

4.3.949 Passage_technology to Inter_stratum_extent

Each Passage_technology has as_finished_inter_stratum_extent defined by exactly one Inter_stratum_extent. Each Inter_stratum_extent defines as_finished_inter_stratum_extent for zero, one, or more Passage_technology objects.

4.3.950 Passage_technology to Interconnect_module

Each Passage_technology has associated_definition defined by exactly one Interconnect_module. Each Interconnect_module defines associated_definition for zero, one, or more Passage_technology objects.

4.3.951 Pca to Pca_usage_view

Each Pca has usage_view defined by exactly one Pca_usage_view. Each Pca_usage_view defines usage_view for zero, one, or more Pca objects.

4.3.952 Pca_terminal to Pca_usage_view

Each Pca_terminal has associated_definition defined by exactly one Pca_usage_view. Each Pca_usage_view defines associated_definition for zero, one, or more Pca_terminal objects.

4.3.953 Pcb to Pcb_usage_view

Each Pcb has usage_view defined by exactly one Pcb_usage_view. Each Pcb_usage_view defines usage_view for zero, one, or more Pcb objects.

4.3.954 Person_and_organization to Organization

Each Person_and_organization has assigned_organization defined by exactly one Organization. Each Organization defines assigned_organization for zero, one, or more Person_and_organization objects.

4.3.955 Person_and_organization to Person

Each Person_and_organization has assigned_person defined by exactly one Person. Each Person defines assigned_person for zero, one, or more Person_and_organization objects.

4.3.956 Physical_component to Physical_unit

Each Physical_component has usage_definition defined by exactly one Physical_unit. Each Physical_unit defines usage_definition for zero, one, or more Physical_component objects.

4.3.957 Physical_connectivity_abstraction_map to Conductive_interconnect_element

Each Physical_connectivity_abstraction_map has geometric_context_based_definition defined by exactly one Conductive_interconnect_element. Each Conductive_interconnect_element defines geometric_context_based_definition for zero, one, or more Physical_connectivity_abstraction_map objects.

4.3.958 Physical_connectivity_abstraction_map to Physical_connectivity_element

Each Physical_connectivity_abstraction_map has name_space_context_based_definition defined by exactly one Physical_connectivity_element. Each Physical_connectivity_element defines name_space_context_based_definition for zero, one, or more Physical_connectivity_abstraction_map objects.

4.3.959 Physical_connectivity_definition to Physical_component_terminal

Each Physical_connectivity_definition has associated_terminals defined by two or more Physical_component_terminal objects. Each Physical_component_terminal defines associated_terminals for zero or one Physical_connectivity_definition objects.

4.3.960 Physical_connectivity_definition to Physical_unit_network_definition

Each Physical_connectivity_definition has associated_definition defined by exactly one Physical_unit_network_definition. Each Physical_unit_network_definition defines associated_definition for zero, one, or more Physical_connectivity_definition objects.

4.3.961 Physical_connectivity_definition_relationship to Physical_connectivity_definition

Each Physical_connectivity_definition_relationship has current_definition defined by exactly one Physical_connectivity_definition. Each Physical_connectivity_definition defines current_definition for zero, one, or more Physical_connectivity_definition_relationship objects. Each Physical_connectivity_definition_relationship has previous_definition defined by exactly one Physical_connectivity_definition. Each Physical_connectivity_definition defines previous_definition for zero, one, or more Physical_connectivity_definition_relationship objects.

4.3.962 Physical_connectivity_definition_relationship to Ee_requirement_occurrence

Each Physical_connectivity_definition_relationship has requirement defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines requirement for zero, one, or more Physical_connectivity_definition_relationship objects.

4.3.963 Physical_connectivity_element to Physical_connectivity_structure_definition

Each Physical_connectivity_element has connectivity_context defined by exactly one Physical_connectivity_structure_definition. Each Physical_connectivity_structure_definition defines connectivity_context for one or more Physical_connectivity_element objects.

4.3.964 Physical_connectivity_element to Component_terminal

Each Physical_connectivity_element has end_terminus defined by zero or one Component_terminal objects. Each Component_terminal defines end_terminus for zero, one, or more Physical_connectivity_element objects. This assertion is established through a SELECT type. Each Physical_connectivity_element has start_terminus defined by zero or one Component_terminal objects. Each Component_terminal defines start_terminus for zero, one, or more Physical_connectivity_element objects. This assertion is established through a SELECT type.

4.3.965 Physical_connectivity_element to Topological_junction

Each Physical_connectivity_element has end_terminus defined by zero or one Topological_junction objects. Each Topological_junction defines end_terminus for zero, one, or more Physical_connectivity_element objects. This assertion is established through a SELECT type. Each Physical_connectivity_element has start_terminus defined by zero or one Topological_junction objects. Each Topological_junction defines start_terminus for zero, one, or more Physical_connectivity_element objects. This assertion is established through a SELECT type.

4.3.966 Physical_connectivity_interrupting_cutout to Conductive_interconnect_element

Each Physical_connectivity_interrupting_cutout has interrupted_connectivity_element defined by one or more Conductive_interconnect_element objects. Each Conductive_interconnect_element defines interrupted_connectivity_element for zero, one, or more Physical_connectivity_interrupting_cutout objects.

4.3.967 Physical_connectivity_make_from_relationship to Physical_connectivity_definition

Each Physical_connectivity_make_from_relationship has resultant_definition defined by exactly one Physical_connectivity_definition. Each Physical_connectivity_definition defines resultant_definition for zero, one, or more Physical_connectivity_make_from_relationship objects. Each Physical_connectivity_make_from_relationship has reusable_definition defined by exactly one Physical_connectivity_definition. Each Physical_connectivity_definition defines reusable_definition for zero, one, or more Physical_connectivity_make_from_relationship objects.

4.3.968 Physical_network to Part_connected_terminals_definition

Each Physical_network has reference_connected_terminals defined by exactly one Part_connected_terminals_definition. Each Part_connected_terminals_definition defines reference_connected_terminals for zero, one, or more Physical_network objects.

4.3.969 Physical_network to Join_relationship

Each Physical_network has interconnect_module_network_topology_element defined by one or more Join_relationship objects. Each Join_relationship defines interconnect_module_network_topology_element for zero, one, or more Physical_network objects.

4.3.970 Physical_network to Laminate_component_join_terminal

Each Physical_network has connectivity_requirement_element defined by two or more Laminate_component_join_terminal objects. Each Laminate_component_join_terminal defines connectivity_requirement_element for zero or one Physical_network objects.

4.3.971 Physical_network to Interconnect_module

Each Physical_network has prior_associated_definition defined by one or more Interconnect_module objects. Each Interconnect_module defines prior_associated_definition for zero, one, or more Physical_network objects. Each Physical_network has current_associated_definition defined by exactly one Interconnect_module. Each Interconnect_module defines current_associated_definition for zero, one, or more Physical_network objects.

4.3.972 Physical_node_requirement_to_implementing_component_allocation to Assembly_joint

Each Physical_node_requirement_to_implementing_component_allocation has implementation_joint_set defined by one or more Assembly_joint objects. Each Assembly_joint defines implementation_joint_set for zero, one, or more Physical_node_requirement_to_implementing_component_allocation objects.

4.3.973 Physical_node_requirement_to_implementing_component_allocation to Interface_mounted_join

Each Physical_node_requirement_to_implementing_component_allocation has implementation_interface_joint_set defined by one or more Interface_mounted_join objects. Each Interface_mounted_join defines implementation_interface_joint_set for zero, one, or more Physical_node_requirement_to_implementing_component_allocation objects.

4.3.974 Physical_node_requirement_to_implementing_component_allocation to Assembly_component

Each Physical_node_requirement_to_implementing_component_allocation has implementation_component defined by exactly one Assembly_component. Each Assembly_component defines implementation_component for zero, one, or more Physical_node_requirement_to_implementing_component_allocation objects.

4.3.975 Physical_node_requirement_to_implementing_component_allocation to Physical_connectivity_definition

Each Physical_node_requirement_to_implementing_component_allocation has physical_node_requirement defined by exactly one Physical_connectivity_definition. Each Physical_connectivity_definition defines physical_node_requirement for zero, one, or more Physical_node_requirement_to_implementing_component_allocation objects.

4.3.976 Physical_unit to Ee_requirement_occurrence

Each Physical_unit has design_requirement defined by one or more Ee_requirement_occurrence objects. Each Ee_requirement_occurrence defines design_requirement for zero, one, or more Physical_unit objects.

4.3.977 Physical_unit to Coordinated_characteristic

Each Physical_unit has physical_device_coordinated_characteristic defined by one or more Coordinated_characteristic objects. Each Coordinated_characteristic defines physical_device_coordinated_characteristic for zero, one, or more Physical_unit objects.

4.3.978 Physical_unit to Characteristic

Each Physical_unit has physical_device_characteristic defined by one or more Characteristic objects. Each Characteristic defines physical_device_characteristic for zero, one, or more Physical_unit objects.

4.3.979 Physical_unit to Technology

Each Physical_unit has unit_technology defined by exactly one Technology. Each Technology defines unit_technology for zero, one, or more Physical_unit objects.

4.3.980 Physical_unit to Analytical_representation

Each Physical_unit has analytical_physical_unit_representation defined by one or more Analytical_representation objects. Each Analytical_representation defines analytical_physical_unit_representation for zero, one, or more Physical_unit objects.

4.3.981 Physical_unit_3d_keepout_shape to Cartesian_point

Each Physical_unit_3d_keepout_shape has centroid_location defined by exactly one Cartesian_point. Each Cartesian_point defines centroid_location for zero, one, or more Physical_unit_3d_keepout_shape objects.

4.3.982 Physical_unit_3d_keepout_shape to External_definition

Each Physical_unit_3d_keepout_shape has shape_purpose defined by zero or one External_definition objects. Each External_definition defines shape_purpose for zero, one, or more Physical_unit_3d_keepout_shape objects. This assertion is established through a SELECT type.

4.3.983 Physical_unit_3d_keepout_shape to Physical_unit

Each Physical_unit_3d_keepout_shape has shape_characterized_physical_unit defined by exactly one Physical_unit. Each Physical_unit defines shape_characterized_physical_unit for zero, one, or more Physical_unit_3d_keepout_shape objects.

4.3.984 Physical_unit_3d_keepout_shape to Ee_requirement_occurrence

Each Physical_unit_3d_keepout_shape has application_technology_constraint defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines application_technology_constraint for zero, one, or more Physical_unit_3d_keepout_shape objects.

4.3.985 Physical_unit_3d_shape to Cartesian_point

Each Physical_unit_3d_shape has centroid_location defined by exactly one Cartesian_point. Each Cartesian_point defines centroid_location for zero, one, or more Physical_unit_3d_shape objects.

4.3.986 Physical_unit_3d_shape to External_definition

Each Physical_unit_3d_shape has shape_purpose defined by zero or one External_definition objects. Each External_definition defines shape_purpose for zero, one, or more Physical_unit_3d_shape objects. This assertion is established through a SELECT type.

4.3.987 Physical_unit_3d_shape to Physical_unit

Each Physical_unit_3d_shape has shape_characterized_physical_unit defined by exactly one Physical_unit. Each Physical_unit defines shape_characterized_physical_unit for zero, one, or more Physical_unit_3d_shape objects.

4.3.988 Physical_unit_3d_shape to Ee_requirement_occurrence

Each Physical_unit_3d_shape has application_technology_constraint defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines application_technology_constraint for zero, one, or more Physical_unit_3d_shape objects.

4.3.989 Physical_unit_design_view to Physical_unit_usage_view

Each Physical_unit_design_view has usage_view defined by exactly one Physical_unit_usage_view. Each Physical_unit_usage_view defines usage_view for zero, one, or more Physical_unit_design_view objects.

4.3.990 Physical_unit_planar_keepout_shape to External_definition

Each Physical_unit_planar_keepout_shape has shape_purpose defined by zero or one External_definition objects. Each External_definition defines shape_purpose for zero, one, or more Physical_unit_planar_keepout_shape objects. This assertion is established through a SELECT type.

4.3.991 Physical_unit_planar_keepout_shape to Cartesian_point

Each Physical_unit_planar_keepout_shape has centroid_location defined by exactly one Cartesian_point. Each Cartesian_point defines centroid_location for zero, one, or more Physical_unit_planar_keepout_shape objects.

4.3.992 Physical_unit_planar_keepout_shape to Length_data_element

Each Physical_unit_planar_keepout_shape has shape_distance_from_seating_plane defined by exactly one Length_data_element. Each Length_data_element defines shape_distance_from_seating_plane for zero, one, or more Physical_unit_planar_keepout_shape objects.

4.3.993 Physical_unit_planar_keepout_shape to Physical_unit

Each Physical_unit_planar_keepout_shape has shape_characterized_physical_unit defined by exactly one Physical_unit. Each Physical_unit defines shape_characterized_physical_unit for zero, one, or more Physical_unit_planar_keepout_shape objects.

4.3.994 Physical_unit_planar_keepout_shape to Ee_requirement_occurrence

Each Physical_unit_planar_keepout_shape has application_technology_constraint defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines application_technology_constraint for zero, one, or more Physical_unit_planar_keepout_shape objects.

4.3.995 Physical_unit_planar_shape to External_definition

Each Physical_unit_planar_shape has shape_purpose defined by zero or one External_definition objects. Each External_definition defines shape_purpose for zero, one, or more Physical_unit_planar_shape objects. This assertion is established through a SELECT type.

4.3.996 Physical_unit_planar_shape to Cartesian_point

Each Physical_unit_planar_shape has centroid_location defined by exactly one Cartesian_point. Each Cartesian_point defines centroid_location for zero, one, or more Physical_unit_planar_shape objects.

4.3.997 Physical_unit_planar_shape to Physical_unit

Each Physical_unit_planar_shape has shape_characterized_physical_unit defined by exactly one Physical_unit. Each Physical_unit defines shape_characterized_physical_unit for zero, one, or more Physical_unit_planar_shape objects.

4.3.998 Physical_unit_planar_shape to Ee_requirement_occurrence

Each Physical_unit_planar_shape has application_technology_constraint defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines application_technology_constraint for zero, one, or more Physical_unit_planar_shape objects.

4.3.999 Physical_unit_relationship to Physical_unit

Each Physical_unit_relationship has related_unit defined by exactly one Physical_unit. Each Physical_unit defines related_unit for zero, one, or more Physical_unit_relationship objects. Each Physical_unit_relationship has relating_unit defined by exactly one Physical_unit. Each Physical_unit defines relating_unit for zero, one, or more Physical_unit_relationship objects.

4.3.1000 Pitch_class to Range_characteristic

Each Pitch_class has class_member defined by exactly one Range_characteristic. Each Range_characteristic defines class_member for zero, one, or more Pitch_class objects.

4.3.1001 Placement_group to Ee_requirement_occurrence

Each Placement_group has requirement defined by one or more Ee_requirement_occurrence objects. Each Ee_requirement_occurrence defines requirement for zero, one, or more Placement_group objects.

4.3.1002 Placement_group_area_assignment to Mounting_restriction_area

Each Placement_group_area_assignment has area defined by exactly one Mounting_restriction_area. Each Mounting_restriction_area defines area for zero, one, or more Placement_group_area_assignment objects.

4.3.1003 Placement_group_area_assignment to Placement_group

Each Placement_group_area_assignment has placed_group defined by exactly one Placement_group. Each Placement_group defines placed_group for zero, one, or more Placement_group_area_assignment objects.

4.3.1004 Placement_group_volume_assignment to Mounting_restriction_volume

Each Placement_group_volume_assignment has volume defined by exactly one Mounting_restriction_volume. Each Mounting_restriction_volume defines volume for zero, one, or more Placement_group_volume_assignment objects.

4.3.1005 Placement_group_volume_assignment to Placement_group

Each Placement_group_volume_assignment has placed_group defined by exactly one Placement_group. Each Placement_group defines placed_group for zero, one, or more Placement_group_volume_assignment objects.

4.3.1006 Planned_characteristic to Coordinated_characteristic

Each Planned_characteristic has planned_coordinated_characteristic defined by exactly one Coordinated_characteristic. Each Coordinated_characteristic defines planned_coordinated_characteristic for zero, one, or more Planned_characteristic objects.

4.3.1007 Planned_characteristic to Assembly_requirement_allocation

Each Planned_characteristic has reference_requirement defined by zero or one Assembly_requirement_allocation objects. Each Assembly_requirement_allocation defines reference_requirement for zero, one, or more Planned_characteristic objects. This assertion is established through a SELECT type.

4.3.1008 Planned_characteristic to Requirement_allocation

Each Planned_characteristic has reference_requirement defined by zero or one Requirement_allocation objects. Each Requirement_allocation defines reference_requirement for zero, one, or more Planned_characteristic objects. This assertion is established through a SELECT type.

4.3.1009 Planned_characteristic to Functional_unit_requirement_allocation

Each Planned_characteristic has reference_requirement defined by zero or one Functional_unit_requirement_allocation objects. Each Functional_unit_requirement_allocation defines reference_requirement for zero, one, or more Planned_characteristic objects. This assertion is established through a SELECT type.

4.3.1010 Planned_date_effectivity to Date_and_time

Each Planned_date_effectivity has end_date defined by zero or one Date_and_time objects. Each Date_and_time defines end_date for zero, one, or more Planned_date_effectivity objects. This assertion is established through a SELECT type. Each Planned_date_effectivity has start_date defined by zero or one Date_and_time objects. Each Date_and_time defines start_date for zero, one, or more Planned_date_effectivity objects. This assertion is established through a SELECT type.

4.3.1011 Planned_date_effectivity to Date

Each Planned_date_effectivity has end_date defined by zero or one Date objects. Each Date defines end_date for zero, one, or more Planned_date_effectivity objects. This assertion is established through a SELECT type. Each Planned_date_effectivity has start_date defined by zero or one Date objects. Each Date defines start_date for zero, one, or more Planned_date_effectivity objects. This assertion is established through a SELECT type.

4.3.1012 Planned_effectivity to Data_element

Each Planned_effectivity has component_quantity defined by exactly one Data_element. Each Data_element defines component_quantity for zero, one, or more Planned_effectivity objects.

4.3.1013 Planned_effectivity to Ee_product_configuration

Each Planned_effectivity has configuration defined by exactly one Ee_product_configuration. Each Ee_product_configuration defines configuration for zero, one, or more Planned_effectivity objects.

4.3.1014 Planned_effectivity to Ee_approval

Each Planned_effectivity has effectivity_approval defined by exactly one Ee_approval. Each Ee_approval defines effectivity_approval for zero, one, or more Planned_effectivity objects.

4.3.1015 Planned_effectivity to Assembly_composition_relationship

Each Planned_effectivity has effective_assembly defined by exactly one Assembly_composition_relationship. Each Assembly_composition_relationship defines effective_assembly for zero, one, or more Planned_effectivity objects.

4.3.1016 Planned_lot_effectivity to Data_element

Each Planned_lot_effectivity has lot_size defined by exactly one Data_element. Each Data_element defines lot_size for zero, one, or more Planned_lot_effectivity objects.

4.3.1017 Plated_cutout_edge_segment to Partially_plated_cutout

Each Plated_cutout_edge_segment has composed_cutout defined by exactly one Partially_plated_cutout. Each Partially_plated_cutout defines composed_cutout for zero, one, or more Plated_cutout_edge_segment objects.

4.3.1018 Plated_interconnect_module_edge_segment to Partially_plated_interconnect_module_edge

Each Plated_interconnect_module_edge_segment has composed_edge defined by exactly one Partially_plated_interconnect_module_edge. Each Partially_plated_interconnect_module_edge defines composed_edge for zero, one, or more Plated_interconnect_module_edge_segment objects.

4.3.1019 Plus_minus_tolerance_characteristic to Numeric_parameter

Each Plus_minus_tolerance_characteristic has component_characteristic defined by exactly three Numeric_parameter objects. Each Numeric_parameter defines component_characteristic for zero, one, or more Plus_minus_tolerance_characteristic objects.

4.3.1020 Plus_minus_tolerance_range_representation to Data_element

Each Plus_minus_tolerance_range_representation has lower_deviation defined by exactly one Data_element. Each Data_element defines lower_deviation for zero, one, or more Plus_minus_tolerance_range_representation objects. Each Plus_minus_tolerance_range_representation has upper_deviation defined by exactly one Data_element. Each Data_element defines upper_deviation for zero, one, or more Plus_minus_tolerance_range_representation objects. Each Plus_minus_tolerance_range_representation has basic_dimension_value defined by exactly one Data_element. Each Data_element defines basic_dimension_value for zero, one, or more Plus_minus_tolerance_range_representation objects.

4.3.1021 Polarity_indication_feature to Package_terminal

Each Polarity_indication_feature has associated_terminal defined by exactly one Package_terminal. Each Package_terminal defines associated_terminal for zero, one, or more Polarity_indication_feature objects.

4.3.1022 Polarity_indication_feature to Package_body_surface

Each Polarity_indication_feature has associated_body_vertical_extent defined by one or two Package_body_surface objects. Each Package_body_surface defines associated_body_vertical_extent for zero, one, or more Polarity_indication_feature objects.

4.3.1023 Polygonal_area to Cartesian_point

Each Polygonal_area has bounds defined by three or more Cartesian_point objects. Each Cartesian_point defines bounds for zero, one, or more Polygonal_area objects.

4.3.1024 Positional_boundary_and_profile_boundary_member_relationship to Tolerance_zone_boundary_member

Each Positional_boundary_and_profile_boundary_member_relationship has base_profile_tolerance_zone_boundary_member defined by exactly one Tolerance_zone_boundary_member. Each Tolerance_zone_boundary_member defines base_profile_tolerance_zone_boundary_member for zero, one, or more Positional_boundary_and_profile_boundary_member_relationship objects.

4.3.1025 Positional_boundary_and_profile_boundary_member_relationship to Profile_related_positional_boundary

Each Positional_boundary_and_profile_boundary_member_relationship has offset_positional_boundary defined by exactly one Profile_related_positional_boundary. Each Profile_related_positional_boundary defines offset_positional_boundary for zero, one, or more Positional_boundary_and_profile_boundary_member_relationship objects.

4.3.1026 Positional_boundary_definition to Positional_boundary

Each Positional_boundary_definition has defined_positional_boundary defined by exactly one Positional_boundary. Each Positional_boundary defines defined_positional_boundary for zero, one, or more Positional_boundary_definition objects.

4.3.1027 Positional_boundary_member_definition to Dimensional_size

Each Positional_boundary_member_definition has associated_dimension defined by exactly one Dimensional_size. Each Dimensional_size defines associated_dimension for zero, one, or more Positional_boundary_member_definition objects.

4.3.1028 Positional_boundary_member_definition to Length_data_element

Each Positional_boundary_member_definition has tolerance_value defined by exactly one Length_data_element. Each Length_data_element defines tolerance_value for zero, one, or more Positional_boundary_member_definition objects.

4.3.1029 Positional_boundary_member_definition to Positional_boundary_member

Each Positional_boundary_member_definition has defined_positional_boundary_member defined by exactly one Positional_boundary_member. Each Positional_boundary_member defines defined_positional_boundary_member for zero, one, or more Positional_boundary_member_definition objects.

4.3.1030 Positional_boundary_offset to Length_data_element

Each Positional_boundary_offset has tolerance_value defined by exactly one Length_data_element. Each Length_data_element defines tolerance_value for zero, one, or more Positional_boundary_offset objects.

4.3.1031 Positional_boundary_offset to Positional_boundary_and_profile_boundary_member_relationship

Each Positional_boundary_offset has offset_boundary_relationship defined by exactly one Positional_boundary_and_profile_boundary_member_relationship. Each Positional_boundary_and_profile_boundary_member_relationship defines offset_boundary_relationship for zero, one, or more Positional_boundary_offset objects.

4.3.1032 Pre_defined_datum_axis_3d_symbol to Datum_axis

Each Pre_defined_datum_axis_3d_symbol has associated_element defined by exactly one Datum_axis. Each Datum_axis defines associated_element for zero, one, or more Pre_defined_datum_axis_3d_symbol objects.

4.3.1033 Pre_defined_datum_plane_3d_symbol to Datum_plane

Each Pre_defined_datum_plane_3d_symbol has associated_element defined by exactly one Datum_plane. Each Datum_plane defines associated_element for zero, one, or more Pre_defined_datum_plane_3d_symbol objects.

4.3.1034 Pre_defined_parallel_datum_axis_2d_symbol to Datum_axis

Each Pre_defined_parallel_datum_axis_2d_symbol has associated_element defined by exactly one Datum_axis. Each Datum_axis defines associated_element for zero, one, or more Pre_defined_parallel_datum_axis_2d_symbol objects.

4.3.1035 Pre_defined_parallel_datum_axis_symbol_3d_2d_relationship to Pre_defined_datum_axis_3d_symbol

Each Pre_defined_parallel_datum_axis_symbol_3d_2d_relationship has projected_volume defined by exactly one Pre_defined_datum_axis_3d_symbol. Each Pre_defined_datum_axis_3d_symbol defines projected_volume for zero, one, or more Pre_defined_parallel_datum_axis_symbol_3d_2d_relationship objects.

4.3.1036 Pre_defined_parallel_datum_axis_symbol_3d_2d_relationship to Pre_defined_parallel_datum_axis_2d_symbol

Each Pre_defined_parallel_datum_axis_symbol_3d_2d_relationship has surface_intersection_result defined by exactly one Pre_defined_parallel_datum_axis_2d_symbol. Each Pre_defined_parallel_datum_axis_2d_symbol defines surface_intersection_result for zero, one, or more Pre_defined_parallel_datum_axis_symbol_3d_2d_relationship objects.

4.3.1037 Pre_defined_perpendicular_datum_axis_2d_symbol to Datum_axis

Each Pre_defined_perpendicular_datum_axis_2d_symbol has associated_element defined by exactly one Datum_axis. Each Datum_axis defines associated_element for zero, one, or more Pre_defined_perpendicular_datum_axis_2d_symbol objects.

4.3.1038 Pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship to Pre_defined_datum_axis_3d_symbol

Each Pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship has projected_volume defined by exactly one Pre_defined_datum_axis_3d_symbol. Each Pre_defined_datum_axis_3d_symbol defines projected_volume for zero, one, or more Pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship objects.

4.3.1039 Pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship to Pre_defined_perpendicular_datum_axis_2d_symbol

Each Pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship has surface_intersection_result defined by exactly one Pre_defined_perpendicular_datum_axis_2d_symbol. Each Pre_defined_perpendicular_datum_axis_2d_symbol defines surface_intersection_result for zero, one, or more Pre_defined_perpendicular_datum_axis_symbol_3d_2d_relationship objects.

4.3.1040 Pre_defined_perpendicular_datum_plane_2d_symbol to Datum_axis

Each Pre_defined_perpendicular_datum_plane_2d_symbol has associated_element defined by exactly one Datum_axis. Each Datum_axis defines associated_element for zero, one, or more Pre_defined_perpendicular_datum_plane_2d_symbol objects.

4.3.1041 Pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship to Pre_defined_datum_plane_3d_symbol

Each Pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship has projected_volume defined by exactly one Pre_defined_datum_plane_3d_symbol. Each Pre_defined_datum_plane_3d_symbol defines projected_volume for zero, one, or more Pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship objects.

4.3.1042 Pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship to Pre_defined_perpendicular_datum_plane_2d_symbol

Each Pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship has surface_intersection_result defined by exactly one Pre_defined_perpendicular_datum_plane_2d_symbol. Each Pre_defined_perpendicular_datum_plane_2d_symbol defines surface_intersection_result for zero, one, or more Pre_defined_perpendicular_datum_plane_symbol_3d_2d_relationship objects.

4.3.1043 Primary_orientation_feature to Package_body_surface

Each Primary_orientation_feature has associated_body_vertical_extent defined by one or two Package_body_surface objects. Each Package_body_surface defines associated_body_vertical_extent for zero, one, or more Primary_orientation_feature objects.

4.3.1044 Printed_component to Layer

Each Printed_component has required_material_stack defined by exactly one Layer. Each Layer defines required_material_stack for zero, one, or more Printed_component objects.

4.3.1045 Printed_component to Printed_component_link

Each Printed_component has printed_component_stack defined by one or more Printed_component_link objects. Each Printed_component_link defines printed_component_stack for zero, one, or more Printed_component objects.

4.3.1046 Printed_component to Printed_part_template

Each Printed_component has usage_definition defined by exactly one Printed_part_template. Each Printed_part_template defines usage_definition for zero, one, or more Printed_component objects.

4.3.1047 Printed_component to Stratum_feature

Each Printed_component has stratum_feature_implementation defined by one or more Stratum_feature objects. Each Stratum_feature defines stratum_feature_implementation for zero, one, or more Printed_component objects.

4.3.1048 Printed_component_join_terminal to Stratum_feature

Each Printed_component_join_terminal has stratum_concept_implementation defined by exactly one Stratum_feature. Each Stratum_feature defines stratum_concept_implementation for zero, one, or more Printed_component_join_terminal objects.

4.3.1049 Printed_component_join_terminal to Printed_component

Each Printed_component_join_terminal has associated_component defined by exactly one Printed_component. Each Printed_component defines associated_component for one or more Printed_component_join_terminal objects.

4.3.1050 Printed_component_join_terminal to Printed_part_template_join_terminal

Each Printed_component_join_terminal has definition defined by exactly one Printed_part_template_join_terminal. Each Printed_part_template_join_terminal defines definition for zero, one, or more Printed_component_join_terminal objects.

4.3.1051 Printed_component_link to Printed_part_template_link

Each Printed_component_link has definition defined by exactly one Printed_part_template_link. Each Printed_part_template_link defines definition for zero, one, or more Printed_component_link objects.

4.3.1052 Printed_component_link to Printed_component

Each Printed_component_link has subsequent_printed_component defined by exactly one Printed_component. Each Printed_component defines subsequent_printed_component for zero or one Printed_component_link objects. Each Printed_component_link has precedent_printed_component defined by exactly one Printed_component. Each Printed_component defines precedent_printed_component for zero or one Printed_component_link objects.

4.3.1053 Printed_connector_component to Printed_connector_template

Each Printed_connector_component has usage_definition defined by exactly one Printed_connector_template. Each Printed_connector_template defines usage_definition for zero, one, or more Printed_connector_component objects.

4.3.1054 Printed_connector_component_interface_terminal to Stratum_feature

Each Printed_connector_component_interface_terminal has stratum_concept_implementation defined by exactly one Stratum_feature. Each Stratum_feature defines stratum_concept_implementation for zero, one, or more Printed_connector_component_interface_terminal objects.

4.3.1055 Printed_connector_component_interface_terminal to Printed_connector_component

Each Printed_connector_component_interface_terminal has associated_component defined by exactly one Printed_connector_component. Each Printed_connector_component defines associated_component for one or more Printed_connector_component_interface_terminal objects.

4.3.1056 Printed_connector_component_interface_terminal to Printed_part_template_interface_terminal

Each Printed_connector_component_interface_terminal has definition defined by exactly one Printed_part_template_interface_terminal. Each Printed_part_template_interface_terminal defines definition for zero, one, or more Printed_connector_component_interface_terminal objects.

4.3.1057 Printed_connector_template_terminal_relationship to Printed_connector_template

Each Printed_connector_template_terminal_relationship has connector defined by exactly one Printed_connector_template. Each Printed_connector_template defines connector for one or more Printed_connector_template_terminal_relationship objects.

4.3.1058 Printed_connector_template_terminal_relationship to Printed_part_template_interface_terminal

Each Printed_connector_template_terminal_relationship has interface_terminal defined by exactly one Printed_part_template_interface_terminal. Each Printed_part_template_interface_terminal defines interface_terminal for one or more Printed_connector_template_terminal_relationship objects.

4.3.1059 Printed_connector_template_terminal_relationship to Printed_part_template_join_terminal

Each Printed_connector_template_terminal_relationship has join_terminal defined by exactly one Printed_part_template_join_terminal. Each Printed_part_template_join_terminal defines join_terminal for zero or one Printed_connector_template_terminal_relationship objects.

4.3.1060 Printed_part_cross_section_template to Edge_segment_vertex

Each Printed_part_cross_section_template has end_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines end_vertex for zero, one, or more Printed_part_cross_section_template objects. Each Printed_part_cross_section_template has start_vertex defined by exactly one Edge_segment_vertex. Each Edge_segment_vertex defines start_vertex for zero, one, or more Printed_part_cross_section_template objects.

4.3.1061 Printed_part_cross_section_template to Length_data_element

Each Printed_part_cross_section_template has minimum_width defined by exactly one Length_data_element. Each Length_data_element defines minimum_width for zero, one, or more Printed_part_cross_section_template objects. Each Printed_part_cross_section_template has maximum_width defined by exactly one Length_data_element. Each Length_data_element defines maximum_width for zero, one, or more Printed_part_cross_section_template objects.

4.3.1062 Printed_part_cross_section_template to Analytical_representation

Each Printed_part_cross_section_template has minimum_transmission_line_characteristic defined by one or more Analytical_representation objects. Each Analytical_representation defines minimum_transmission_line_characteristic for zero, one, or more Printed_part_cross_section_template objects. Each Printed_part_cross_section_template has maximum_transmission_line_characteristic defined by one or more Analytical_representation objects. Each Analytical_representation defines maximum_transmission_line_characteristic for zero, one, or more Printed_part_cross_section_template objects.

4.3.1063 Printed_part_cross_section_template to Analytical_model

Each Printed_part_cross_section_template has transmission_line_model defined by exactly one Analytical_model. Each Analytical_model defines transmission_line_model for zero, one, or more Printed_part_cross_section_template objects.

4.3.1064 Printed_part_cross_section_template to Printed_part_template_material_link

Each Printed_part_cross_section_template has vertical_material_link defined by one or more Printed_part_template_material_link objects. Each Printed_part_template_material_link defines vertical_material_link for zero, one, or more Printed_part_cross_section_template objects. Each Printed_part_cross_section_template has horizontal_material_link defined by one or more Printed_part_template_material_link objects. Each Printed_part_template_material_link defines horizontal_material_link for zero, one, or more Printed_part_cross_section_template objects.

4.3.1065 Printed_part_cross_section_template_terminal to Printed_part_template_material_link

Each Printed_part_cross_section_template_terminal has material_to_bottom_of_terminal defined by exactly one Printed_part_template_material_link. Each Printed_part_template_material_link defines material_to_bottom_of_terminal for zero, one, or more Printed_part_cross_section_template_terminal objects. Each Printed_part_cross_section_template_terminal has material_to_top_of_terminal defined by exactly one Printed_part_template_material_link. Each Printed_part_template_material_link defines material_to_top_of_terminal for zero, one, or more Printed_part_cross_section_template_terminal objects. Each Printed_part_cross_section_template_terminal has material_to_right_of_terminal defined by exactly one Printed_part_template_material_link. Each Printed_part_template_material_link defines material_to_right_of_terminal for zero, one, or more Printed_part_cross_section_template_terminal objects. Each Printed_part_cross_section_template_terminal has material_to_left_of_terminal defined by exactly one Printed_part_template_material_link. Each Printed_part_template_material_link defines material_to_left_of_terminal for zero, one, or more Printed_part_cross_section_template_terminal objects.

4.3.1066 Printed_part_cross_section_template_terminal to Printed_part_cross_section_template

Each Printed_part_cross_section_template_terminal has cross_section_definition defined by exactly one Printed_part_cross_section_template. Each Printed_part_cross_section_template defines cross_section_definition for one or more Printed_part_cross_section_template_terminal objects.

4.3.1067 Printed_part_template to Functional_unit_usage_view

Each Printed_part_template has implemented_function defined by exactly one Functional_unit_usage_view. Each Functional_unit_usage_view defines implemented_function for zero, one, or more Printed_part_template objects.

4.3.1068 Printed_part_template to Printed_part_template_link

Each Printed_part_template has printed_part_template_stack defined by one or more Printed_part_template_link objects. Each Printed_part_template_link defines printed_part_template_stack for zero, one, or more Printed_part_template objects.

4.3.1069 Printed_part_template to Stratum_technology_link

Each Printed_part_template has material_stack defined by one or more Stratum_technology_link objects. Each Stratum_technology_link defines material_stack for zero, one, or more Printed_part_template objects.

4.3.1070 Printed_part_template to Stratum_technology

Each Printed_part_template has of_stratum_technology defined by exactly one Stratum_technology. Each Stratum_technology defines of_stratum_technology for zero, one, or more Printed_part_template objects.

4.3.1071 Printed_part_template_connected_terminals_definition to Printed_part_template_terminal

Each Printed_part_template_connected_terminals_definition has connected_terminals defined by two or more Printed_part_template_terminal objects. Each Printed_part_template_terminal defines connected_terminals for zero or one Printed_part_template_connected_terminals_definition objects.

4.3.1072 Printed_part_template_interface_terminal to Printed_connector_template

Each Printed_part_template_interface_terminal has associated_definition defined by exactly one Printed_connector_template. Each Printed_connector_template defines associated_definition for zero, one, or more Printed_part_template_interface_terminal objects.

4.3.1073 Printed_part_template_link to Printed_part_template

Each Printed_part_template_link has subsequent_printed_part_template defined by exactly one Printed_part_template. Each Printed_part_template defines subsequent_printed_part_template for zero, one, or more Printed_part_template_link objects. Each Printed_part_template_link has precedent_printed_part_template defined by exactly one Printed_part_template. Each Printed_part_template defines precedent_printed_part_template for zero, one, or more Printed_part_template_link objects.

4.3.1074 Printed_part_template_material to Stratum_technology

Each Printed_part_template_material has required_material defined by exactly one Stratum_technology. Each Stratum_technology defines required_material for zero, one, or more Printed_part_template_material objects.

4.3.1075 Printed_part_template_material to Length_data_element

Each Printed_part_template_material has minimum_width defined by exactly one Length_data_element. Each Length_data_element defines minimum_width for zero, one, or more Printed_part_template_material objects. Each Printed_part_template_material has maximum_width defined by exactly one Length_data_element. Each Length_data_element defines maximum_width for zero, one, or more Printed_part_template_material objects.

4.3.1076 Printed_part_template_material_link to Template_material_cross_section_boundary

Each Printed_part_template_material_link has subsequent_material defined by exactly one Template_material_cross_section_boundary. Each Template_material_cross_section_boundary defines subsequent_material for zero, one, or more Printed_part_template_material_link objects. Each Printed_part_template_material_link has precedent_material defined by exactly one Template_material_cross_section_boundary. Each Template_material_cross_section_boundary defines precedent_material for zero, one, or more Printed_part_template_material_link objects.

4.3.1077 Printed_part_template_terminal to Connection_zone

Each Printed_part_template_terminal has terminal_connection_zone defined by one or more Connection_zone objects. Each Connection_zone defines terminal_connection_zone for zero, one, or more Printed_part_template_terminal objects.

4.3.1078 Printed_part_template_terminal to Printed_part_template

Each Printed_part_template_terminal has associated_definition defined by exactly one Printed_part_template. Each Printed_part_template defines associated_definition for zero, one, or more Printed_part_template_terminal objects.

4.3.1079 Printed_part_template_terminal_relationship to Printed_part_template_terminal

Each Printed_part_template_terminal_relationship has relating_printed_part_terminal defined by exactly one Printed_part_template_terminal. Each Printed_part_template_terminal defines relating_printed_part_terminal for zero, one, or more Printed_part_template_terminal_relationship objects. Each Printed_part_template_terminal_relationship has related_printed_part_terminal defined by exactly one Printed_part_template_terminal. Each Printed_part_template_terminal defines related_printed_part_terminal for zero, one, or more Printed_part_template_terminal_relationship objects.

4.3.1080 Probe_access_area to Connection_zone

Each Probe_access_area has probe_contact_zone defined by exactly one Connection_zone. Each Connection_zone defines probe_contact_zone for zero, one, or more Probe_access_area objects.

4.3.1081 Probe_access_area to Stratum_feature

Each Probe_access_area has probed_layout_item defined by exactly one Stratum_feature. Each Stratum_feature defines probed_layout_item for zero, one, or more Probe_access_area objects.

4.3.1082 Product_association to Ee_specification

Each Product_association has constraint_source defined by exactly one Ee_specification. Each Ee_specification defines constraint_source for zero, one, or more Product_association objects.

4.3.1083 Product_association to Ee_product_version

Each Product_association has related_product defined by one or more Ee_product_version objects. Each Ee_product_version defines related_product for zero, one, or more Product_association objects. Each Product_association has relating_product defined by exactly one Ee_product_version. Each Ee_product_version defines relating_product for zero, one, or more Product_association objects.

4.3.1084 Profile_boundary_definition to Tolerance_zone_opposing_boundary_set

Each Profile_boundary_definition has defined_zone_boundary defined by exactly one Tolerance_zone_opposing_boundary_set. Each Tolerance_zone_opposing_boundary_set defines defined_zone_boundary for zero, one, or more Profile_boundary_definition objects.

4.3.1085 Profile_boundary_definition to True_profile

Each Profile_boundary_definition has basic_profile defined by exactly one True_profile. Each True_profile defines basic_profile for one or more Profile_boundary_definition objects.

4.3.1086 Profile_boundary_definition_with_offsets to Tolerance_zone_boundary_member_offset

Each Profile_boundary_definition_with_offsets has boundary_offsets defined by exactly two Tolerance_zone_boundary_member_offset objects. Each Tolerance_zone_boundary_member_offset defines boundary_offsets for zero, one, or more Profile_boundary_definition_with_offsets objects.

4.3.1087 Profile_boundary_definition_with_offsets to Tolerance_zone_explicit_opposing_boundary_set

Each Profile_boundary_definition_with_offsets has defined_zone_boundary defined by exactly one Tolerance_zone_explicit_opposing_boundary_set. Each Tolerance_zone_explicit_opposing_boundary_set defines defined_zone_boundary for zero, one, or more Profile_boundary_definition_with_offsets objects.

4.3.1088 Profile_related_positional_boundary_definition to Positional_boundary_offset

Each Profile_related_positional_boundary_definition has boundary_offset defined by exactly one Positional_boundary_offset. Each Positional_boundary_offset defines boundary_offset for zero, one, or more Profile_related_positional_boundary_definition objects.

4.3.1089 Profile_related_positional_boundary_definition to Profile_related_positional_boundary

Each Profile_related_positional_boundary_definition has defined_positional_boundary defined by exactly one Profile_related_positional_boundary. Each Profile_related_positional_boundary defines defined_positional_boundary for zero, one, or more Profile_related_positional_boundary_definition objects.

4.3.1090 Projected_tolerance_zone_definition to Projected_zone_height_characteristic

Each Projected_tolerance_zone_definition has projected_zone_height defined by exactly one Projected_zone_height_characteristic. Each Projected_zone_height_characteristic defines projected_zone_height for zero, one, or more Projected_tolerance_zone_definition objects.

4.3.1091 Projected_zone_and_base_relationship to Tolerance_zone

Each Projected_zone_and_base_relationship has projected_zone defined by exactly one Tolerance_zone. Each Tolerance_zone defines projected_zone for zero, one, or more Projected_zone_and_base_relationship objects.

4.3.1092 Projected_zone_and_base_relationship to Physical_feature_or_part_template

Each Projected_zone_and_base_relationship has base_physical_feature defined by exactly one Physical_feature_or_part_template. Each Physical_feature_or_part_template defines base_physical_feature for zero, one, or more Projected_zone_and_base_relationship objects.

4.3.1093 Projected_zone_height_characteristic to Length_data_element

Each Projected_zone_height_characteristic has projected_height_value defined by exactly one Length_data_element. Each Length_data_element defines projected_height_value for zero, one, or more Projected_zone_height_characteristic objects.

4.3.1094 Projected_zone_height_characteristic to Projected_zone_and_base_relationship

Each Projected_zone_height_characteristic has defined_height_of defined by exactly one Projected_zone_and_base_relationship. Each Projected_zone_and_base_relationship defines defined_height_of for zero, one, or more Projected_zone_height_characteristic objects.

4.3.1095 Promissory_usage_relationship to Physical_unit_design_view

Each Promissory_usage_relationship has assembly defined by exactly one Physical_unit_design_view. Each Physical_unit_design_view defines assembly for zero, one, or more Promissory_usage_relationship objects.

4.3.1096 Promissory_usage_relationship to Security_classification

Each Promissory_usage_relationship has security_code defined by exactly one Security_classification. Each Security_classification defines security_code for zero, one, or more Promissory_usage_relationship objects.

4.3.1097 Promissory_usage_relationship to Physical_unit

Each Promissory_usage_relationship has component defined by exactly one Physical_unit. Each Physical_unit defines component for zero, one, or more Promissory_usage_relationship objects.

4.3.1098 Radius_edge_feature_shape to Length_data_element

Each Radius_edge_feature_shape has maximum_radius_length defined by exactly one Length_data_element. Each Length_data_element defines maximum_radius_length for zero, one, or more Radius_edge_feature_shape objects. Each Radius_edge_feature_shape has minimum_radius_length defined by exactly one Length_data_element. Each Length_data_element defines minimum_radius_length for zero, one, or more Radius_edge_feature_shape objects.

4.3.1099 Range_characteristic to Numeric_parameter

Each Range_characteristic has component_characteristic defined by exactly two Numeric_parameter objects. Each Numeric_parameter defines component_characteristic for zero, one, or more Range_characteristic objects.

4.3.1100 Rectangular_area to Length_data_element

Each Rectangular_area has y defined by exactly one Length_data_element. Each Length_data_element defines y for zero, one, or more Rectangular_area objects. Each Rectangular_area has x defined by exactly one Length_data_element. Each Length_data_element defines x for zero, one, or more Rectangular_area objects.

4.3.1101 Rectangular_area to Axis_placement_2d

Each Rectangular_area has position defined by exactly one Axis_placement_2d. Each Axis_placement_2d defines position for zero, one, or more Rectangular_area objects.

4.3.1102 Rectangular_array_placement_group_component to Length_data_element

Each Rectangular_array_placement_group_component has terminus_row_positive_y_displacement defined by exactly one Length_data_element. Each Length_data_element defines terminus_row_positive_y_displacement for zero, one, or more Rectangular_array_placement_group_component objects. Each Rectangular_array_placement_group_component has initial_row_positive_y_displacement defined by exactly one Length_data_element. Each Length_data_element defines initial_row_positive_y_displacement for zero, one, or more Rectangular_array_placement_group_component objects.

4.3.1103 Rectangular_array_placement_group_component to Linear_array_placement_group_component_link

Each Rectangular_array_placement_group_component has element defined by one or more Linear_array_placement_group_component_link objects. Each Linear_array_placement_group_component_link defines element for zero, one, or more Rectangular_array_placement_group_component objects.

4.3.1104 Reference_composition_path to Functional_unit

Each Reference_composition_path has reference_functional_unit defined by exactly one Functional_unit. Each Functional_unit defines reference_functional_unit for zero, one, or more Reference_composition_path objects. Each Reference_composition_path has path_element defined by one or more Functional_unit objects. Each Functional_unit defines path_element for zero, one, or more Reference_composition_path objects.

4.3.1105 Reference_functional_unit_assignment_to_part to Coordinated_characteristic

Each Reference_functional_unit_assignment_to_part has of_property defined by one or more Coordinated_characteristic objects. Each Coordinated_characteristic defines of_property for zero, one, or more Reference_functional_unit_assignment_to_part objects.

4.3.1106 Reference_functional_unit_assignment_to_part to Part_template

Each Reference_functional_unit_assignment_to_part has implementation defined by zero or one Part_template objects. Each Part_template defines implementation for zero, one, or more Reference_functional_unit_assignment_to_part objects. This assertion is established through a SELECT type.

4.3.1107 Reference_functional_unit_assignment_to_part to Physical_unit

Each Reference_functional_unit_assignment_to_part has implementation defined by zero or one Physical_unit objects. Each Physical_unit defines implementation for zero, one, or more Reference_functional_unit_assignment_to_part objects. This assertion is established through a SELECT type.

4.3.1108 Reference_functional_unit_assignment_to_part to Reference_composition_path

Each Reference_functional_unit_assignment_to_part has functional_design_definition_path defined by exactly one Reference_composition_path. Each Reference_composition_path defines functional_design_definition_path for zero, one, or more Reference_functional_unit_assignment_to_part objects.

4.3.1109 Registered_font to Ee_document

Each Registered_font has registration_document defined by exactly one Ee_document. Each Ee_document defines registration_document for zero, one, or more Registered_font objects.

4.3.1110 Registered_style to Ee_document

Each Registered_style has registration_document defined by exactly one Ee_document. Each Ee_document defines registration_document for zero, one, or more Registered_style objects.

4.3.1111 Requirement_allocation to Ee_requirement_occurrence

Each Requirement_allocation has allocated_requirement defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines allocated_requirement for zero, one, or more Requirement_allocation objects. Each Requirement_allocation has target_product_object defined by zero or one Ee_requirement_occurrence objects. Each Ee_requirement_occurrence defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1112 Requirement_allocation to Ee_product_configuration

Each Requirement_allocation has target_product_object defined by zero or one Ee_product_configuration objects. Each Ee_product_configuration defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1113 Requirement_allocation to Ee_product_definition

Each Requirement_allocation has target_product_object defined by zero or one Ee_product_definition objects. Each Ee_product_definition defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1114 Requirement_allocation to Ee_product_version

Each Requirement_allocation has target_product_object defined by zero or one Ee_product_version objects. Each Ee_product_version defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1115 Requirement_allocation to Ee_product

Each Requirement_allocation has target_product_object defined by zero or one Ee_product objects. Each Ee_product defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1116 Requirement_allocation to Part_feature

Each Requirement_allocation has target_product_object defined by zero or one Part_feature objects. Each Part_feature defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1117 Requirement_allocation to Physical_connectivity_element

Each Requirement_allocation has target_product_object defined by zero or one Physical_connectivity_element objects. Each Physical_connectivity_element defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1118 Requirement_allocation to Physical_connectivity_definition

Each Requirement_allocation has target_product_object defined by zero or one Physical_connectivity_definition objects. Each Physical_connectivity_definition defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1119 Requirement_allocation to Laminate_component

Each Requirement_allocation has target_product_object defined by zero or one Laminate_component objects. Each Laminate_component defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1120 Requirement_allocation to Inter_stratum_feature

Each Requirement_allocation has target_product_object defined by zero or one Inter_stratum_feature objects. Each Inter_stratum_feature defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1121 Requirement_allocation to Stratum_feature

Each Requirement_allocation has target_product_object defined by zero or one Stratum_feature objects. Each Stratum_feature defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1122 Requirement_allocation to Stratum

Each Requirement_allocation has target_product_object defined by zero or one Stratum objects. Each Stratum defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1123 Requirement_allocation to Stratum_surface

Each Requirement_allocation has target_product_object defined by zero or one Stratum_surface objects. Each Stratum_surface defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1124 Requirement_allocation to Assembly_component

Each Requirement_allocation has target_product_object defined by zero or one Assembly_component objects. Each Assembly_component defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1125 Requirement_allocation to Component_external_reference

Each Requirement_allocation has target_product_object defined by zero or one Component_external_reference objects. Each Component_external_reference defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1126 Requirement_allocation to Component_feature

Each Requirement_allocation has target_product_object defined by zero or one Component_feature objects. Each Component_feature defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1127 Requirement_allocation to Component_feature_external_reference

Each Requirement_allocation has target_product_object defined by zero or one Component_feature_external_reference objects. Each Component_feature_external_reference defines target_product_object for zero, one, or more Requirement_allocation objects. This assertion is established through a SELECT type.

4.3.1128 Requirement_composition to Requirement_group_occurrence

Each Requirement_composition has composition defined by exactly one Requirement_group_occurrence. Each Requirement_group_occurrence defines composition for zero, one, or more Requirement_composition objects.

4.3.1129 Requirement_composition to Ee_requirement_occurrence

Each Requirement_composition has element defined by one or more Ee_requirement_occurrence objects. Each Ee_requirement_occurrence defines element for zero or one Requirement_composition objects.

4.3.1130 Restraint_condition to Datum_feature_usage_in_datum_relationship

Each Restraint_condition has applied_to defined by zero or one Datum_feature_usage_in_datum_relationship objects. Each Datum_feature_usage_in_datum_relationship defines applied_to for zero, one, or more Restraint_condition objects. This assertion is established through a SELECT type.

4.3.1131 Restraint_condition to Physical_feature_or_part_template

Each Restraint_condition has applied_to defined by zero or one Physical_feature_or_part_template objects. Each Physical_feature_or_part_template defines applied_to for zero, one, or more Restraint_condition objects. This assertion is established through a SELECT type.

4.3.1132 Restraint_condition to Ee_requirement_occurrence

Each Restraint_condition has restraint_description defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines restraint_description for zero, one, or more Restraint_condition objects.

4.3.1133 Routed_interconnect_component to Curve

Each Routed_interconnect_component has routed_centreline_shape defined by exactly one Curve. Each Curve defines routed_centreline_shape for zero, one, or more Routed_interconnect_component objects.

4.3.1134 Routed_physical_component to Curve

Each Routed_physical_component has routed_centreline_shape defined by exactly one Curve. Each Curve defines routed_centreline_shape for zero, one, or more Routed_physical_component objects.

4.3.1135 Routed_printed_component to Inter_stratum_extent

Each Routed_printed_component has component_extent defined by exactly one Inter_stratum_extent. Each Inter_stratum_extent defines component_extent for zero, one, or more Routed_printed_component objects.

4.3.1136 Routed_printed_component to Printed_part_cross_section_template

Each Routed_printed_component has usage_definition defined by exactly one Printed_part_cross_section_template. Each Printed_part_cross_section_template defines usage_definition for zero, one, or more Routed_printed_component objects.

4.3.1137 Routed_printed_component to Curve

Each Routed_printed_component has routed_centreline_shape defined by exactly one Curve. Each Curve defines routed_centreline_shape for zero, one, or more Routed_printed_component objects.

4.3.1138 Rule_action to Ee_rule_version

Each Rule_action has subject_rule defined by exactly one Ee_rule_version. Each Ee_rule_version defines subject_rule for one or more Rule_action objects.

4.3.1139 Rule_action to Participant_date_and_time_assignment

Each Rule_action has subject_action_assignment defined by exactly one Participant_date_and_time_assignment. Each Participant_date_and_time_assignment defines subject_action_assignment for zero, one, or more Rule_action objects.

4.3.1140 Rule_based_constraint_occurrence to Ee_rule_version

Each Rule_based_constraint_occurrence has design_constraint defined by exactly one Ee_rule_version. Each Ee_rule_version defines design_constraint for zero, one, or more Rule_based_constraint_occurrence objects.

4.3.1141 Rule_justification to Rule_action

Each Rule_justification has justified_action defined by exactly one Rule_action. Each Rule_action defines justified_action for zero, one, or more Rule_justification objects.

4.3.1142 Rule_modification to Rule_change_request

Each Rule_modification has modification_rationale defined by exactly one Rule_change_request. Each Rule_change_request defines modification_rationale for zero, one, or more Rule_modification objects.

4.3.1143 Rule_priority to Ee_rule_version

Each Rule_priority has prioritized_rule defined by exactly one Ee_rule_version. Each Ee_rule_version defines prioritized_rule for zero, one, or more Rule_priority objects.

4.3.1144 Rule_set to Rule_priority

Each Rule_set has rule_priority_member defined by one or more Rule_priority objects. Each Rule_priority defines rule_priority_member for zero, one, or more Rule_set objects.

4.3.1145 Rule_set_group to Rule_set

Each Rule_set_group has elements defined by two or more Rule_set objects. Each Rule_set defines elements for zero, one, or more Rule_set_group objects.

4.3.1146 Rule_supersedence to Ee_rule_version

Each Rule_supersedence has superseded_rule defined by exactly one Ee_rule_version. Each Ee_rule_version defines superseded_rule for zero, one, or more Rule_supersedence objects.

4.3.1147 Runout_tolerance_zone_definition_with_specified_angle to Runout_zone_orientation

Each Runout_tolerance_zone_definition_with_specified_angle has runout_orientation defined by exactly one Runout_zone_orientation. Each Runout_zone_orientation defines runout_orientation for zero, one, or more Runout_tolerance_zone_definition_with_specified_angle objects.

4.3.1148 Runout_tolerance_zone_orienting_relationship to Directed_axis

Each Runout_tolerance_zone_orienting_relationship has orienting_axis defined by exactly one Directed_axis. Each Directed_axis defines orienting_axis for zero, one, or more Runout_tolerance_zone_orienting_relationship objects.

4.3.1149 Runout_tolerance_zone_orienting_relationship to Tolerance_zone

Each Runout_tolerance_zone_orienting_relationship has oriented_zone defined by exactly one Tolerance_zone. Each Tolerance_zone defines oriented_zone for zero, one, or more Runout_tolerance_zone_orienting_relationship objects.

4.3.1150 Runout_zone_orientation to Angle_data_element

Each Runout_zone_orientation has semi_angle_value defined by exactly one Angle_data_element. Each Angle_data_element defines semi_angle_value for zero, one, or more Runout_zone_orientation objects.

4.3.1151 Runout_zone_orientation to Runout_tolerance_zone_orienting_relationship

Each Runout_zone_orientation has oriented_relationship defined by exactly one Runout_tolerance_zone_orienting_relationship. Each Runout_tolerance_zone_orienting_relationship defines oriented_relationship for zero, one, or more Runout_zone_orientation objects.

4.3.1152 Scalar_terminal_definition_link to Scalar_terminal_definition

Each Scalar_terminal_definition_link has subsequent_terminal_definition defined by exactly one Scalar_terminal_definition. Each Scalar_terminal_definition defines subsequent_terminal_definition for zero, one, or more Scalar_terminal_definition_link objects. Each Scalar_terminal_definition_link has precedent_terminal_definition defined by exactly one Scalar_terminal_definition. Each Scalar_terminal_definition defines precedent_terminal_definition for zero, one, or more Scalar_terminal_definition_link objects.

4.3.1153 Secondary_orientation_feature to Package_body_surface

Each Secondary_orientation_feature has associated_body_vertical_extent defined by one or two Package_body_surface objects. Each Package_body_surface defines associated_body_vertical_extent for zero, one, or more Secondary_orientation_feature objects.

4.3.1154 Security_classification to Date_and_time

Each Security_classification has declassification_date defined by zero or one Date_and_time objects. Each Date_and_time defines declassification_date for zero, one, or more Security_classification objects. This assertion is established through a SELECT type. Each Security_classification has classification_date defined by zero or one Date_and_time objects. Each Date_and_time defines classification_date for zero, one, or more Security_classification objects. This assertion is established through a SELECT type.

4.3.1155 Security_classification to Date

Each Security_classification has declassification_date defined by zero or one Date objects. Each Date defines declassification_date for zero, one, or more Security_classification objects. This assertion is established through a SELECT type. Each Security_classification has classification_date defined by zero or one Date objects. Each Date defines classification_date for zero, one, or more Security_classification objects. This assertion is established through a SELECT type.

4.3.1156 Security_classification to Ee_approval

Each Security_classification has security_classification_approval defined by exactly one Ee_approval. Each Ee_approval defines security_classification_approval for zero, one, or more Security_classification objects.

4.3.1157 Security_classification to Person_and_organization

Each Security_classification has classification_officer defined by exactly one Person_and_organization. Each Person_and_organization defines classification_officer for zero, one, or more Security_classification objects.

4.3.1158 Separate_geometric_tolerance_requirement to Geometric_tolerance_with_referenced_datum_system

Each Separate_geometric_tolerance_requirement has separated_geometric_tolerances defined by one or more Geometric_tolerance_with_referenced_datum_system objects. Each Geometric_tolerance_with_referenced_datum_system defines separated_geometric_tolerances for zero, one, or more Separate_geometric_tolerance_requirement objects.

4.3.1159 Set_characteristic to Characteristic

Each Set_characteristic has values defined by one or more Characteristic objects. Each Characteristic defines values for zero, one, or more Set_characteristic objects.

4.3.1160 Shape_and_ee_product_definition_based_constraint_occurrence to Shape_definition

Each Shape_and_ee_product_definition_based_constraint_occurrence has constraining_shape defined by one or more Shape_definition objects. Each Shape_definition defines constraining_shape for zero, one, or more Shape_and_ee_product_definition_based_constraint_occurrence objects.

4.3.1161 Shape_composition_relationship to Axis_placement

Each Shape_composition_relationship has related_feature_shape_placement defined by exactly one Axis_placement. Each Axis_placement defines related_feature_shape_placement for zero, one, or more Shape_composition_relationship objects.

4.3.1162 Shape_definition to Shape_item

Each Shape_definition has element defined by one or more Shape_item objects. Each Shape_item defines element for one or more Shape_definition objects.

4.3.1163 Shape_definition to Cartesian_coordinate_system

Each Shape_definition has geometric_context defined by exactly one Cartesian_coordinate_system. Each Cartesian_coordinate_system defines geometric_context for zero, one, or more Shape_definition objects.

4.3.1164 Shape_element_composing_relationship to Composite_shape_element

Each Shape_element_composing_relationship has relating_shape_element defined by exactly one Composite_shape_element. Each Composite_shape_element defines relating_shape_element for two or more Shape_element_composing_relationship objects.

4.3.1165 Shape_element_deriving_relationship to Derived_shape_element

Each Shape_element_deriving_relationship has relating_shape_element defined by exactly one Derived_shape_element. Each Derived_shape_element defines relating_shape_element for one or more Shape_element_deriving_relationship objects.

4.3.1166 Shape_element_locating_relationship to Shape_element

Each Shape_element_locating_relationship has located_shape_element defined by exactly one Shape_element. Each Shape_element defines located_shape_element for zero, one, or more Shape_element_locating_relationship objects. Each Shape_element_locating_relationship has locating_shape_element defined by exactly one Shape_element. Each Shape_element defines locating_shape_element for zero, one, or more Shape_element_locating_relationship objects.

4.3.1167 Shape_element_relationship to Shape_element

Each Shape_element_relationship has related_shape_element defined by exactly one Shape_element. Each Shape_element defines related_shape_element for zero, one, or more Shape_element_relationship objects. Each Shape_element_relationship has relating_shape_element defined by exactly one Shape_element. Each Shape_element defines relating_shape_element for zero, one, or more Shape_element_relationship objects.

4.3.1168 Shape_formed_terminal to Lead_form_specification

Each Shape_formed_terminal has terminal_form_specification defined by exactly one Lead_form_specification. Each Lead_form_specification defines terminal_form_specification for zero, one, or more Shape_formed_terminal objects.

4.3.1169 Shield to Assembly_component

Each Shield has shielded_item defined by zero or one Assembly_component objects. Each Assembly_component defines shielded_item for zero, one, or more Shield objects. This assertion is established through a SELECT type.

4.3.1170 Shield to Component_feature

Each Shield has shielded_item defined by zero or one Component_feature objects. Each Component_feature defines shielded_item for zero, one, or more Shield objects. This assertion is established through a SELECT type.

4.3.1171 Shield to Physical_connectivity_definition

Each Shield has shielded_item defined by zero or one Physical_connectivity_definition objects. Each Physical_connectivity_definition defines shielded_item for zero, one, or more Shield objects. This assertion is established through a SELECT type.

4.3.1172 Shield_allocation to Electromagnetic_requirement_occurrence

Each Shield_allocation has requirement defined by exactly one Electromagnetic_requirement_occurrence. Each Electromagnetic_requirement_occurrence defines requirement for zero, one, or more Shield_allocation objects.

4.3.1173 Shield_allocation to Shield

Each Shield_allocation has assembly_assignment defined by exactly one Shield. Each Shield defines assembly_assignment for zero, one, or more Shield_allocation objects.

4.3.1174 Signal to External_definition

Each Signal has signal_category defined by exactly one External_definition. Each External_definition defines signal_category for zero, one, or more Signal objects.

4.3.1175 Signal_property to External_definition

Each Signal_property has signal_property_category defined by exactly one External_definition. Each External_definition defines signal_property_category for zero, one, or more Signal_property objects.

4.3.1176 Signal_property to Signal

Each Signal_property has characterized_signal defined by exactly one Signal. Each Signal defines characterized_signal for zero, one, or more Signal_property objects.

4.3.1177 Signal_property to Characteristic_data_table

Each Signal_property has signal_property_representation defined by exactly one Characteristic_data_table. Each Characteristic_data_table defines signal_property_representation for zero, one, or more Signal_property objects.

4.3.1178 Signal_specification to Functional_unit

Each Signal_specification has characterizing_functional_unit defined by exactly one Functional_unit. Each Functional_unit defines characterizing_functional_unit for zero, one, or more Signal_specification objects.

4.3.1179 Signal_specification to Functional_unit_network_definition

Each Signal_specification has characterization_network defined by exactly one Functional_unit_network_definition. Each Functional_unit_network_definition defines characterization_network for zero, one, or more Signal_specification objects.

4.3.1180 Signal_specification to Signal_property

Each Signal_specification has maximum_characteristic defined by exactly one Signal_property. Each Signal_property defines maximum_characteristic for zero, one, or more Signal_specification objects. Each Signal_specification has minimum_characteristic defined by exactly one Signal_property. Each Signal_property defines minimum_characteristic for zero, one, or more Signal_specification objects.

4.3.1181 Signal_specification to Functional_unit_terminal

Each Signal_specification has reference_access_mechanism defined by exactly one Functional_unit_terminal. Each Functional_unit_terminal defines reference_access_mechanism for zero, one, or more Signal_specification objects. Each Signal_specification has measurement_access_mechanism defined by exactly one Functional_unit_terminal. Each Functional_unit_terminal defines measurement_access_mechanism for zero, one, or more Signal_specification objects.

4.3.1182 Signal_specification to Test_specification

Each Signal_specification has measurement_condition defined by exactly one Test_specification. Each Test_specification defines measurement_condition for zero, one, or more Signal_specification objects.

4.3.1183 Simultaneous_geometric_tolerance_requirement to Geometric_tolerance

Each Simultaneous_geometric_tolerance_requirement has grouped_geometric_tolerances defined by two or more Geometric_tolerance objects. Each Geometric_tolerance defines grouped_geometric_tolerances for zero, one, or more Simultaneous_geometric_tolerance_requirement objects.

4.3.1184 Singular_dimension_representation to Data_element

Each Singular_dimension_representation has dimension_value defined by exactly one Data_element. Each Data_element defines dimension_value for zero, one, or more Singular_dimension_representation objects.

4.3.1185 Special_symbol_laminate_component to Stratum_feature

Each Special_symbol_laminate_component has stratum_feature_implementation defined by exactly one Stratum_feature. Each Stratum_feature defines stratum_feature_implementation for zero, one, or more Special_symbol_laminate_component objects.

4.3.1186 Special_symbol_laminate_component to Special_symbol_part_template

Each Special_symbol_laminate_component has usage_definition defined by exactly one Special_symbol_part_template. Each Special_symbol_part_template defines usage_definition for zero, one, or more Special_symbol_laminate_component objects.

4.3.1187 Special_symbol_part_template to Stratum_technology

Each Special_symbol_part_template has of_stratum_technology defined by exactly one Stratum_technology. Each Stratum_technology defines of_stratum_technology for zero, one, or more Special_symbol_part_template objects.

4.3.1188 Specification_allocation to Ee_product_configuration

Each Specification_allocation has target_product_object defined by zero or one Ee_product_configuration objects. Each Ee_product_configuration defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1189 Specification_allocation to Ee_product_definition

Each Specification_allocation has target_product_object defined by zero or one Ee_product_definition objects. Each Ee_product_definition defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1190 Specification_allocation to Ee_product_version

Each Specification_allocation has target_product_object defined by zero or one Ee_product_version objects. Each Ee_product_version defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1191 Specification_allocation to Ee_product

Each Specification_allocation has target_product_object defined by zero or one Ee_product objects. Each Ee_product defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1192 Specification_allocation to Part_feature

Each Specification_allocation has target_product_object defined by zero or one Part_feature objects. Each Part_feature defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1193 Specification_allocation to Physical_connectivity_element

Each Specification_allocation has target_product_object defined by zero or one Physical_connectivity_element objects. Each Physical_connectivity_element defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1194 Specification_allocation to Physical_connectivity_definition

Each Specification_allocation has target_product_object defined by zero or one Physical_connectivity_definition objects. Each Physical_connectivity_definition defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1195 Specification_allocation to Laminate_component

Each Specification_allocation has target_product_object defined by zero or one Laminate_component objects. Each Laminate_component defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1196 Specification_allocation to Inter_stratum_feature

Each Specification_allocation has target_product_object defined by zero or one Inter_stratum_feature objects. Each Inter_stratum_feature defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1197 Specification_allocation to Stratum_feature

Each Specification_allocation has target_product_object defined by zero or one Stratum_feature objects. Each Stratum_feature defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1198 Specification_allocation to Stratum

Each Specification_allocation has target_product_object defined by zero or one Stratum objects. Each Stratum defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1199 Specification_allocation to Stratum_surface

Each Specification_allocation has target_product_object defined by zero or one Stratum_surface objects. Each Stratum_surface defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1200 Specification_allocation to Ee_requirement_occurrence

Each Specification_allocation has target_product_object defined by zero or one Ee_requirement_occurrence objects. Each Ee_requirement_occurrence defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1201 Specification_allocation to Assembly_component

Each Specification_allocation has target_product_object defined by zero or one Assembly_component objects. Each Assembly_component defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1202 Specification_allocation to Component_external_reference

Each Specification_allocation has target_product_object defined by zero or one Component_external_reference objects. Each Component_external_reference defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1203 Specification_allocation to Component_feature

Each Specification_allocation has target_product_object defined by zero or one Component_feature objects. Each Component_feature defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1204 Specification_allocation to Component_feature_external_reference

Each Specification_allocation has target_product_object defined by zero or one Component_feature_external_reference objects. Each Component_feature_external_reference defines target_product_object for zero, one, or more Specification_allocation objects. This assertion is established through a SELECT type.

4.3.1205 Specification_allocation to Ee_specification

Each Specification_allocation has allocated_specification defined by exactly one Ee_specification. Each Ee_specification defines allocated_specification for zero, one, or more Specification_allocation objects.

4.3.1206 Statistical_dimensional_tolerance to Ee_requirement_occurrence

Each Statistical_dimensional_tolerance has statistical_control_requirement defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines statistical_control_requirement for zero, one, or more Statistical_dimensional_tolerance objects.

4.3.1207 Statistical_dimensional_tolerance to Dimensional_characteristic

Each Statistical_dimensional_tolerance has alternate_dimension defined by exactly one Dimensional_characteristic. Each Dimensional_characteristic defines alternate_dimension for zero, one, or more Statistical_dimensional_tolerance objects.

4.3.1208 Statistical_geometric_tolerance to Ee_requirement_occurrence

Each Statistical_geometric_tolerance has statistical_control_requirement defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines statistical_control_requirement for zero, one, or more Statistical_geometric_tolerance objects.

4.3.1209 Statistical_geometric_tolerance to Geometric_tolerance

Each Statistical_geometric_tolerance has alternate_tolerance defined by exactly one Geometric_tolerance. Each Geometric_tolerance defines alternate_tolerance for zero, one, or more Statistical_geometric_tolerance objects.

4.3.1210 Step_edge_feature_shape to Length_data_element

Each Step_edge_feature_shape has minimum_step_depth defined by exactly one Length_data_element. Each Length_data_element defines minimum_step_depth for zero, one, or more Step_edge_feature_shape objects. Each Step_edge_feature_shape has maximum_step_depth defined by exactly one Length_data_element. Each Length_data_element defines maximum_step_depth for zero, one, or more Step_edge_feature_shape objects. Each Step_edge_feature_shape has maximum_step_width defined by exactly one Length_data_element. Each Length_data_element defines maximum_step_width for zero, one, or more Step_edge_feature_shape objects. Each Step_edge_feature_shape has minimum_step_width defined by exactly one Length_data_element. Each Length_data_element defines minimum_step_width for zero, one, or more Step_edge_feature_shape objects.

4.3.1211 Stratum to Stratum_technology

Each Stratum has of_technology defined by exactly one Stratum_technology. Each Stratum_technology defines of_technology for zero, one, or more Stratum objects.

4.3.1212 Stratum to External_definition

Each Stratum has stratum_usage defined by exactly one External_definition. Each External_definition defines stratum_usage for zero, one, or more Stratum objects.

4.3.1213 Stratum_3d_shape to Stratum

Each Stratum_3d_shape has shape_characterized_stratum defined by exactly one Stratum. Each Stratum defines shape_characterized_stratum for zero or one Stratum_3d_shape objects.

4.3.1214 Stratum_average_surface to Stratum

Each Stratum_average_surface has of_stratum defined by exactly one Stratum. Each Stratum defines of_stratum for zero or one Stratum_average_surface objects.

4.3.1215 Stratum_average_surface_shape to Stratum_average_surface

Each Stratum_average_surface_shape has of_surface defined by exactly one Stratum_average_surface. Each Stratum_average_surface defines of_surface for zero or one Stratum_average_surface_shape objects.

4.3.1216 Stratum_concept_relationship to Ee_requirement_occurrence

Each Stratum_concept_relationship has technology_requirement defined by one or more Ee_requirement_occurrence objects. Each Ee_requirement_occurrence defines technology_requirement for zero, one, or more Stratum_concept_relationship objects.

4.3.1217 Stratum_concept_relationship to Feature_shape_definition

Each Stratum_concept_relationship has resulting_shape defined by exactly one Feature_shape_definition. Each Feature_shape_definition defines resulting_shape for zero, one, or more Stratum_concept_relationship objects.

4.3.1218 Stratum_concept_to_physical_usage_view_assignment to Part_feature

Each Stratum_concept_to_physical_usage_view_assignment has defined_part_feature defined by exactly one Part_feature. Each Part_feature defines defined_part_feature for zero or one Stratum_concept_to_physical_usage_view_assignment objects.

4.3.1219 Stratum_concept_to_physical_usage_view_assignment to Laminate_component

Each Stratum_concept_to_physical_usage_view_assignment has assigned_design_object defined by zero or one Laminate_component objects. Each Laminate_component defines assigned_design_object for zero, one, or more Stratum_concept_to_physical_usage_view_assignment objects. This assertion is established through a SELECT type.

4.3.1220 Stratum_concept_to_physical_usage_view_assignment to Inter_stratum_feature

Each Stratum_concept_to_physical_usage_view_assignment has assigned_design_object defined by zero or one Inter_stratum_feature objects. Each Inter_stratum_feature defines assigned_design_object for zero, one, or more Stratum_concept_to_physical_usage_view_assignment objects. This assertion is established through a SELECT type.

4.3.1221 Stratum_concept_to_physical_usage_view_assignment to Stratum_feature

Each Stratum_concept_to_physical_usage_view_assignment has assigned_design_object defined by zero or one Stratum_feature objects. Each Stratum_feature defines assigned_design_object for zero, one, or more Stratum_concept_to_physical_usage_view_assignment objects. This assertion is established through a SELECT type.

4.3.1222 Stratum_concept_to_physical_usage_view_assignment to Stratum

Each Stratum_concept_to_physical_usage_view_assignment has assigned_design_object defined by zero or one Stratum objects. Each Stratum defines assigned_design_object for zero, one, or more Stratum_concept_to_physical_usage_view_assignment objects. This assertion is established through a SELECT type.

4.3.1223 Stratum_concept_to_physical_usage_view_assignment to Stratum_surface

Each Stratum_concept_to_physical_usage_view_assignment has assigned_design_object defined by zero or one Stratum_surface objects. Each Stratum_surface defines assigned_design_object for zero, one, or more Stratum_concept_to_physical_usage_view_assignment objects. This assertion is established through a SELECT type.

4.3.1224 Stratum_feature to Stratum

Each Stratum_feature has resident_stratum defined by exactly one Stratum. Each Stratum defines resident_stratum for zero, one, or more Stratum_feature objects.

4.3.1225 Stratum_feature_3d_shape to Stratum_feature

Each Stratum_feature_3d_shape has represented_stratum_feature defined by exactly one Stratum_feature. Each Stratum_feature defines represented_stratum_feature for zero, one, or more Stratum_feature_3d_shape objects.

4.3.1226 Stratum_feature_conductive_join to Stratum_feature_template_component

Each Stratum_feature_conductive_join has relating_concept defined by exactly one Stratum_feature_template_component. Each Stratum_feature_template_component defines relating_concept for zero, one, or more Stratum_feature_conductive_join objects. Each Stratum_feature_conductive_join has related_concept defined by exactly one Stratum_feature_template_component. Each Stratum_feature_template_component defines related_concept for zero, one, or more Stratum_feature_conductive_join objects.

4.3.1227 Stratum_feature_in_stratum_3d_position to Stratum_feature_non_planar_2d_shape

Each Stratum_feature_in_stratum_3d_position has feature_shape defined by zero or one Stratum_feature_non_planar_2d_shape objects. Each Stratum_feature_non_planar_2d_shape defines feature_shape for zero, one, or more Stratum_feature_in_stratum_3d_position objects. This assertion is established through a SELECT type.

4.3.1228 Stratum_feature_in_stratum_3d_position to Stratum_feature_3d_shape

Each Stratum_feature_in_stratum_3d_position has feature_shape defined by zero or one Stratum_feature_3d_shape objects. Each Stratum_feature_3d_shape defines feature_shape for zero, one, or more Stratum_feature_in_stratum_3d_position objects. This assertion is established through a SELECT type.

4.3.1229 Stratum_feature_in_stratum_3d_position to Axis_placement_3d

Each Stratum_feature_in_stratum_3d_position has transformation defined by exactly one Axis_placement_3d. Each Axis_placement_3d defines transformation for zero, one, or more Stratum_feature_in_stratum_3d_position objects.

4.3.1230 Stratum_feature_in_stratum_3d_position to Stratum_3d_shape

Each Stratum_feature_in_stratum_3d_position has stratum_shape defined by exactly one Stratum_3d_shape. Each Stratum_3d_shape defines stratum_shape for zero, one, or more Stratum_feature_in_stratum_3d_position objects.

4.3.1231 Stratum_feature_in_stratum_planar_position to Stratum_feature_styled_area_representation

Each Stratum_feature_in_stratum_planar_position has feature_shape defined by zero or one Stratum_feature_styled_area_representation objects. Each Stratum_feature_styled_area_representation defines feature_shape for zero, one, or more Stratum_feature_in_stratum_planar_position objects. This assertion is established through a SELECT type.

4.3.1232 Stratum_feature_in_stratum_planar_position to Stratum_feature_planar_shape

Each Stratum_feature_in_stratum_planar_position has feature_shape defined by zero or one Stratum_feature_planar_shape objects. Each Stratum_feature_planar_shape defines feature_shape for zero, one, or more Stratum_feature_in_stratum_planar_position objects. This assertion is established through a SELECT type.

4.3.1233 Stratum_feature_in_stratum_planar_position to Axis_placement_2d

Each Stratum_feature_in_stratum_planar_position has transformation defined by exactly one Axis_placement_2d. Each Axis_placement_2d defines transformation for zero, one, or more Stratum_feature_in_stratum_planar_position objects.

4.3.1234 Stratum_feature_in_stratum_planar_position to Stratum_planar_shape

Each Stratum_feature_in_stratum_planar_position has stratum_shape defined by exactly one Stratum_planar_shape. Each Stratum_planar_shape defines stratum_shape for zero, one, or more Stratum_feature_in_stratum_planar_position objects.

4.3.1235 Stratum_feature_non_planar_2d_shape to Stratum_feature

Each Stratum_feature_non_planar_2d_shape has represented_stratum_feature defined by exactly one Stratum_feature. Each Stratum_feature defines represented_stratum_feature for zero, one, or more Stratum_feature_non_planar_2d_shape objects.

4.3.1236 Stratum_feature_planar_shape to Stratum_feature

Each Stratum_feature_planar_shape has represented_stratum_feature defined by exactly one Stratum_feature. Each Stratum_feature defines represented_stratum_feature for zero, one, or more Stratum_feature_planar_shape objects.

4.3.1237 Stratum_feature_shape_stratum_average_surface_shape_relationship to Stratum_average_surface_shape

Each Stratum_feature_shape_stratum_average_surface_shape_relationship has of_stratum_average_surface_shape defined by exactly one Stratum_average_surface_shape. Each Stratum_average_surface_shape defines of_stratum_average_surface_shape for zero, one, or more Stratum_feature_shape_stratum_average_surface_shape_relationship objects.

4.3.1238 Stratum_feature_shape_stratum_average_surface_shape_relationship to Stratum_feature_non_planar_2d_shape

Each Stratum_feature_shape_stratum_average_surface_shape_relationship has of_stratum_feature_shape defined by exactly one Stratum_feature_non_planar_2d_shape. Each Stratum_feature_non_planar_2d_shape defines of_stratum_feature_shape for zero, one, or more Stratum_feature_shape_stratum_average_surface_shape_relationship objects.

4.3.1239 Stratum_feature_shape_stratum_surface_shape_relationship to Stratum_surface_shape

Each Stratum_feature_shape_stratum_surface_shape_relationship has of_stratum_surface_shape defined by exactly one Stratum_surface_shape. Each Stratum_surface_shape defines of_stratum_surface_shape for zero, one, or more Stratum_feature_shape_stratum_surface_shape_relationship objects.

4.3.1240 Stratum_feature_shape_stratum_surface_shape_relationship to Stratum_feature_non_planar_2d_shape

Each Stratum_feature_shape_stratum_surface_shape_relationship has of_stratum_feature_shape defined by exactly one Stratum_feature_non_planar_2d_shape. Each Stratum_feature_non_planar_2d_shape defines of_stratum_feature_shape for zero, one, or more Stratum_feature_shape_stratum_surface_shape_relationship objects.

4.3.1241 Stratum_feature_styled_area_representation to Stratum_feature

Each Stratum_feature_styled_area_representation has represented_stratum_feature defined by exactly one Stratum_feature. Each Stratum_feature defines represented_stratum_feature for zero, one, or more Stratum_feature_styled_area_representation objects.

4.3.1242 Stratum_feature_styled_area_representation to Fill_area_occurrence

Each Stratum_feature_styled_area_representation has shape_styled_area_representation defined by zero or one Fill_area_occurrence objects. Each Fill_area_occurrence defines shape_styled_area_representation for zero, one, or more Stratum_feature_styled_area_representation objects. This assertion is established through a SELECT type.

4.3.1243 Stratum_feature_styled_area_representation to Styled_curve_occurrence

Each Stratum_feature_styled_area_representation has shape_styled_area_representation defined by zero or one Styled_curve_occurrence objects. Each Styled_curve_occurrence defines shape_styled_area_representation for zero, one, or more Stratum_feature_styled_area_representation objects. This assertion is established through a SELECT type.

4.3.1244 Stratum_feature_styled_area_representation to Stratum_feature_planar_shape

Each Stratum_feature_styled_area_representation has derived_planar_shape defined by one or more Stratum_feature_planar_shape objects. Each Stratum_feature_planar_shape defines derived_planar_shape for zero, one, or more Stratum_feature_styled_area_representation objects.

4.3.1245 Stratum_feature_template to Stratum_technology

Each Stratum_feature_template has of_stratum_technology defined by exactly one Stratum_technology. Each Stratum_technology defines of_stratum_technology for zero, one, or more Stratum_feature_template objects.

4.3.1246 Stratum_feature_template_component to Padstack_definition

Each Stratum_feature_template_component has reference_padstack defined by exactly one Padstack_definition. Each Padstack_definition defines reference_padstack for zero, one, or more Stratum_feature_template_component objects.

4.3.1247 Stratum_feature_template_component to Stratum_feature

Each Stratum_feature_template_component has stratum_feature_implementation defined by exactly one Stratum_feature. Each Stratum_feature defines stratum_feature_implementation for zero, one, or more Stratum_feature_template_component objects.

4.3.1248 Stratum_feature_template_component to Stratum_feature_template

Each Stratum_feature_template_component has usage_definition defined by exactly one Stratum_feature_template. Each Stratum_feature_template defines usage_definition for zero, one, or more Stratum_feature_template_component objects.

4.3.1249 Stratum_interconnect_module_3d_position to Axis_placement_3d

Each Stratum_interconnect_module_3d_position has transformation defined by exactly one Axis_placement_3d. Each Axis_placement_3d defines transformation for zero, one, or more Stratum_interconnect_module_3d_position objects.

4.3.1250 Stratum_interconnect_module_3d_position to Physical_unit_3d_shape

Each Stratum_interconnect_module_3d_position has interconnect_module_shape defined by exactly one Physical_unit_3d_shape. Each Physical_unit_3d_shape defines interconnect_module_shape for zero, one, or more Stratum_interconnect_module_3d_position objects.

4.3.1251 Stratum_interconnect_module_3d_position to Stratum_3d_shape

Each Stratum_interconnect_module_3d_position has stratum_shape defined by exactly one Stratum_3d_shape. Each Stratum_3d_shape defines stratum_shape for zero, one, or more Stratum_interconnect_module_3d_position objects.

4.3.1252 Stratum_interconnect_module_3d_position to Interconnect_module_stratum_assembly_relationship

Each Stratum_interconnect_module_3d_position has stratum_component defined by exactly one Interconnect_module_stratum_assembly_relationship. Each Interconnect_module_stratum_assembly_relationship defines stratum_component for zero or one Stratum_interconnect_module_3d_position objects.

4.3.1253 Stratum_interconnect_module_planar_position to Axis_placement_2d

Each Stratum_interconnect_module_planar_position has transformation defined by exactly one Axis_placement_2d. Each Axis_placement_2d defines transformation for zero, one, or more Stratum_interconnect_module_planar_position objects.

4.3.1254 Stratum_interconnect_module_planar_position to Physical_unit_planar_shape

Each Stratum_interconnect_module_planar_position has interconnect_module_shape defined by exactly one Physical_unit_planar_shape. Each Physical_unit_planar_shape defines interconnect_module_shape for zero, one, or more Stratum_interconnect_module_planar_position objects.

4.3.1255 Stratum_interconnect_module_planar_position to Stratum_planar_shape

Each Stratum_interconnect_module_planar_position has stratum_shape defined by exactly one Stratum_planar_shape. Each Stratum_planar_shape defines stratum_shape for zero, one, or more Stratum_interconnect_module_planar_position objects.

4.3.1256 Stratum_interconnect_module_planar_position to Interconnect_module_stratum_assembly_relationship

Each Stratum_interconnect_module_planar_position has stratum_component defined by exactly one Interconnect_module_stratum_assembly_relationship. Each Interconnect_module_stratum_assembly_relationship defines stratum_component for zero or one Stratum_interconnect_module_planar_position objects.

4.3.1257 Stratum_make_from_relationship to Stratum

Each Stratum_make_from_relationship has resultant_stratum defined by exactly one Stratum. Each Stratum defines resultant_stratum for zero, one, or more Stratum_make_from_relationship objects. Each Stratum_make_from_relationship has reusable_stratum defined by exactly one Stratum. Each Stratum defines reusable_stratum for zero, one, or more Stratum_make_from_relationship objects.

4.3.1258 Stratum_planar_shape to Stratum

Each Stratum_planar_shape has shape_characterized_stratum defined by exactly one Stratum. Each Stratum defines shape_characterized_stratum for zero or one Stratum_planar_shape objects.

4.3.1259 Stratum_surface to Stratum

Each Stratum_surface has of_stratum defined by exactly one Stratum. Each Stratum defines of_stratum for one or two Stratum_surface objects.

4.3.1260 Stratum_surface_in_stratum_3d_position to Stratum_surface_shape

Each Stratum_surface_in_stratum_3d_position has surface_shape defined by zero or one Stratum_surface_shape objects. Each Stratum_surface_shape defines surface_shape for zero, one, or more Stratum_surface_in_stratum_3d_position objects. This assertion is established through a SELECT type.

4.3.1261 Stratum_surface_in_stratum_3d_position to Stratum_average_surface_shape

Each Stratum_surface_in_stratum_3d_position has surface_shape defined by zero or one Stratum_average_surface_shape objects. Each Stratum_average_surface_shape defines surface_shape for zero, one, or more Stratum_surface_in_stratum_3d_position objects. This assertion is established through a SELECT type.

4.3.1262 Stratum_surface_in_stratum_3d_position to Axis_placement_3d

Each Stratum_surface_in_stratum_3d_position has transformation defined by exactly one Axis_placement_3d. Each Axis_placement_3d defines transformation for zero, one, or more Stratum_surface_in_stratum_3d_position objects.

4.3.1263 Stratum_surface_in_stratum_3d_position to Stratum_3d_shape

Each Stratum_surface_in_stratum_3d_position has stratum_shape defined by exactly one Stratum_3d_shape. Each Stratum_3d_shape defines stratum_shape for zero, one, or more Stratum_surface_in_stratum_3d_position objects.

4.3.1264 Stratum_surface_shape to Stratum_surface

Each Stratum_surface_shape has of_surface defined by exactly one Stratum_surface. Each Stratum_surface defines of_surface for zero or one Stratum_surface_shape objects.

4.3.1265 Stratum_technology to Process_specification

Each Stratum_technology has specification defined by exactly one Process_specification. Each Process_specification defines specification for zero, one, or more Stratum_technology objects.

4.3.1266 Stratum_technology to Length_data_element

Each Stratum_technology has maximum_feature_size_requirement defined by exactly one Length_data_element. Each Length_data_element defines maximum_feature_size_requirement for zero, one, or more Stratum_technology objects. Each Stratum_technology has minimum_finished_feature_spacing defined by exactly one Length_data_element. Each Length_data_element defines minimum_finished_feature_spacing for zero, one, or more Stratum_technology objects. Each Stratum_technology has minimum_finished_feature_size defined by exactly one Length_data_element. Each Length_data_element defines minimum_finished_feature_size for zero, one, or more Stratum_technology objects. Each Stratum_technology has minimum_stratum_thickness defined by exactly one Length_data_element. Each Length_data_element defines minimum_stratum_thickness for zero, one, or more Stratum_technology objects. Each Stratum_technology has maximum_stratum_thickness defined by exactly one Length_data_element. Each Length_data_element defines maximum_stratum_thickness for zero, one, or more Stratum_technology objects.

4.3.1267 Stratum_technology to Ee_material

Each Stratum_technology has stratum_material defined by exactly one Ee_material. Each Ee_material defines stratum_material for zero, one, or more Stratum_technology objects.

4.3.1268 Stratum_technology_link to Stratum_technology_link

Each Stratum_technology_link has precedent_stratum_technology_link defined by exactly one Stratum_technology_link. Each Stratum_technology_link defines precedent_stratum_technology_link for zero, one, or more Stratum_technology_link objects.

4.3.1269 Stratum_technology_link to Stratum_technology

Each Stratum_technology_link has subsequent_stratum_technology defined by exactly one Stratum_technology. Each Stratum_technology defines subsequent_stratum_technology for zero, one, or more Stratum_technology_link objects. Each Stratum_technology_link has precedent_stratum_technology defined by exactly one Stratum_technology. Each Stratum_technology defines precedent_stratum_technology for zero, one, or more Stratum_technology_link objects.

4.3.1270 Structured_text to Structured_text

Each Structured_text has structured_text_content defined by one or more Structured_text objects. Each Structured_text defines structured_text_content for zero, one, or more Structured_text objects. Each Structured_text has precedent_structured_text defined by exactly one Structured_text. Each Structured_text defines precedent_structured_text for zero, one, or more Structured_text objects.

4.3.1271 Structured_text to Ee_text

Each Structured_text has plain_text_content defined by exactly one Ee_text. Each Ee_text defines plain_text_content for zero, one, or more Structured_text objects.

4.3.1272 Structured_text to External_definition

Each Structured_text has content_markup defined by exactly one External_definition. Each External_definition defines content_markup for zero, one, or more Structured_text objects.

4.3.1273 Styled_curve_occurrence to Curve_style

Each Styled_curve_occurrence has of_curve_style defined by exactly one Curve_style. Each Curve_style defines of_curve_style for zero, one, or more Styled_curve_occurrence objects.

4.3.1274 Styled_curve_occurrence to Curve

Each Styled_curve_occurrence has styled_curve defined by exactly one Curve. Each Curve defines styled_curve for zero, one, or more Styled_curve_occurrence objects.

4.3.1275 Styled_text to Registered_font

Each Styled_text has text_font defined by zero or one Registered_font objects. Each Registered_font defines text_font for zero, one, or more Styled_text objects. This assertion is established through a SELECT type.

4.3.1276 Styled_text to Font_definition

Each Styled_text has text_font defined by zero or one Font_definition objects. Each Font_definition defines text_font for zero, one, or more Styled_text objects. This assertion is established through a SELECT type.

4.3.1277 Substitute_product to Assembly_composition_relationship

Each Substitute_product has substitutable_component defined by exactly one Assembly_composition_relationship. Each Assembly_composition_relationship defines substitutable_component for zero, one, or more Substitute_product objects.

4.3.1278 Substitute_product to Ee_product

Each Substitute_product has defined_alternate_product defined by one or more Ee_product objects. Each Ee_product defines defined_alternate_product for zero, one, or more Substitute_product objects.

4.3.1279 Sub_assembly_relationship to Assembly_group_component

Each Sub_assembly_relationship has relating_component defined by exactly one Assembly_group_component. Each Assembly_group_component defines relating_component for one or more Sub_assembly_relationship objects.

4.3.1280 Sub_assembly_relationship to Assembly_component

Each Sub_assembly_relationship has related_component defined by exactly one Assembly_component. Each Assembly_component defines related_component for zero, one, or more Sub_assembly_relationship objects.

4.3.1281 Supplied_product_version to Organization

Each Supplied_product_version has supplier defined by exactly one Organization. Each Organization defines supplier for zero, one, or more Supplied_product_version objects.

4.3.1282 Supplied_product_version to Ee_approval

Each Supplied_product_version has supplied_product_version_approval defined by exactly one Ee_approval. Each Ee_approval defines supplied_product_version_approval for zero, one, or more Supplied_product_version objects.

4.3.1283 Supplied_product_version to Ee_product_version

Each Supplied_product_version has supplied_product_version defined by exactly one Ee_product_version. Each Ee_product_version defines supplied_product_version for zero, one, or more Supplied_product_version objects.

4.3.1284 Surface_prepped_terminal to Surface_finish_specification

Each Surface_prepped_terminal has surface_preparation defined by exactly one Surface_finish_specification. Each Surface_finish_specification defines surface_preparation for zero, one, or more Surface_prepped_terminal objects.

4.3.1285 Symmetrical_tolerance_characteristic to Numeric_parameter

Each Symmetrical_tolerance_characteristic has component_characteristic defined by exactly two Numeric_parameter objects. Each Numeric_parameter defines component_characteristic for zero, one, or more Symmetrical_tolerance_characteristic objects.

4.3.1286 Technology to Ee_material

Each Technology has material_product_system defined by exactly one Ee_material. Each Ee_material defines material_product_system for zero, one, or more Technology objects.

4.3.1287 Technology to External_definition

Each Technology has classification defined by exactly one External_definition. Each External_definition defines classification for zero, one, or more Technology objects.

4.3.1288 Technology to Process_specification

Each Technology has process_technology defined by exactly one Process_specification. Each Process_specification defines process_technology for zero, one, or more Technology objects.

4.3.1289 Template_material_cross_section_boundary to Printed_part_template_material

Each Template_material_cross_section_boundary has associated_definition defined by exactly one Printed_part_template_material. Each Printed_part_template_material defines associated_definition for zero, one, two, three, or four Template_material_cross_section_boundary objects.

4.3.1290 Template_stratum_assignment to Stratum

Each Template_stratum_assignment has bound_stratum defined by exactly one Stratum. Each Stratum defines bound_stratum for zero, one, or more Template_stratum_assignment objects.

4.3.1291 Template_stratum_assignment to Stratum_feature_template

Each Template_stratum_assignment has bound_template defined by zero or one Stratum_feature_template objects. Each Stratum_feature_template defines bound_template for zero, one, or more Template_stratum_assignment objects. This assertion is established through a SELECT type.

4.3.1292 Template_stratum_assignment to Material_addition_feature_template

Each Template_stratum_assignment has bound_template defined by zero or one Material_addition_feature_template objects. Each Material_addition_feature_template defines bound_template for zero, one, or more Template_stratum_assignment objects. This assertion is established through a SELECT type.

4.3.1293 Template_stratum_assignment to Material_removal_feature_template

Each Template_stratum_assignment has bound_template defined by zero or one Material_removal_feature_template objects. Each Material_removal_feature_template defines bound_template for zero, one, or more Template_stratum_assignment objects. This assertion is established through a SELECT type.

4.3.1294 Terminal_pair_port_equivalence_relationship to Analytical_model_scalar_port

Each Terminal_pair_port_equivalence_relationship has scalar_ports defined by exactly two Analytical_model_scalar_port objects. Each Analytical_model_scalar_port defines scalar_ports for zero, one, or more Terminal_pair_port_equivalence_relationship objects.

4.3.1295 Terminal_pair_port_equivalence_relationship to Analytical_model_port

Each Terminal_pair_port_equivalence_relationship has equivalent_port defined by exactly one Analytical_model_port. Each Analytical_model_port defines equivalent_port for zero, one, or more Terminal_pair_port_equivalence_relationship objects.

4.3.1296 Terminal_swap_specification to Functional_unit_terminal_node_assignment

Each Terminal_swap_specification has current_design_object defined by exactly one Functional_unit_terminal_node_assignment. Each Functional_unit_terminal_node_assignment defines current_design_object for zero, one, or more Terminal_swap_specification objects. Each Terminal_swap_specification has previous_design_object defined by exactly one Functional_unit_terminal_node_assignment. Each Functional_unit_terminal_node_assignment defines previous_design_object for zero, one, or more Terminal_swap_specification objects.

4.3.1297 Termination_constraint to Ee_requirement_occurrence

Each Termination_constraint has termination_usage_constraint defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines termination_usage_constraint for zero, one, or more Termination_constraint objects.

4.3.1298 Termination_constraint to Mating_connector_termination

Each Termination_constraint has constrained_termination defined by two or more Mating_connector_termination objects. Each Mating_connector_termination defines constrained_termination for zero, one, or more Termination_constraint objects.

4.3.1299 Tertiary_orientation_feature to Package_body_surface

Each Tertiary_orientation_feature has associated_body_vertical_extent defined by one or two Package_body_surface objects. Each Package_body_surface defines associated_body_vertical_extent for zero, one, or more Tertiary_orientation_feature objects.

4.3.1300 Test_requirement_allocation to Functional_usage_view_to_part_terminal_assignment

Each Test_requirement_allocation has functional_specification_based_test_access defined by one or more Functional_usage_view_to_part_terminal_assignment objects. Each Functional_usage_view_to_part_terminal_assignment defines functional_specification_based_test_access for zero, one, or more Test_requirement_allocation objects.

4.3.1301 Test_requirement_allocation to Part_feature_model_port_assignment

Each Test_requirement_allocation has analytical_model_based_test_access defined by one or more Part_feature_model_port_assignment objects. Each Part_feature_model_port_assignment defines analytical_model_based_test_access for zero, one, or more Test_requirement_allocation objects.

4.3.1302 Test_requirement_allocation to Test_requirement_occurrence

Each Test_requirement_allocation has allocated_requirement defined by exactly one Test_requirement_occurrence. Each Test_requirement_occurrence defines allocated_requirement for zero, one, or more Test_requirement_allocation objects.

4.3.1303 Test_requirement_allocation to Ee_product_version

Each Test_requirement_allocation has target_product_object defined by exactly one Ee_product_version. Each Ee_product_version defines target_product_object for zero, one, or more Test_requirement_allocation objects.

4.3.1304 Thermal_isolation_laminate_component to Thermal_isolation_removal_template

Each Thermal_isolation_laminate_component has usage_definition defined by exactly one Thermal_isolation_removal_template. Each Thermal_isolation_removal_template defines usage_definition for zero, one, or more Thermal_isolation_laminate_component objects.

4.3.1305 Thermal_isolation_requirement_assignment to Ee_requirement_occurrence

Each Thermal_isolation_requirement_assignment has angular_orientation_requirement defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines angular_orientation_requirement for zero, one, or more Thermal_isolation_requirement_assignment objects. Each Thermal_isolation_requirement_assignment has effective_current_capacity_requirement defined by exactly one Ee_requirement_occurrence. Each Ee_requirement_occurrence defines effective_current_capacity_requirement for zero, one, or more Thermal_isolation_requirement_assignment objects.

4.3.1306 Thermal_isolation_requirement_assignment to Layout_spacing_requirement_occurrence

Each Thermal_isolation_requirement_assignment has thermal_isolation_spacing_requirement defined by exactly one Layout_spacing_requirement_occurrence. Each Layout_spacing_requirement_occurrence defines thermal_isolation_spacing_requirement for zero, one, or more Thermal_isolation_requirement_assignment objects.

4.3.1307 Thermal_isolation_requirement_assignment to Thermal_isolation_removal_structure

Each Thermal_isolation_requirement_assignment has resulting_structure defined by zero or one Thermal_isolation_removal_structure objects. Each Thermal_isolation_removal_structure defines resulting_structure for zero, one, or more Thermal_isolation_requirement_assignment objects. This assertion is established through a SELECT type.

4.3.1308 Thermal_isolation_requirement_assignment to Thermal_isolation_removal_template

Each Thermal_isolation_requirement_assignment has resulting_structure defined by zero or one Thermal_isolation_removal_template objects. Each Thermal_isolation_removal_template defines resulting_structure for zero, one, or more Thermal_isolation_requirement_assignment objects. This assertion is established through a SELECT type.

4.3.1309 Thermal_requirement_allocation to Thermal_requirement_occurrence

Each Thermal_requirement_allocation has requirement defined by exactly one Thermal_requirement_occurrence. Each Thermal_requirement_occurrence defines requirement for zero, one, or more Thermal_requirement_allocation objects.

4.3.1310 Thermal_requirement_allocation to Thermal_component

Each Thermal_requirement_allocation has assembly_assignment defined by exactly one Thermal_component. Each Thermal_component defines assembly_assignment for zero, one, or more Thermal_requirement_allocation objects.

4.3.1311 Tolerance_characteristic to Numeric_parameter

Each Tolerance_characteristic has component_characteristic defined by one or more Numeric_parameter objects. Each Numeric_parameter defines component_characteristic for zero, one, or more Tolerance_characteristic objects.

4.3.1312 Tolerance_specific_restraint_condition to Geometric_tolerance

Each Tolerance_specific_restraint_condition has affected_tolerances defined by zero or one Geometric_tolerance objects. Each Geometric_tolerance defines affected_tolerances for zero, one, or more Tolerance_specific_restraint_condition objects. This assertion is established through a SELECT type.

4.3.1313 Tolerance_specific_restraint_condition to Dimensional_characteristic

Each Tolerance_specific_restraint_condition has affected_tolerances defined by zero or one Dimensional_characteristic objects. Each Dimensional_characteristic defines affected_tolerances for zero, one, or more Tolerance_specific_restraint_condition objects. This assertion is established through a SELECT type.

4.3.1314 Tolerance_zone to Tolerance_zone_boundary

Each Tolerance_zone has zone_boundary defined by exactly one Tolerance_zone_boundary. Each Tolerance_zone_boundary defines zone_boundary for zero, one, or more Tolerance_zone objects.

4.3.1315 Tolerance_zone_and_viewing_plane_orienting_relationship to Tolerance_zone

Each Tolerance_zone_and_viewing_plane_orienting_relationship has oriented_tolerance_zone defined by exactly one Tolerance_zone. Each Tolerance_zone defines oriented_tolerance_zone for zero, one, or more Tolerance_zone_and_viewing_plane_orienting_relationship objects.

4.3.1316 Tolerance_zone_and_viewing_plane_orienting_relationship to Viewing_plane

Each Tolerance_zone_and_viewing_plane_orienting_relationship has orienting_viewing_plane defined by exactly one Viewing_plane. Each Viewing_plane defines orienting_viewing_plane for zero, one, or more Tolerance_zone_and_viewing_plane_orienting_relationship objects.

4.3.1317 Tolerance_zone_boundary_definition to Tolerance_zone_boundary

Each Tolerance_zone_boundary_definition has defined_zone_boundary defined by exactly one Tolerance_zone_boundary. Each Tolerance_zone_boundary defines defined_zone_boundary for zero, one, or more Tolerance_zone_boundary_definition objects.

4.3.1318 Tolerance_zone_boundary_member_offset to Length_data_element

Each Tolerance_zone_boundary_member_offset has offset_value defined by exactly one Length_data_element. Each Length_data_element defines offset_value for zero, one, or more Tolerance_zone_boundary_member_offset objects.

4.3.1319 Tolerance_zone_boundary_member_offset to Tolerance_zone_boundary_member

Each Tolerance_zone_boundary_member_offset has offset_tolerance_zone_boundary_member defined by exactly one Tolerance_zone_boundary_member. Each Tolerance_zone_boundary_member defines offset_tolerance_zone_boundary_member for zero, one, or more Tolerance_zone_boundary_member_offset objects.

4.3.1320 Tolerance_zone_definition to Tolerance_zone_form

Each Tolerance_zone_definition has form defined by exactly one Tolerance_zone_form. Each Tolerance_zone_form defines form for zero, one, or more Tolerance_zone_definition objects.

4.3.1321 Tolerance_zone_definition to Tolerance_zone_boundary_definition

Each Tolerance_zone_definition has boundary_definition defined by exactly one Tolerance_zone_boundary_definition. Each Tolerance_zone_boundary_definition defines boundary_definition for zero, one, or more Tolerance_zone_definition objects.

4.3.1322 Tolerance_zone_definition to Tolerance_zone

Each Tolerance_zone_definition has defined_tolerance_zone defined by exactly one Tolerance_zone. Each Tolerance_zone defines defined_tolerance_zone for zero, one, or more Tolerance_zone_definition objects.

4.3.1323 Tolerance_zone_definition_with_per_unit_size_specification to Tolerance_zone_per_unit_size_specification

Each Tolerance_zone_definition_with_per_unit_size_specification has per_unit_size_specification defined by exactly one Tolerance_zone_per_unit_size_specification. Each Tolerance_zone_per_unit_size_specification defines per_unit_size_specification for zero, one, or more Tolerance_zone_definition_with_per_unit_size_specification objects.

4.3.1324 Tolerance_zone_definition_with_specified_orientation to Datum_axis_related_orientation

Each Tolerance_zone_definition_with_specified_orientation has zone_orientation defined by zero or one Datum_axis_related_orientation objects. Each Datum_axis_related_orientation defines zone_orientation for zero, one, or more Tolerance_zone_definition_with_specified_orientation objects. This assertion is established through a SELECT type.

4.3.1325 Tolerance_zone_definition_with_specified_orientation to Viewing_plane_based_orientation

Each Tolerance_zone_definition_with_specified_orientation has zone_orientation defined by zero or one Viewing_plane_based_orientation objects. Each Viewing_plane_based_orientation defines zone_orientation for zero, one, or more Tolerance_zone_definition_with_specified_orientation objects. This assertion is established through a SELECT type.

4.3.1326 Tolerance_zone_definition_with_specified_orientation to Datum_based_vector_orientation

Each Tolerance_zone_definition_with_specified_orientation has zone_orientation defined by zero or one Datum_based_vector_orientation objects. Each Datum_based_vector_orientation defines zone_orientation for zero, one, or more Tolerance_zone_definition_with_specified_orientation objects. This assertion is established through a SELECT type.

4.3.1327 Tolerance_zone_explicit_opposing_boundary_set to Tolerance_zone_boundary_member

Each Tolerance_zone_explicit_opposing_boundary_set has boundary_members defined by exactly two Tolerance_zone_boundary_member objects. Each Tolerance_zone_boundary_member defines boundary_members for zero, one, or more Tolerance_zone_explicit_opposing_boundary_set objects.

4.3.1328 Tolerance_zone_form to Tolerance_zone

Each Tolerance_zone_form has characterized_tolerance_zone defined by exactly one Tolerance_zone. Each Tolerance_zone defines characterized_tolerance_zone for zero, one, or more Tolerance_zone_form objects.

4.3.1329 Tolerance_zone_per_unit_size_specification to Length_data_element

Each Tolerance_zone_per_unit_size_specification has per_unit_size defined by one or two Length_data_element objects. Each Length_data_element defines per_unit_size for zero, one, or more Tolerance_zone_per_unit_size_specification objects.

4.3.1330 Tolerance_zone_per_unit_size_specification to Tolerance_zone

Each Tolerance_zone_per_unit_size_specification has specified_tolerance_zone defined by exactly one Tolerance_zone. Each Tolerance_zone defines specified_tolerance_zone for zero, one, or more Tolerance_zone_per_unit_size_specification objects.

4.3.1331 Topological_junction to Physical_connectivity_structure_definition

Each Topological_junction has scope defined by exactly one Physical_connectivity_structure_definition. Each Physical_connectivity_structure_definition defines scope for zero, one, or more Topological_junction objects.

4.3.1332 Trace_template to Curve_style

Each Trace_template has trace_style defined by exactly one Curve_style. Each Curve_style defines trace_style for zero, one, or more Trace_template objects.

4.3.1333 Transmission_line_functional_unit_terminal_allocation to Transmission_line_functional_unit_to_routed_printed_component_allocation

Each Transmission_line_functional_unit_terminal_allocation has functional_unit_design_path defined by exactly one Transmission_line_functional_unit_to_routed_printed_component_allocation. Each Transmission_line_functional_unit_to_routed_printed_component_allocation defines functional_unit_design_path for zero, one, or more Transmission_line_functional_unit_terminal_allocation objects.

4.3.1334 Transmission_line_functional_unit_terminal_allocation to Functional_unit_terminal

Each Transmission_line_functional_unit_terminal_allocation has transmission_line_functional_unit_terminal defined by exactly one Functional_unit_terminal. Each Functional_unit_terminal defines transmission_line_functional_unit_terminal for zero, one, or more Transmission_line_functional_unit_terminal_allocation objects.

4.3.1335 Transmission_line_functional_unit_terminal_allocation to Printed_component_join_terminal

Each Transmission_line_functional_unit_terminal_allocation has implementation defined by exactly one Printed_component_join_terminal. Each Printed_component_join_terminal defines implementation for zero, one, or more Transmission_line_functional_unit_terminal_allocation objects.

4.3.1336 Transmission_line_functional_unit_to_routed_printed_component_allocation to Routed_printed_component

Each Transmission_line_functional_unit_to_routed_printed_component_allocation has implementation defined by exactly one Routed_printed_component. Each Routed_printed_component defines implementation for zero, one, or more Transmission_line_functional_unit_to_routed_printed_component_allocation objects.

4.3.1337 Trimmed_line to Cartesian_point

Each Trimmed_line has end_point defined by exactly one Cartesian_point. Each Cartesian_point defines end_point for zero, one, or more Trimmed_line objects. Each Trimmed_line has start_point defined by exactly one Cartesian_point. Each Cartesian_point defines start_point for zero, one, or more Trimmed_line objects.

4.3.1338 True_profile to Dimension_set

Each True_profile has profile_representation defined by zero or one Dimension_set objects. Each Dimension_set defines profile_representation for zero, one, or more True_profile objects. This assertion is established through a SELECT type.

4.3.1339 True_profile to Ee_document

Each True_profile has profile_representation defined by zero or one Ee_document objects. Each Ee_document defines profile_representation for zero, one, or more True_profile objects. This assertion is established through a SELECT type.

4.3.1340 True_profile to Ee_rule_function

Each True_profile has profile_representation defined by zero or one Ee_rule_function objects. Each Ee_rule_function defines profile_representation for zero, one, or more True_profile objects. This assertion is established through a SELECT type.

4.3.1341 True_profile to Bound_volume_shape

Each True_profile has profile_representation defined by zero or one Bound_volume_shape objects. Each Bound_volume_shape defines profile_representation for zero, one, or more True_profile objects. This assertion is established through a SELECT type.

4.3.1342 True_profile to Physical_feature_or_part_template

Each True_profile has profiled_surface defined by exactly one Physical_feature_or_part_template. Each Physical_feature_or_part_template defines profiled_surface for zero, one, or more True_profile objects.

4.3.1343 Unrouted_conductive_interconnect_element to Layer_connection_point_link

Each Unrouted_conductive_interconnect_element has connected_points defined by one or more Layer_connection_point_link objects. Each Layer_connection_point_link defines connected_points for zero, one, or more Unrouted_conductive_interconnect_element objects.

4.3.1344 Unsupported_passage to Unsupported_passage_template

Each Unsupported_passage has usage_definition defined by exactly one Unsupported_passage_template. Each Unsupported_passage_template defines usage_definition for zero, one, or more Unsupported_passage objects.

4.3.1345 Unsupported_passage_dependent_non_functional_land to Default_unsupported_passage_based_land_physical_template

Each Unsupported_passage_dependent_non_functional_land has usage_definition defined by exactly one Default_unsupported_passage_based_land_physical_template. Each Default_unsupported_passage_based_land_physical_template defines usage_definition for zero, one, or more Unsupported_passage_dependent_non_functional_land objects.

4.3.1346 Unsupported_passage_dependent_non_functional_land to Unsupported_passage

Each Unsupported_passage_dependent_non_functional_land has reference_passage defined by exactly one Unsupported_passage. Each Unsupported_passage defines reference_passage for zero, one, or more Unsupported_passage_dependent_non_functional_land objects.

4.3.1347 Unsupported_passage_template to Default_unsupported_passage_definition

Each Unsupported_passage_template has of_passage_technology defined by exactly one Default_unsupported_passage_definition. Each Default_unsupported_passage_definition defines of_passage_technology for zero, one, or more Unsupported_passage_template objects.

4.3.1348 Usage_concept_usage_relationship to Axis_placement

Each Usage_concept_usage_relationship has associated_usage_placement defined by exactly one Axis_placement. Each Axis_placement defines associated_usage_placement for zero, one, or more Usage_concept_usage_relationship objects.

4.3.1349 Usage_concept_usage_relationship to Shape_definition

Each Usage_concept_usage_relationship has associated_shape_definition defined by exactly one Shape_definition. Each Shape_definition defines associated_shape_definition for zero, one, or more Usage_concept_usage_relationship objects.

4.3.1350 Usage_concept_usage_relationship to Land_template_terminal

Each Usage_concept_usage_relationship has associated_usage defined by zero or one Land_template_terminal objects. Each Land_template_terminal defines associated_usage for zero or one Usage_concept_usage_relationship objects. This assertion is established through a SELECT type.

4.3.1351 Usage_concept_usage_relationship to Component_termination_passage_template_terminal

Each Usage_concept_usage_relationship has associated_usage defined by zero or one Component_termination_passage_template_terminal objects. Each Component_termination_passage_template_terminal defines associated_usage for zero or one Usage_concept_usage_relationship objects. This assertion is established through a SELECT type.

4.3.1352 Usage_concept_usage_relationship to Via_template_terminal

Each Usage_concept_usage_relationship has associated_usage defined by zero or one Via_template_terminal objects. Each Via_template_terminal defines associated_usage for zero or one Usage_concept_usage_relationship objects. This assertion is established through a SELECT type.

4.3.1353 Usage_concept_usage_relationship to Non_feature_shape_element

Each Usage_concept_usage_relationship has associated_usage defined by zero or one Non_feature_shape_element objects. Each Non_feature_shape_element defines associated_usage for zero, one, or more Usage_concept_usage_relationship objects. This assertion is established through a SELECT type.

4.3.1354 Usage_concept_usage_relationship to Part_feature

Each Usage_concept_usage_relationship has associated_usage defined by zero or one Part_feature objects. Each Part_feature defines associated_usage for zero, one, or more Usage_concept_usage_relationship objects. This assertion is established through a SELECT type.

4.3.1355 Usage_concept_usage_relationship to Printed_part_template_terminal

Each Usage_concept_usage_relationship has associated_usage defined by zero or one Printed_part_template_terminal objects. Each Printed_part_template_terminal defines associated_usage for one or more Usage_concept_usage_relationship objects. This assertion is established through a SELECT type.

4.3.1356 Usage_concept_usage_relationship to Part_template_planar_shape

Each Usage_concept_usage_relationship has associating_usage_shape defined by zero or one Part_template_planar_shape objects. Each Part_template_planar_shape defines associating_usage_shape for zero, one, or more Usage_concept_usage_relationship objects. This assertion is established through a SELECT type.

4.3.1357 Usage_concept_usage_relationship to Physical_unit_planar_shape

Each Usage_concept_usage_relationship has associating_usage_shape defined by zero or one Physical_unit_planar_shape objects. Each Physical_unit_planar_shape defines associating_usage_shape for zero, one, or more Usage_concept_usage_relationship objects. This assertion is established through a SELECT type.

4.3.1358 Usage_concept_usage_relationship to Part_template_3d_shape

Each Usage_concept_usage_relationship has associating_usage_shape defined by zero or one Part_template_3d_shape objects. Each Part_template_3d_shape defines associating_usage_shape for zero, one, or more Usage_concept_usage_relationship objects. This assertion is established through a SELECT type.

4.3.1359 Usage_concept_usage_relationship to Part_template_non_planar_2d_shape

Each Usage_concept_usage_relationship has associating_usage_shape defined by zero or one Part_template_non_planar_2d_shape objects. Each Part_template_non_planar_2d_shape defines associating_usage_shape for zero, one, or more Usage_concept_usage_relationship objects. This assertion is established through a SELECT type.

4.3.1360 Usage_concept_usage_relationship to Physical_unit_3d_shape

Each Usage_concept_usage_relationship has associating_usage_shape defined by zero or one Physical_unit_3d_shape objects. Each Physical_unit_3d_shape defines associating_usage_shape for zero, one, or more Usage_concept_usage_relationship objects. This assertion is established through a SELECT type.

4.3.1361 Usage_concept_usage_relationship to Non_feature_shape_definition

Each Usage_concept_usage_relationship has associating_non_feature_usage_shape defined by exactly one Non_feature_shape_definition. Each Non_feature_shape_definition defines associating_non_feature_usage_shape for zero, one, or more Usage_concept_usage_relationship objects.

4.3.1362 Usage_view_connection_zone_terminal_shape_relationship to Assembly_module_terminal

Each Usage_view_connection_zone_terminal_shape_relationship has associating_terminal defined by zero or one Assembly_module_terminal objects. Each Assembly_module_terminal defines associating_terminal for zero, one, or more Usage_view_connection_zone_terminal_shape_relationship objects. This assertion is established through a SELECT type.

4.3.1363 Usage_view_connection_zone_terminal_shape_relationship to Bare_die_terminal

Each Usage_view_connection_zone_terminal_shape_relationship has associating_terminal defined by zero or one Bare_die_terminal objects. Each Bare_die_terminal defines associating_terminal for zero, one, or more Usage_view_connection_zone_terminal_shape_relationship objects. This assertion is established through a SELECT type.

4.3.1364 Usage_view_connection_zone_terminal_shape_relationship to Component_termination_passage_template_terminal

Each Usage_view_connection_zone_terminal_shape_relationship has associating_terminal defined by zero or one Component_termination_passage_template_terminal objects. Each Component_termination_passage_template_terminal defines associating_terminal for zero, one, or more Usage_view_connection_zone_terminal_shape_relationship objects. This assertion is established through a SELECT type.

4.3.1365 Usage_view_connection_zone_terminal_shape_relationship to Interconnect_module_terminal

Each Usage_view_connection_zone_terminal_shape_relationship has associating_terminal defined by zero or one Interconnect_module_terminal objects. Each Interconnect_module_terminal defines associating_terminal for zero, one, or more Usage_view_connection_zone_terminal_shape_relationship objects. This assertion is established through a SELECT type.

4.3.1366 Usage_view_connection_zone_terminal_shape_relationship to Land_template_terminal

Each Usage_view_connection_zone_terminal_shape_relationship has associating_terminal defined by zero or one Land_template_terminal objects. Each Land_template_terminal defines associating_terminal for zero, one, or more Usage_view_connection_zone_terminal_shape_relationship objects. This assertion is established through a SELECT type.

4.3.1367 Usage_view_connection_zone_terminal_shape_relationship to Package_terminal

Each Usage_view_connection_zone_terminal_shape_relationship has associating_terminal defined by zero or one Package_terminal objects. Each Package_terminal defines associating_terminal for zero, one, or more Usage_view_connection_zone_terminal_shape_relationship objects. This assertion is established through a SELECT type.

4.3.1368 Usage_view_connection_zone_terminal_shape_relationship to Printed_part_template_terminal

Each Usage_view_connection_zone_terminal_shape_relationship has associating_terminal defined by zero or one Printed_part_template_terminal objects. Each Printed_part_template_terminal defines associating_terminal for zero, one, or more Usage_view_connection_zone_terminal_shape_relationship objects. This assertion is established through a SELECT type.

4.3.1369 Usage_view_connection_zone_terminal_shape_relationship to Via_template_terminal

Each Usage_view_connection_zone_terminal_shape_relationship has associating_terminal defined by zero or one Via_template_terminal objects. Each Via_template_terminal defines associating_terminal for zero, one, or more Usage_view_connection_zone_terminal_shape_relationship objects. This assertion is established through a SELECT type.

4.3.1370 Usage_view_connection_zone_terminal_shape_relationship to Part_mounting_feature

Each Usage_view_connection_zone_terminal_shape_relationship has associating_terminal defined by zero or one Part_mounting_feature objects. Each Part_mounting_feature defines associating_terminal for zero, one, or more Usage_view_connection_zone_terminal_shape_relationship objects. This assertion is established through a SELECT type.

4.3.1371 Usage_view_connection_zone_terminal_shape_relationship to Axis_placement

Each Usage_view_connection_zone_terminal_shape_relationship has associated_usage_placement defined by exactly one Axis_placement. Each Axis_placement defines associated_usage_placement for zero, one, or more Usage_view_connection_zone_terminal_shape_relationship objects.

4.3.1372 Usage_view_connection_zone_terminal_shape_relationship to Feature_shape_definition

Each Usage_view_connection_zone_terminal_shape_relationship has associated_connection_zone_shape_definition defined by exactly one Feature_shape_definition. Each Feature_shape_definition defines associated_connection_zone_shape_definition for zero, one, or more Usage_view_connection_zone_terminal_shape_relationship objects. Each Usage_view_connection_zone_terminal_shape_relationship has associating_terminal_shape defined by exactly one Feature_shape_definition. Each Feature_shape_definition defines associating_terminal_shape for zero, one, or more Usage_view_connection_zone_terminal_shape_relationship objects.

4.3.1373 Usage_view_connection_zone_terminal_shape_relationship to Connection_zone

Each Usage_view_connection_zone_terminal_shape_relationship has associated_usage defined by exactly one Connection_zone. Each Connection_zone defines associated_usage for zero, one, or more Usage_view_connection_zone_terminal_shape_relationship objects.

4.3.1374 Via to Via_template

Each Via has usage_definition defined by exactly one Via_template. Each Via_template defines usage_definition for zero, one, or more Via objects.

4.3.1375 Via_and_contact_size_dependent_land to Via

Each Via_and_contact_size_dependent_land has reference_via defined by exactly one Via. Each Via defines reference_via for zero, one, or more Via_and_contact_size_dependent_land objects.

4.3.1376 Via_and_contact_size_dependent_land to Default_attachment_size_and_via_based_land_physical_template

Each Via_and_contact_size_dependent_land has usage_definition defined by exactly one Default_attachment_size_and_via_based_land_physical_template. Each Default_attachment_size_and_via_based_land_physical_template defines usage_definition for zero, one, or more Via_and_contact_size_dependent_land objects.

4.3.1377 Via_and_contact_size_dependent_non_functional_land to Default_attachment_size_and_via_based_land_physical_template

Each Via_and_contact_size_dependent_non_functional_land has usage_definition defined by exactly one Default_attachment_size_and_via_based_land_physical_template. Each Default_attachment_size_and_via_based_land_physical_template defines usage_definition for zero, one, or more Via_and_contact_size_dependent_non_functional_land objects.

4.3.1378 Via_and_contact_size_dependent_non_functional_land to Via

Each Via_and_contact_size_dependent_non_functional_land has reference_via defined by exactly one Via. Each Via defines reference_via for zero, one, or more Via_and_contact_size_dependent_non_functional_land objects.

4.3.1379 Via_dependent_land to Default_via_based_land_physical_template

Each Via_dependent_land has usage_definition defined by exactly one Default_via_based_land_physical_template. Each Default_via_based_land_physical_template defines usage_definition for zero, one, or more Via_dependent_land objects.

4.3.1380 Via_dependent_land to Via

Each Via_dependent_land has reference_via defined by exactly one Via. Each Via defines reference_via for zero, one, or more Via_dependent_land objects.

4.3.1381 Via_dependent_non_functional_land to Default_via_based_land_physical_template

Each Via_dependent_non_functional_land has usage_definition defined by exactly one Default_via_based_land_physical_template. Each Default_via_based_land_physical_template defines usage_definition for zero, one, or more Via_dependent_non_functional_land objects.

4.3.1382 Via_dependent_non_functional_land to Via

Each Via_dependent_non_functional_land has reference_via defined by exactly one Via. Each Via defines reference_via for zero, one, or more Via_dependent_non_functional_land objects.

4.3.1383 Via_template to Default_via_definition

Each Via_template has of_passage_technology defined by exactly one Default_via_definition. Each Default_via_definition defines of_passage_technology for zero, one, or more Via_template objects.

4.3.1384 Via_template_terminal to Connection_zone

Each Via_template_terminal has terminal_connection_zone defined by one or more Connection_zone objects. Each Connection_zone defines terminal_connection_zone for zero, one, or more Via_template_terminal objects.

4.3.1385 Via_template_terminal to Inter_stratum_extent

Each Via_template_terminal has disallowed_inter_stratum_extent defined by exactly one Inter_stratum_extent. Each Inter_stratum_extent defines disallowed_inter_stratum_extent for zero, one, or more Via_template_terminal objects.

4.3.1386 Via_template_terminal to Via_template

Each Via_template_terminal has associated_definition defined by exactly one Via_template. Each Via_template defines associated_definition for two or more Via_template_terminal objects.

4.3.1387 Via_terminal to Via

Each Via_terminal has associated_component defined by exactly one Via. Each Via defines associated_component for zero, one, or more Via_terminal objects.

4.3.1388 Via_terminal to Via_template_terminal

Each Via_terminal has definition defined by exactly one Via_template_terminal. Each Via_template_terminal defines definition for zero, one, or more Via_terminal objects.

4.3.1389 Viewing_plane_based_orientation to Viewing_plane_definition

Each Viewing_plane_based_orientation has viewing_plane_specification defined by exactly one Viewing_plane_definition. Each Viewing_plane_definition defines viewing_plane_specification for zero, one, or more Viewing_plane_based_orientation objects.

4.3.1390 Viewing_plane_based_orientation to Tolerance_zone_and_viewing_plane_orienting_relationship

Each Viewing_plane_based_orientation has orienting_relationship defined by exactly one Tolerance_zone_and_viewing_plane_orienting_relationship. Each Tolerance_zone_and_viewing_plane_orienting_relationship defines orienting_relationship for zero, one, or more Viewing_plane_based_orientation objects.

4.3.1391 Viewing_plane_definition to Axis_placement

Each Viewing_plane_definition has viewing_plane_representation defined by exactly one Axis_placement. Each Axis_placement defines viewing_plane_representation for zero, one, or more Viewing_plane_definition objects.

4.3.1392 Viewing_plane_definition to Viewing_plane

Each Viewing_plane_definition has defined_viewing_plane defined by exactly one Viewing_plane. Each Viewing_plane defines defined_viewing_plane for zero, one, or more Viewing_plane_definition objects.

4.3.1393 View_level_non_feature_shape_definition to Part_template_3d_shape

Each View_level_non_feature_shape_definition has model_shape defined by zero or one Part_template_3d_shape objects. Each Part_template_3d_shape defines model_shape for zero, one, or more View_level_non_feature_shape_definition objects. This assertion is established through a SELECT type.

4.3.1394 View_level_non_feature_shape_definition to Physical_unit_3d_shape

Each View_level_non_feature_shape_definition has model_shape defined by zero or one Physical_unit_3d_shape objects. Each Physical_unit_3d_shape defines model_shape for zero, one, or more View_level_non_feature_shape_definition objects. This assertion is established through a SELECT type.

4.3.1395 View_level_non_feature_shape_definition to Part_template_non_planar_2d_shape

Each View_level_non_feature_shape_definition has model_shape defined by zero or one Part_template_non_planar_2d_shape objects. Each Part_template_non_planar_2d_shape defines model_shape for zero, one, or more View_level_non_feature_shape_definition objects. This assertion is established through a SELECT type.

4.3.1396 View_level_non_feature_shape_definition to Part_template_planar_shape

Each View_level_non_feature_shape_definition has model_shape defined by zero or one Part_template_planar_shape objects. Each Part_template_planar_shape defines model_shape for zero, one, or more View_level_non_feature_shape_definition objects. This assertion is established through a SELECT type.

4.3.1397 View_level_non_feature_shape_definition to Physical_unit_planar_shape

Each View_level_non_feature_shape_definition has model_shape defined by zero or one Physical_unit_planar_shape objects. Each Physical_unit_planar_shape defines model_shape for zero, one, or more View_level_non_feature_shape_definition objects. This assertion is established through a SELECT type.

4.3.1398 Volume_shape_intersection to Axis_placement_2d

Each Volume_shape_intersection has planar_shape_origin defined by exactly one Axis_placement_2d. Each Axis_placement_2d defines planar_shape_origin for zero, one, or more Volume_shape_intersection objects.

4.3.1399 Volume_shape_intersection to Axis_placement_3d

Each Volume_shape_intersection has orientation_intersection_plane defined by exactly one Axis_placement_3d. Each Axis_placement_3d defines orientation_intersection_plane for zero, one, or more Volume_shape_intersection objects.

4.3.1400 Volume_shape_intersection to Bound_volume_shape

Each Volume_shape_intersection has projected_volume defined by exactly one Bound_volume_shape. Each Bound_volume_shape defines projected_volume for zero, one, or more Volume_shape_intersection objects.

4.3.1401 Volume_shape_intersection to Planar_shape

Each Volume_shape_intersection has surface_intersection_result defined by exactly one Planar_shape. Each Planar_shape defines surface_intersection_result for zero, one, or more Volume_shape_intersection objects.

4.3.1402 Volume_shape_plane_projection to Axis_placement_2d

Each Volume_shape_plane_projection has planar_shape_origin defined by exactly one Axis_placement_2d. Each Axis_placement_2d defines planar_shape_origin for zero, one, or more Volume_shape_plane_projection objects.

4.3.1403 Volume_shape_plane_projection to Axis_placement_3d

Each Volume_shape_plane_projection has viewing_plane defined by exactly one Axis_placement_3d. Each Axis_placement_3d defines viewing_plane for zero, one, or more Volume_shape_plane_projection objects. Each Volume_shape_plane_projection has orientation_viewing_plane defined by exactly one Axis_placement_3d. Each Axis_placement_3d defines orientation_viewing_plane for zero, one, or more Volume_shape_plane_projection objects.

4.3.1404 Volume_shape_plane_projection to Bound_volume_shape

Each Volume_shape_plane_projection has projected_volume defined by exactly one Bound_volume_shape. Each Bound_volume_shape defines projected_volume for zero, one, or more Volume_shape_plane_projection objects.

4.3.1405 Volume_shape_plane_projection to Planar_shape

Each Volume_shape_plane_projection has surface_projection_result defined by exactly one Planar_shape. Each Planar_shape defines surface_projection_result for zero, one, or more Volume_shape_plane_projection objects.

4.3.1406 Volume_shape_point_projection to Axis_placement_2d

Each Volume_shape_point_projection has planar_shape_origin defined by exactly one Axis_placement_2d. Each Axis_placement_2d defines planar_shape_origin for zero, one, or more Volume_shape_point_projection objects.

4.3.1407 Volume_shape_point_projection to Cartesian_point

Each Volume_shape_point_projection has viewing_point defined by exactly one Cartesian_point. Each Cartesian_point defines viewing_point for zero, one, or more Volume_shape_point_projection objects.

4.3.1408 Volume_shape_point_projection to Axis_placement_3d

Each Volume_shape_point_projection has orientation_viewing_plane defined by exactly one Axis_placement_3d. Each Axis_placement_3d defines orientation_viewing_plane for zero, one, or more Volume_shape_point_projection objects.

4.3.1409 Volume_shape_point_projection to Bound_volume_shape

Each Volume_shape_point_projection has projected_volume defined by exactly one Bound_volume_shape. Each Bound_volume_shape defines projected_volume for zero, one, or more Volume_shape_point_projection objects.

4.3.1410 Volume_shape_point_projection to Planar_shape

Each Volume_shape_point_projection has surface_projection_result defined by exactly one Planar_shape. Each Planar_shape defines surface_projection_result for zero, one, or more Volume_shape_point_projection objects.

4.3.1411 Wire_terminal to Length_data_element

Each Wire_terminal has minimum_wire_terminal_length defined by exactly one Length_data_element. Each Length_data_element defines minimum_wire_terminal_length for zero, one, or more Wire_terminal objects. Each Wire_terminal has maximum_wire_terminal_length defined by exactly one Length_data_element. Each Length_data_element defines maximum_wire_terminal_length for zero, one, or more Wire_terminal objects.

4.3.1412 Wire_terminal to Connection_zone

Each Wire_terminal has internal_connection_zone defined by one or more Connection_zone objects. Each Connection_zone defines internal_connection_zone for zero, one, or more Wire_terminal objects.

4.3.1413 Work_order to Contract

Each Work_order has authorizing_agreement defined by exactly one Contract. Each Contract defines authorizing_agreement for zero, one, or more Work_order objects.

4.3.1414 Work_order to Date_and_time

Each Work_order has release_date defined by zero or one Date_and_time objects. Each Date_and_time defines release_date for zero, one, or more Work_order objects. This assertion is established through a SELECT type. Each Work_order has start_date defined by zero or one Date_and_time objects. Each Date_and_time defines start_date for zero, one, or more Work_order objects. This assertion is established through a SELECT type.

4.3.1415 Work_order to Date

Each Work_order has release_date defined by zero or one Date objects. Each Date defines release_date for zero, one, or more Work_order objects. This assertion is established through a SELECT type. Each Work_order has start_date defined by zero or one Date objects. Each Date defines start_date for zero, one, or more Work_order objects. This assertion is established through a SELECT type.

4.3.1416 Work_order to Person_and_organization

Each Work_order has initiator defined by zero or one Person_and_organization objects. Each Person_and_organization defines initiator for zero, one, or more Work_order objects. This assertion is established through a SELECT type.

4.3.1417 Work_order to Organization

Each Work_order has initiator defined by zero or one Organization objects. Each Organization defines initiator for zero, one, or more Work_order objects. This assertion is established through a SELECT type.

4.3.1418 Work_order to Ee_approval

Each Work_order has work_order_approval defined by exactly one Ee_approval. Each Ee_approval defines work_order_approval for zero, one, or more Work_order objects.

4.3.1419 Work_order to Ee_text

Each Work_order has additional_data defined by exactly one Ee_text. Each Ee_text defines additional_data for zero, one, or more Work_order objects. Each Work_order has analysis_data defined by exactly one Ee_text. Each Ee_text defines analysis_data for zero, one, or more Work_order objects.

4.3.1420 Work_order to Ee_product_version

Each Work_order has resulting_product defined by one or more Ee_product_version objects. Each Ee_product_version defines resulting_product for zero, one, or more Work_order objects.

4.3.1421 Work_order to Work_request

Each Work_order has referenced_work_request defined by one or more Work_request objects. Each Work_request defines referenced_work_request for zero or one Work_order objects.

4.3.1422 Work_request to Person_and_organization

Each Work_request has initiator defined by zero or one Person_and_organization objects. Each Person_and_organization defines initiator for zero, one, or more Work_request objects. This assertion is established through a SELECT type. Each Work_request has request_recipient defined by zero or one Person_and_organization objects. Each Person_and_organization defines request_recipient for zero, one, or more Work_request objects. This assertion is established through a SELECT type.

4.3.1423 Work_request to Organization

Each Work_request has initiator defined by zero or one Organization objects. Each Organization defines initiator for zero, one, or more Work_request objects. This assertion is established through a SELECT type. Each Work_request has request_recipient defined by zero or one Organization objects. Each Organization defines request_recipient for zero, one, or more Work_request objects. This assertion is established through a SELECT type.

4.3.1424 Work_request to Evaluated_characteristic

Each Work_request has reason defined by zero or one Evaluated_characteristic objects. Each Evaluated_characteristic defines reason for zero, one, or more Work_request objects. This assertion is established through a SELECT type.

4.3.1425 Work_request to Ee_text

Each Work_request has reason defined by zero or one Ee_text objects. Each Ee_text defines reason for zero, one, or more Work_request objects. This assertion is established through a SELECT type. Each Work_request has description defined by exactly one Ee_text. Each Ee_text defines description for zero, one, or more Work_request objects.

4.3.1426 Work_request to Date_and_time

Each Work_request has request_date defined by zero or one Date_and_time objects. Each Date_and_time defines request_date for zero, one, or more Work_request objects. This assertion is established through a SELECT type.

4.3.1427 Work_request to Date

Each Work_request has request_date defined by zero or one Date objects. Each Date defines request_date for zero, one, or more Work_request objects. This assertion is established through a SELECT type.

4.3.1428 Work_request to Ee_product_version

Each Work_request has referenced_product defined by one or more Ee_product_version objects. Each Ee_product_version defines referenced_product for zero, one, or more Work_request objects.

4.3.1429 Work_request to Ee_approval

Each Work_request has work_request_approval defined by exactly one Ee_approval. Each Ee_approval defines work_request_approval for zero, one, or more Work_request objects.

5 Application interpreted model

5.1 Mapping table

This clause contains the mapping table that shows how each UoF and application object of this part of ISO 10303 (see clause 4) maps to one or more AIM constructs (see annex A). The mapping table is organized in five columns.

Column 1) Application element: Name of an application element as it appears in the application object definition in 4.2. Application object names are written in uppercase. Attribute names and assertions are listed after the application object to which they belong and are written in lower case.

Column 2) AIM element: Name of an AIM element as it appears in the AIM (see annex A), the term 'IDENTICAL MAPPING', or the term 'PATH'. AIM entities are written in lower case. Attribute names of AIM entities are referred to as <entity name> . <attribute name>. The mapping of an application element may result in several related AIM elements. Each of these AIM elements requires a line of its own in the table. The term 'IDENTICAL MAPPING' indicates that both application objects of an application assertion map to the same AIM element. The term 'PATH' indicates that the application assertion maps to the entire reference path.

Column 3) Source: For those AIM elements that are interpreted from the integrated resources or the application interpreted constructs, this is the number of the corresponding part of ISO 10303. For those AIM elements that are created for the purpose of this part of ISO 10303, this is the number of this part. Entities or types that are defined within the integrated resources have an AIC as the source reference if the use of the entity or type for the mapping is within the scope of the AIC.

Column 4) Rules: One or more numbers may be given that refer to rules that apply to the current AIM element. For rules that are derived from relationships between application objects, the same rule is referred to by the mapping entries of all the involved AIM elements. Global rules are given for each application object or AIM element to which they apply. The number in the rules column refers to the subclause number n of 5.2.4.n where the global rule is defined.

Column 5) Reference path: To describe fully the mapping of an application object, it may be necessary to specify a reference path through several related AIM elements. The reference path column documents the role of an AIM element relative to the AIM element in the row succeeding it. Two or more such related AIM elements define the interpretation of the integrated resources that satisfies the requirement specified by the application object. For each AIM element that has been created for use within this part of ISO 10303, a reference path up to its supertype from an integrated resource is specified.

For the expression of reference paths the following notational conventions apply:

- a) [] : enclosed section constrains multiple AIM elements or sections of the reference path are required to satisfy an information requirement;
- b) () : enclosed section constrains multiple AIM elements or sections of the reference path are identified as alternatives within the mapping to satisfy an information requirement;

- c) `{ }` : enclosed section constrains the reference path to satisfy an information requirement;
- d) `<>` : enclosed section constrains at one or more required reference path;
- e) `| |` : enclosed section constrains the supertype entity;
- f) `->` : attribute references the entity or select type given in the following row;
- g) `<-` : entity or select type is referenced by the attribute in the following row;
- h) `[ i ]` : attribute is an aggregation of which a single member is given in the following row;
- i) `[ n ]` : attribute is an aggregation of which member n is given in the following row;
- j) `=>` : entity is a supertype of the entity given in the following row;
- k) `<=` : entity is a subtype of the entity given in the following row;
- l) `=` : the string, select, or enumeration type is constrained to a choice or value;
- m) `\` : the reference path expression continues on the next line.
